

1 Introduction	24
1.1 How to use the Manual	26
2 Installing Bforartists	29
3 Interface	39
4 Workspaces	50
5.1.1 Topbar and Statusbar - File menu	63
5.1.2 Topbar and Statusbar - Edit menu	124
5.1.3 Topbar and Statusbar - Render menu	131
5.1.4 Topbar and Statusbar - Window menu	134
5.1.5 Topbar and Statusbar - Help menu	136
5 Topbar and Statusbar	138
6 Editors introduction	147
7.0.10 Editors - 3D Viewport - Metaball - Edit Mode - Metaball context menu	166
7.0.11 Editors - 3D Viewport - Text - Edit Mode - Text context menu	170
7.0.12 Editors - 3D Viewport - Grease Pencil object - Edit Mode - Point+Stroke context menu	174
7.0.13 Editors - 3D Viewport - Grease Pencil object - Sculpt Mode - Brushes context menu	191
7.0.14 Editors - 3D Viewport - Grease Pencil object - Draw Mode - Brushes context menu	193
7.0.15 Editors - 3D Viewport - Grease Pencil object - Vertex Paint Mode - Brushes context menu	196
7.0.16 Editors - 3D Viewport - Grease Pencil object - Weight Paint Mode - Brushes context menu	199
7.0.17 Editors - 3D Viewport - Armature - Edit Mode - Armature context menu	201
7.0.18 Editors - 3D Viewport - Armature - Pose Mode - Pose context menu	211

7.0.19 Editors - 3D Viewport - Armature - Edit Mode - Lattice context menu _____	219
7.0.1 Editors - 3D Viewport - Object mode - Object Context Menu .	222
7.0.2 Editors - 3D Viewport - Mesh Object - Edit Mode - Vertex Context Menu _____	262
7.0.3 Editors - 3D Viewport - Mesh Object - Edit Mode - Edge Context Menu _____	278
7.0.4 Editors - 3D Viewport - Mesh Object - Edit Mode - Face Context Menu _____	295
7.0.5 Editors - 3D Viewport - Mesh Object - Sculpt Mode - Brushes context menus _____	314
7.0.6 Editors - 3D Viewport - Mesh Object - Vertex Paint Mode - Brushes context menus _____	317
7.0.7 Editors - 3D Viewport - Mesh Object - Weight Paint Mode - Brushes context menus _____	319
7.0.8 Editors - 3D Viewport - Mesh Object - Texture Paint Mode - Brushes context menus _____	321
7.0.9 Editors - 3D Viewport - Curve + Surface Object - Edit Mode - Curve context menus _____	323
7.1.10 Editors - 3D Viewport - Header - Mesh - Edit Mode - Vertex Menu _____	335
7.1.11 Editors - 3D Viewport - Header - Mesh - Edit mode - Edge Menu _____	350
7.1.12 Editors - 3D Viewport - Header - Mesh - Edit mode - Faces menu _____	363
7.1.13 Editors - 3D Viewport - Header - Mesh - Edit mode - UV menu _____	376
7.1.14 Editors - 3D Viewport - Header - Mesh - Sculpt mode - Sculpt menu _____	384

7.1.15 Editors - 3D Viewport - Header - Mesh - Sculpt mode - Brush menu _____	399
7.1.16 Editors - 3D Viewport - Header - Mesh - Sculpt mode - Mask menu _____	400
7.1.17 Editors - 3D Viewport - Header - Mesh - Sculpt mode - Face Sets menu _____	403
7.1.18 Editors - 3D Viewport - Header - Mesh - Vertex Paint mode - Paint menu _____	406
7.1.19 Editors - 3D Viewport - Header - Mesh - Vertex Paint mode - Brush menu _____	410
7.1.1 Editors - 3D Viewport - Header tools and Options _____	411
7.1.20 Editors - 3D Viewport - Header - Mesh - Weight Paint mode - Weights menu _____	493
7.1.22 Editors - 3D Viewport - Header - Mesh - Texture Paint mode - Brush menu _____	503
7.1.23 Editors - 3D Viewport - Header - Curve - Edit mode - Curve menu _____	504
7.1.24 Editors - 3D Viewport - Header - Surface - Edit mode - Surface menu _____	519
7.1.25 Editors - 3D Viewport - Header - Curve & Surface - Edit mode - Control points menu _____	536
7.1.26 Editors - 3D Viewport - Header - Curve & Surface - Edit mode - Segments menu _____	543
7.1.27 Editors - 3D Viewport - Header - Metaball - Edit mode - Metaball menu _____	544
7.1.29 Editors - 3D Viewport - Header - Text - Edit mode - Text menu _____	558
7.1.2 Editors - 3D Viewport - Header - Quick Menu _____	562
7.1.30 Editors - 3D Viewport - Header - Grease Pencil - Edit mode - Grease Pencil menu _____	564

7.1.31 Editors - 3D Viewport - Header - Grease Pencil - Edit mode - Stroke menu _____	580
7.1.32 Editors - 3D Viewport - Header - Grease Pencil - Edit mode - Point menu _____	590
7.1.33 Editors - 3D Viewport - Header - Grease Pencil - Draw mode - Draw menu _____	593
7.1.34 Editors - 3D Viewport - Header - Grease Pencil - Vertex Paint mode - Animation menu _____	597
7.1.35 Editors - 3D Viewport - Header - Grease Pencil - Vertex Paint mode - Active Layer menu _____	599
7.1.36 Editors - 3D Viewport - Header - Grease Pencil - Vertex Paint mode - Paint menu _____	600
7.1.37 Editors - 3D Viewport - Header - Grease Pencil - Weight Paint Mode - Weights Menu _____	603
7.1.38 Editors - 3D Viewport - Header - Armature - Edit mode - Armature menu _____	607
7.1.39 Editors - 3D Viewport - Header - Armature - Pose mode - Pose menu _____	626
7.1.3 Editors - 3D Viewport - Header - View Menu _____	648
7.1.40 Editors - 3D Viewport - Header - Lattice - Edit mode - Lattice menu _____	658
7.1.41 Editors - 3D Viewport - Header - Particle - Particle mode - Particle menu _____	671
7.1.42 Editors - 3D Viewport - Header - Hair Curve - Edit mode - Curves menu _____	674
7.1.43 Editors - 3D Viewport - Header - Hair Curve - Edit mode - Control Points menu _____	680
7.1.44 Editors - 3D Viewport - Header - Hair Curve - Edit mode - Segments menu _____	682

7.1.45 Editors - 3D Viewport - Header - Hair Curve - Sculpt mode - Curves menu _____	683
7.1.4 Editors - 3D Viewport - Header - Navigation Menu _____	684
7.1.5 Editors - 3D Viewport - Header - Select Menu _____	694
7.1.6 Editors - 3D Viewport - Header - Add Menu _____	746
7.1.7 Editors - 3D Viewport - Header - Edit mode - Add menu _____	773
7.1.8 Editors - 3D Viewport - Header - Object menu _____	775
7.1.9 Editors - 3D Viewport - Header - Mesh - Edit mode - Mesh menu _____	829
7.1 Editors - 3D Viewport - Header _____	880
7.2.10 Editors - 3D Viewport - Tool Shelf - Metaball - Edit Mode _____	883
7.2.11 Editors - 3D Viewport - Tool Shelf - Text - Edit Mode _____	886
7.2.12 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Edit Mode _____	887
7.2.13 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Sculpt Mode _____	896
7.2.14 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Draw Mode _____	899
7.2.15 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Vertex Paint Mode _____	905
7.2.16 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Weight Paint Mode _____	907
7.2.17 Editors - 3D Viewport - Tool Shelf - Armature - Edit Mode _____	909
7.2.18 Editors - 3D Viewport - Tool Shelf - Armature - Pose Mode _____	921
7.2.19 Editors - 3D Viewport - Tool Shelf - Lattice - Edit Mode _____	925
7.2.1 Editors - 3D Viewport - Tool Shelf - Object Mode _____	928
7.2.20 Editors - 3D Viewport - Tool Shelf - Hair Curve - Edit Mode _____	965
7.2.21 Editors - 3D Viewport - Tool Shelf - Hair Curve - Sculpt Mode _____	972
7.2.2 Editors - 3D Viewport - Tool Shelf - Mesh - Edit Mode _____	976

7.2.3 Editors - 3D Viewport - Tool Shelf - Mesh - Sculpt Mode	_____	1023
7.2.4 Editors - 3D Viewport - Tool Shelf - Mesh - Vertex Paint Mode	_____	1039
7.2.5 Editors - 3D Viewport - Tool Shelf - Mesh - Weight Paint Mode	_____	1042
7.2.6 Editors - 3D Viewport - Tool Shelf - Mesh - Texture Paint Mode	_____	1049
7.2.7 Editors - 3D Viewport - Tool Shelf - Mesh - Particle Edit Mode	_____	1052
7.2.8 Editors - 3D Viewport - Tool Shelf - Curve - Edit Mode	_____	1057
7.2.9 Editors - 3D Viewport - Tool Shelf - Surface - Edit Mode	_____	1070
7.2 Editors - 3D Viewport - Tool Shelf	_____	1073
7.3.10 Editors - 3D Viewport - Sidebar - Tool Tab - Particle Edit Mode	_____	1077
7.3.11 Editors - 3D Viewport - Sidebar - Tool Tab - Grease Pencil - Sculpt Mode	_____	1081
7.3.12 Editors - 3D Viewport - Sidebar - Tool Tab - Grease Pencil - Draw Mode	_____	1089
7.3.13 Editors - 3D Viewport - Sidebar - Tool Tab - Grease Pencil - Vertex Paint Mode	_____	1106
7.3.14 Editors - 3D Viewport - Sidebar - Tool Tab - Grease Pencil - Weight Paint Mode	_____	1111
7.3.15 Editors - 3D Viewport - Sidebar - Tool Tab - Grease Pencil - Layer Panel	_____	1114
7.3.16 Editors - 3D Viewport - Sidebar - Tool Tab - Hair Curve - Sculpt Mode	_____	1117
7.3.17 Editors - 3D Viewport - Sidebar - View Tab	_____	1130
7.3.18 Editors - 3D Viewport - Sidebar - Animation Tab	_____	1142
7.3.1 Editors - 3D Viewport - Sidebar - Item tab	_____	1145
7.3.2 Editors - 3D Viewport - Sidebar - Tool Tab	_____	1159

7.3.3 Editors - 3D Viewport - Sidebar - Tool Tab - Object Mode	1161
7.3.4 Editors - 3D Viewport - Sidebar - Tool Tab - Edit Mode	1162
7.3.5 Editors - 3D Viewport - Sidebar - Tool Tab - Pose Mode	1165

# **The Bforartists 4 Reference Manual**

**Version 4.2.1**

## Introduction

Welcome to the reference manual for Bforartists 4, the free and open source 3D creation suite.

First let's explain what the manual is and what it is not: this is a reference manual. This means every chapter lists and explains the available tools, operators, the interface and general concepts.

What this is not: this is not a general CG tutorial. This manual will not explain workflows on how to create artwork. If you'd like to learn the creative fundamentals, there are numerous courses and tutorials for Blender from the community which will translate to Bforartists workflows seamlessly. This manual does however cover the needed workflow to get a tool working or explains how the tool is meant to work.

Chapters 1 to 5 covers general interface fundamental concepts. Chapters 6 to 30 explain the single editors and their tools. And every chapter afterwards is additional information.

This reference manual is for Bforartists 4 version 4.2.1 published on 27.08.2024

## 1.1 How to use the manual

### Table of content

How to use the Manual.....	1
General Manual structure.....	1
Editor Type.....	2
Editor Area.....	2
Menus, options, tabs and panels.....	3
Object Types and their modes.....	3

### How to use the Manual

The question of how to use the manual sounds odd in the first moment. You simply read it! But there are a few things to know before you can really find easily what you are looking for. Because using a 3d software requires some special 3d knowledge. And it needs a bit of knowledge about Bforartists to understand the structure of the manual. So that you can find what you need, both, from coming the software side, and from coming the manual side.

In worst case a manual chapter looks like this:

#### **7.3.14 Editors - 3D View - Sidebar - Tool Tab - Grease Pencil - Weight Paint Mode**

How do you supposed to find the needed information here? Why is this title so long? What is a mode, what is a sidebar, a tab? And what is a grease pencil?

Well, the manual chapter names are some sort of breadcrumbs. And you can follow this breadcrumbs. It is always the same pattern, at least for the chapters about the editor types and their tools.

**Chapter number - Editor type - Editor area - Tab and panel if available - Object type - and the Mode** in which the object needs to be to show the tool.

And with this knowledge you should now easily be able to find what you are looking for. And this in both directions. Coming from the software and searching in the manual. And coming from the manual and searching the tool in the software.

Let's talk about the details.

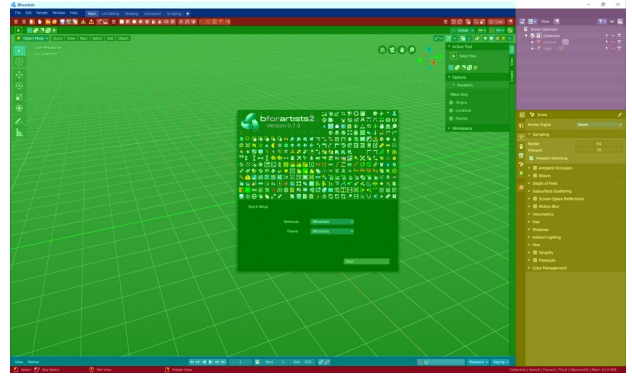

### General Manual structure

Chapter 1 to 6 contains some general information. Like the official key map. Or the general interface. The different single editor types starts with chapter 7. And at the end you will find some miscellaneous information.

## Editor Type

The different editor types is the first thing that brings structure into the manual. The different Editor types.

In the shot at the right you see that Bforartists is made of several areas. These are the several editor types. They all have their purpose. You have one editor type for the 3d view. One for the file browser, one for the UV editing, one for the Node editor, and so on. In this shot we see the 3D view (green), Toolbar editor (red), Outliner (pink), the Properties Editor (yellow), at the bottom the Timeline editor (blue). And the header and footer.

Each editor type has its own main chapter.

Chapter 7 is all about the 3D view. So every chapter that starts with a 7 is a chapter for the 3D view.

Chapter 8 is all about the Image Editor.

Chapter 9 is all about the UV Editor, and so on.

Please have a look in the manual chapter 6 Editors Introduction. Here we list and describe all the different Editor types.

**Conclusion**

The manual chapter for the editors starts with the number. Followed by the editor type.

Example: 7 Editors - 3D View

## Editor Area

Each editor can have several areas. The header, a toolbar at the left, a sidebar at the right, A tools area, the viewport to display and modify the content, some navigation elements, a panel where you can adjust some operations, and maybe even a footer.

Here as an example the 3D view.

At the top is the Tool Settings. Marked with blue. Here you can find settings for the currently active tool.

Below the tool settings is the Header. Marked with pink. It contains menus, tools and settings.

In the middle is the actual viewport. Here you see and modify for example your mesh data.

At the left you can find the Tool Shelf. Marked with green. It contains all the tools.

The yellow area is the navigate widgets.

At the right of it you can find the Sidebar. Marked with blue again. It contains settings and transform values.

And it is the place where ad dons adds its panels.

At the bottom left you can find the Adjust Last Operation panel. Marked with red. This panel appears when you do an operation, like move the mesh to another location, and allows you to adjust the values for the operation afterwards.

### Conclusion

The manual chapter for the editors starts with the number. Followed by the editor type. Followed by the area type.

Example: 7.1 Editors - 3D View - Header

## Menus, options, tabs and panels

Text menus and options are usually to find in the Header. So this are logical sub chapters for all header chapters.

Tabs and panels are usually to find in the sidebar. So this is the logical sub chapters for all sidebar chapters.

### Conclusion

The manual chapter for the editors starts with the number. Followed by the editor type. Followed by the area type. Followed by the sub types in this area.

Example: 7.1.5 Editors - 3D View - Header - Select Menu

Example: 7.3.2 Editors - 3D View - Sidebar - Tool Tab

## Object Types and their modes

There are several object types in Bforartists that you can work with. One of the most common object types is the mesh object.

Each object can have several modes to modify this object type. The mesh object has for example an edit mode where you can modify the mesh. A sculpt mode where you can sculpt the mesh. A vertex paint mode, a weight paint and a texture paint mode.

Each mode has its own tool set. This means that some tools just shows with specific object types and being in a mode where these tools shows.

And this is the last and very important breadcrumb in our manual chapter titles. Object type and required mode.

### Conclusion

The manual chapter for the editors starts with the number. Followed by the editor type. Followed by the area type. Followed by the sub types in this area. Followed by object type and needed mode to show these tools.

Example: 7.3.7 Editors - 3D View - Sidebar - Tool Tab - Mesh - Vertex Paint Mode

## Getting Bforartists

### Download Bforartists

Bforartists downloads can be downloaded here: <https://www.bforartists.de/content/download>

Bforartists is available for download for Linux, mac OS and MS-Windows. Linux users needs to compile Bforartists by themselves though. We don't have binaries for this OS

There is also the source code available at GitHub. <https://github.com/Bforartists/Bforartists>

## Minimum Requirements

### Minimum

- 32-bit dual core 2Ghz CPU with SSE2 support.
- 2 GB RAM
- 24 bits 1280×768 display
- Mouse or track pad
- OpenGL 2.1 compatible graphics with 512 MB RAM

### Recommended

- 64-bit quad core CPU
- 8 GB RAM
- Full HD display with 24 bit color
- Three button mouse
- OpenGL 3.2 compatible graphics with 2 GB RAM

## Installing on Linux

### Compiling yourself

There may not be the newest version of Bforartists available for Linux. Or not for your Linux distribution. Or not at all. Means you want or need to compile Bforartists from source code. Here you can find a tutorial that shows the whole process under Linux Ubuntu 17. Most of the process should work for other Linux distributions too.

[https://www.bforartists.de/data/tuts/Building\\_with\\_Ubuntu17.pdf](https://www.bforartists.de/data/tuts/Building_with_Ubuntu17.pdf)

## Installing

Compile the Linux version for your architecture to the desired location (eg. ~/software or /usr/local).

Bforartists 2 can now be launched by double-clicking the executable.

For easy access, you can configure your system by adding a menu entry or shortcut for Bforartists and associate and open `.blend` files with Bforartists when opening from the file browser. These settings typically belong to the Window Manager (KDE, Gnome, Unity).

## Running from the terminal

To run Bforartists from the terminal without needing to be in the executable directory, add the extracted folder to the environment `PATH`.

Add the following command to `.bash_rc` or `.bash_profile` with Bforartists's binary:

```
export PATH=$/path/to/Bforartists-VERSION-linux-glibcVERSION-ARCH:$PATH
```

### Tip

If you use daily builds and update Bforartists frequently, you can link or always rename your folder to 'Bforartists' and use this name for the `PATH` environment variable and for keeping the window manager menu up to date.

## Avoiding Alt+Mouse Conflict

Many Window Managers default to `Alt - LMB` for moving windows, which is a shortcut that Bforartists uses to simulate a 3 button mouse. You can either have this feature disabled `User Preferences > Input > Emulate 3 Button Mouse` or you can change the Window Manager settings to use the *Meta* key instead (also called *Super* or *Windows key*):

- **KDE:** System Settings > Window Behavior > Window Behavior > Window Actions , Switch 'Alt' for 'Meta' key
- **Unity/Gnome:** enter the following in a command line (effective at next login):

```
gsettings set org.gnome.desktop.wm.preferences mouse-button-modifier '<Super>'
```

## Installing on OSX

After downloading Bforartists for Mac-OS X, uncompress the file and drag `Bforartists.app` onto the Applications folder.

### Tip

Because *Bforartists* doesn't use the standard OS menu system, you likely have a redundant menu-bar at the top.

To remove it see this post on Macworld, but beware that it is somewhat complex. As an alternative: simply make *Bforartists* full screen by **Alt - F11** or by **File ▶ Window ▶ Toggle Window Full screen**.

## Installing on MS-Windows

### Exe

Download the installer, and execute it. Follow the advice of the installer.

### Uninstalling previous versions

Bforartists 1 and 2 have different folders and settings. This will not conflict. And you can have them installed side by side.

But in case you want to install a new version of Bforartists 2, and have an earlier version of Bforartists 2 already installed, then please uninstall this previous version first. Bforartists is in permanent development. And so lots of things can change with every version. Like which add-on is in what folder, or the number of add-ons at all. And this can lead to dysfunctional or a double set of add-ons or files then when you simply install over the old installation.

Changes at the settings are not affected by uninstalling the software. They are stored in the appdata directory, and will remain. You can work with the old settings, see point below. But there is no guarantee that everything works flawless then. Old settings may or may not work proper.

---

### Zip

Download the .zip file.

Place the zip file where you want Bforartists to be. This can be everywhere at your system. Then extract the zip file. To start Bforartists you have to double click at the exe file inside the created folder now.

It is also recommend to make a shortcut towards this executable. So that you don't have to navigate to the folder all the time when you want to start Bforartists. Place this shortcut at the desktop or the quickstart taskbar.

## Import Existing settings

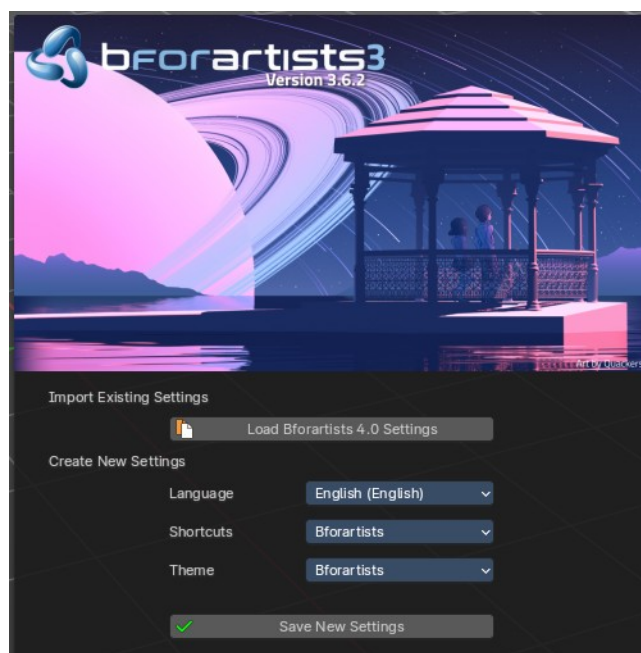

When you install a new version of Bforartists and had an older version installed, then you might experience that your old settings are gone, and Bforartists starts with the factory settings again.

Have a look at the splash screen. When there is a Import Existing settings field at the top, then this means that you run a new version the first time, and the old settings from the previous version is available. And that you can import it. Which can be done with a click at the Load Bforartists xxx Settings button.

Bforartists is based at Blender. And follows under the hood the naming conventions of Blender. So the number that you can see at the button here is the Blender version number that was used for the old settings.

This just works for the former version. You can import 2.81 settings in 2.82. Or 3.6.2 settings in 4.0. And 4.0 settings in 4.1. But settings from former versions older than the previous version does not show.

Beware of possible conflicts. The key map is still in change here and there. New add-ons or code might conflict with the ones that you have installed.

## Configuration

Here are some quick preferences that you may wish to set as quickly as possible. The full list and explanation of the preferences is in the section *User Preferences*.

## Language

At File ▶ User Preferences ▶ System, enable **International Fonts** to choose the **Language** and what to translate from **Interface, Tool tips** and **New Data**. See more at [Internationalization](#)

## Input

If you have a compact keyboard without a separate number pad enable File ▶ User Preferences ▶ **Emulate Numpad**.

If you don't have a middle mouse button you can enable File ▶ User Preferences ▶ **Emulate 3 Button Mouse**.

## File and Paths

At File ▶ User Preferences ▶ File you can set options such as what external **Image Editor** to use, such as GIMP or Krita, and the **Animation Player**.

The **Temp** directory sets where to store files such as temporary renders and autosaves.

### Tip

// at the start of a path in Bforartists means the directory of the currently opened **.blend** file, used to reference relative-paths.

If you trust the source of your **.blend** files, you can enable **Auto Run Python Scripts**. This option is meant to protect you from malicious Python scripts that someone can include inside a Bforartists file. This would not happen by accident, and most users leave this option on to automatically run scripts such as **Rigify** that controls the skeleton of a human rig.

## Input Devices

Bforartists supports various types of input devices:

Keyboard (recommended: keyboard with numeric keypad, English layout works best)

Mouse (recommended: 3 button mouse with scroll wheel)

NDOF Devices (also known as *3D Mouse*)

Graphic Tablets

## Mice

### **Mouse Button Emulation**

If you do not have a 3 button mouse, you will need to emulate it by checking the option in the User Preferences.

The following table shows the combinations used:

**3-button Mouse**

LMB

MMB

RMB

2-button Mouse

LMB

Alt-LMB

RMB

## Keyboards

### *Numpad Emulation*

If you do not have a numeric Numpad on the side of your keyboard, at a laptop for example, you may want to emulate one (uses the numbers at the top of the keyboard instead, however, removes quick access to layer visibility).

### *Non-English Keyboards*

Bforartists defaults are made for an English keyboard layout. It works fine at non-English keyboards in most cases. But in the input manager in the user preferences you may stumble across some oddities.

## Graphic Tablets

Graphics tablets can be used to provide a more traditional method of controlling the mouse cursor using a pen. This can help to provide a more familiar experience for artists who are used to painting and drawing with similar tools, as well as provide additional controls such as pressure sensitivity.

## 3D Mice

3D Mice or NDOF devices are hardware that you can use to navigate a scene in Bforartists. Currently only devices made by 3Dconnexion are supported. These devices allow you to explore a scene, as well as Walk/Fly modes.

## Configuring Directories

There are three different directories Bforartists may use, their exact locations are operating system dependent.

### **LOCAL**

Location of configuration and runtime data (for self contained bundle)

### **USER**

Location of configuration files (normally in the user's home directory).

### **SYSTEM**

Location of runtime data for system wide installation (may be read-only).

For system installations both **SYSTEM** and **USER** directories are needed.

For locally extracted Bforartists distributions, the user configuration and data runtime data are kept in the same sub-directory, allowing multiple Bforartists versions to run without conflict, ignoring the **USER** and **SYSTEM** files.

### Note

You may need to have the “show hidden files” option checked in your file browser settings.

## Platform Dependent Paths

Every OS handles the peripheral paths a bit different. The default locations for each system are as follow. Note that the path `./|BFORARTISTS_VERSION|/` is relative to the Bforartists executable.

## Linux

### LOCAL

`./2.80/`

### USER

`$HOME/.config/Bforartists/2.80/`

### SYSTEM

`/usr/share/Bforartists/2.80/`

#### Note

The **USER** path will use `$XDG_CONFIG_HOME` if its set:

`$XDG_CONFIG_HOME/Bforartists/2.80/`

---

## Mac OSX

### LOCAL

`./2.80/`

### USER

`/Users/$USER/Library/Application Support/Bforartists/2.80/`

### SYSTEM

`/Library/Application Support/Bforartists/2.80/`

#### Note

OSX stores the Bforartists binary in `./Bforartists.app/Contents/MacOS/Bforartists`, so the local path to data & config is:

`./Bforartists.app/Contents/MacOS/2.80/`

---

## MS-Windows

### LOCAL

. \2.80\.

## USER

C:\Documents and Settings\%USERNAME%\AppData\Roaming\Bforartists\Bforartists\2.80\

## SYSTEM

C:\Documents and Settings\All Users\AppData\Roaming\Bforartists\Bforartists\2.80\

---

## Path Layout

This is the path layout which is used within the directories described above.

Where `./config/startup.blend` could be `~/Bforartists/2.80/config/startup.blend` for example.

`./autosave/ ...`

Autosave blend file location. *Windows only, temp directory used for other systems.*

Search order: LOCAL, USER.

`./config/ ...`

Defaults & session info.

Search order: LOCAL, USER.

`./config/startup.blend`

Default file to load on startup.

`./config/userpref.blend`

Default preferences to load on startup.

`./config/bookmarks.txt`

File selector bookmarks.

`./config/recent-files.txt`

Recent file menu list.

`./datafiles/ ...`

Runtime files.

Search order: LOCAL, USER, SYSTEM

`./datafiles/locale/{language}/`

Static precompiled language files for UI translation.

`./datafiles/icons/*.png`

Icon themes for Bforartists user interface. *Not currently selectable in the theme preferences.*

`./datafiles/brushicons/*.png`

Images for each brush.

`./scripts/ ...`

Python scripts for the user interface and tools.

Search order: LOCAL, USER, SYSTEM.

`./scripts/addons/*.py`

Python add-ons which may be enabled in the user preferences, includes import/export format support, render engine integration and many handy utilities.

`./scripts/addons/modules/*.py`

Modules for add-ons to use (added to Python's `sys.path`).

`./scripts/addons_contrib/*.py`

Another add-ons directory which is used for community maintained add-ons (must be manually created).

`./scripts/addons_contrib/modules/*.py`

Modules for `addons_contrib` to use (added to Python's `sys.path`).

`./scripts/modules/*.py`

Python modules containing our core API and utility functions for other scripts to import (added to Python's `sys.path`).

`./scripts/startup/*.py`

Scripts which are automatically imported on startup.

`./scripts/presets/{preset}/*.py`

Presets used for storing user defined settings for cloth, render formats etc.

`./scripts/templates/*.py`

Example scripts which can be accessed from: Text Space's Header → Text → Script Templates.

`./python/ ...`

Bundled Python distribution, only necessary when the system Python installation is absent or incompatible.

Search order: LOCAL, SYSTEM.

## Temporary Directory

The temporary directory is used to store various files at run-time (including render layers, physics cache, copy-paste buffer and crash logs).

The temporary directory is selected based on the following priority:

- User Preference
- Environment variables (`TEMP` on MS-Windows, `TMP` & `TMP_DIR` on other platforms).
- The `/tmp/` directory.

## Tooltips

When you hover with the mouse over an UI element, like a button, then you can see a tooltip.

A tooltip can contain the tool name, a short description of the tool, the hotkey, and a Python tooltip.

The Python tool tip shows you the name of the operator. It is of interest for programming needs. It can be turned off in the User Preferences.

The tool tips in the Tool Shelf acts a bit different than the tool tips in the rest of the UI. It will not show you the Python tool tips, since it is a gigantic hack on top of the existing UI.

# Interface

## User Interface Principles

The UI is made of several different workspaces. Each workspace is made of several editors for the different purposes. And this editors are made of several sub elements. Like a Header or a tool shelf, or a sidebar. UI elements are organized in tabs, menus and panels.

The idea is to have a non overlapping and blocking UI with a non modal tool set. Which is just partially to achieve. See header below. And by the fact that you work in modes ...

As a consequence of the non overlapping UI concept, the interface avoids to work with popup panels where possible. You can adjust the tool after you use it, in the so called last operation panel. It can be found in the 3D view for example, down left.

## Splash Screen

The splash screen shows at startup. The splash screen will vanish when you click with the mouse. You can also turn its showing at startup completely off in the User Preferences.

At the very first start you can do a quick setup, and choose with what language and key map and what theme you want to work. Clicking at the Save new Preferences button will then make this change permanent.

When you don't have any recent files, then the splash screen shows a Getting Started section with some links to useful resources.

And when you have recent files, then the splash screen lists them instead of the Getting Started section.

In the splash screen you can also read at what Blender version the current Bforartists version is based at.

## Header

Every editor has a header area. It usually contains the menu. And some tools or settings.

### Scroll Header

**A header can be scrolled!** This is especially useful in the layouts where the header is this crowded with tools that it doesn't fit to display all content into the layout anymore. This is for example the case in the UV layout.

To scroll the header, click with the middle mouse button at it, and drag.

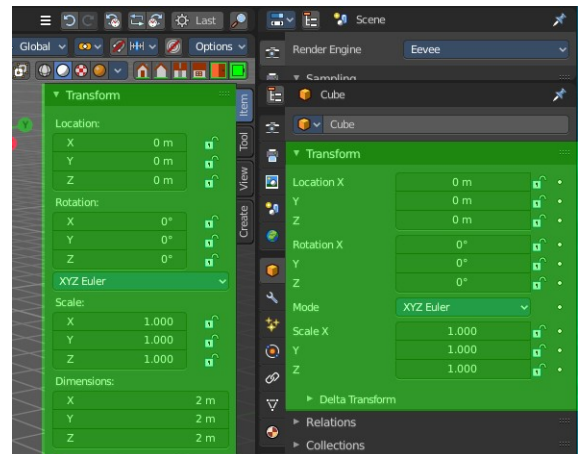

## Panels

A Panel is a container that contains tools and settings. They are used in quite a few locations. In the Properties editor for example. Or in the sidebars.

Panels can be rearranged in order. Simply drag them over each other to achieve the order that you need.

Panels can be expanded and collapsed by clicking at the title bar.

When you hold down ctrl and click at the title bar then this panel will open, and all other panels will close.

### Pinning panels

Normally the tabs just displays the panels of the current tab. But you can pin panels so that they display always. This counts also for content from other tabs. Here i have pinned the panel from the Mini Lightlib in the Create tab. And it shows in the View tab now.

Right click at the tab that you want to pin. A menu pops up. Check the Pin checkbox. The tab will now show a pin, and will display permanently.

To unpin the panel simply click at the Pin icon.

## Open just one Panel at a time

This can be done by clicking at the header of a panel and holding down ctrl.

## Tabs

The Sidebars can have Tabs to switch between different content. Also the Properties editor has them. The tabs helps to organize the available tools into categories. In the 3D view it's also a common place where addons adds themselves.

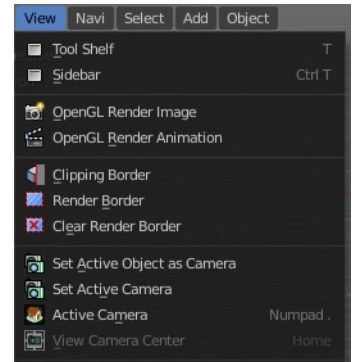

## Menus, Buttons and Controls

The UI contains various control elements. Buttons, Menus, toggles, etc.

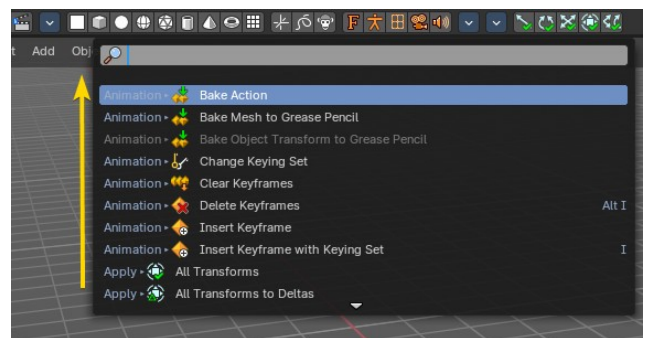

### Menu

In the header you may find text menus. A text menu contains usually buttons. But it can also contain toggles. Or other menus.

### Menu Search

You can search any header menu while it is open with the search menu operator by pressing SPACE. This will allow filtering the menu contents without navigating into the sub-menus.

### Button

A button is a UI element that allows you to perform an operation at click. There are various button types in the UI. Text Buttons in the text menus, text buttons in the panels, and icon buttons in the header and in the tool shelf.

## Toggles

Toggles can be radio buttons. But also icon or text buttons. Where they are the same is that they have states. On and off for example. They can also have more states than just two.

## Edit Box

Some UI elements are editable. Edit boxes are used for things like position, angle, name, etc. . Click into the editable area to enter the edit mode. Do the changes, like typing in a new value, then press Enter to confirm the change.

Value edit boxes have some extra functionality. They work as sliders too. Hover with the mouse over the edit box. The mouse cursor will turn into two arrows.

## Snapping

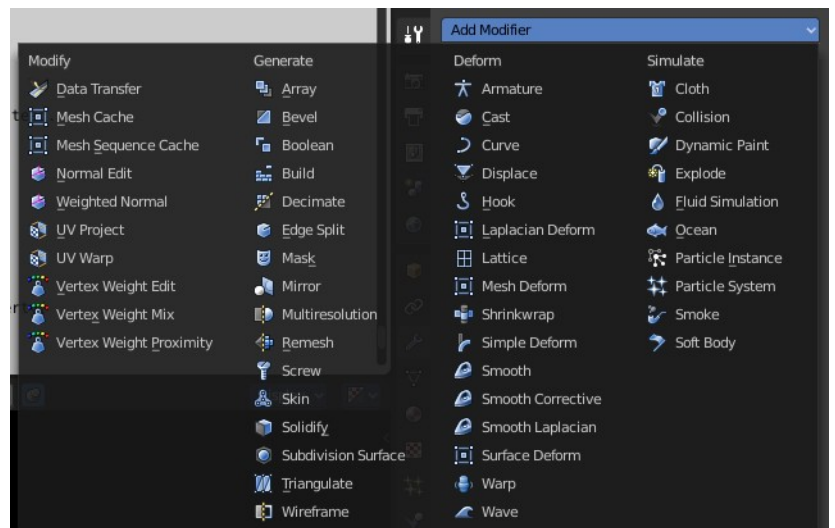

Sliders can snap incrementally. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

## Drop down box

A drop down box is another kind of a menu. Usually you choose something here. Like a special setting. Or when you add a modifier. A list drop down box can show you the loaded textures for example. and allow you to choose another one.

## Color Picker

You may stumble across color pickers in the UI. When you do a painting job for example. This allows you to adjust color for the specific task. Like adjusting the brush color.

## Widgets

There are various widget types in Bforartists to find.

Most of them in the 3D View. Widgets allows you to manipulate the transformation along one or more axis.

## Cursors

A cursor is a center point, and allows manipulation in different ways.

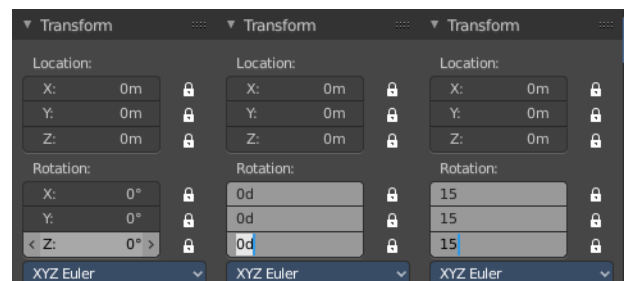

Objects gets created at the 3D cursor in the 3D view. You can set the cursor at different locations. You can snap it to elements, and you can snap elements to it.

# Value Editing

You will find lots of value edit boxes in the Bforartists interface. To set the render size for example. Or to set the position of an object.

## Multi Value Editing

Sometimes you want to edit multiple values at once. The object scale for example. This can be done by clicking into the first edit box, and then drag with the mouse across the other edit boxes. They will become active now. And when you edit one value, then the other values will change too.

## Expressions

You can also enter expressions in value edit boxes. And the result will be calculated. For example,  $3 * 2$  instead of 6. or  $5 / 10 + 3$ . Even constants like  $\pi$  (3.142) or functions like  $\text{sqrt}(2)$  (square root of 2) may be used.

## Expressions as Drivers

You may want your expression to be re-evaluated after its entered. Blender supports this using *Drivers* (a feature of the animation system).

Expression beginning with #, have a special use. Instead of evaluating the value and discarding the expression, a driver is added to the property with the expression entered.

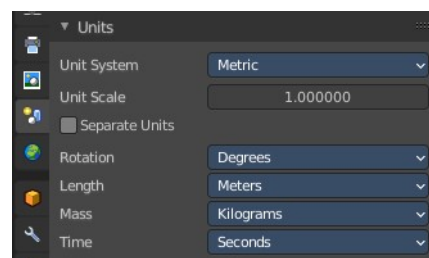

The expression `#frame` is a quick way to access map a value to the current frame, but more complex expressions are also supported `#fmod( frame, 24) / 24` for example.

This is simply a convenient shortcut to add drivers which can also be added via the RMB menu.

## Units

You can mix units with numbers. This means when you work in meters, then you can type in cm for centimeters. And the correct value will be used then.

You can even mix units in the same expression. For example `1m, 3mm`. Or do complex mathematical calculations like `2.2mm + 5' / 3" - 2yards`. Commas are optional.

Units can be adjusted in the Properties Editor in the Scene tab in the Units panel.

Such units needs to be set in the scene settings. Metric or Imperial.

## Unit Names

Unit names have can be used with both long and short forms. Both is recognized.

Here is a list of recognized unit names you can use. Plurals of the names are recognized too, so `meter` and `meters` can both be used.

Imperial Units

Full Name	Short Name(s)	Scale of a Meter
<b>thou</b>	mi l	0.0000254
<b>inch</b>	", in	0.0254
<b>foot, feet</b>	', ft	0.3048
<b>yard</b>	yd	0.9144
<b>chain</b>	ch	20.1168
<b>furlong</b>	fur	201.168
<b>mile</b>	mi, m	1609.344

Metric Units

Full Name	Short Name(s)	Scale of a Meter
<b>micrometer</b>	um	0.000001
<b>millimeter</b>	mm	0.001
<b>centimeter</b>	cm	0.01
<b>decimeter</b>	dm	0.1
<b>meter</b>	m	1.0

Full Name	Short Name(s)	Scale of a Meter
<b>dekameter</b>	dam	10.0
<b>hectometer</b>	hm	100.0
<b>kilometer</b>	km	1000.0

## Menu shortcuts

- Arrow keys can be used to navigate into a menu
- Each menu item has an underlined character which can be pressed to activate it.
- Number keys or numpad can be used to access menu items. (Where 1 is the first menu item, 2 the second... etc. For larger menus **Alt - 1** the 11th... up to **Alt - 0** the 20th)
- Press **Return** to activate the selected menu item.
- Press **ESC** to cancel the menu.

## Tool Shelf

Some editors have a Tool Shelf at the left side. This tool shelf contains the tools. It can be resized by dragging. It can be closed and opened.

### Opening and closing by menu and hotkey

The view menu provides you with menus to close and to open the Tool shelf.

It also shows the hotkey.

### Resize

You can grab the border and drag the Tool Shelf and the Properties Sidebar to the left or to the right to expand or to close it.

The tool shelf shows a special behavior when you drag it bigger. Then the icon buttons becomes text buttons.

### Open Tool Shelf by Plus Button

When a sidebar is closed then you will see a little plus button. When you click at this button then the sidebar will reappear.

## Sidebar

Some editors have a Sidebar at the right side. It can be resized by dragging. It can be closed and opened.

### Opening and closing by menu and hotkey

The view menu provides you with menus to close and to open the Tool shelf.

It also shows the hotkey.

## Resize

You can grab the border and drag the Sidebar to the left or to the right to expand or to close it.

### Open Sidebar by Plus Button

When a sidebar is closed then you will see a little plus button. When you click at this button then the sidebar will reappear.

## Input Devices

Bforartists supports various types of input devices:

- Keyboard (recommended: keyboard with numeric keypad, English layout works best)
- Mouse (recommended: 3 button mouse with scroll wheel)
- NDOF Devices (also known as *3D Mouse*)
- Graphic Tablets

### Non English Keyboard

If you use a keyboard with a non-English keyboard layout, you may stumble across bugs and quirks and odd behaviors. Blender was developed for and with the UK or US layout. Some quirks for other keyboard layouts slipped through. And quite a few of those old bugs are still unfixed in Bforartists too.

# Introduction

A Workspace is a layout with different editors. For example, in most workspaces you have a 3d view editor, an outliner and a properties editor. It includes Top Bar and Footer. And every workspace can have some specific settings. The Sculpting Workspace starts for example in Sculpt mode. And not in Edit Mode like the default workspace.

To switch between the workspaces simply click at the tabs.

The chapter tabs and default workspaces is explained in the chapter Topbar. It is menu functionality. And menu functionality gets explained where the menu is.

This chapter here is about the general functionality of workspaces.

# Modifying Workspaces

## Resizing Editor Windows

Move the mouse over a border between the editors. The mouse cursor will turn into a double arrow. Drag the arrow around and the editor will resize with your moving mouse.

In the Default layout there are two editors that are collapsed to just show the menu. The menu bar at the top is an own editor. The Info editor. You can drag it down to reveal a text field. Here Bforartists displays all the former actions as strings. When you create a primitive for example, then it displays a string with the python command for it.

The other collapsed editor is at the bottom. The timeline.

## Splitting Editor Windows

When you move the mouse over the upper corner of an editor window, then the mouse pointer turns into a white cross.

When you click and drag the mouse inwards of the current editor, then the editor splits up. You open a second 3D view for example.

## Unioning Editor Windows

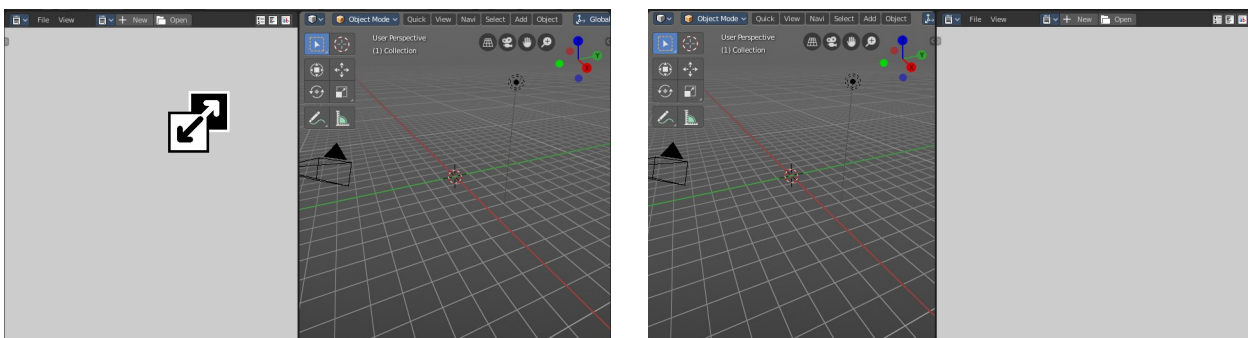

The method is nearly the same than with splitting the editor windows. When you move the mouse over the upper corner of an editor window, then the mouse pointer turns into a white cross.

When you click and drag the mouse outwards of the current editor, then the editor unions with the neighbor editor. Note that this just works when they are in one row, horizontally or vertically.

## Swapping Contents

You can swap the contents between two editors with clicking at the corner area, holding Ctrl, and drag into the target editor. The mouse pointer will turn into a swap icon. When you release the mouse the two editors will swap their positions.

## Make Editor Window floating

When you move the mouse over the upper corner of an editor window, then the mouse pointer turns into a white cross.

Hold down Shift, and drag the mouse. The editor will detach from the Blender surface. This is useful for a multi monitor setup for example. Now you can place this editor at Monitor 2.

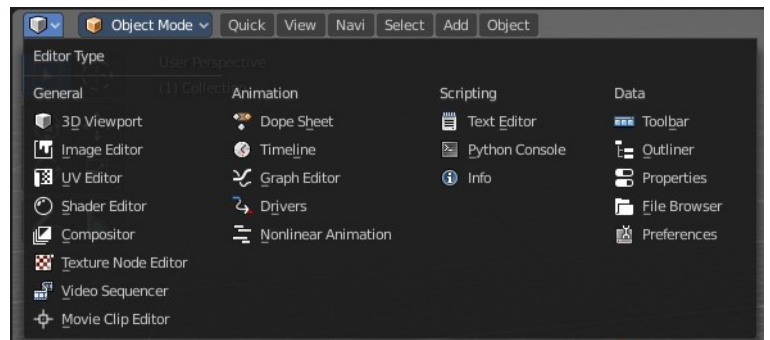

Note that there is no way to reintegrate this floating editor window back into the Blender UI once it is detached. You have to close it.

## Change Editor Type

There is a Editor Type menu in every header. This menu is usually hidden in the default layouts. It can be revealed by either splitting the editor window. Or in the right click menu in the header. Hide editortype menu. See next point.

When you click at this button then a menu with all available editor types opens up. And you can change the current editor to another editor type.

## Show / Hide the editor type menu

You might have noticed that the editor type menu is not available in the editors of the standard layouts. This is to reduce visual noise and to free some UI space.

You can show and hide this editor type menu. To do so right click at an empty space somewhere at the menu bar of an editor. You will see a menu now. Check or uncheck the menu item Hide Editortype Menu to show or hide the Editor Type menu.

## Collapse Menus

The text menus can be collapsed to free some UI space. Right click at an empty space somewhere at the menu bar of an editor. You will see a menu now. Choose if you want to display the text menu collapsed or expanded.

## Resize Tool Shelf and Properties content

You can resize the Tool Shelf content and the Properties Sidebar content. This means that you can zoom in or out. This trick also works in the Properties Editor.

Move the mouse over the upper region of the Tool Shelf.  
Hold down Ctrl key  
Click with Middle Mouse button. The mouse pointer will turn into two white triangles.

Now drag up or down to resize the area content

OR

Move the mouse over the upper region of the Tool Shelf.  
Simply press Numpad + or Numpad -

To reset the area content to default scale move the mouse over the area and press Home key ( german keyboard layout Pos 1)

## Create new Workspace

Click at the + sign at the right of the tabs. The Add Workspace menu will open up. Choose Duplicate Current. This will create a new tab. The name will be something like mycurrentworkspace.001.

To rename the new layout double click at the name. The text becomes editable.

Now you can start to edit your workspace and its settings.

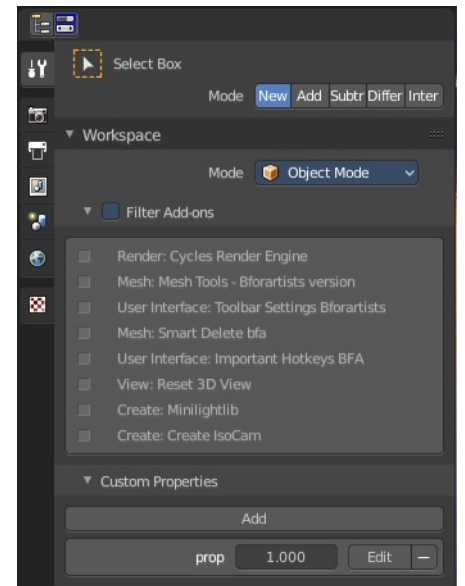

## Workspace Settings

A workspace is not only a set of editor windows. In the Properties editor you can also find some workspace specific settings.

In this settings you can define in what mode the workspace starts. You can exclude addons. And you can add custom properties. Which are basically just values for scripting needs.

The settings from this panel will load every time you switch to this workspace.

## Save changes at the Workspace

You cannot save new workspaces or modifications at an existing workspace directly. To save modifications at an existing workspace you have to save the Startup File. This menu item can be found in the File menu.

Once saved you will find this new workspace also in the add workspace menu under your template.

When you are in the default application template then this settings will save the new workspace to the defaults.

When you are in one of the other application templates though, then you will save the new workspace to the template. Same counts for the factory settings. You will then load the factory settings from the current active application template.

The menu entry will also look a bit different then. You will see a label that gives you a hint about the current application template in use. In this case the sculpting application template.

Note that this also affects other changes. Bforartists will for example now start with the currently active layout. And it will also preserve the changes that you did at other layouts before saving.

So when you work at a layout be sure that you don't accidentally do changes at other areas. And before you save the startup file you should switch back to the layout with which you want to start Bforartists.

## Delete Workspace

Workspace can also be deleted. To do so right click at the tab that you want to delete, and choose delete in the menu.

Note that you can remove your own created workspaces this way. But the default workspaces will remain in the menus. They will just vanish from the tabs. These workspaces are protected so that you cannot remove them completely.

## Load Workspace layout from Blend Files

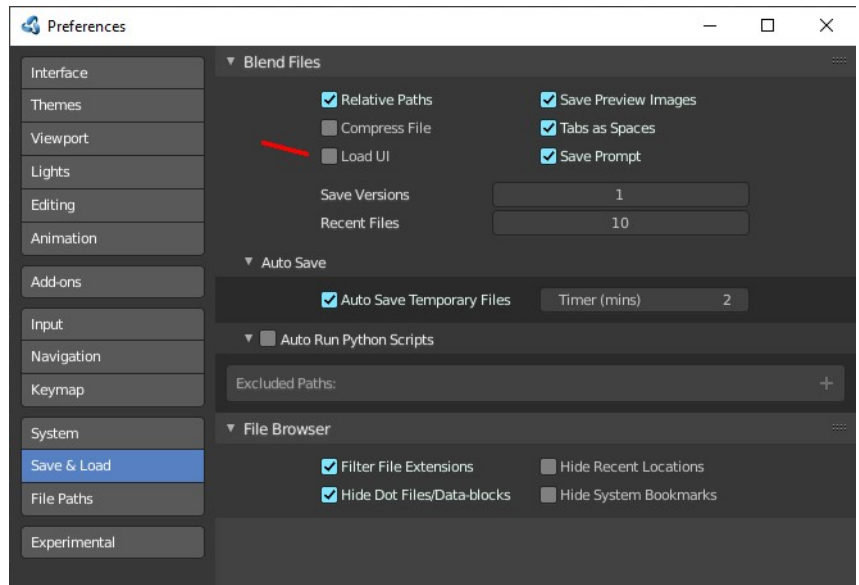

Every blend file saves also the layout in which the scene is at the point of saving. Means you can load a layout from the blend file.

This feature is off by default since it is usually unwanted behavior to load layouts from other people.

You can turn it on in the User Preferences in the File tab. Tick the menu item Load UI. Then save User Settings.

Note that now all Blend files that you open will load the workspace layout that the Blend files are saved with.

You can also do this at a file by file base. The file browser allows you to load a blend file with the saved layout. This setting can be found down left in the file browser.

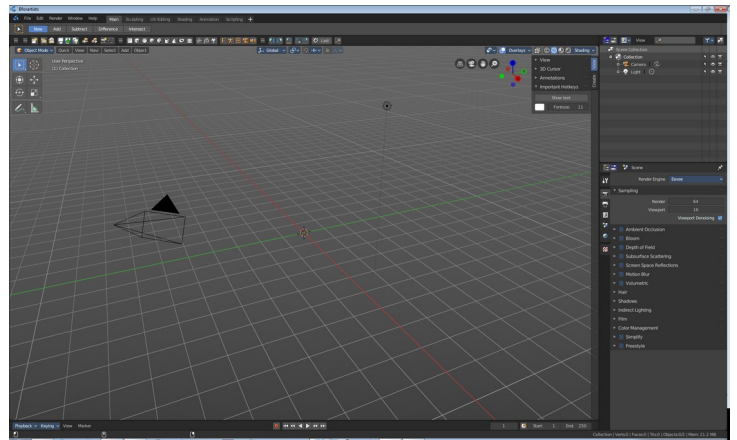

# Standard Workspaces

## Default

This layout is for general 3D work. Here you work at your 3D scene. Here happens modeling, texturing, etc. . It is also the workspace with which Bforartists opens up. It contains a 3D View editor, an Info editor, a Timeline editor, a Outliner editor and a Properties editor.

It starts in Object Mode.

## Modeling

Same as the Default workspace.

It starts in Object Mode.

## Sculpting

This workspace is dedicated to sculpting.

It starts in Sculpt Mode in case you have an object in the scene.

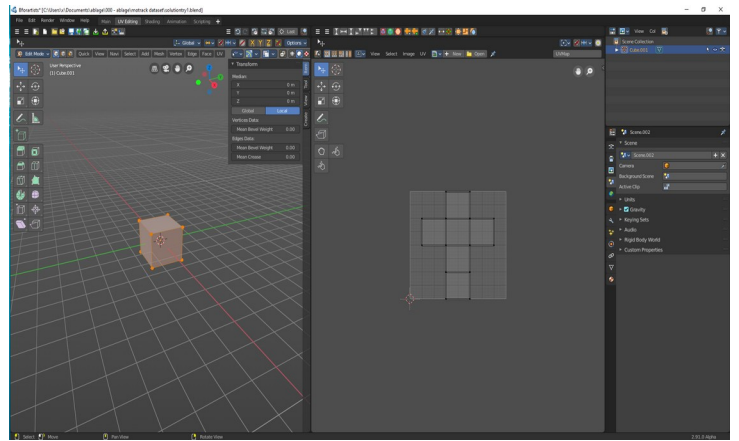

## UV Editing

The UV Editing is made for texturing and UV mapping. It contains an Info Editor, a UV Editor and a 3D View editor.

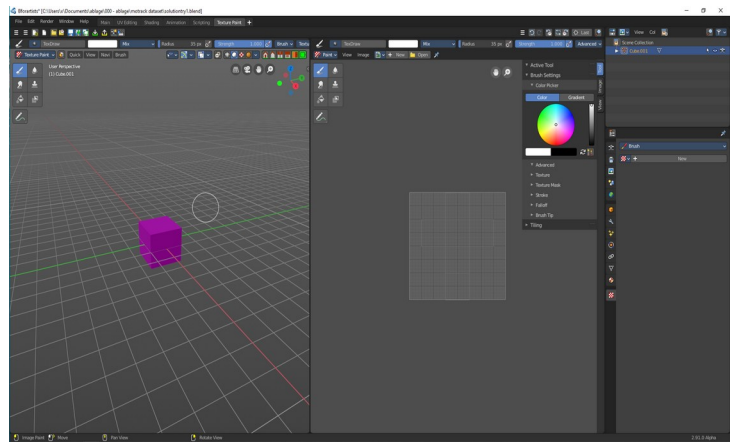

The 3D View starts in Edit mode.

## Texture Painting

The texture painting workspace is made to do texture painting work. It contains an Info Editor, a Image Editor and a 3D View editor.

The 3D View starts in Edit mode.

## Shading

The workspace to do all the shader and material work.

It comes with a file browser, an image editor, the 3D view in a special view look setup, the shader editor, outliner and properties editor.

## Nodes

The workspace to work with the geometry nodes.

Basic 3d view with the geometry nodes editor plus the spreadsheet editor to have access to the mesh data. A timeline at the bottom. And the usual outliner and properties editor.

## Animation

This workspace provides you with a layout that is optimized for Animation tasks. It contains two 3D View editors, an Info Editor, a Outliner Editor, a Properties Editor, a Timeline Editor, a Dope Sheet Editor.

## Compositing

The workspace to do compositing and post processing.

## Rendering

A workspace for the rendering.

## Scripting

The scripting workspace gives you a layout where you can write Python code. It contains an Info editor, a 3D View editor, a Console editor, a Text editor, a Outliner Editor and a Properties Editor.

## 2D Animation

A workspace to work with the grease pencil and to create 2D animation.

## Full Canvas

A workspace to work with the grease pencil and to create 2D animation. The 3D view is maximized.

## Material

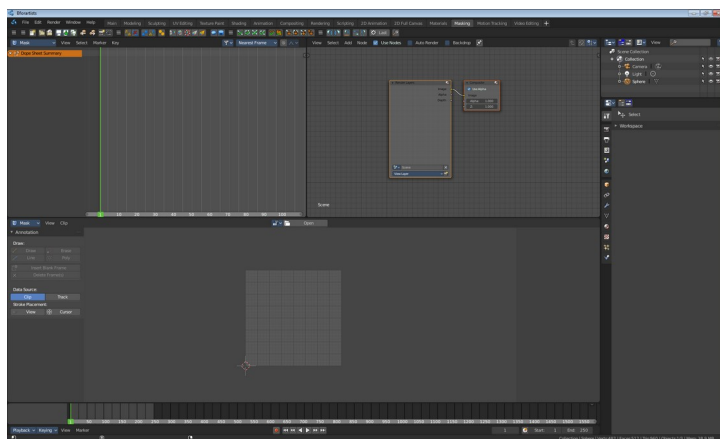

The workspace to do all the shader and material work.

It comes with a file browser, an image editor, the 3D view in a special view look setup, the shader editor, outliner and properties editor.

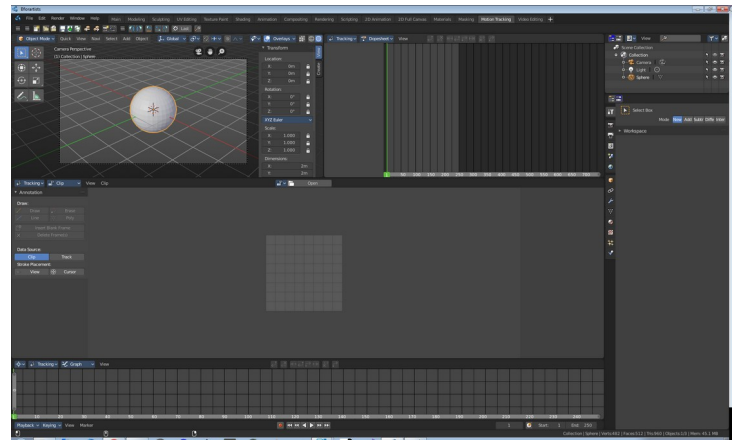

## Masking

A workspace for the VFX workflow, to mask content.

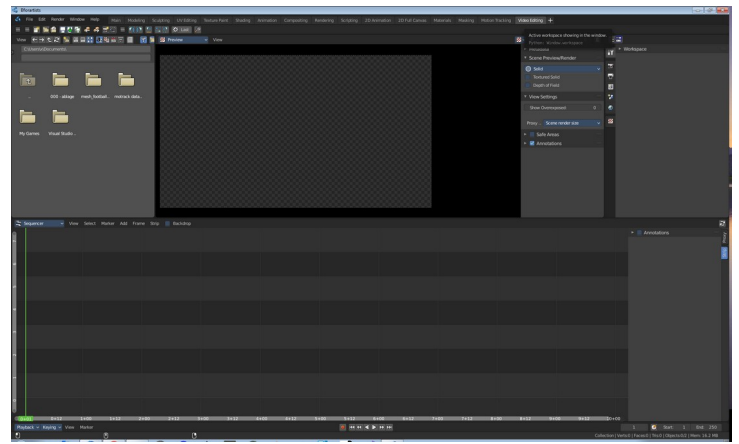

## Motion Tracking

A workspace for the VFX workflow. The Motion tracking layout.

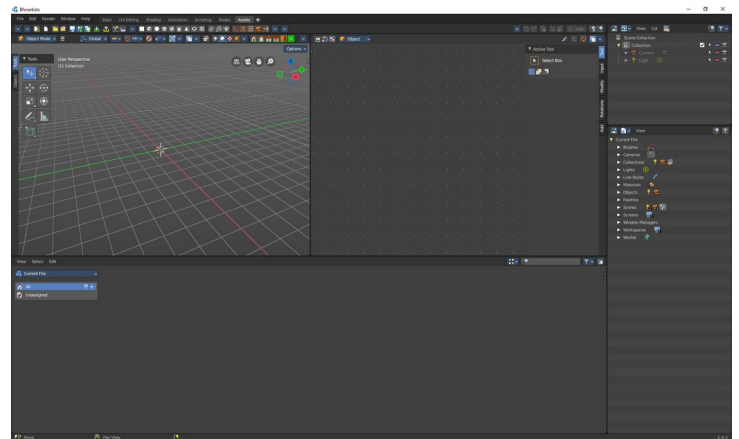

## Video Editing

A workspace to edit videos.

## Assets

A workspace that provides you the asset browser.

## File Menu

The File menu contains file related functionality.

### New

Creates a new scene, using the current active template.

### New from Template

Choose to create a new file with predefined Application Templates.

Application templates is a collection of workspaces for a predefined purpose.

## Standard Application Templates

### General

The general application template comes with the workspaces to create 3D content.

### 2D Animation

The 2D Animation application template comes with the workspaces to create 2D animation.

### All

The All application template contains all default workspaces.

### Sculpting

The Sculpting application template comes with the workspaces for sculpting needs.

### VFX

The VFX application template comes with the workspaces for motion

tracking.

## Video Editing

The Video Editing application template comes with the workspaces for video editing.

Video Editing Rendering +

## Open

Open a blend file.

## Clear Recent Files List

Clears the recent files list.

## Open Recent

Open last recent blend files.

## Recent Context Menu - Open File Location

Opens the recent blend file file location in the operating system's file explorer.

## Revert

Reload the last saved file.

## Recover last Session

Open the last closed blend file. (quit.blend)

## Recover Autosave

Open the last autosaved blend file.

## Save

Save blend file.

## Incremental Save

Saves an already saved blend file with incremental file name. myfile.blend gets saved as myfile1.blend, myfile2.blend, myfile3.blend, and so on.

You need to have the blend file saved once to set this save method active.

## Save As

Save blend file as.

## Save Copy

Saves a copy of the current file.

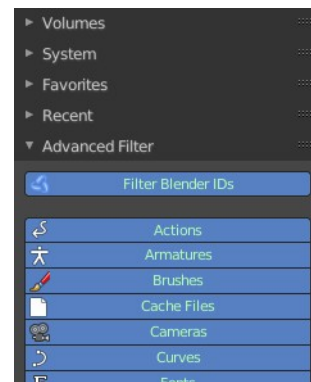

## Link

Link allows you to link content from another blend file. The content remains in the other blend file. The linked blend file will be required to work with the linked content.

When you click at Link then a file browser will open. Down left you will see some further options.

## Advanced Filter

This filter allows you to filter the content of the blend file for specific object types.

## Import Settings

At the right you can reveal the import settings.

### **Relative Path**

Available only when linking, see *relative paths*.

### **Select**

Makes the object *Active* after it is loaded.

### **Active Layer**

Enabled by default, the object is assigned to the visible layers in your scene. Otherwise, it is assigned to the same layers it resides on in the source file.

### **Instance Collections**

This option links the collection to an object, adding it to the active scene.

## Please Note:

When you select an Object type, it will be placed in your scene at the cursor. Many other data types - cameras, curves, and materials for example - must be linked to an object before they become visible.

You cannot move a linked object. Its position is defined in its source file. If you want to modify the object locally you can either use Dupli Groups or make the object local, in the 3D View, Object / Relations menu.

Appending data you already have linked, will add objects / groups to the scene, but will keep them linked (and un-editable).

## Known Limitations

In general dependencies shouldn't go in both directions. Attempting to link or append data which links back to the current file will likely result in missing links.

When linking objects **directly** into a .blend file, the *Rigid Body* settings won't be linked in since they're associated with their scenes world. As an alternative you could link in the entire scene and set it as a Background Set Scene.

---

## Append

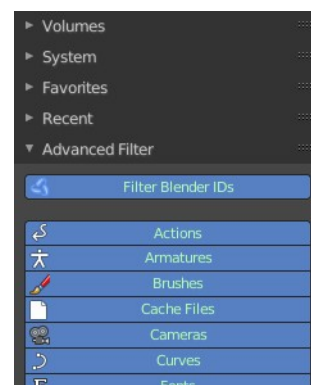

Append allows you to append content from another blend file. The content will be copied over, and become part of the current blend file.

When you click at Link then a file browser will open. Down left you will see some further options.

The difference to Link is that with Append the object becomes part of the current blend file. And it is editable.

## Advanced Filter

This filter allows you to filter the content of the blend file for specific object types.

## Import Settings

At the right you can reveal the import settings.

### Select

Makes the object *Active* after it is loaded.

### Active Collection

Put the new objects into the active collection.

### Instance Collection

Create instances for collections rather than adding them directly to the scene.

## Fake User

Set Fake User for appended objects, except Objects and Groups

## Localize All

Localize all appended data, including indirectly linked from other libraries.

## Data Previews

Data Previews is a sub menu with functionality around the Data Preview in the Bforartists file browser. The functionality in this menu creates and handles previews of the objects in a blend file.

Data Previews are displayed in the file browser when you link or append something from this file and when you use thumbnails as display method. It is meant for the case when you want to turn a blend file into an asset library. Materials, ready textured objects, etc. .

**This feature is currently broken. You can't create data previews yet in Bforartists 2. Example images taken from Bforartists 1.**

### Workflow:

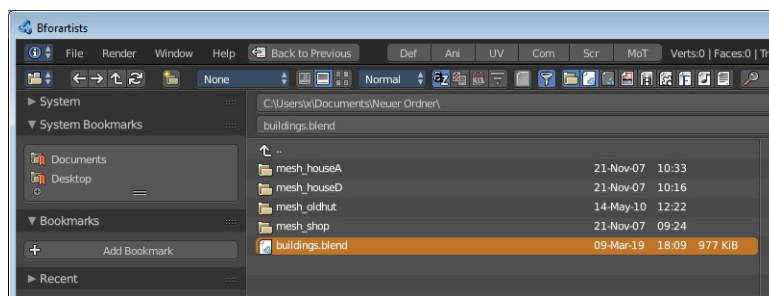

First create a scene with your assets. Make sure to remove the camera from the scene. It can work, but it can also make trouble, and prevent the batch generation to work at the blend file. And an asset library doesn't need a camera anyways. Not so important is lights, it does not make trouble like the camera. But you won't get a data preview icon for lights.

Save the scene. Restart Bforartists or create at least a new scene. We want to have a look what we currently get as preview when we want to link or append from this blend file. Make sure to turn the view in the file browser to thumbnails. It's always just the default icon for the assets. Left Materials, right the Objects.

Now let's run Batch Generate Previews at this blend file.

This process takes a while. Now let's try to append from the same file again. You will get proper preview thumbnails now. Left Materials, right the objects. Here you will see again that lamps have no preview icon.

## Refresh Data Set Previews

Refreshes the existing data set previews.

## Batch Generate Previews

Generates the previews for the data objects in the selected blend file(s). The scene that you want to work at should not be loaded.

## Clear Data Set Previews

Removes existing previews for some types in the target blend file.

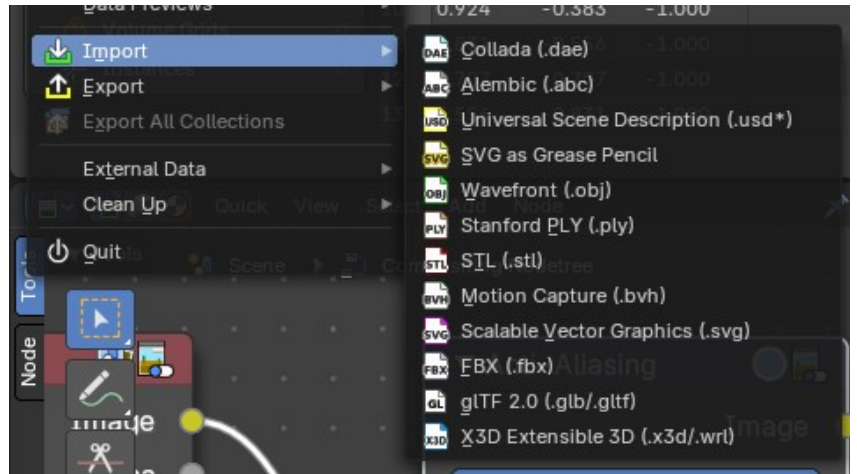

## Batch Clear Previews

Removes all existing previews in the target blend file.

## Import

Import is a sub menu with the available 3D import file formats. You will be prompted to the load dialog which provides some further import options down left in the file browser tool shelf.

Note that im- and exporters are partially addons that can be disabled. So some content might miss.

## Operator Presets

The operator presets exist on nearly all importers and exporters. Exceptions are for example the \*.stl importer. They allow you to reset the importer settings to the defaults. And allow you to store your own presets. The presets are just valid for the importer or exporter with which you have saved the presets.

### Operator Presets dropdown

#### Restore Operator Defaults

Restores the importer or exporter settings to their default values

#### List of available presets

The list of available presets. The string \*Missing Paths\* indicates that no custom preset exists yet.

#### Add Operator Preset

Adds a new operator preset. A popup dialog will appear where you can give the new preset a name.

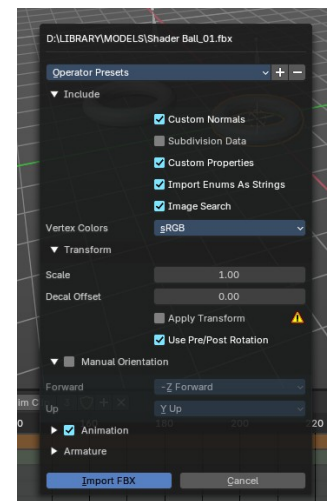

#### Remove Operator Preset

Removes the active preset. Note that you cannot display the current active preset. So choose it from the list, and then click at the remove operator.

## Import Drag and Drop

You can optionally drag and drop multiple files into the 3D Viewport to directly import different file types. This will batch import the selection from the explorer with a floating dialogue from the importer settings.

**Note:** You can only drag in a group of multiple files if they are the same file format. If you have multiple selected, it will prompt you if you should import one or the other file type.

---

## Collada

Imports a file in collada file format. Collada is a general file format that is able to store and load animation.

### ***Import Data Options***

#### **Import Units**

Imports the units that is used to save the collada file . If unticked Blender Units will be used.

#### **Custom Normals**

Import custom normals if available.

### ***Armature Options***

#### **Fix Leaf Bones**

Fix orientation of Leaf bones. Collada file formats only supports joints, not bones.

#### **Find Bone Chains**

Find best matching bone chains and ensure that the bones in the chain are connected.

#### **Auto Connect**

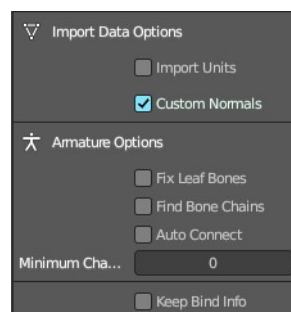

Auto connect parent bones that have exactly one child bone.

#### **Minimum Chain Length**

When searching bone chains disregard chains of length below this value.

#### ***Keep Bind Info***

Store Bindpose Information in custom bone properties for later use in later collada export.

---

## Alembic

The alembic file format is for static geometry. It does not support armatures, hair or particles.

## General

### Scale

Set the import scale factor.

### Options

#### Relative Path

Select the file relative to the blend file.

#### Set Frame Range

Sets the Frame range start and end point in Bforartists to match the one in the alembic file.

#### Is Sequence

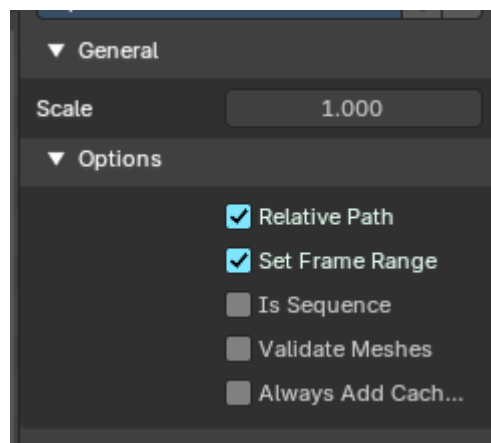

Import sequenced files that are split in cache parts.

#### Validate Meshes

Check for invalid mesh data in the file. Note that this operation may take some time.

#### Always add Cache Reader

Add cache modifiers and constraints to imported objects even when they are not animated. This allows updating the alembic archive when reloading.

## USD

Imports a Universal Scene Description (USD) file. It reads \*.usd, \*.usdc and \*.usda files.

### General

#### Path Mask

Import only the subset of the USD scene rooted at the given primitive.

#### Include

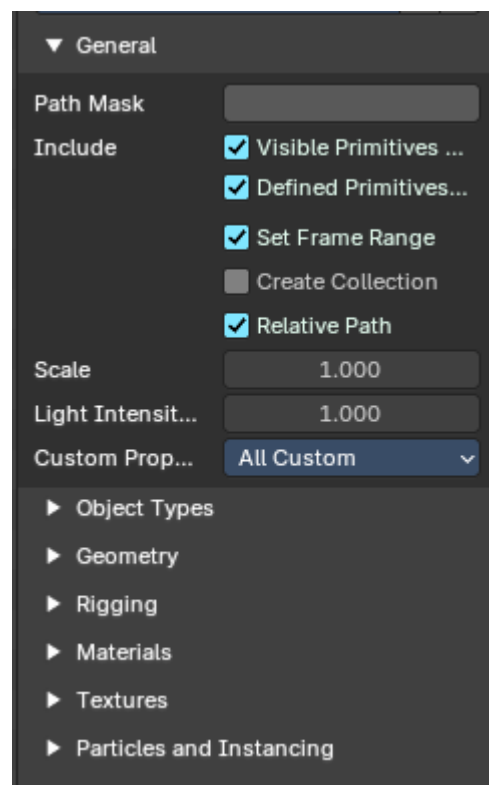

What to include

#### Visible Primitives Only

Do not import invisible USD primitives. Only applies to primitives with a non-animated visibility attribute. Primitives with animated visibility will always be imported.

#### Defined Primitives Only

Import only defined USD primitives. When this is disabled, this allows importing USD primitives which are not defined, such as those with an override specifier.

### ***Set Frame Range***

Update the scene's start and end frame to match those of the USD stage.

### ***Create Collection***

Add all imported objects to a new collection.

### ***Relative Path***

Select the file relative to the blend file.

### **Scale**

The scale size at import.

### **Light Intensity Scale**

Scale for the intensity of imported lights.

### **Custom Properties**

Behaviour when importing USD attributes as custom properties.

### ***All Custom***

Import all USD custom attributes as custom properties. Namespaces will be retained in the property names.

### ***User***

Import all USD user defined attributes as custom properties. Namespaces will be retained in the property names.

### ***User***

Import not custom attributes as custom properties.

## ***Object Types***

### **Cameras**

Import cameras (perspective and orthographic).

### **Curves**

Import curve primitives, including USD basis and NURBS curves. (Note that support for Bézier basis is not yet fully implemented.)

### **Lights**

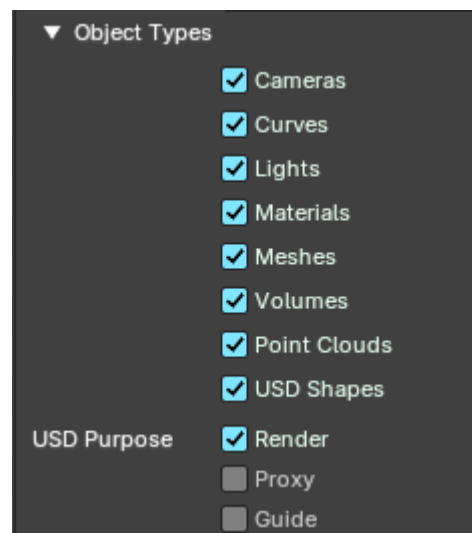

Import lights. Does not currently include USD dome, cylinder or geometry lights.

### **Materials**

Import materials. See also the experimental Import USD Preview option.

### **Meshes**

Import meshes.

## Volumes

Import USD OpenVDB field assets.

## Point Clouds

Import pointcloud data.

## USD Shapes

Import USD Shapes.

## USD Purpose

### *Proxy*

Include primitives with purpose proxy.

### *Render*

Include primitives with purpose render.

### *Guide*

Include primitives with purpose guide.

## Geometry

### UV Coordinates

Load mesh UV coordinates.

### Color Attributes

Import the USD mesh display Color values as Blender mesh vertex colors.

### Mesh Attributes

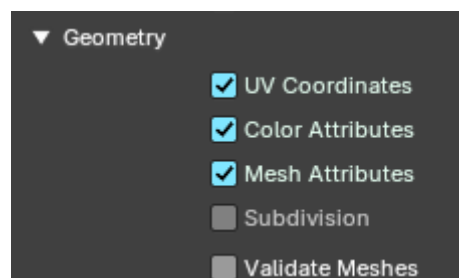

Read USD PrimVars as mesh attributes.

### Subdivision

Import Subdivision.

### Validate Meshes

Ensure the data is valid on import (when disabled, data may be imported which causes crashes displaying or editing)

## Rigging

### Shape Keys

Import all shape keys.

### Animation

Import all animation keyframes.

## Materials

### Import all Materials

Import all materials. Also materials that are not used by the geometry.

### Import USD Preview

Convert USD Preview Surface shaders to Principled BSDF shader networks.

### Create World Material

Convert the first discovered USD dome light to a world background shader.

### Material Name

How to import the material name when it conflicts with an existing material in the scene.

### Make Unique

Import each USD material as a unique material.

### Reference Existing

If the material with the same name exists, replace the USD material with existing material.

## Textures

### Set Material Blend

If the Import USD Preview option is enabled, the material blend method will automatically be set based on the opacity and opacityThreshold shader inputs, allowing for visualization of transparent objects.

### Import Textures

How to import textures.

### None

Don't import textures.

### Packed

Import Texture as packed data.

### Copy

Copy files to texture directory.

### Textures Directory

The textures directory.

### File Name Collision

What to do if a texture name already exists.

## Particles and Instancing

### Scene Instancing

Import USD scene graph instances as collection instances.

---

### SVG as Grease Pencil

Imports a svg file as a grease pencil object.

#### Resolution

The resolution of the svg import.

#### Scale

The scale of the svg import.

---

### Wavefront(OBJ)

Imports a wavefront obj file.

#### General

##### Scale

Scale factor for the obj import.

##### Clamp Bounding Box

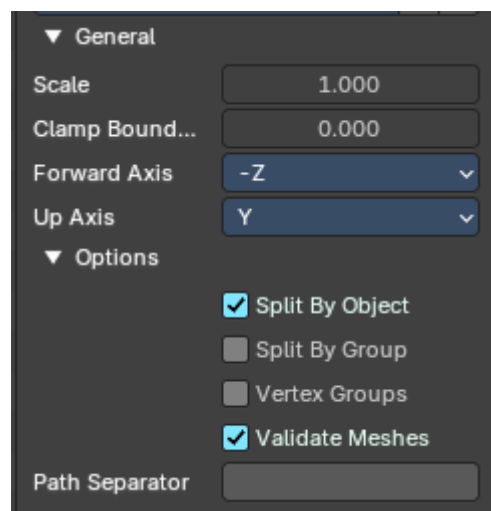

Clamp bounds under this value. A value of zero disables this feature.

##### Forward Axis

The Forward orientation at import.

##### Up

The Up orientation at import.

## Options

### Split by Object

Import loose mesh parts as single objects.

### Split by Group

Import Obj Groups as meshes.

### Vertex Groups

Import Obj groups as vertex groups.

### Validate Meshes

Check at import for invalid data.

### Path Separator

Import option to create collection hierarchy by splitting names with a separator.

Names found in the OBJ file are split by that, and a Collection hierarchy is made, so you can have e.g. "o House/Roof/Tile" in the OBJ file.

---

## Motion Capture (BVH)

The Biovision Hierarchy (BVH) character animation file format is a file format to carry motion capture data.

### Target

You can either target an armature or an object.

### Transform

#### Scale

The import scale.

#### Rotation

The rotation type.

#### Forward

The forward orientation.

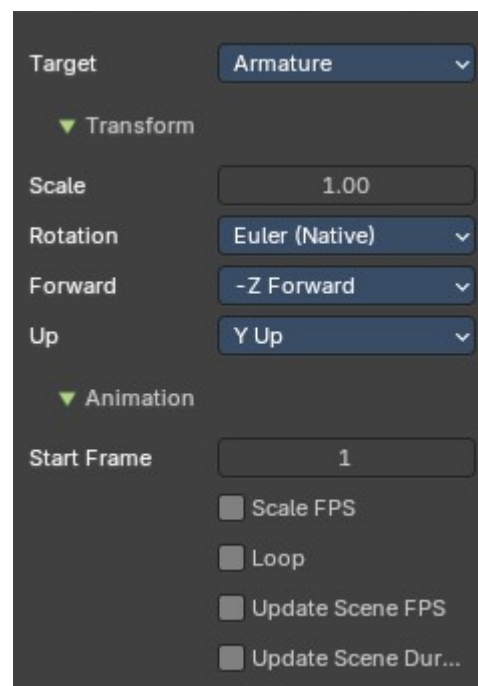

#### Up

The Up orientation.

### Animation

#### Start Frame

The start frame for the animation.

## Scale FPS

Scale the frame rate of the BVH file to the current scenes. With off every frame of the BVH is one frame in Bforartists.

## Loop

Loop the animation playback.

## Update Scene FPS

Sets the scene frame rate to that of the BVH file. Note that this nullifies the Scale FPS feature since the scale will be 1:1.

## Update Scene Duration

Extend the scene duration to be the one of the BVH file duration.

---

## Scalable Vector Graphics (SVG)

Scalable Vector Graphics is usually a 2D file format to describe vector graphics. But Vector graphics are also curves. Which can be used in a 3 dimensional space.

SVG has no import properties.

---

## Stanford (PLY)

The Stanford Triangle Format was designed to store three-dimensional data from 3D scanners. It is a static file format for mesh data, and cannot carry animation data.

### *General*

#### Scale

The scale factor for the imported geometry.

#### Scene Unit

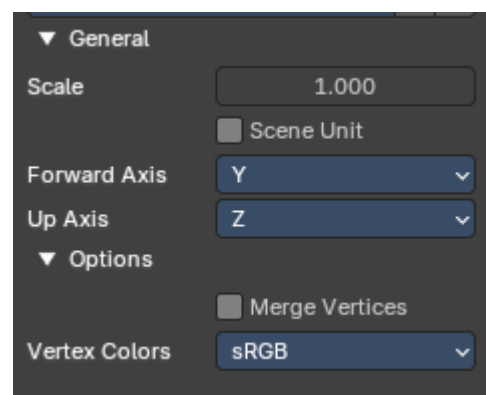

Apply current scene units at importing the geometry.

#### Forward Axis

The forward axis for the imported geometry.

#### Up Axis

The up axis for the imported geometry.

## Options

### Merge Vertices

Merges vertices by distance.

### Vertex Colors

Import vertex colors if they exist. These are Color attributes.

#### sRGB

8bit colors

#### Linear

32bit float colors

## STL

STL (Standard Triangulation/Tessellation Language ) is a standard format for many cad software. It is a format for static geometry, it cannot handle animation. The format is popular for 3d printing purposes.

### General

#### Scale

The import scale.

#### Scene Unit

Apply the scene unit at the geometry at import.

#### Forward

The Forward orientation at import.

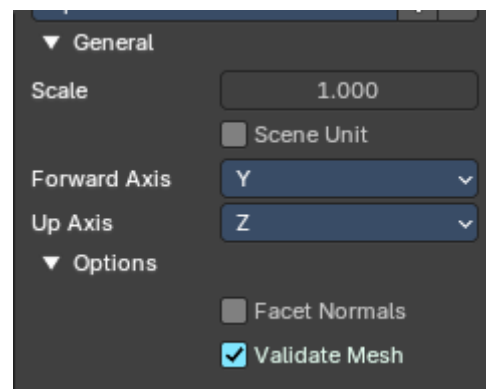

#### Up

The Up orientation at import.

### Options

#### Facet Normals

Import the geometry with faceted faces.

## Validate Meshes

Check at import for invalid data.

## FBX

FBX is a proprietary file format from Autodesk. FBX is a general file format that is able to store and load animation.

### *Include*

What data to import.

#### Custom Normals

Import custom normals.

#### Subdivision Data

Import Subdivision.

#### Custom Properties

Import User properties as Custom properties

#### Import Enums as Strings

Store enumeration values as strings.

#### Image Search

Search the sub directions for associated images.

#### Vertex Colors

Import vertex colors if they exist. These are Color attributes.

##### *sRGB*

8bit colors

##### *Linear*

32bit float colors

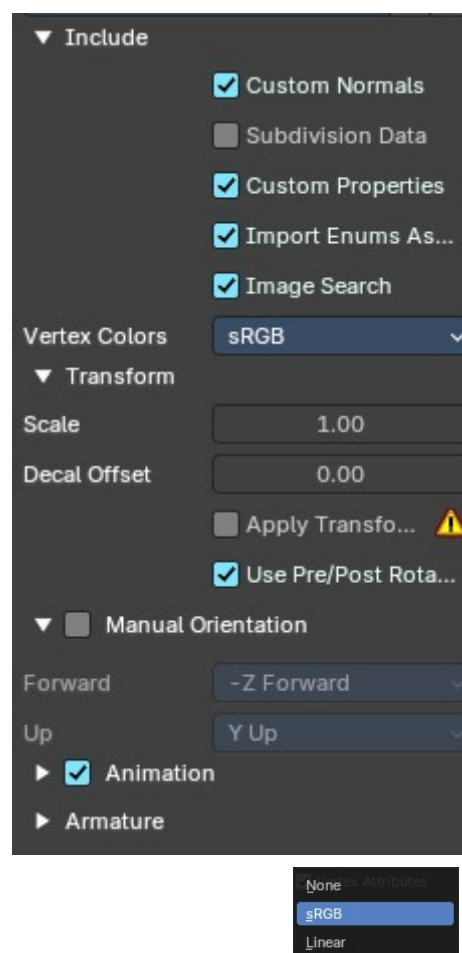

### *Transform*

#### Scale

Adjust the scale factor at import.

#### Decal Offset

Displace geometry of alpha meshes.

## **!Experimental! Apply Transform**

Bake space transform into object data. This avoids unwanted rotations when the target space is not aligned with the Bforartists space. Warning! This feature is experimental. Use at own risk.

## **Use Pre/ Post Rotation**

Use Pre or Post Rotation from FBX transform. This feature may not work in all cases.

## **Manual Orientation**

Enables custom orientation instead of using the orientation from the fbx file.

### **Forward**

The Forward orientation at import.

### **Up**

The Up orientation at import.

## **Animation**

### **Animation Offset**

Adjust an offset in frames for the imported animation.

## **Armature**

### **Ignore Leaf Bones**

Ignore the last bone at the end of the chain.

### **Force Connect Children**

Force connection of the children bones to their parent.

### **Automatic Bone Orientation**

Try to align the mayor bone axis with the bone children.

### **Primary and secondary Bone Axis**

Manually adjust the bone orientation per axis. Note that this features are greyed out when Automatic Bone Orientation is ticked.

## glTF 2.0 (glb, gltf )

The GL Transmission Format from the Khronos Group is a file format for 3D scenes and models, and is based at the JSON standard.

### **Pack Images**

Pack all images into the Blend file at loading the glTF file.

### **Merge Vertices**

glTF stores every vertice of faces as an extra vertice. There is no shared vertice between two faces. Merge vertices merges the vertices of neighbor faces together.

Attention! It currently cannot combine vertices with different normals.

### **Shading**

Define the shading of the imported geometry.

#### **Use Normal Data**

Use the existing Normals.

#### **Flat shading**

Shades the whole mesh flat and faceted.

#### **Smooth shading**

Shades the whole mesh smooth.

### **Guess original bind pose**

Tries to guess the original bind pose for skinned meshes. Off means the rest pose is used as the bind pose.

### **Import WebP textures**

If a texture exists in WebP format, loads the WebP texture instead of the fallback PNG/JPEG one.

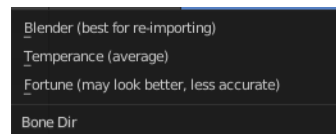

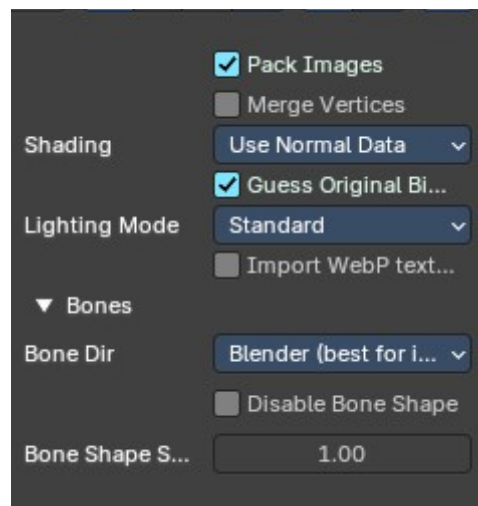

## **Bones**

### **Bone Direction**

Heuristic method for placing bones.

### **Disable Bone Shapes**

Do not create bone shapes.

## Bone Shape Scale

The scale factor of the bone shapes for viewport display.

---

## X3D Extensible 3D

Extensible 3D (X3D) is a family of co-ordinated royalty-free open standards for file formats that can store representations of interactive 3D objects and scenes.

## Transform Panel

The scale factor.

## Forward

The forward orientation.

## Up

The up orientation.

---

## Export

Export is a sub menu with the available export formats.

Note that im- and exporters are partially addons that can be disabled. So some content might miss.

## Operator Presets

The operator presets exists on nearly all im- and exporters. Exceptions are for example the stl importer. They allow you to reset the importer settings to the defaults. And allow you to store your own presets. The presets are just valid for the im- or exporter with which you have saved the presets.

## Operator Presets dropdown

### Restore Operator Defaults

Restores the im or exporter settings to their default values

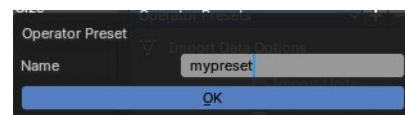

### List of available presets

The list of available presets. The string '\*Missing Paths\*' indicates that no custom preset exists yet.

## Add Operator Preset

Adds a new operator preset. A popup dialog will appear where you can give the new preset a name.

## Remove Operator Preset

Removes the active preset. Note that you cannot display the current active preset. So choose it from the list, and then click at the remove operator.

## Collada

Exports a file in collada file format. Collada is a general file format that is able to store and load animation.

The Collada exporter is divided into several sub tabs since it would be too much to display all settings at once.

### Main

#### Selection Only

Only export selected elements, not the whole scene.

#### Include Children

Export all children of selected objects, even if not selected.

#### Include Armatures

Export related armatures, even if not selected.

#### Include Shape Keys

Export all shape keys from Mesh Objects.

#### Global Orientation

##### Apply

Rotate all root objects to match the global orientation. With this option off the global settings are used by a collada object basis.

##### Forward Axis

The forward axis orientation.

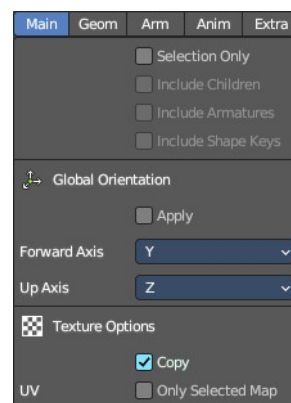

##### Up Axis

The up axis orientation.

#### Texture Options

##### Copy

Copy the textures to the same folder where the .dae file is exported.

## UV

### Only Selected Map

Export only the selected UV map.

## Geom

The geometry export section.

### Export Data Options

#### Triangulate

Triangulates the mesh at export.

#### Apply Modifiers

Applies the modifiers for export. The resolution can be adjusted in the drop down box behind the Apply Modifiers checkbox. You can choose between View and Render.

#### Transform

The transform type. Either transform the whole matrix. Or decomposed into the single components.

## Arm

The armature export section.

### Armature Options

#### Deform Bones only

Only export deforming bones with armatures.

#### Export to SL/OpenSim

Compatibility mode for SL, OpenSim and other compatible online worlds.

## Anim

The Animation export section.

### Include Animations

Export Animation if available.

### Key Type

#### Samples/Curves

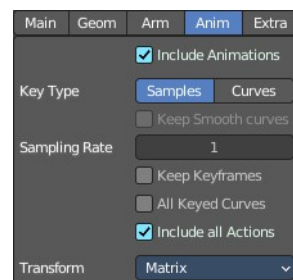

Export sample keys or curves keys.

#### Keep Smooth Curve

Just available with TransRotLoc transformation type. Export also the curve handles if available.

#### Sampling Rate

The distance between two key frames.

### **Keep Key frames**

Use existing key frames. as sample points.

### **All Keyed Curves**

Export also curves that has just one key or are completely flat.

### **Include all Actions**

Export also unassigned actions.

### **Transform Type**

The transform type for translation, scale and rotation. Matrix or TransRotLoc.

### **Extra**

Some extra export settings.

### **Collada Options**

#### **Use Object Instances**

Instantiate multiple objects from same data.

#### **Use Blender Profile**

Export Blender specific settings for shader, bones, materials, etc.

#### **Sort by Object Name**

Sort exported data by name.

#### **Keep Bind Info**

Store Bind Pose Information in custom bone properties for later use during Collada export.

#### **Limit Precision**

Reduce the precision of the exported data to 6 digits.

---

## **Alembic**

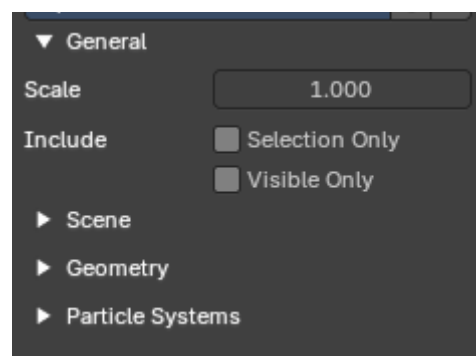

The alembic file format is for static geometry. It does not support armatures, hair or particles. However, there are some options to export at least some data of it.

The alembic export options are divided into four sections.

### **General**

#### **Scale**

The export scale factor.

## **Include**

### **Selection Only**

Export just the selected object(s), and not the whole scene.

### **Visible Only**

Export visible geometry only.

## **Scene**

### **Frame Start**

The start frame of the export.

### **End**

The end frame of the export.

### **Samples Transform**

Number of times per frame at which animated transformations are sampled.

### **Geometry Samples**

Number of times per frame at which geometry transformations are sampled.

### **Shutter Open**

The start frame to sample transform and geometry samples. Valid range is -1 to 1. -1 indicates the previous frame, 0 indicates the current frame, and 1 indicates the next frame.

### **Shutter Closed**

The end frame to sample transform and geometry samples. Valid range is -1 to 1. -1 indicates the previous frame, 0 indicates the current frame, and 1 indicates the next frame.

### **Use Instancing**

Export data duplicated objects as alembic instances.

### **Custom Properties**

Export custom properties to Alembic . userProperties

### **Flatten Hierarchy**

Remove parent / children relationship.

## **Settings**

Determines visibility of objects, modifier settings, and other areas where there are different settings for viewport and rendering.

## **Render**

User render settings for object visibility, modifier settings, etc

## Visibility

User visibility settings for object visibility, modifier settings, etc

## Geometry

### UV's

Export UV's. Note that Alembic just supports a single UV map.

### Pack UV Islands

Export UV's with packed islands.

### Normals

Export Normals.

### Vertex Colors

Export Vertex Colors. These are Color attributes.

### Generate Coordinates

Export undeformed mesh vertex coordinates.

### Face Sets

Export per Face shading group assignments.

### Curves as Mesh

Export Curves and Nurbs surfaces as meshes.

### Subdivisions

#### Apply

Export subdivision surfaces as meshes. Means apply subdivision modifier before export.

#### Use Schema

Export meshes using Alembic's subdivision schema.

### Triangulate

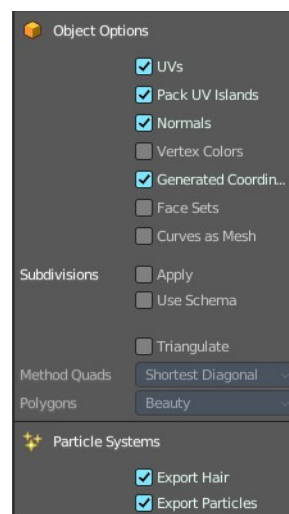

Triangulate meshes before export.

### Method Quad

The quad method that gets used to triangulate the meshes. You need to activate Triangulate.

### Polygons

The polygon method that gets used to triangulate the meshes. You need to activate Triangulate.

## Particle Systems

Alembic does not support hair or particles. However, here you can find some options to export at least some data of it.

### Export Hair

Export hair particle systems as animated curves.

### Export Particles

Export non-hair particles.

## Universal Scene Description ( USD )

USD is a system for authoring, composing and reading hierarchically organized scene description. It is developed by Pixar.

### General

#### Root Prim

If set, add a transform primitive as the parent of exported rig with the given path name for all exported data. Default is “/root”

#### Include

##### **Selection Only**

Export just the selected object(s), and not the whole scene.

##### **Visible Only**

Export visible geometry only.

##### **Animation**

Export animation.

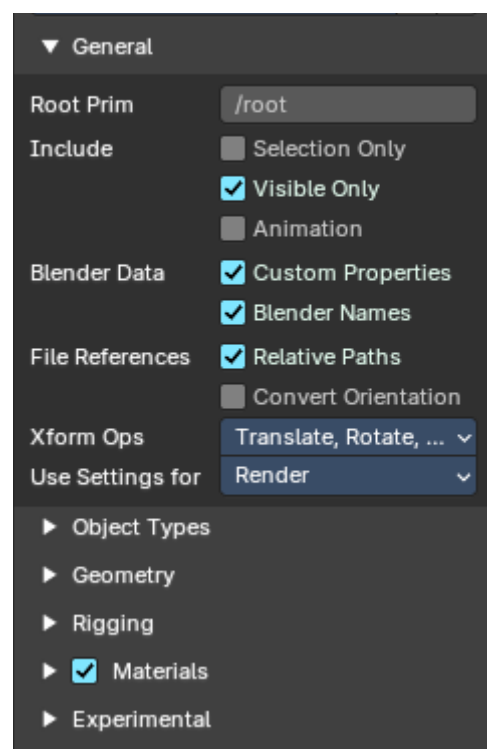

#### Blender Data

##### **Custom Properties**

Export custom properties if available.

##### **Blender Names**

Author USD custom attributes containing the original Blender object and object data names. Uses the Bforartists standard of naming conventions and nomenclature.

## File References

### Relative Paths

The path will be shortened to just the file name. For example, C:\myfolder\mysubfolder\mytexture.jpg turns into texture.jpg . Relative paths allows you to move the whole project folder to another location. The file paths will still be valid.

### Convert Paths

Author USD custom attributes containing the original Blender object and object data names. Uses the Bforartists standard of naming conventions and nomenclature.

## Xform Ops

The type of transform operators to write.

## User Settings for

Use Render settings for object visibility, modifier settings, etc

## Object Types

### Meshes

Import meshes.

### Lights

Export lights.

### Cameras

Export cameras (perspective and orthographic).

### Volumes

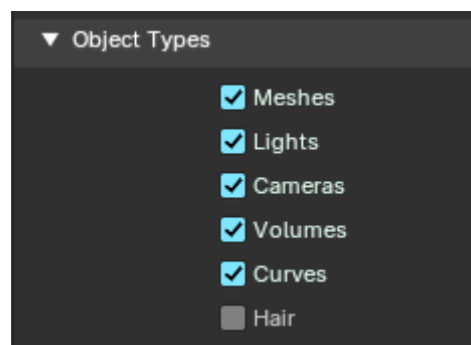

Export USD OpenVDB field assets.

### Curves

Export curve primitives, including USD basis and NURBS curves.

### Hair

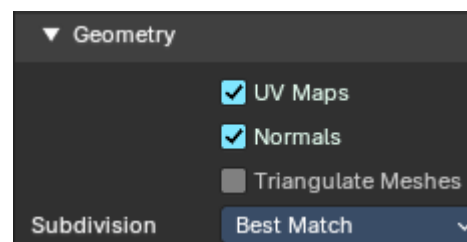

Export hair/fur curves.

## Geometry

### UV Maps

Export UV Maps.

## Normals

Export Normals.

## Triangulated Mesh

Export the geometry triangulated.

## Subdivision

How Subdivision will be mapped to USD.

## Rigging

### Shape Keys

Export Shape Keys.

### Armatures

Export Armatures

### Only Deform Bones

Only export deform bones and their parents.

## Materials

### USD Preview Surface Network

Generate an approximate USD Preview Surface shader representation of a Principled BSDF.

### MaterialX Network

Generate a MaterialX network representation of the material.

### Export Textures

Export referenced textures to a "textures" directory.

### Convert World Material

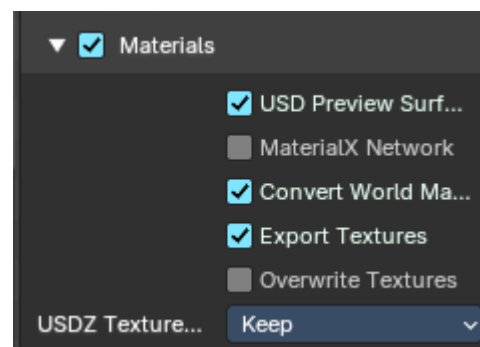

Convert the world background shader discovered as a USD dome light.

### Overwrite Textures

Overwrite existing textures.

### USDZ Texture Downsample

Choose a maximum size for all exported textures.

## Experimental

### Instancing

Instanced objects are exported as references in USD. Else they are exported as real objects.

## Grease Pencil as SVG

Exports the grease pencil object as a svg file.

### Scene Options

#### Object

What kind of objects to export from the scene.

### Export Options

#### Sampling

Precision of Stroke sampling. Low values gives high precision. Zero disables the feature.

#### Fill

Export strokes with fill enabled.

#### Normalize

Export strokes with constant thickness.

#### Clip Camera

Clip drawings to camera size when exporting.

---

## Grease Pencil as PDF

Exports the grease pencil object as a pdf file.

### Scene Options

#### Object

What kind of objects to export from the scene.

## Export Options

### Frame

Which frames to include in the export. The active frame or the selected frames. The active frame must not be the selected frames since you can select more than one.

### Sampling

Precision of Stroke sampling. Low values gives high precision. Zero disables the feature.

### Fill

Export strokes with fill enabled.

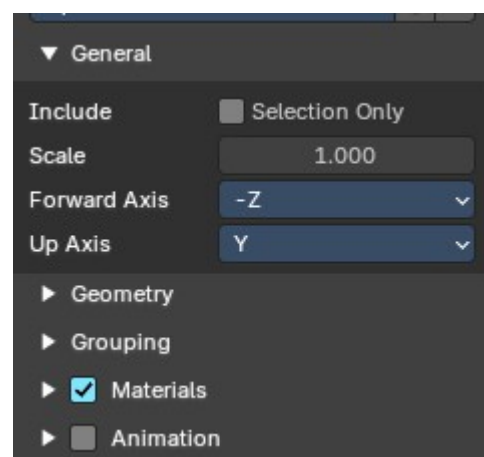

### Normalize

Export strokes with constant thickness.

---

## Wavefront(OBJ)

Wavefront Obj is a file format for static geometry. And while you can still create a sequence of meshes for animation with it (some software stores shape keys that way for example), you cannot store animation in the file. It is also unique since it is usually made of two files. A OBJ part that contains the mesh data. And a MTL part that contains the material including the connected textures.

### General

#### Include Selection Only

Just export the selected geometry.

#### Scale

The export scale factor.

#### Forward Axis

Which axis points forward.

## Up Axis

Which axis points upwards.

## Geometry

What kind of data to export. The labels should be self explaining.

Note that the OBJ file format cannot carry the Blender material settings. The Obj file format uses a primitive Phong shader.

## UV Coordinates

Export UV's.

## Normals

Export Normals.

## Vertex Colors

Export Vertex Colors. These are Color attributes.

## Curves as NURBS

Export Curves and Nurbs surfaces as meshes.

## Triangulated Mesh

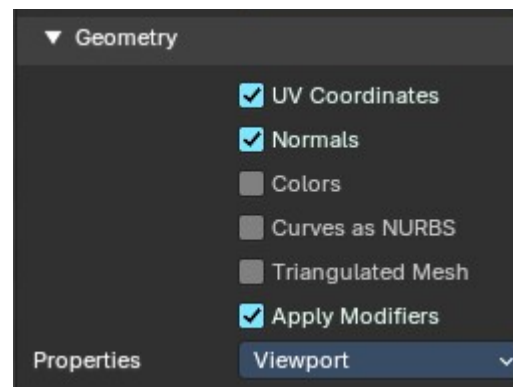

Triangulate meshes before export.

## Apply Modifiers

Apply modifiers before exporting the geometry.

## Properties

Where to grab the object properties from. They can differ between viewport settings and render settings.

## Grouping

What kind of relationship data to export. The labels should be self explaining.

Note that the OBJ file format cannot carry the Blender material settings. The Obj file format uses a primitive Phong shader.

## Object Groups

Append mesh name to object name by a '\_'

## Material Groups

Generate an OBJ group for each part of a geometry user a different material.

## Vertex Groups

Export the name of the vertex group of a face. It is approximated by choosing the vertex group with the most members among the vertices of a face.

## Smooth Groups

Every smooth-shaded face is assigned group “1” and every flat-shaded face “off”

## Smooth Groups Bitflags

Only available when Smooth Groups is enabled.

## Materials

### Export Materials Checkbox

Export MTL Library. You need a Principled Node with a texture node connected.

### PBR Extensions

Export MTL Library using PBR extensions. Roughness, Metallic, Sheen, Clearcoat, Anisotropic and Transmission.

### Path Mode

The method to use reference paths.

## Animation

### Export Animation Checkbox

Export the animation. Note that Obj is no file format that can store animations. What gets exported is a sequence of single meshes.

### Frame Start / End

The frame start and frame end of the animation.

---

## Stanford (PLY)

The Stanford Triangle Format was designed to store three-dimensional data from 3D scanners. It is a static file format for mesh data, and cannot carry animation data.

## General

### Format

#### Ascii

Ascii format when ticked, else binary format.

### Include

#### Selected only

Limit the export to the selected geometry only. Else it exports the whole scene.

### Scale

The scale factor for the export.

### Forward Axis

The forward orientation of the geometry.

### Up Axis

The up orientation of the geometry.

## Geometry

### UV Coordinates

Export UV Coordinates

### Vertex Normals

Export Normals.

### Vertex Attributes

Export vertex attributes.

### Vertex Colors

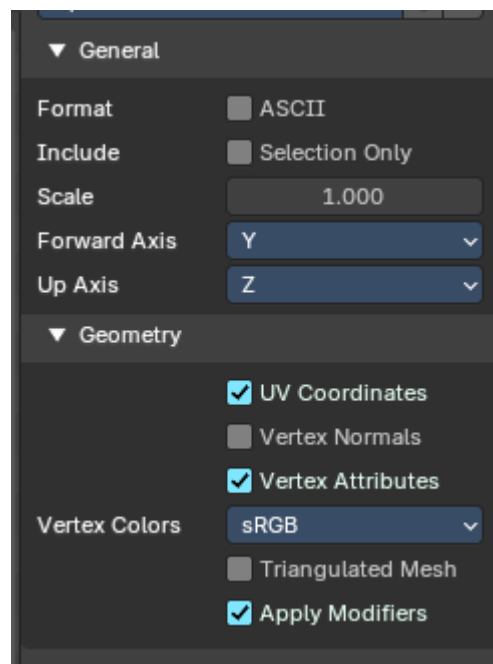

Vertex Color settings if available. These are Color attributes.

### Triangulated Meshes

Export the geometry triangulated.

### Subdivision Scheme

How Subdivision will be mapped to USD.

---

## STL

STL (Standard Triangulation/Tessellation Language ) is a standard format for many cad software. It is a format for static geometry, it cannot handle animation. The format is popular for 3d printing purposes.

## General

### Format

#### ASCII

You can either export the file as binary format or as ASCII format.

### Batch

Export all geometry to one file or create a file for every object.

### Include

#### Selected Only

Export only the selected object(s).

### Scale

The import scale.

### Scene Unit

Apply the scene unit at the geometry at export.

### Forward

The Forward orientation at export.

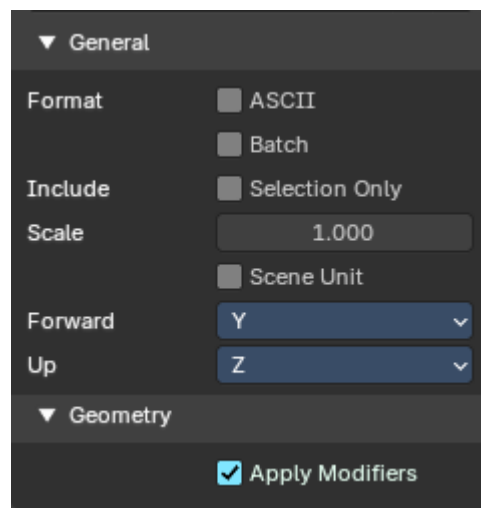

### Up

The Up orientation at export.

## Geometry

### Apply Modifiers

Apply all modifiers before export.

---

## Motion Capture BVH

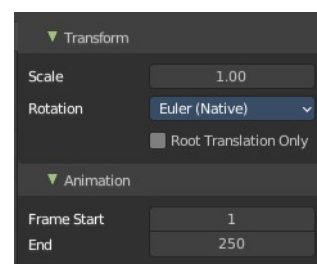

The Biovision Hierarchy (BVH) character animation file format is a file format to carry motion capture data.

**Note:** To export BVH you need to have an armature with animation selected.

### Transform

#### Scale

The scale factor for the export.

## Rotation

The rotation order that is defined in the BVH file.

## Root Translation Only

Only write out translation values for the root bone.

## Animation

### Start Frame

The start frame of the animation.

### End Frame

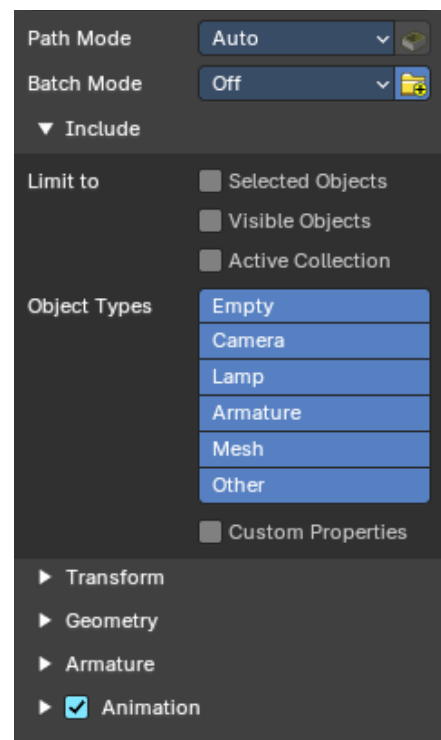

The end frame of the animation.

---

## FBX

FBX is a proprietary file format from Autodesk. FBX is a general file format that is able to store and load animation.

The FBX exporter is divided into several panels since it would be too much to display all settings at once.

## Path Mode

Method used to reference paths. Methods are Auto, Absolute, Relative, Match, Strip Path and Copy.

## Embed Textures

Embed textures in the FBX Binary. Enabled only with the method **Copy**.

## Batch Mode

Gives the opportunity to batch export independent parts. Like one file for each scene. Or one file for each collection. Methods are Scene, Collection, Scene Collections and Active Scene Collections.

## Batch Own Dir

Setup the export directory for batch export.

## Include

### Limit to

#### Selected Objects

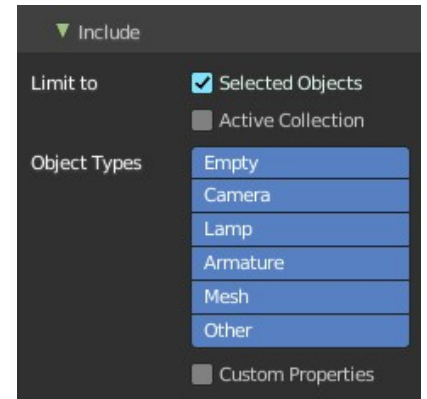

Export just selected objects.

#### Active Collection

Export just the active collection.

### Object Types

What object types in the scene to export. Holding shift key adds to the current selection.

### Custom Properties

Export custom properties if available.

## Transform

### Scale

The scale factor for export.

### Apply Scaling

How to apply custom and unit scaling in the generated FBX file.

### Forward

The forward orientation.

### Up

The up orientation.

### Apply Unit

Take the current Blender Units into account.

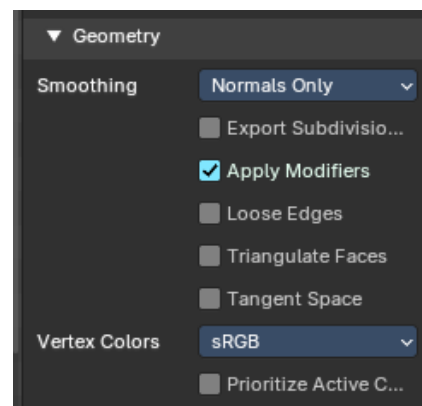

## Use Space Transform

Apply global space transforms to the object rotations.

## !Experimental! Apply Transform

Bake space transform into object data.

## Geometry

### Smoothing

Define what smoothing information gets exported.

### Export Subdivision Surface

Export the last catmull rom subdivision modifier as FBX subdivision. This does not apply the modifier, even if apply modifiers is enabled.

### Apply Modifiers

Apply existing modifiers before exporting.

### Loose Edges

Export loose edges. Loose edges are polygons with just two vertices.

### Triangulated Meshes

Export the geometry triangulated.

### Vertex Color

Export vertex color attribute if available. You can export as sRGB 8bit and Linear 32 bit float color bit depths.

### Tangent Space

Add binormal and tangent vectors together with the tangent space information. This feature just works with tris or quads.

### Prioritize Active Color

Make sure active color will be exported first. Could be important since some other software can discard other color attributes other than the first one.

## Armatures

### Primary Bone Axis

The primary bone axis orientation.

### Secondary Bone Axis

The secondary bone axis orientation.

### Armature FBX Node Type

FBX type of node used to represent a Blender Bone.

### Only Deform Bones

Only export deforming bones, and none deforming ones when they have children.

### Add Leaf Bones

Add a final bone at the end of every bone chain.

## Animation

Export baked keyframe animation.

### Key all Bones

Force export at least one key of animation for all bones.

### NLA Strips

Export each non muted NLA strip.

### All Actions

Export each action as a separated FBX anim stack.

### Force Start/ End Keying

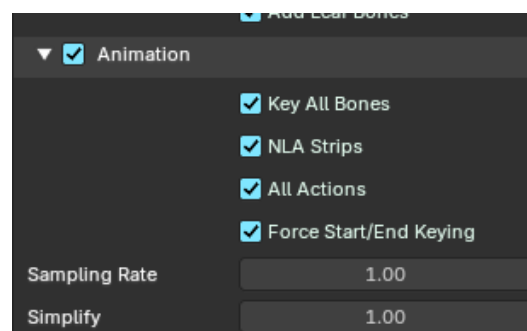

Always add a key frame at start and end of actions for animation channels.

### Sampling Rate

How often to evaluate animated values, in frames.

### Simplify

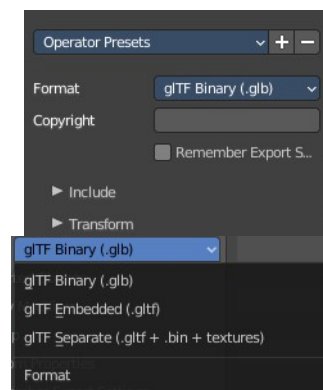

Simplify the animation. 0.0 to disable. 1.0 does not simplify at all. Higher values simplifies the animation then.

---

## glTF 2.0 (glb, gltf )

The GL Transmission Format from the Khronos Group is a file format for 3D scenes and models, and is based at the JSON standard.

## **Format**

Choose between three export formats. Binary, Embedded and Separate.

## **Copyright**

Enter a custom copyright string.

## **Remember Export Settings**

Store glTF settings in the blender project. You need to save the project then.

---

## **Include**

### **Limit to**

Limit the export to the chosen selection.

### **Selected Objects**

Export just selected objects.

### **Visible Objects**

Export just visible objects.

### **Renderable Objects**

Export just renderable objects.

### **Active Collection**

Export just selected objects from the active collection.

### **Active Scene**

Export everything in the active scene

## **Data**

### **Custom Properties**

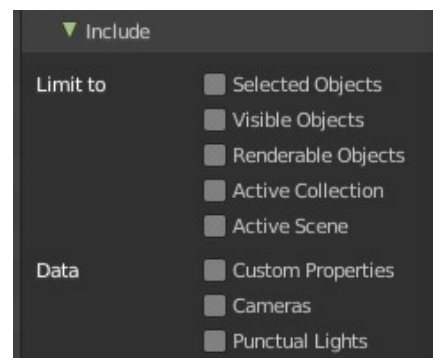

Include custom properties in the export.

### **Cameras**

Include cameras in the export.

### **Punctual Lights**

Include punctual lights in the export.

## **Transform**

### **Y+ Up**

Export all objects with the Y up orientation.

---

## **Data**

### **Scene Graph**

Geometry Node Instances !experimental!

GPU Instances

Flatten Object Hierarchy

Full Collection Hierarchy

### **Mesh**

#### **Apply Modifiers**

Apply all modifiers before export.

#### **UV's**

Export UV's

#### **Normals**

Export Normals.

#### **Tangents**

Export Tangents.

#### **Attributes**

Export attributes when the names start with an underscore '\_'

#### **Loose Edges**

Export loose edges.

#### **Loose Points**

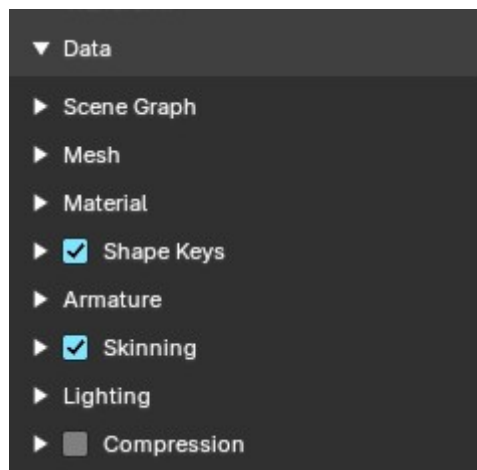

Export loose points.

### **Vertex Colors**

These are Color attributes.

#### **Use Vertex Color**

How to export the vertex colors. You can export them from the Material, Active vertex color selected in the mesh data or None.

#### **Export all vertex colors**

Export all vertex colors, even if not used by any material. If not vertex color is used in the mesh materials, a face COLOR\_0 will be created, in order to keep material unchanged.

## ***Export active vertex color when no materials***

When there is no material on an object, export the active vertex color (color attribute)

## **Material**

### ***Materials***

How to deal with materials at export. Export them, export with placeholders, or don't export.

### ***Images***

How to deal with images at export.

#### **Automatic**

exports PNG images as Png Images, and Jpg Images as Jpg images.

#### **Jpeg Format (jpg)**

Exports all images as jpg.

#### **None**

Exports no images.

#### ***Image Quality***

Quality of the image compression.

#### ***Create WebP***

Creates a WebP texture image for every texture image. For images that are already a WebP texture, nothing happens.

#### ***WebP Fallback***

For all WebP textures, create a PNG fallback texture.

## **Shape Keys**

Export Shape Keys. Also called Morph Targets.

### ***Export Shape Keys***

Toggle to export the shape keys.

#### ***Shape Key Normals***

Export vertex normals with shape keys (morph targets)

#### ***Shape Key Tangents***

Export vertex tangents with shape keys (morph targets)

#### ***Optimize Shape Keys Subpanel***

##### **Use Sparse Accessor if better**

Try use Sparse Accessor if it saves file size space on disk.

### **Omitting Sparse Accessor if data is empty**

Omits Sparse Accessor if data is empty.

## **Armature**

### ***Use Rest Position Armatures***

Export armatures using the default rest position as joints' rest pose. When off, current frame pose is used as the rest pose.

### ***Export Deformation Bones Only***

Export only the bones that have deform influence assigned.

### ***Remove Armature Object***

Remove Armature object if possible. If Armature has multiple root bones, object will not be removed.

### ***Flatten Bone Hierarchy***

Flattens bone hierarchy. Useful in cases of non-decomposable transformation matrices.

## **Skinning**

### ***Bone Influences***

Choose how many Bone influences to export.

### ***Include All one Influences***

Allow export of all joint vertex influences. Models may appear incorrectly in many viewers. Allow vertex influences greater 4.

## **Lighting**

### ***Lighting Mode***

Optional backwards compatibility for non-standard render engines. Applies to lights. Standard is the Physically- based glTF lighting units (cd, lx, nt) and Raw is the standard Blender lighting units, now deprecated.

## **Compression**

Compress the mesh data using the Draco algorithm.

The settings should be self explaining.

## **Animation**

Export active actions and NLA tracks from the animation data.

## Animation Mode

Export actions, active merged actions, NLA tracks or the Scene animation data.

## Bake All Objects Animations

Force exporting animation on every object. Can be useful when using constraints or drivers. Also useful when exporting only selection.

## Rest & Ranges

General timeline rules for the animation export.

### ***Use Current Frame as Object Rest Transformations***

Export the scene in the current animation frame. When off, frame 0 is used as rest transformations for objects.

### ***Limit to Playback Range***

Clips animations to selected playback range.

### ***Set all glTF Animation starting at 0***

Set all glTF animation starting at 0.0s. Can be useful for looping animations.

### ***Negative Frames***

Negative frames are slid or cropped to frame 0.

## Armatures

Armature animation export settings.

### ***Export all armature Actions***

Export all actions bound to a single armature.

**Note:** Option does not support exporting multiple armatures and their actions.

### ***Reset pose bones between actions***

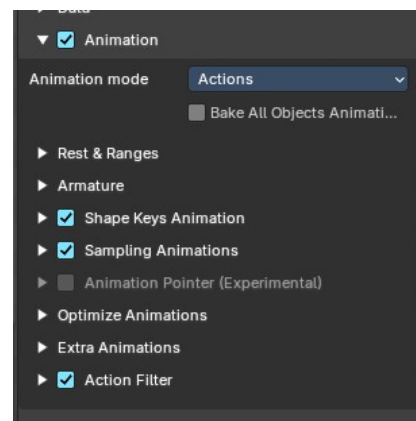

Reset pose bones between each exported action. This is needed when some bones are not keyed on some animations.

## Shape Keys Animations

Shape Key animation export settings.

### ***Shape Keys Animations Toggle***

Toggle to export Shape Key animations.

### ***Reset pose bones between actions***

Reset shape keys between each exported action. This is needed when some shape key channels are not keyed on some animations.

## **Sampling Animations**

### ***Sampling Animations Toggle***

Toggle to re-sample animations.

### ***Sampling Rate***

How often to evaluate animated values in frames

### ***Animation Pointer !experimental!***

Export material, Light & Camera animation as Animation Pointer.

### ***Animation Pointer Toggle***

Toggle to set Animation Pointers.

### ***Convert TRS/weights to Animation Pointer***

Export translations, rotations and scale and weights as Animation Pointers. Uses the KHR\_animation\_pointer extension.

## **Optimize Animations**

These options help to optimize the file size.

### ***Optimize Animation Size***

Reduce exported file size by removing duplicate keyframes.

### ***Force keeping channels for bones***

If all keyframes are identical in a rig, force keeping the minimal animation. When off, all possible channels for the bones will be exported, even if empty (minimum animation: 2 keyframes)

### ***Force keeping channel for objects***

If all keyframes are identical for object transformations, force keeping the minimal animation.

### ***Disable viewport for other objects***

When exporting animations, disable viewport for other objects, for performance.

## **Extra Animations**

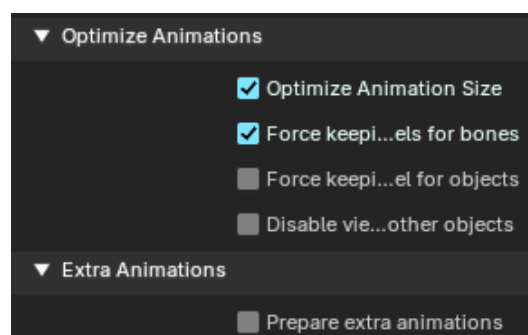

The are considered somewhat experimental and require third-party extensions.

### ***Prepare extra animations***

Export additional animations. This feature is not standard and needs and external extension to be included in the glTF file.

## **Action Filter**

This is a filter that will detect and list all the action clips of a scene. Here you can select one specific action clip.

### **Action Filter Toggle**

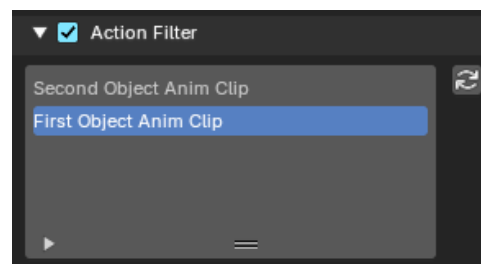

Turn on the action filter.

### **Action Filter List**

Shows all the action clips of the file.

### **Action Filter Refresh**

Refreshes the action clip list.

---

## **X3D Extensible 3D**

Extensible 3D (X3D) is a family of co-ordinated royalty-free open standards for file formats that can store representations of interactive 3D objects and scenes.

### **Include**

#### **Selection Only**

Export just selected objects.

#### **Hierarchy**

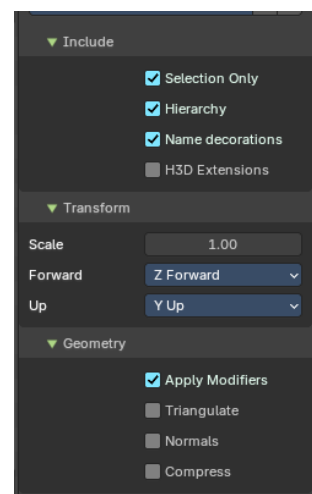

Export Parent Child relationship.

#### **Name Decorations**

Add Name Prefixes to indicate their type.

#### **H3D Extensions**

Export shaders for H3D.

### **Transform**

#### **Scale**

The scale factor.

#### **Forward**

The forward orientation.

#### **Up**

The up orientation.

## Geometry

### Apply Modifiers

Apply modifiers before export.

### Triangulate

Triangulate the geometry before export.

### Normals

Export Normals.

### Compress

Compress the exported file.

## Export All Collections

Export all collections that have been assigned Exporter Operators in the Properties Editor Collections Tab. When an Exporter Operator is assigned to a collection, it will export with the Exporter Operator properties and assigned file paths.

**Note:** To assign Exporter Operators to a collection, use the Exporters panel in the Collections Tab in the Properties Editor.

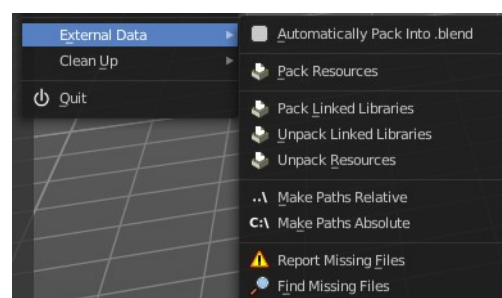

## External Data

A Blend file may work with external data. Textures for example. Or text files. Or other Blend files, used as libraries.

In this menu you can adjust some settings for external data.

External data like textures or text files can also be packed directly into the blend file. This has some advantages, like that now all data is in one file. But also some drawbacks. Texture editing is for example not longer possible. You would have to export the texture first to be able to save the modifications.

Packed data displays a packed icon in the drop down box. This example is from the header of the UV editor. But you can see this icon also in the material editor at the texture node then.

Library Blend files cannot be packed. Use append instead of link to have the data of another blend file in the blend file.

## Automatically Pack into .blend

Automatically pack all files into the blend file. Don't forget to save the blend file. Note that this greys out the two menu items Pack all into Blend and Unpack packed Files.

## Pack Resources

Packs all external data into the blend file. Note that the paths must fit, and the external data must be available. A common pitfall here is that the textures uses absolute paths, and are moved to another location meanwhile. See Make all Paths Relative or Find missing Files. Or that you have a not longer existing file linked that shouldn't be in the blend file at all. See Outliner, Orphan Data.

You will get a warning when something is missing.

## Pack linked libraries

Pack all linked library files into the current .blend file

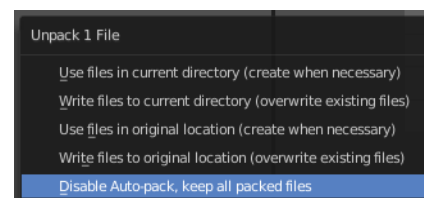

## Unpack linked libraries

Unpack all linked library files from the current .blend file to their original locations.

---

## Unpack Resources

Unpack packed files exports all packed data. You will get an options menu choose between several different unpack methods.

### ***Use Files in current Directory (create when necessary)***

Extracts all files to the current directory of the blend file. If the files in the current directory exists, reuse it. Else extract the ones from the blend file.

NOTE! The title is misleading, it does NOT write the files to the current directory. But into a sub folder, textures for example, in the current directory. Which gets created if necessary. And this option is not to change.

### ***Write files to current directory (overwrite existing files)***

Extracts all files to the current directory of the blend file, and writes it to the current directory. Existing content will be overwritten.

NOTE! The title is misleading, it does NOT write the files to the current directory. But into a sub folder, textures for example, in the current directory. Which gets created if necessary. And this option is not to change.

### ***Use files in original location (create when necessary)***

Extracts all files into their original directories where they were before packing them into the blend file. If the files in the original directory exists, reuse it. Else extract the ones from the blend file. This feature uses absolute

paths.

### ***Write files to original location(overwrite existing files)***

Extracts all files into their original directories where they were before packing them into the blend file. If the files in the original directory exists, reuse it. Else extract the ones from the blend file. This feature uses absolute paths.

---

### **Make Paths Relative**

The path will be shortened to just the file name. For example, C:\myfolder\mysubfolder\mytexture.jpg turns into texture.jpg . Relative paths allows you to move the whole project folder to another location. The file paths will still be valid.

### **Make Paths Absolute**

Makes all paths absolute. For example, texture.jpg turns into C:\myfolder\mysubfolder\mytexture.jpg. Absolute paths requires the full valid path for all files.

### **Report Missing Files**

Scans through the blend file and tries to find missing files. You will get a warning when a missing file is found.

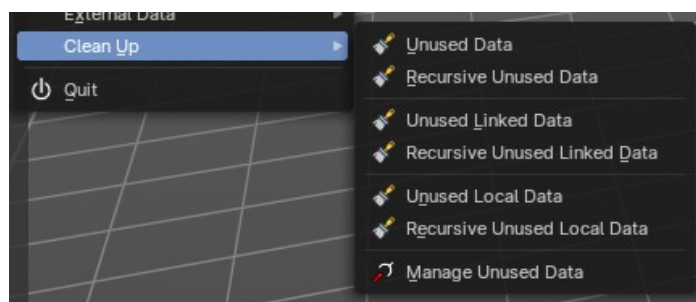

### **Find Missing Files**

Browse for the new location of moved files.

---

## **Clean Up**

Here you can remove unused data. It removes all data from the scene that is not longer in use and has no fake user assigned to keep it in the scene.

It is similar functionality to the Clean Up feature in the outliner. But more granular. Unused Data does the same than the Clean Up button in the outliner.

### **Unused Data**

Removes unused data blocks.

## Recursive Unused Data

Recursively removes unused data blocks. Means the child objects gets removed too.

## Unused Linked Data

Removes unused data that is linked to this file.

## Recursive Unused Linked Data

Recursively removes unused data that is linked to this file. Means the child objects gets removed too.

## Unused Local Data

Removes unused local data.

## Recursive Unused Local Data

Recursively removes unused local data. Means the child objects gets removed too.

## Manage Unused Data

This opens a pop-out floating Outliner Editor in the Unused Data mode, so you can view and manage the unused data.

## Quit

Quit Bforartists.

## Edit Menu

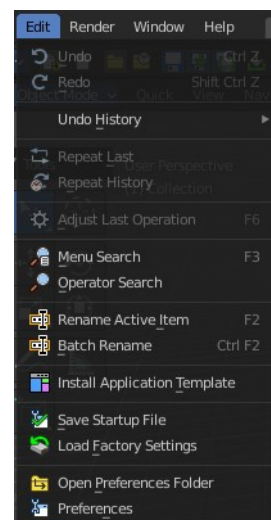

### Undo

Reverts the last step.

Note. Bforartists uses two separated histories for the Object Mode and the Edit Mode. Means when you leave the Edit mode then you will loose the undo steps in the edit mode.

### Redo

Rolls back your last Undo action.

### Undo History

The Undo History is a list of the last operations. Here you can roll back to a specific step.

Note that this Undo History is a session history, and does not save to the Blend file.

### Repeat Last

Repeat last repeats the last operation. For example, when you have moved an object by 5 in X, then it moves the object by 5 in X with every repeat last step.

### Repeat History

Repeat History calls a menu with the last actions where you can choose an action to be repeated.

### Adjust Last Operation

Some operations have settings, and can be further tweaked. It's the Blender ass forward concept for setting up an operation. In other software you set up an operation and perform it then with this settings. In Blender you first perform the operation, and tweak its settings afterwards. At least sometimes, this concept is not consistent. Bforartists is a fork of Blender. And so we have to live with this concept too.

For example, when you create a primitive, then you may want to adjust the size, or tick options like generate UV's at creation. This is done in the Last Operator panel. This Last Operator Panel is usually down left in the view.

The Adjust Last Operation calls exactly this content as a menu popup.

Note that when you perform another operation, like moving the cube after creation, then the last operation content for creation is gone. It will now display the last operation content for the transform operation.

## Menu search

Lists the available menus.

## Operator Search

This menu item calls a search menu where you can search through all available operators, and perform them if needed. Think of it as one gigantic searchable drop down menu that contains everything available.

Even operators that have no menu entries are listed. Which is useful for scripting purposes, when you want to perform a script operation, but don't have a menu button (yet).

You can navigate with the mouse or with arrow up and down buttons. Performing an operator can be done by clicking at it or by hitting enter.

Note that this search just lists the old traditional operators from before Blender 2.80. Not the ones in the Tool Shelf, which is a completely independent tool system.

---

## Rename active Item

Allows you to rename the currently active item. A rename dialog will pop up where you can type in a new name for the current item. You can have more than one item selected. Just the active item gets renamed.

---

## Batch Rename

Allows you to rename more than one item or parts of the name at once. It will open a rename dialog with

various settings.

## Add / Remove Operator

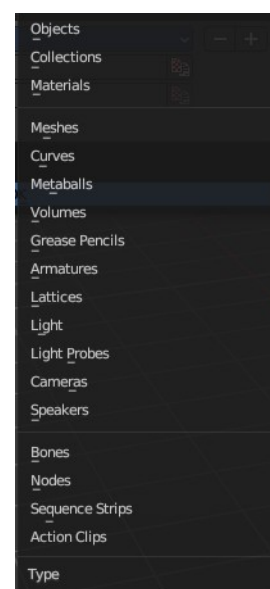

This allows you to add more than one operator and method. And here you can remove the operators too.

## Data Source

Rename just the selected objects, or all objects.

## Data Type

Choose the data type that you want to process.

## Type

Choose the operation method. The content of the panel will change with the different types.

## Find / Replace

Find and replace names in the chosen objects.

## Find

The string that you want to modify.

## Replace

The replacement.

## Case Sensitive

Operate case sensitive, or handle small and big letters as equal.

## Set Name

Set name of the chosen objects.

## Method

Set the method.

Sets the name new. Sets a number as a prefix Or Sets a number as a suffix.

## Name

The name to set.

## Strip Characters

Strip characters in the names of the chosen objects.

## Characters

What type of characters to change.

## Strip From

To strip from the start or to strip from the end.

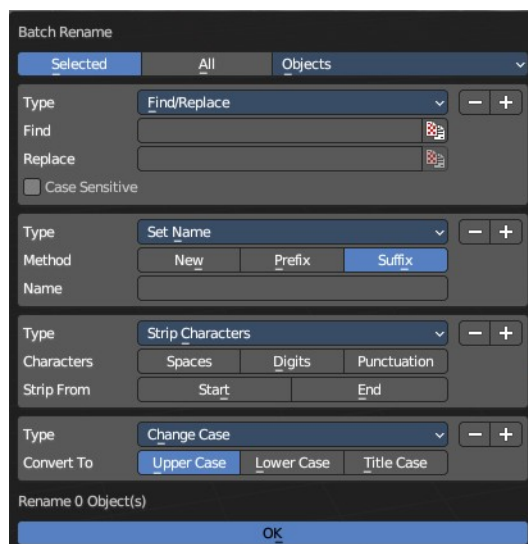

## Change Case

## Convert to

Change the string to upper case, lower case or title case.

## OK

Accept the settings and apply the batch rename operation.

---

## Application Templates

Load a new application template.

Application templates is a predefined set of workspaces with its own setup. It can contain its own layout, theming, its own startup file, its own add on set and scripts, a own key map and own lighting, and its own User Preferences.

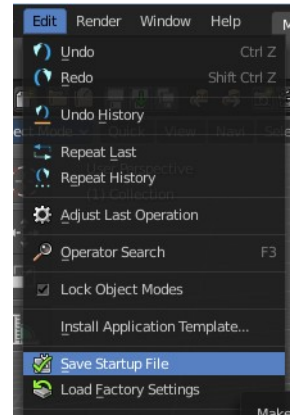

Bforartists comes with six internal application templates already. Have a look at the "new" menu item in the file menu. Clicking at one of the menu items creates in fact a new scene by using one of the existing application templates.

## How to create an application template

An application template is basically a zip file that contains a startup.blend, a userpref.blend, a splash.png and a \_\_init\_\_.py file that defines this all as an application template.

startup.blend and userpref.blend can be created in the Edit menu. So tweak everything to your needs, and save the startup file.

At Windows you will find them in the appdata directory in the Bforartists folder.

At Linux it's in /home/yourusername/.config/bforartists/2.80/config/

Copy those two files, startup.blend and userpref.blend, and throw them into a folder where you want to build the application template in. Rename this folder to AT\_01, or to whatever name you want it to use.

Next create a png image as a splash screen for your template, and save it as splash.png into the AT\_01 folder. The required size is 501x250. Everything else will throw an error, and you won't be able to see the new splash. You can alternatively also create a splashx2.png file in double size. This is for hi dpi monitors.

The required \_\_init\_\_.py file is a python file with a def register and a def unregister.

```
def register():
    print(Registering application template : {0}.format(__name__))

def unregister():
    print(Unregistering application template : {0}.format(__name__))
```

So copy over this text, and save this file as \_\_init\_\_.py in the AT\_01 folder

We should now have four files in the AT\_01 folder. Zip the AT\_01 folder. The template is finished for installing.

But as a last step, and before you install the template, remove the startup.blend and userpref.blend that we have created to build the application template from the config directory, to have a clean environment.

Once installed you will find the new application template in the New menu.

To remove an application template you need to remove its data in the config folder. There is no functionality to uninstall it.

## Save Startup File

Saves a startup.blend with the current configuration.

A startup.blend stores layout informations. Editor layouts, default values, if a panel is open or closed, etc. .

## Load Factory Settings

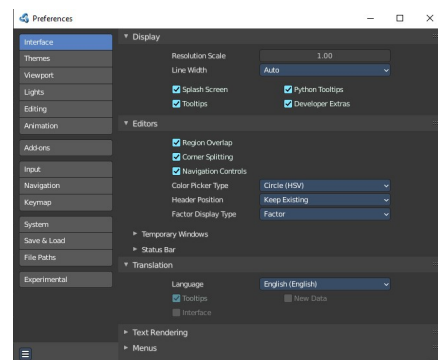

Resets Bforartists into a fresh installed state. All customer modifications, like activated addons, changes at the layout, etc. will be ignored.

## Open Preferences Folder

Opens the folder in which the Bforartists settings and addons are stored.

## Preferences

Opens the Preferences window. Adjust various settings.

## 5.1.3 Topbar and Statusbar - Render menu

### Table of content

Render Menu.....	2
Render Image.....	2
Render Animation.....	2
Mixdown Audio.....	2
Options.....	2
Relative Path.....	2

Play rendered Animation.....	3
Lock Interface.....	3

## Render Menu

This menu contains functionality around rendering.

Most of the render settings can be found in the Properties editor in the Render tab. And here you can also choose the render engine.

Rendered images can be saved in the Image menu like any other image.

### Render Image

Renders the current scene as an image by using the current chosen renderer.

### Render Animation

Renders the current scene as an animation by using the current chosen renderer.

## Mixdown Audio

Mixdown and export the scene's audio to an audio file. You will open an export dialog when you click at Mixdown Audio. Further Audio settings can be found in the Properties editor.

### Options

The options can be found down left in the Save dialog.

#### **Relative Path**

Select the file relative to the blend-file.

#### **Accuracy**

Sample accuracy, important for animation data (the lower the value, the more accurate).

#### **Containers**

Choose between different audio export formats.

#### **Format**

Some *Audio Containers* also have option to choose a codec. For more information see [here](#).

#### **Split Channels**

Each audio channel will be rendered into a separate file.

## **OpenGL Render Image**

Renders an Image, using the Viewport OpenGL renderer.

## **OpenGL Render Animation**

Renders an animation, using the Viewport OpenGL renderer.

## **Show / Hide Render**

Toggles the display of the render view.

## **Play rendered Animation**

Plays back the rendered animation sequence.

## **Lock Interface**

Lock the interface while rendering to free the memory for the UI to the renderer.

## 5.1.4 Topbar and Statusbar - Window menu

## Introduction

The interface of Bforartists is made of several UI elements and layouts. Topbar and status bar are the two UI elements that are visible in all layouts. They contain some general functionality.

## Top bar

The Topbar is the area at the top that is visible in all workspaces. The top bar contains some general menus like File and Edit. And it contains tabs to switch between workspaces.

## Header Right Click menu

The header has, like all headers, some right click menu functionality.

## Collapse Menus

Make the menus in the header appear collapsed.

## Hide Editortype Menu

This menu item has no purpose in the Topbar header. The Topbar header does not have a editortype menu.

## Navigation Tabs

With the tabs you can switch between different workspaces of an application template.

Application templates are a collection of Workspaces. A Workspace is a layout of screens and special setups. Like in what mode the workspace starts, how the windows are arranged and so on.

Every layout is made of several editors. The 3D View, a Properties Editor, the header and footer, the Toolbar at the top, and so on.

## Adding a new tab

You can also add a new workspace to the existing ones. For this you can either add one of the existing workspaces from the Add Workspace menu that hides under the + button at the right. The greyed out menu items are already added to the Tabs.

The other way is by duplicating the current workspace, tweak it to your needs, and rename it then. This can also be done in the Add Workspace menu. Duplicate Current.

When done, save the startup file to make the change permanent. Be careful here, this overwrites the current startup.blend file with all its settings.

## Rename a tab

To rename a tab double click at it. The name turns into an edit box. And you can edit the name of the tab.

## Tab Right Click Menu

When you right click at a tab then you will reveal a menu with further functionality.

### Duplicate

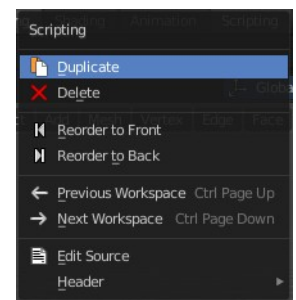

Duplicates the workspace with all its settings.

### Delete

Deletes the workspace with all its settings.

### Reorder to Front

Orders the tab to be the first in the list.

## Reorder to Back

Orders the tab to be the last in the list.

## Previous Workspace

Cycle to the previous workspace.

## Next Workspace

Cycle to the next workspace.

## Edit Source

Open the Python script that contains this button in the text editor. Note that you need to have a text editor open.

## Header

Same menu than the right click menu in the header area.

## Show Menus

Make the menus in the header appear collapsed.

## Hide Editortype Menu

This menu item has no purpose in the Topbar header. The Topbar header does not have a editortype menu.

# Topbar Toolbar

The Topbar Toolbar is similar to the Toolbar editor found in the chapter **Editors – Toolbar** . This is a bunch of double menu entries in a fixed header that you can customize and/or toggle. It is made by lots of tools that already exists elsewhere.

But the value of this double menu here is that it is configurable, making it possible to have the most needed tools at top UI level. This can save a ton of clicks, tabbing, scrolling, and digging in sub menus and you can display what you need for your personal workflow. And hide away the rest.

The toolbar editor uses pure Icon buttons.

**Note:** *Parts of the toolbars are just visible when you are in the right mode. The full Primitives toolbar for example in just visible in Object mode. Parts of it are visible in Edit mode, dependent of what type of object you modify. And in the other modes the toolbars are hidden. Parts of the toolbars are just visible when the right object type in the scene exists / is selected.*

As mentioned, the toolbars are double menu entries. For more information of the operators, please refer to the chapter **Editors – Toolbar**.

## Limits

- The toolbar does not contain all possible tools. More the opposite, the selection is very limited. Lots of tools depends to be performed in the editor type where you want to do the change. They just work there. And not in other editors. This affects for example most tools in edit mode. And the toolbar is another editor. This limits the available tools in the toolbar dramatically.

- The toolbars have a fixed order. The content is not sortable. The sorting is defined by the order of the toolbar type. And inside the toolbar type by the order in the toolbars menu. You would need to have to edit the python file to change this order.

## Menus

### Topbar Manager menu

The first entry of a toolbar is the Toolbar Type menu.

Choose what kind of Toolbar Type you want to show. You can show multiple types of toolbars at once.

The toolbar types are independent from each other. You can set up every toolbar to display different content.

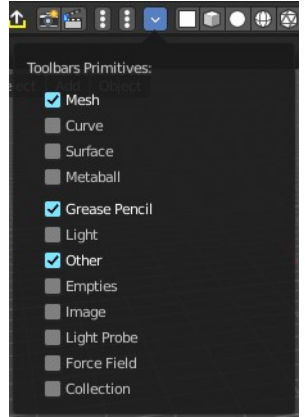

### Toolbars Menus

Every toolbar type has several toolbars to display.

In the toolbar menu at the front of a toolbar type you can choose what toolbars you want to display.

The toolbars are not independent. This setup is global. When you for example tick the Toolbar File in this

toolbar, then it will be displayed in all other toolbars too. Including in other layouts. These check boxes are also available in the Toolbar Settings Bforartists add-on

## Options

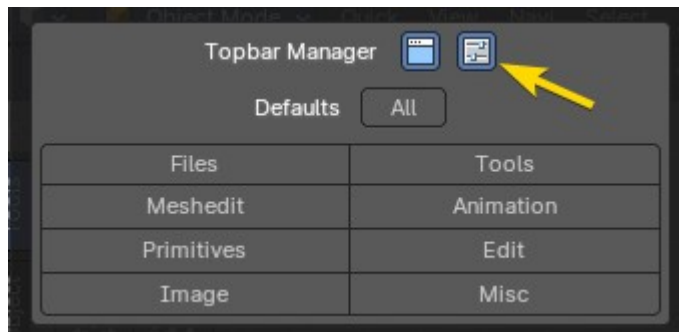

### Show Topbar

Toggles the visibility of the Topbar Toolbar

### BFA Defaults

Sets the topbar toolbar to Bforartists defaults, either by all tool types or individual tool types.

### Types

The single toolbar types. Each one of these toggle the type of toolbar groups of operators divided into separate categories.

**Note:** You need to save the startup file to make changes at the topbar toolbar types permanent. They are part of the layout. Which was the only way to allow them to act independent from each other.

**File** - Contains some file menu related tools. Like load save. But also the render menu.

**Meshedit** - Contains tools for Meshes in Edit Mode.

**Primitives** - Contains the primitives from the Create tab in the Tool Shelf.

**Image** - Contains some tools for editing UV

**Tools** - Contains the content of the Relations panel in Object mode.

**Animation** - Contains Animation tools

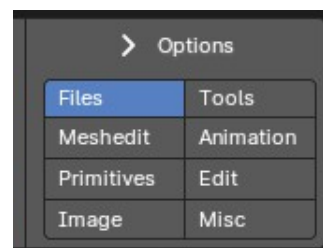

**Edit** - Contains some tools from Object and Edit Mode

**Misc** - Contains Undo, and an empty menu as a place holder.

## Options

Toggle the sub-group of operators per type. This is a quick hand method to customize the toolbar sub-groups of operators per type of groups, so you can Hide / Show tool groups of all tool types in one go.

**Example:** you can toggle the sub-group of operators of the Files type from the check boxes below.

**Note:** You can only configure the options of one type at a time.

## Show Quick Toggles

By default you need to turn on or off the toolbar types in the toolbar type menu. With quick toggles turned on you will reveal small buttons besides the single toolbar types that allows you to expand or collapse the toolbar types from within the toolbar.

Each quick toggle represents a toolbar type.

## Status Bar

The statusbar is, besides the Topbar, the second UI element that will display in all workspaces. At least when you don't hide it away. Which is not recommended. Since here you can find the scene information. In this area you will also see informations and warnings about the current operation. For example, you can see the progress bar for rendering in this area. Besides that, the footer also displays some infos about navigation.

The Navigation content changes, dependent of where you have the mouse over, and what tool or functionality you want to use.

In the middle to the right you will see things like the render status bar, when you have a render job running. But in this area you can also see some warnings occur.

When you right click at the status bar then you will reveal a context menu where you can choose what information you want to display in the right area of the footer. By default the Bforartists version number is shown.

## Status Bar Context Menu

### Scene Statistics

This shows scene statistics like the active collection, object, faces, tris and total objects in the scene.

### Scene Duration

This shows the scene frame information including total duration and current frame of total frames.

### System Memory

This shows system memory usage.

## Video Memory

This shows GPU memory usage.

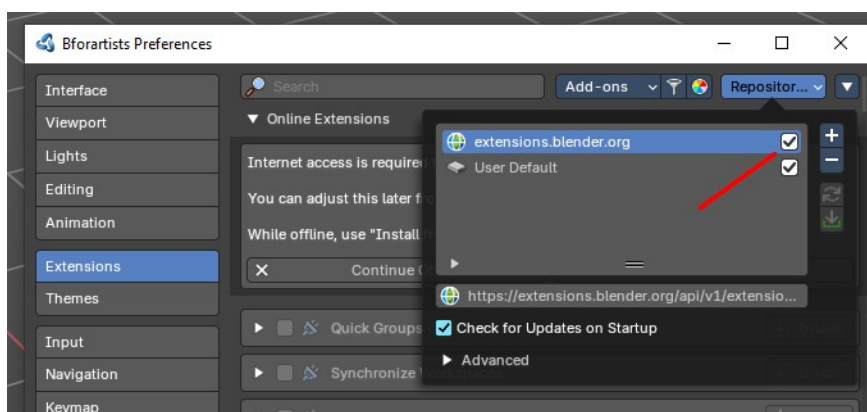

## Extension Updates

Shows a status icon for the extensions and available updates. Extension are hosted externally in the internet by the Blender foundation.

A click at the icon will open the preferences, where you can adjust the extension settings, and manually update to new versions.

Please beware, some extensions are doubles to the Bforartists ones. So it can happen that you pull the newest functionality, but loose all icons for example. We do our best to keep the addons updated.

First you will see a warning icon. You have to allow the online access.

You will see the online status once the online access is granted and the extensions.blender.org webpage is activated. And the icon will now show the number of available updates.

## Bforartists Version

This displays the version number of Bforartists.

# Introduction

The Bforartists Interface is made of several workspaces. And every layout is made of several editors.

The editors brings the functionality to the layout. Every editor type has another purpose. The 3D View for example is made to modify 3D data such as meshes or curves.

In this chapter we will talk about the general aspects of the editors. And give an overview over the available editor types and their purpose.

The detailed description happens for every editor one by one then.

## Header right click menu

Each header has a header menu that appears when you right click at it.

### Toggle Header

Hides the header. To reveal it you have to click at the small triangle at the right side then.

### Flip to Bottom / Top

Displays the header at the top or the bottom of the editor.

### Collapse Menus

Displays the text menus as one collapsed icon.

### Hide Editortype Menu

Hides the editortype menu where you can switch to other editor types.

### Horizontal Split

Splits the current view horizontally into two independent editor windows.

### Vertical Split

Splits the current view vertically into two independent editor windows.

### Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

### Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

### Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the editor.

# Area Options

When you right click at a border of an editor, then you will call the Area options menu.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Join Areas

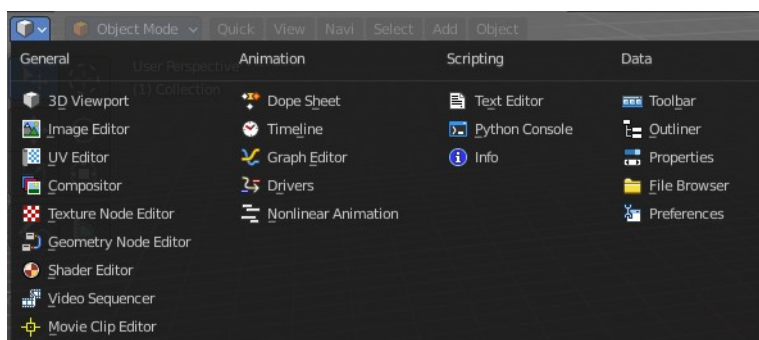

Joins the two editors that shares the border.

## Swap Areas

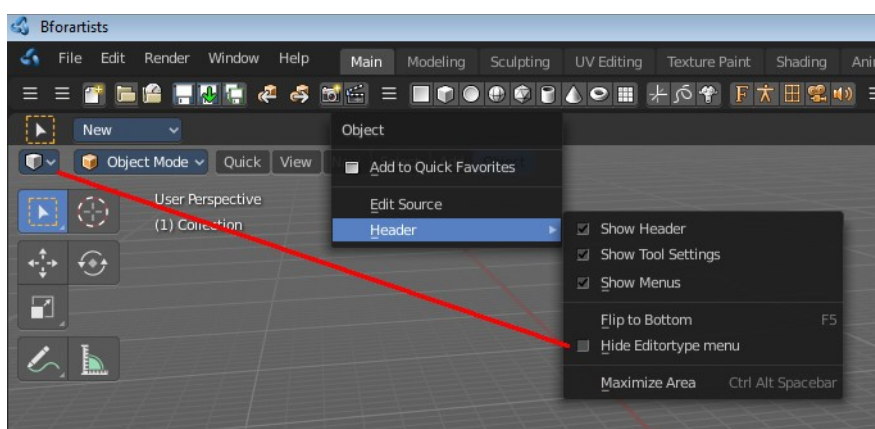

Swaps the content of the editors that shares the border.

# Editor Type menu

The Editor Type menu gives you an overview of all available editor types. And here you can switch to another editortype.

This menu is hidden in the standard workspaces. See Header Menu, Hide Editortype menu.

# General Right Click menus

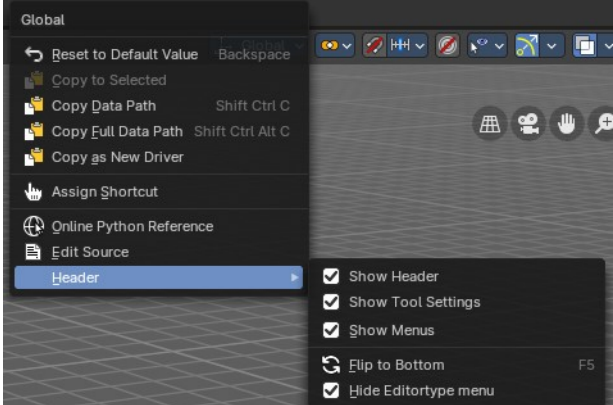

Not every functionality has a menu entry. Some is even a right click at an existing menu. Like clicking at an operator or a property in the UI to add it to the quick favourites menu or to add a shortcut.

Note that not all right click menu functionality might be documented. This chapter here covers the general right click functionality that can be found in all editors.

## Header menu

This menu appears when you right click in the header. Note that in the header of the 3d view you need to click between menu items or operators to reveal this menu. Or right click at a item and choose Header.

## Show header

Hides the header. Obviously you can't reveal the header this way, since now the header is hidden, and the "toggle" is not to reach anymore. But there is another way.

Hidden headers shows a little triangle button at the right side. You can reveal the header by clicking at it.

## Show Menus

Collapses or expands the text menus.

In collapsed state the menus is reduced to one button. When you click it then you can access the whole menu.

## Flip Header to top or bottom

The header can either be displayed at the top or at the bottom.

Right click at an empty space somewhere at the menu bar of an editor. You will see a menu now. This allows you to choose if you want to display the menu bar at the top of the editor, or at the bottom. The menu item is either called Flip to Top, or Flip to Bottom, dependent of the current status.

## General right click menus at menu operators

This menu appears for example when you right click at an operator in a text menu

## Add to Quick Favourites

Adds the operator to the quick favourites menu.

## Assign Shortcut

Allows you to assign a shortcut or edit the existing shortcut.

## Online Python Reference

Opens the Blender Python Reference. Note that this link goes to the Blender page.

## Copy Python Command

Copies the python command of the operator. Which you then can paste into a text editor.

## Edit Source

This is mainly of use for addon developers, but also works for the UI code. It opens the python source code of the selected element in the text editor. When you have the text editor open then the source code opens directly in the text editor. If not then you have to use the dropdown box to choose the python file. Note that some elements in the UI does not have python source code, but C source code. You will get a warning then.

## Header

See Header menu above.

# Right click menus at tools and properties

Every tool or UI element has usually a RMB menu where you can find various things.

The content is varying, dependent of the tool where you right click at. Value edit boxes have for example a Reset to Default Value menu item. For other tools you might be able to add or change the shortcut here. They all have the last three menu items, Online Python Reference, Edit source and Edit translation.

A few examples below. But we will cover important right click functionality also at the specific tool if necessary. The outliner has for example quite a few right click menus that are not documented in the outliner chapter.

Note that there are also right click menus that are pure double entries that exists in the regular UI. Like this Library Override example here.

## **Assign Shortcut / Change Shortcut / Non Keyboard Shortcut / Remove Shortcut**

These buttons allows you to assign or to remove a new shortcut to the tool or to change an existing shortcut for the tool. Note that this may or may not work proper. For some tools you might need to change the shortcut in the User preferences. Non Keyboard shortcut is such a case.

## **Online Python Reference**

The Online Python Reference button opens the Bforartists Online Python reference page in your browser.

## **Edit Source**

The Edit Source button opens the corresponding Python file for this element. Note that you need to be in the Scripting layout. The file loads in the Text editor there.

## **Reset to Default Value**

Reset to Default Value is usually a RMB menu entry when you right click at an edit box. It resets the value to the default value.

## **Reset All to Default Value**

Reset All to Default Value is usually a RMB menu entry when you right click at an edit box combo made of two, three or more edit boxes together. It resets the value for all the edit boxes in the combo to the default value.

## **Reset Single to Default Value**

Reset Single to Default Value is usually a RMB menu entry when you right click at an edit box combo made of two, three or more edit boxes together. It resets the value for the single edit box under the mouse to the default value.

## **Unset**

Unset is usually a RMB menu entry when you right click at an edit box. It is somehow similar to Reset to Default Value. But it clears the property instead of resetting it to the default value. Which can end in another value.

## **Insert Keyframes**

Inserts keyframes at the current position.

## **Insert Single Keyframes**

Inserts a single keyframe at the current position.

## **Add Driver**

In Bforartists lots of things can be animated. Also buttons. Add Driver does exactly what it tells. It adds a driver

for animation needs to the element. The driver can be edited in the drivers editor.

## Copy Driver

Copies the driver.

## Copy Driver to Selected

Copies the driver from the active to the selected object. You need to have more than one object selected. Select first object, hold shift, select second object.

## Copy all Drivers to Selected

Copies all driver from the active to the selected object. You need to have more than one object selected. Select first object, hold shift, select second object.

## Edit Driver

Opens the driver settings where you can edit the driver. It is the same settings that are covered in the driver editor. So we won't cover it here.

## Open Drivers Editor

Opens the Drivers editor as a floating window.

## Add Single Driver

In Bforartists lots of things can be animated. Also buttons. Add Driver does exactly what it tells. It adds a driver for animation needs to the single element under the mouse.

## Add to Keying Set

Add to Keying Set adds the information of the element to the current key frame.

## Add All to Keying Set

Add All to Keying Set adds the information of the element to the current key frame.

## Add single to Keying Set

Add to Keying Set adds the information of the element to the current key frame.

## Remove from Keying Set

Remove from Keying Set removes the information of the element from the current key frame

## Copy All to Selected

Copy to Selected copies the property of this element to all selected objects or bones.

## Copy Single to Selected

Copy to Selected copies the property of this element to selected active objects or bones.

## Copy Data Path

Copy Data Path copies the last element of the RNA data path for this property.

## Copy Full Data Path

Copy Data Path copies the full RNA data path for this property.

## Copy as new Driver

Create a new driver with this property as input, and copy it. It can then be pasted to the target property. Or pasted as a driver variable to extend an existing driver.

## Mark as Asset

Marks the current property as an asset. It will be added to the active asset library then.

## Clear Asset

Removes the asset from the asset library.

## Resize Tool Shelf and Properties content

You can resize the Tool Shelf content and the Properties Sidebar content. This means that you can zoom in or out. This trick also works in the Properties Editor.

Move the mouse over the upper region of the Tool Shelf.

Hold down Ctrl key

Click with Middle Mouse button. The mouse pointer will turn into two white triangles.

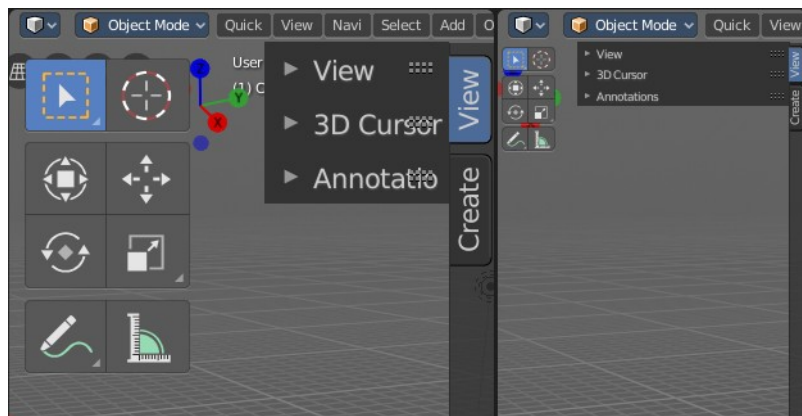

Now drag up or down to resize the area content

OR

Move the mouse over the upper region of the Tool Shelf.

Simply press Numpad + or Numpad -

To reset the area content to default scale move the mouse over the area and press Home key ( german keyboard layout Pos 1)

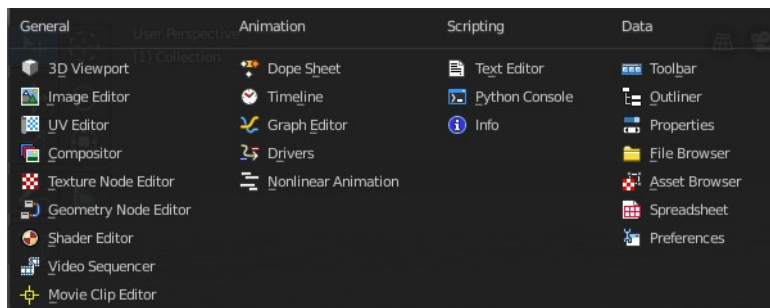

## Hotkey recognition

What hotkey set works is dependent of the mouse position, over which editor the mouse is. Means when your mouse is over the 3d View, then the hotkeys from the 3D View gets recognized. This means when your mouse is not over the 3D View but the Outliner, and you press the hotkey for let's say move, then this hotkey will not be recognized.

A special behavior shows the sidebars here. They are part of the editors. But to have the mouse over the toolbars at the side can already prevent a hotkey from being triggered. Your mouse needs to stay in the active part of the editor.

## The editor types

Bforartists provides a number of different Editor types for different purposes. For example, the 3D view is made to modify the 3D data, such as meshes or curves. You can have more than one editor window open at the same time.

## 3D Viewport

The 3D View is the editor where you do your 3D work. The 3D view is the editor to model meshes, etc. . It's the core editor for everything where you work at your 3D data.

You will find it in every layout where you need to display your 3d data.

## Image Editor

The Image Editor is the place where you work with textures.

## UV Editor

The UV Editor is the place where you work with UV mapping. It starts pretty similar to the Image editor. But contains the UV tools.

## Compositor

The editor to do post processing. It is node based.

## Texture Node editor

The editor to do texture work. It is node based.

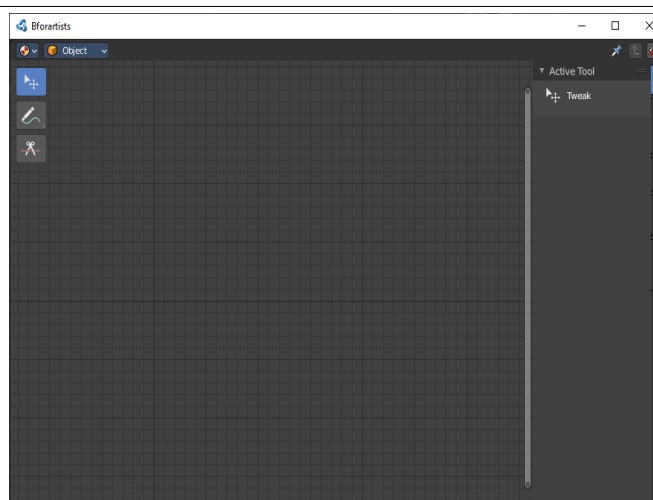

## Geometry Node editor

This editor allows you to manipulate geometry. It is node based.

## Shader Node editor

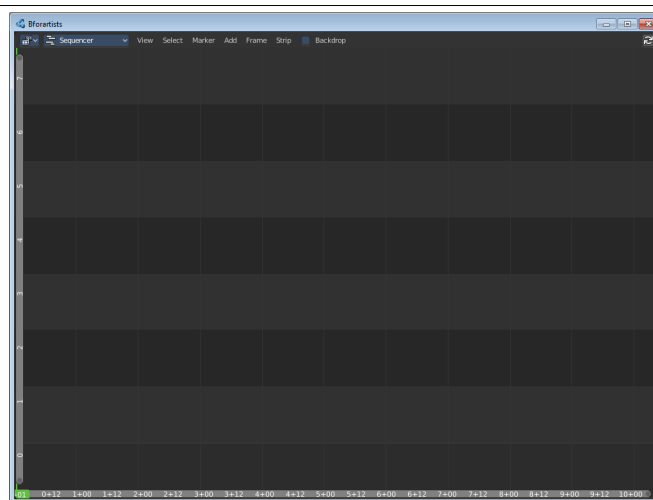

The shader Node editor is to create the materials for your objects. It is node based.

## Video Sequence Editor

The video sequence editor allows you to work with video and audio clips. Here you can cut videos.

This editor can be found in the video editing layout.

## Movie Clip Editor

The movie clip editor is for tracking purposes.

You will find it in the Motion Tracking layout.

## Dope Sheet Editor

The Dope Sheet Editor is the place where you deal with key frames.

The Dope Sheet Editor is one of five special editors for animation needs. You will find it in the animation layout.

## Timeline Editor

The timeline editor provides you with a toolbar for all animation needs. Start, stop, record, set keying set, etc.

The Timeline Editor is one of five special editors for animation needs. You will find it in the animation layout.

## Graph Editor

The Graph Editor is the place where you work with function curves.

The Graph Editor is one of five special editors for animation needs.

## Drivers Editor

See and edit drivers.

The Drivers Editor is one of five special editors for animation needs.

## Nonlinear Animation Editor

The Nonlinear Animation Editor, in short NLA Editor, is the place where you work with Clips and Actions.

The Nonlinear Animation Editor is one of five special editors for animation needs.

## Text Editor

The Text Editor is the place where you write code. The scripts for addons for example.

You will find it in the Scripting layout.

## Python Console

The Python console gives you access to the Python API.

You will find it in the Scripting layout.

## Info Editor

The Info Editor provides you with a list of the last performed operations. Including error messages.

You will find it in the Scripting layout.

## Toolbar Editor

It is as the name says a toolbar. Usually just the header area is visible. The rest of the editor has no purpose.

## Outliner Editor

The Outliner is the place that gives you an overview of what is in the scene and in the file.

## Properties Editor

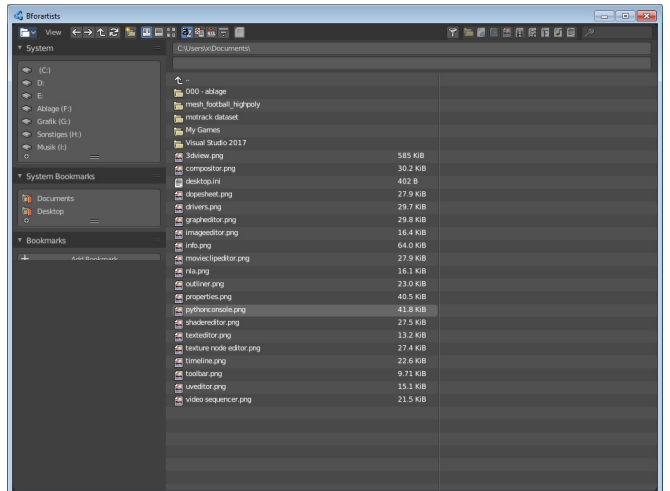

The Properties editor is the place where you can see and tweak all properties for the 3D scene. The range goes from render settings across object settings up to particle settings. It is the data heart.

## File Browser

The File Browser is the editor in which you can load and save data. Your last blend file for example.

This editor is not part of the standard workspaces. It usually gets called when you load or save a data.

## Spreadsheet Editor

The spreadsheet editor provides you with mesh informations.

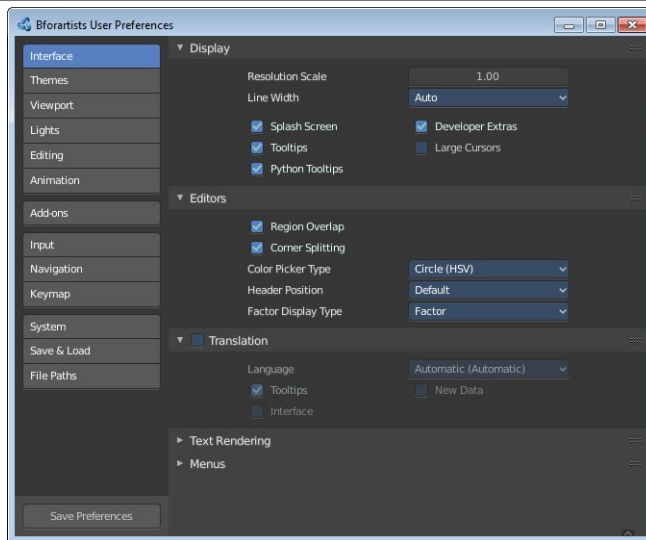

This information can then for example be used in the geometry nodes editor.

	position X	position Y	position Z
0	-1.000	-1.000	-1.000
1	-1.000	-1.000	1.000
2	-1.000	1.000	-1.000
3	-1.000	1.000	1.000
4	1.000	-1.000	-1.000
5	1.000	-1.000	1.000
6	1.000	1.000	-1.000
7	1.000	1.000	1.000

## Preferences

The Preferences is the place where you manage all the settings of the software. Theme, Key map, etc.

This editor is not present in the standard workspaces. This editor can be called from the edit menu in the top bar.

## 7.0.10 Editors - 3D Viewport - Metaball - Edit Mode - Metaball context menu

## Metaball Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a Metaball object.

### Duplicate

Duplicates the current selection.

The copy sticks to the mouse until you release it. A Right click while moving will reset the position of the duplicate. The duplicated part will be part of the same object.

When you drag the duplicate around you will see the position values in the header.

### Last Operator Duplicate

#### *Move X , Y , Z*

#### *Orientation*

Choose the orientation.

#### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

#### **Proportional Falloff**

Adjust the falloff methods.

#### **Proportional Size**

See and adjust the falloff radius.

#### **Connected**

The proportional falloff gets calculated for connected parts only.

#### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Mirror

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Show/Hide

Sub-menu with shows or hide selection, unselected or hidden operators.

## Show Hidden

Makes all geometry in the scene visible again.

## Hide Selected

Hides the selected geometry.

## Last Operator Hide Selected

### Unselected

Hides the not selected geometry.

## Hide Unselected

Hides the not selected geometry. The selected geometry stays visible.

## Delete

Deletes the current selection.

## 7.0.11 Editors - 3D Viewport - Text - Edit Mode - Text context menu

### Table of content

Edit Mode - Text Context Menu.....	2

Reset Kerning.....	4
Last Operator Change Spacing.....	4
Delta.....	4
Delete.....	4

## Edit Mode - Text Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a Text object.

### Cut

Cuts the selection.

### Copy

Copies the selection.

### Paste

Pastes a copied selection.

### Select All

Selects the whole text.

## Text

### Cut

Cuts the selection.

### Copy

Copies the selection.

### Paste

Pastes a copied selection.

### Paste File

Opens the file browser where you can choose a text file to paste the text from. It needs to be UTF8.

### To Uppercase

Sets the selected text to be uppercase letters.

### To Lowercase

Sets the selected text to be uppercase letters.

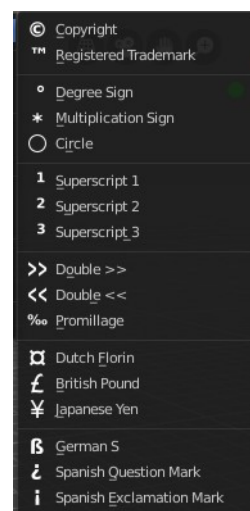

### Last Operator Set Case

Set Case has one Last Operator for all items.

## Special Characters

Special characters is a sub menu that contains some special text characters, like copyright, which you can insert into the text.

## Move Cursor

Set the cursor at specific positions in the text.

## Toggle Bold

Bold sets the selected letters to be displayed as bold letters.

## Toggle Italic

Italic sets the selected letters to be displayed as italic letters.

## Toggle Underline

Underline sets the selected letters to be displayed as underlined letters.

## Toggle Small Caps

Toggle small caps sets the selected letters to be displayed as if they were upper case letters, but with lower case size.

## Kerning

Kerning is the distance between letters. Increase, decrease and reset the kerning.

## Decrease Kerning

Decreases the distance between the letters.

## Increase Kerning

Increases the distance between the letters.

## ***Reset Kerning***

Resets the distance between the letters to the default values from the font.

## ***Last Operator Change Spacing***

### **Delta**

Adjust the spacing. The range goes from -20 to 20.

### **Delete**

Deletes the selected text.

## 7.0.12 Editors - 3D Viewport - Grease Pencil object - Edit Mode - Point+Stroke context menu

## Edit Mode - Point+Stroke Context Menu

Call this menu with right click in the 3D viewport. The different menus appears dependant of the select mode.

### Subdivide

Subdivides the selected grease pencil geometry.

### Last Operator Subdivide

#### **Number of Cuts**

Number of subdivision cuts.

#### **Smooth**

Smoothen the stroke, not just the new added vertices

#### **Repeat**

The number of times to repeat the procedure.

#### **Selected Points**

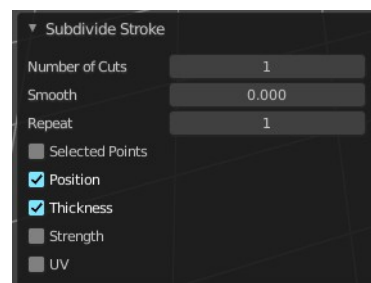

Limits the effect to only the selected points within the stroke.

#### **Position**

The operator affects the points location.

#### **Thickness**

The operator affect the points thickness.

## Strength

The operator affect the points strength (alpha).

## UV

The operator affect the UV rotation on the points.

---

## Simplify sub menu

Stroke mode. Simplify the stroke.

### Fixed

Deletes every second point in the stroke, except the start and end points.

### Last Operator Simplify Fixed Stroke

#### Steps

How much levels of simplifying.

### Adaptive

This method uses an algorithm called RDP algorithm (Ramer-Douglas-Peucker algorithm) for points deletion. The algorithm tries to keep the shape with the remaining points.

### Last Operator Simplify Stroke

#### Factor

How strong the simplification should be performed.

### Sample

Samples points along the shape of the stroke, and increases the length of the edges.

### Last Operator Sample Stroke

#### Factor

How long the edges between the points should be.

---

## Trim

Trims down selected stroke geometry to first loop or intersection.

## Extrude

Extrudes out the selected points. The new points stay connected with the original points of the stroke.

---

## Smooth

Smoothens out the selected geometry.

### Last Operator Smooth Stroke

#### *Repeat*

How often to repeat the procedure.

#### *Factor*

The amount of the smoothness to apply.

#### *Selected points*

When enabled, limits the effect to only the selected points within the stroke.

#### *Position*

When enabled, the operator affect the points location.

#### *Thickness*

When enabled, the operator affect the points thickness.

#### *Strength*

When enabled, the operator affect the points strength (alpha).

#### *UV's*

When enabled, the operator affect the UV rotation on the points.

---

## Bend

Bends the selection.

---

## Shear

Shear shears the selection.

## Last Operator Shear

### Offset

Adjust an offset.

### Shear Axis

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and AxisOrtho items below.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

### Orientation

Choose the orientation for the shear action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

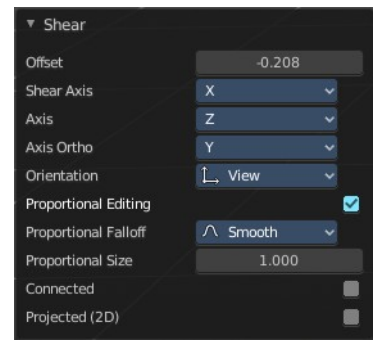

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

## Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

## Last Operator To Sphere Panel

### **Factor**

The factor to transform the selection into a shape form.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Shrink/Fatten

Shrink/Fatten scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

## Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

### Offset

Offset is the strength of the offset for Shrink/Fatten.

### Offset Even

Offset Even scales the selection to give more thickness in even areas.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

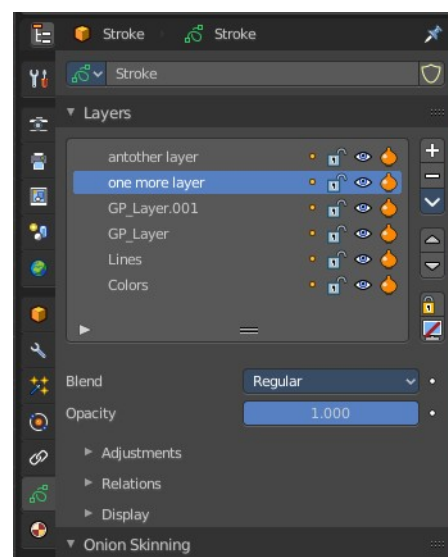

## Move to Layer

Move the current selected stroke to another grease pencil layer. It lists the current layers.

## New Layer

New Layer button adds a new grease pencil layer.

## Last Operator Move Strokes to Layer

### Grease Pencil Layer

Internal the layers are enumerated. So here you move by number.

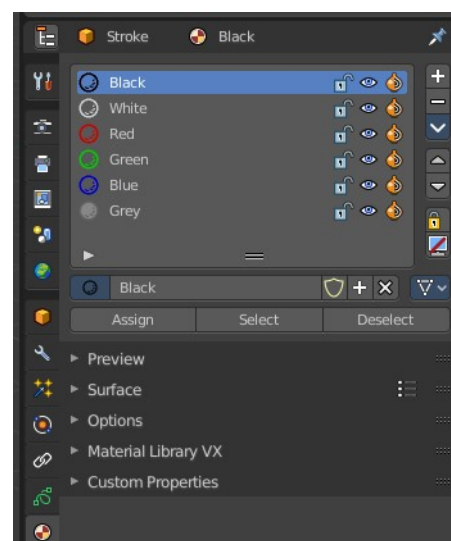

The number of a layer can be found out in the tool tip, in the Python part of it.

## Assign Material

Assign a new material to the current selected stroke geometry.

The materials can be found and edited in the Properties editor. Here you can also create new materials.

## Last Operator Change Stroke Color

### Material

The materials are defined by its name. So when you want to use another material, then change the name here.

## Set as active material

Sets the current selected material as the active material.

## Arrange

Changes the drawing order of the strokes in the 2D layer.

## Bring Forward

Moves the selected points/strokes upper the next one in the drawing order.

## Send Backward

Moves the selected points/strokes below the previous one in the drawing order.

## Bring to Front

Moves to the top the selected points/strokes.

## Send to Back

Moves to the bottom the selected points/strokes.

## Last Operator Arrange Stroke

### Direction

Choose the method again.

## Mirror submenu

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap submenu

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Duplicate

Duplicates the current selection.

When you duplicate a selection, then it sticks to the mouse until you left click. And moves around. A right click repositions the duplicated geometry at its original location.

## Last Operator Duplicate

### Mode

Not to find out. No tool tip, no entry in the Blender manual. Good Job Blender Developers.

### Move X, Y, Z

Adjust the position.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Copy

Copies the selection.

---

## Paste

Pastes a copied selection to active layer. You can have more than one layer.

## Paste by Layer

Pastes a copied selection to same, original layer. You can have more than one layer.

## Last operator Paste Strokes

### Type

Choose between the paste methods again.

## Merge

Allows you to paint a new stroke between the selected vertices. The selected points are not merged though, but a new stroke is created.

### Last Operator Merge Strokes

#### **Mode**

Choose between stroke or point mode.

This feature is not documented in the Blender manual, there is no explanation in the tool tip, and it is not to find out what the difference is. Both do the same.

#### **Draw on back**

Draw the new stroke below all other strokes.

#### **Additive drawing**

Add to previous drawing

#### **Cyclic**

Close the new stroke

#### **Dissolve Points**

Dissolve the old selected points.

#### **Delete Strokes**

Deletes the old selected strokes.

---

## Merge by Distance

Merges vertices that are close to each other.

### Last Operator *Clean Loose Points*

#### **Threshold**

The distance.

#### **Unselected**

Merge also unselected geometry.

---

## Join

Join selected strokes by connecting points.

## Last Operator Join Strokes

### Type

Join or Join and Copy.

### Leave Gaps

Don't connect the strokes by geometry.

---

## Split

Splits the selection.

---

## Separate

Separates the selection into a new grease pencil object.

## Last Operator Separate Strokes

### Mode

#### Active Layer

Separate all the strokes at the current active layer.

#### Selected Strokes

Separate the whole stroke of the current selection.

#### Selected Points

Separate the selected points with its edges.

---

## Delete Points

Delete selected stroke points.

## Last Operator Delete

### Type

Choose what you want to delete.

---

## Dissolve

Dissolve is a union operation. Two edges becomes one edge by removing the vertice

in between.

## Dissolve

Dissolves the selection.

## Dissolve Between

Dissolves the vertices between the selected vertices.

## Dissolve Unselect

Dissolves the vertices that are not selected.

## *Last Operator Dissolve*

### Type

Choose how you want to dissolve.

## Reproject Strokes

Re projects the selected stroke points in the selected view method.

## Last Operator Re project Strokes

### *Projection Type*

Choose the method again.

## Show/Hide

### Show All Layers

Shows all invisible layers again.

## *Adjust Last Operator Show all Layers*

### Select

Select the geometry.

### Hide active Layer

Hide the active layer.

### Hide inactive Layer

Hide the inactive layers.

## ***Adjust Last Operator Hide Layer(s)***

### **Unselected**

Hide the unselected layers instead of the selected layer.

## 7.0.13 Editors - 3D Viewport - Grease Pencil object - Sculpt Mode - Brushes context menu

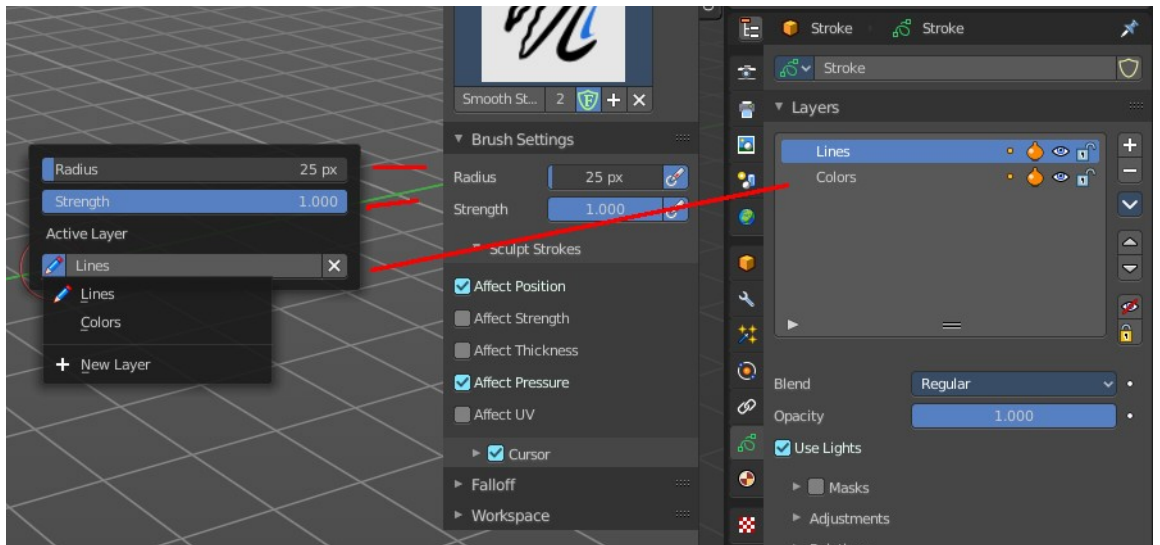

### Table of content

Edit Mode - Brushes Context Menu.....	1
Radius.....	1
Strength.....	1
Active Layer.....	1
Layer drop down box.....	2
New Layer.....	2
Layer Edit Box.....	2
Remove Layer.....	2

### Edit Mode - Brushes Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Sculpt mode with a grease pencil object.

In Sculpt mode you will call a context menu with the sliders from the Brush settings.

### Radius

The radius of the sculpt brush.

### Strength

The strength of the sculpt brush.

### Active Layer

The active grease pencil layer. You can choose another layer, and add new layers here too. It is the same content

than in the Properties editor.

## **Layer drop down box**

The list of available layers.

### ***New Layer***

Add a new grease pencil layer.

## **Layer Edit Box**

The currently active grease pencil layer. Rename it by clicking into the field.

## **Remove Layer**

Remove the grease pencil layer.

## Draw Mode - Brushes Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Draw mode with a grease pencil object.

In Draw mode you will call a context menu with the sliders from the Brush settings.

### Radius

The radius of the sculpt brush.

## Strength

The strength of the sculpt brush.

## Active Layer

The active grease pencil layer. You can choose another layer, and add new layers here too. It is the same content than in the Properties editor.

## Layer drop down box

The list of available layers.

## New Layer

Add a new grease pencil layer.

## Layer Edit Box

The currently active grease pencil layer. Rename it by clicking into the field.

## Remove Layer

Remove the grease pencil layer.

---

## Show/Hide Dropdown

Sub-menu with shows or hide all layers, active layers or inactive layers operators.

## Show All Layers

Makes all layers in the grease pencil object visible again.

## Hide Active Layer

Hides the active grease pencil layer.

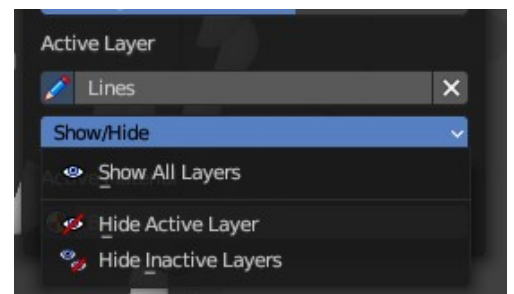

## Last Operator Hide Layer(s)

### Unselected

Hides the not selected geometry.

## Hide Inactive Layers

Hides the not selected grease pencil layer. The selected layer stays visible.

---

## Active Material

The current active material.

## **Material drop down box**

The list of available materials.

## **Material Edit Box**

The currently active material. Rename it by clicking into the field.

# 7.0.15 Editors - 3D Viewport - Grease Pencil object - Vertex Paint Mode - Brushes context menu

## Vertex Paint Mode - Brushes Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Vertex Paint mode with a grease pencil object.

In Vertex Paint mode you will call a context menu with the sliders from the Brush settings.

## Color dialog

Define the color for your brush.

Up left is the active color. Change the color in the color dialog.

## Mode

The stroke mode. What the vertex color affects. Stroke, Fill, or both.

## Radius

The radius of the sculpt brush.

## Strength

The strength of the sculpt brush.

## Active Layer

The active grease pencil layer. You can choose another layer, and add new layers here too. It is the same content than in the Properties editor.

## Layer drop down box

The list of available layers.

### *New Layer*

Add a new grease pencil layer.

## Layer Edit Box

The currently active grease pencil layer. Rename it by clicking into the field.

## Remove Layer

Remove the grease pencil layer.

---

## Show/Hide Dropdown

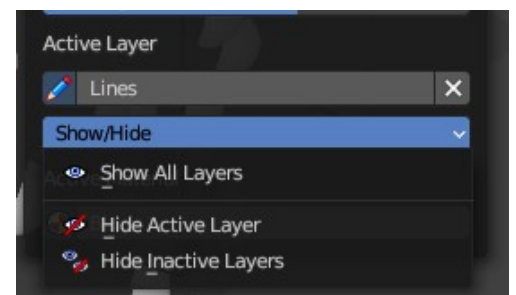

Sub-menu with shows or hide all layers, active layers or inactive layers operators.

### Show All Layers

Makes all layers in the grease pencil object visible again.

### Hide Active Layer

Hides the active grease pencil layer.

## ***Last Operator Hide Layer(s)***

### **Unselected**

Hides the not selected geometry.

## **Hide Inactive Layers**

Hides the not selected grease pencil layer. The selected layer stays visible.

## Weight Paint Mode - Brushes Context Menu

Call this menu with right click in the 3D viewport. You need to be in Weight Paint mode with a grease pencil object.

In Weight Paint mode you will call a context menu with the sliders from the Brush settings.

### Weight

The vertex weight to paint to.

### Direction

Add or subtract the brush stroke.

## **Radius**

The radius of the sculpt brush.

## **Strength**

The strength of the sculpt brush.

## **Active Layer**

The active grease pencil layer. You can choose another layer, and add new layers here too. It is the same content than in the Properties editor.

## **Layer drop down box**

The list of available layers.

## ***New Layer***

Add a new grease pencil layer.

## **Layer Edit Box**

The currently active grease pencil layer. Rename it by clicking into the field.

## **Remove Layer**

Remove the grease pencil layer.

## Edit Mode - Armature Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a armature object.

### Subdivide

Subdivide subdivides the current selection.

### Last Operator Subdivide Multi

#### Number of Cuts

Adjust the number of subdivisions.

### Duplicate

Duplicates selected bones.

You are automatically in grab mode, and so you can easily move the object out of position. Which is sometimes wanted, since you can position the duplicate then. But sometimes this is unwanted. A right click after releasing the mouse lets the object snap back into its creation position.

When you drag the duplicate around you will see the position values in the header.

### Last Operator Duplicate

#### Duplicate Objects

#### Flip Names

Tries to flip the names of the bones. This is a name convention feature. When you have a bone called mybone.R, then it tries to become mybone.L

#### Move X , Y , Z

The Position of the duplicated object.

#### Orientation

Orientation is a drop-down box choose the type of orientation for the duplicate action.

## Proportional editing

This checkbox has no use here. You cannot activate it.

---

## Extrude

Extrudes out a bone from the selected joints.

## Last Operator Extrude

### Forked

You need to tick X Axis Mirror. When you tick Forked, then the bone that you extrude to the one side will now be extruded to the other side too. The extrude gets mirrored along the x axis. This allows you to create a symmetrical armature.

### Move X , Y, Z

The transform values for the new created joint(s)

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Proportional editing

Proportional editing is dysfunctional. You cannot activate it.

## Fill between Joints

Fill between joints fills a bone between two selected joints.

When there is just one joint selected, then the bone is created between this selected joint and the 3D cursor.

## Mirror

Mirror mirrors the selected geometry along the defined axis.

### Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

### X Global, Y Global etc.

Mirrors the selection around the chosen axis.

### Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Switch Direction

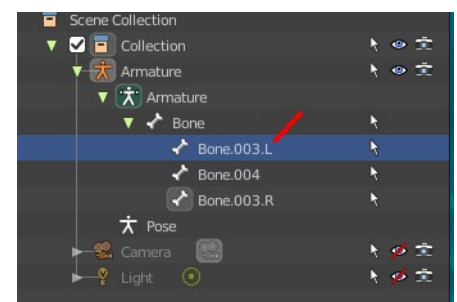

Switches the direction in which the selected bones are pointing.

## Symmetrize

Creates a symmetrical mirrored copy of the currently selected bones along the X axis. The mirror center is the pivot of the armature.

The bones that you want to symmetrize needs to follow the left right name conventions for bones. Bones without this left right naming are not affected by the tool. If there is a lower or upper case “L”, “R”, “left” or “right” with a separating dot in the bone name, then this tool creates and renames the bones names to its counter part. Bone.L becomes Bone.R.

## Last Operator Symmetrize

### Direction

Define the calculation direction. From -X to + X or from +X to -X

## Names

Bforartists has some internal name conventions for a symmetrical armature. Bones are for example named mybone.L or mybone.R, dependent at which side of the mirror axis they are. The Names items allows you to rename the bone names to this name convention.

### Autoname Left/Right

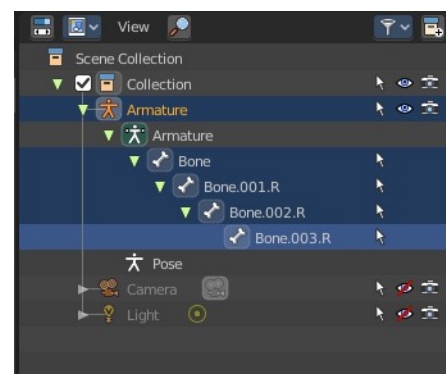

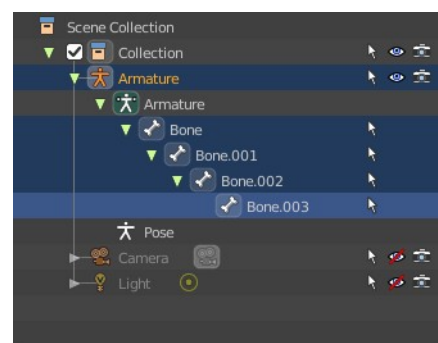

Renames the bones from left to right.

### Autoname Front/Back

Renames the bones from front to back.

### Autoname Top/Bottom

Renames the bones from top to bottom.

## Last operator Autoname by Axis

### Axis

Choose the autoname axis again. Left/Right is X axis, Front/Back is Y axis, and Top/Bottom is Z axis.

## Flip Names

When you mirror a half of an armature you end in names like Bone.001.R.001. But what we need is Bone.001.L for a symmetrical armature. Flip names flips the names to follow the left right name conventions.

## Last operator Autoname by Axis

### Strip Numbers

Tries to remove the numbers in the names if possible.

## Make Parent

Adds a parent relationship.

Select a bone, hold down shift, select the bone that you want to parent it to. Perform Make Parent. In the popup choose the method that you want to use.

### Connected

The child bone will jump to the position of the tail joint of the parent bone.

### Keep Offset

The bone will remain in its original position. The relationship will be displayed by a black dotted line.

### *Last Operator Make Parent*

#### Parent Type

Choose between Connected and Keep Offset method again.

## Clear Parent

Clears the parent relationship of the selected bone(s). It calls a popup menu choose between two methods.

### Clear Parent

Clears the parent relationship of the selected bone(s).

### Disconnect Bone

The parent-ship is kept. Turns a Connected parent relationship into a Keep Offset parent relationship. You can move the disconnected bone around without to pull the parent with it.

### *Last Operator Clear Parent*

#### Clear Type

Choose between Clear Parent and Disconnect Bone method again.

## Split

Split splits the selected bone(s) from connected bones. They are still part of the armature. But the bone is now floating. And you can pull this bone(s) around without pulling the rest of the armature around.

The Last operator for Split has no content.

---

## Separate

Separate separates the selected bone(s) from the armature. And creates a new, independent, armature.

The Last operator for Separate has no content.

---

## Move to Bone Collection

Armature and bones have their own collection system. This menu item opens a popup where you can put the selected bones into a New Collection or an existing Bone Collection.

## New Bone Collection

Assigns the selected bones to a new Bone Collection. This will prompt to name the new collection.

## Bone List

Assigns or unassigns the selected bones to or from the collection. The green + icon and red – icon show if you can remove or add a bone to the listed collection.

---

## Show/Hide

Sub-menu with shows or hide selection, unselected or hidden operators.

## Show Hidden

Makes all geometry in the scene visible again.

## Hide Selected

Hides the selected geometry.

## *Last Operator Hide Selected*

## Unselected

Hides the not selected geometry.

## Hide Unselected

Hides the not selected geometry. The selected geometry stays visible.

---

## Dissolve selected bones

Merges the selected bone or joint with its hierarchical neighbor bones.

## Delete selected bones

Deletes the selected bones. The hierarchy is kept. The involved bones becomes disconnected.

## Pose Mode - Pose Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with an armature object.

### Insert Key frame

Opens a menu where you can insert a key frame with a defined keying set.

### Copy Pose

Copies the current pose. You copy what you have selected.

### Paste Pose

Pastes a previous copied pose.

### Paste X Flipped Pose

Pastes a previous copied pose, but flipped along X axis.

### Last Operator Paste Pose

#### *Flipped on X Axis*

Paste the pose flipped along X Axis.

## ***On Selected Only***

Paste just on the selected bones. Not on the unselected.

## **Rename active Bone**

Calls a dialog where you can rename the active bone.

---

## **“Push Pose from Breakdown**

Exaggerates the current pose. Pushes the current pose further away from the previous pose.

## **Last Operator Push Pose**

### ***Percentage***

The percentage of exaggeration.

### ***Previous Key frame***

The key frame position before the current frame.

### ***Next Key frame***

The key frame position after the current frame.

### ***Channels***

Limit the push effect to specific channels.

### ***Axis Lock***

Limit the push effect to specific axis.

---

## **Relax Pose to Breakdown**

Relaxes the current pose.

## **Last Operator Relax Pose to Breakdown**

### ***Percentage***

The percentage of relaxing.

## ***Previous Key frame***

The key frame position before the current frame.

## ***Next Key frame***

The key frame position after the current frame.

## ***Channels***

Limit the relax effect to specific channels.

## ***Axis Lock***

Limit the relax effect to specific axis.

## ***Pose Breakdowner***

Creates a suitable breakdowner pose on the current frame.

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Pose Breakdowner***

### ***Percentage***

The percentage of exaggeration.

### ***Previous Key frame***

The key frame position before the current frame.

### ***Next Key frame***

The key frame position after the current frame.

### ***Channels***

Limit the breakdowner pose to specific channels.

### ***Axis Lock***

Limit the breakdowner pose to specific axis.

## Blend to Neighbour

Blends the current pose with the neighbouring poses.

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending. Move the mouse to position the blend pose where you need it.

## Last Operator Blend to Neighbour

### **Factor**

The blend factor.

### **Previous Keyframe**

The keyframe to calculate from before the current position.

### **Next Keyframe**

The keyframe to calculate from after the current position.

### **Channels**

### **Axis Lock**

Lock the transformation along an axis.

## Calculate Motion Paths

Objects can be animated. Let's say you send them from a to b to c. The object will move to b, then to c. Some kind of a path. This path is not visible by default.

With motion paths you can calculate this path, and make it visible.

## ***Last Operator Calculate Object Path***

### **Start**

Defines the start frame of the calculation.

### **End**

Defines the end frame of the calculation.

### **Bake Location**

Where to draw the curve. At the head or at the tail of the bone(s)

---

## **Clear Motion Paths**

Clear remove the motion path from the object.

---

## **Update Armature Motion Paths**

Updates the motion paths for the armature object.

---

## **Move to Bone Collection**

Armature and bones have their own collection system. This menu item opens a popup where you can put the selected bones into a New Collection or an existing Bone Collection.

### **New Bone Collection**

Assigns the selected bones to a new Bone Collection. This will prompt to name the new collection.

### **Bone List**

Assigns or unassigns the selected bones to or from the collection. The green + icon and red – icon show if you can remove or add a bone to the listed collection.

---

## **Hide Selected**

Hides the selected bones.

## **Show Hidden**

Reveals the hidden bones.

---

## **Hide Unselected**

Makes all unselected bones hidden.

---

## **Clear User Transforms**

Resets Pose of selected bones back to key frame state.

## Edit Mode - Lattice Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a armature object.

### Mirror

Mirror mirrors the selected geometry along the defined axis.

### Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

### X Global, Y Global etc.

Mirrors the selection around the chosen axis.

### Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Flip

Flips the lattice object along the world axis X, Y or Z .

## Last Operator Flip (Distortion Free)

### Flip Axis

Flip the lattice object along the world axis X, Y or Z .

---

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

---

## Make Regular

Set the UVW control points by a uniform distance apart.

## Object Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Object mode.

The Object Context Menu appears in object mode with all object types. Even without any object in the scene.

The content of this menu differs. With a mesh object you have for example smoothing available too. And with a curve object the convert options.

## Object Context Menu - All objects

This content shows with all object types.

### Copy Objects

Copies the selected object(s).

### Paste Objects

Pastes copied object(s).

### Last Operator Paste Selection from Buffer

#### **Select**

Select pasted object(s).

#### **Active Collection**

Put the pasted objects into the active collection.

## Duplicate Objects

Duplicates selected objects. The copy is completely independent. All containing data gets duplicated too. And you can edit the object instances completely independent. then.

You are automatically in grab mode, and so you can easily move the object out of position. Which is sometimes wanted, since you can position the duplicate then. But sometimes this is unwanted. A right click after releasing the mouse lets the object snap back into its creation position.

When you drag the duplicate around you will see the position values in the header.

## Last Operator Duplicate

### Duplicate Objects

#### Linked

With this option ticked the duplication happens with linked data.

#### Move X, Y, Z

The Position of the duplicated object.

#### Orientation

Orientation is a drop-down box choose the type of orientation for the duplicate action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

#### Proportional Size

See and adjust the falloff radius.

#### Connected

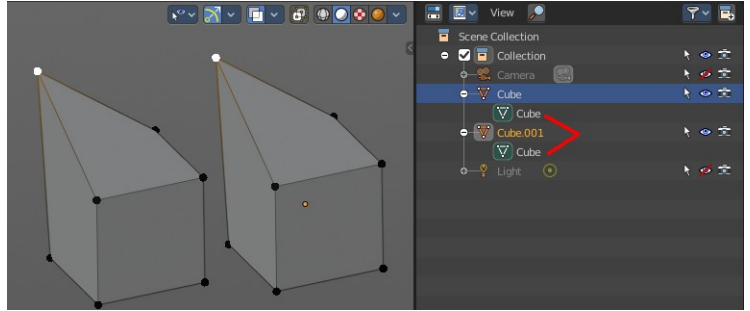

The proportional falloff gets calculated for connected parts only.

#### Projected(2D)

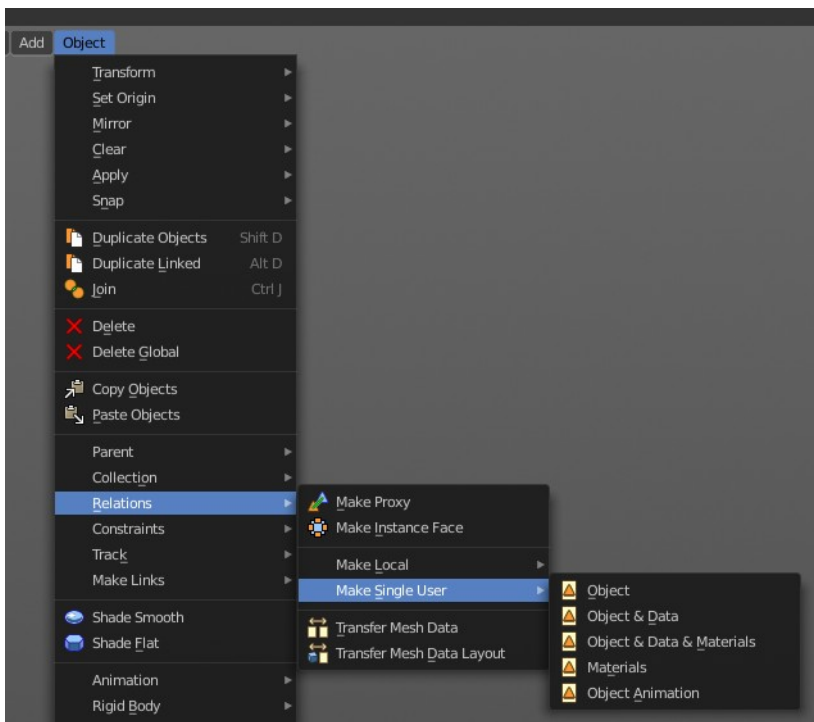

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Duplicate Linked

Duplicates selected objects. The instance has its own transforms. But the duplicate shares some data with the first instance. This means when you for example edit the mesh of one of the instances, then the other instance gets modified too. As you can see this in the screenshot. Here you can also see that the mesh name is the same. The object name is different though.

If you want to make changes to an object in the new linked duplicate independently of the original object, then you will have to manually make the object a “single-user”. This can be done for example in the Outliner, in the right click menu of the object. (Currently broken). Or in the Object menu. Choose what attached data you want to make single user.

When you duplicate an object, then you are automatically in grab mode. And so you can easily move the object out of position. which is sometimes wanted, since you can position the duplicate then. But sometimes this is unwanted. A right click after releasing the mouse lets the object snap back into its creation position.

Duplicate linked instances the object data.

Explanation: Each Bforartists object type (mesh, lamp, curve, camera *etc.*) is composed from two parts: an *Object* and *Object Data* (sometimes abbreviated to *ObData*):

**Object** - Holds information about the position, rotation and size of a particular element.

**Object Data** - Holds everything else. For example. Meshes stores geometry, material lists, vertex groups,

etc. . **Cameras stores focal length, depth of field, sensor size, etc. .**

Each object has a link to its associated object-data, and a single object-data, like a material, may be shared by many objects.

## Last Operator Duplicate Linked

### *Duplicate Objects*

#### **Linked**

With this option ticked the duplication happens with linked data.

#### *Move X, Y, Z*

The Position of the duplicated object.

#### *Orientation*

Orientation is a drop-down box choose the type of orientation for the duplicate action.

#### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

#### **Proportional Falloff**

Adjust the falloff methods.

#### **Proportional Size**

See and adjust the falloff radius.

#### **Connected**

The proportional falloff gets calculated for connected parts only.

#### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Rename active Item / Object

Allows you to rename the currently active item or object. A rename dialog will pop up where you can type in a new name for the current item. You can have more than one item selected. Just the active item gets renamed.

## Mirror

Mirrors the selection.

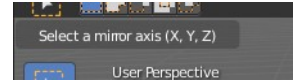

## Interactive Mirror

Mirrors the selection.

### Usage:

Activate the tool. In the header you will now see further instructions. Which is: type in the axis at which you want to mirror. Interactive mirroring starts in Global space. You can change the orientation in the last operator.

### X Y Z Global

Mirrors along the global axis.

### X Y Z Local

Mirrors along the object axis.

## Last Operator Mirror

### Orientation

Choose the orientation in which the transform should happen.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

### Selection to Cursor

Snaps the currently selected object(s) to the cursor location.

### Selection to Cursor(Keep Offset)

Snaps the currently selected object(s) to the cursor location, but keeps the offset of the selected objects to each other. Means the center of the current selection goes to cursor

position. Not every individual object.

## ***Last operator Snap Selection to Cursor***

### **Offset**

Keep the offset of the selected objects to each other.

### **Selection to Active**

Snaps the currently selected object(s) to the active object.

### **Selection to Grid**

Snaps the currently selected object(s) to the nearest grid point.

### **Cursor to Selected**

Moves the cursor to the center of the selected object(s).

### **Cursor to World Origin**

Moves the cursor to the world origin.

### **Cursor to Active**

Moves the cursor to the center of the active object.

### **Cursor to Grid**

Moves the cursor to the nearest grid point.

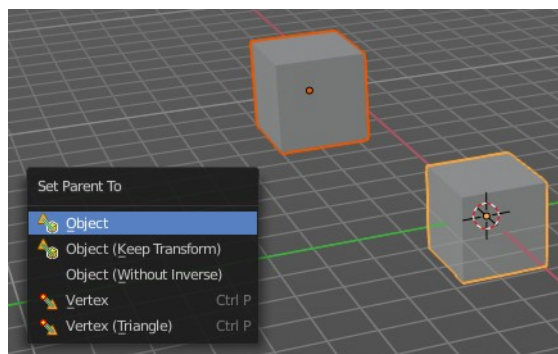

## **Parent**

The parent menu provides you with all parenting methods at object level.

To use parenting you first have to select the source object, hold down shift, then select the target object so that both are selected. This also works in the outliner (here you can also simply hold down shift and drag the source object at the target object to make it a child). The source object becomes the child object then.

The methods are object type dependent. The armature methods requires to have a mesh and an armature. The path methods a curve. The available methods for the current selection can also be found out by pressing the hotkey ctrl P. This calls the parenting menu with just the available methods.

## Object

Sets the parent to selected object.

## Object ( Keep Transform)

Sets the parent to selected object, but applies all transform before the operation.

---

Armature parenting creates an armature modifier at the mesh.

## Armature Deform

Sets the parent to selected Armature.

## With empty Groups

Sets the parent to selected Armature, using empty groups.

## With Envelope Weights

Sets the parent to selected Armature, using envelope weights

## With automatic Weights

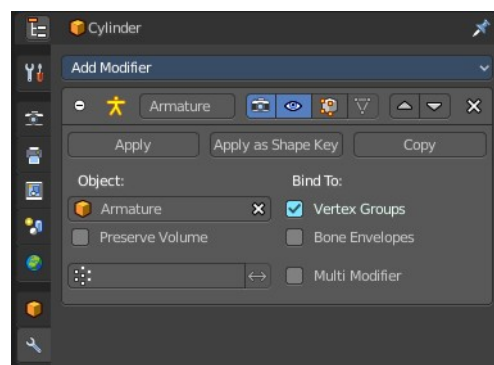

Sets the parent to selected Armature, with automatic weights.

## Bone

Sets the parent absolute to selected Bone.

## Bone Relative

Sets the parent relative to selected Bone.

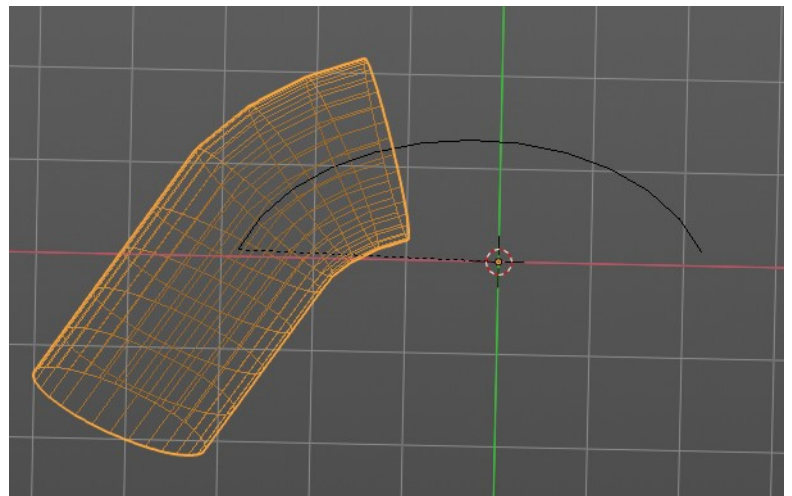

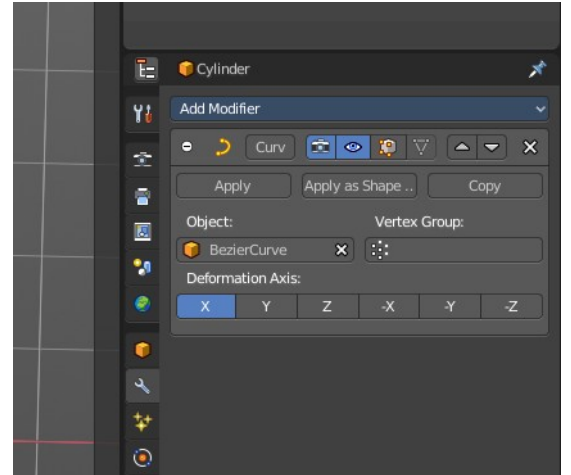

## Curve Deform

allows you to deform a mesh by a curve shape. It adds a curve modifier at the mesh.

Usage:

Create a curve. Bend it in edit mode to your needs. Create a mesh. I have for demonstration purposes created a cylinder with several subdivisions.

To demonstrate the only pitfall, by parenting the center of the object goes to the start point of the curve. So you better put the origin at the bottom of the cylinder before parenting.

## Follow Path

Attaches an object to a curve. The curve then gets used to animate the object position. Every vertice of the curve is one key frame.

Create a curve, create an object, hold down shift and select the curve, make parent ...

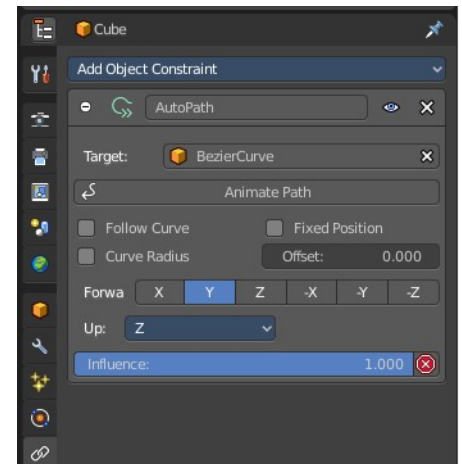

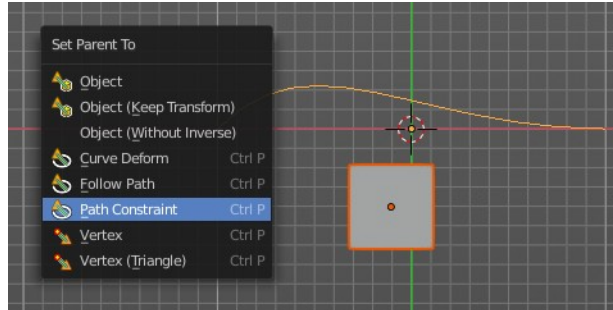

Take care of the position and rotation of the object before parenting it to the curve. It influences how the object behaves.

There is a constraint with the same name and functionality. But parenting with follow path will not create such a constraint.

## Path Constraint

Path constraint adds a AutoPath constraint at the mesh object, which is most probably a wrong labeled path constraint. It is not documented by the Blender developers.

Create a curve, create an object, hold down shift and select the curve, make parent ...

Take care of the position and rotation of the object before parenting it to the curve. It influences how the object behaves.

## Lattice Deform

Parents a lattice object to the object.

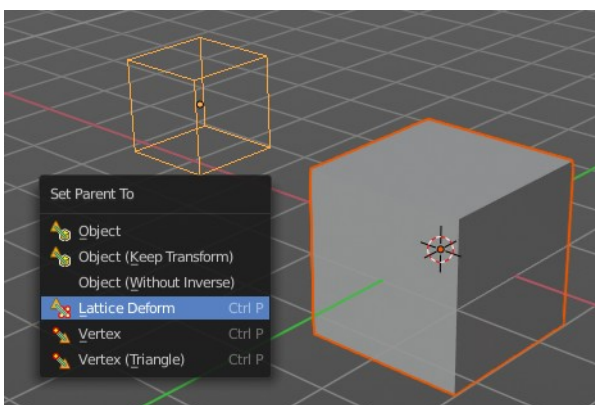

You need a lattice object and a mesh object. Lattice deformations just works with mesh objects.

Create a lattice, create an object, hold down shift and select the lattice, make parent ...

Parent the mesh object to the lattice object with method Lattice Deform. A Lattice Deform constraint will be added at the mesh object.

Take care of the position and size of the lattice object. It influences how the deformation works.

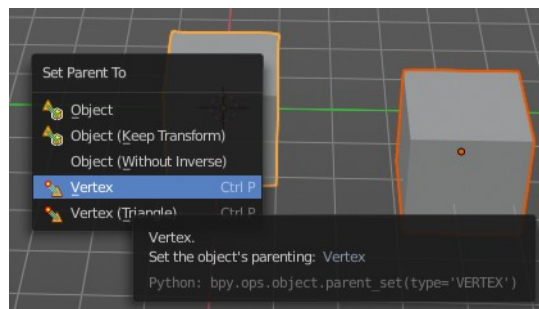

Enter Edit Mode with the lattice object. Deform it. The mesh object will follow the deformation.

## Vertex

Vertex parents the current object to a vertex of the target object. The vertex will be chosen automatically, it's the closest vertice of the parent object. When you want to assign the object to a specific vertice, then you have to do

The vertex parenting in Edit mode. You need to have an object type that has vertices. Mesh or curve.

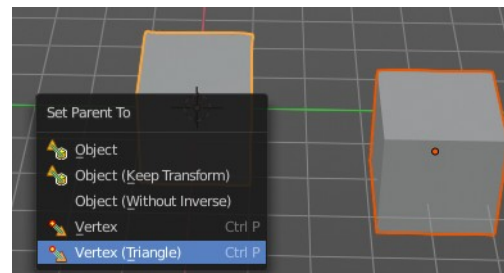

Create a mesh or curve object, create an object, hold down shift and select the mesh object, make parent ...

## Vertex (Triangle)

Vertex (Triangle) parents the current object to a face of the target object. The face will be chosen automatically.

It's the closest face of the parent object. When you want to assign the object to a specific face, then you have to

Do the vertex parenting in Edit mode. You need to have an object type that has vertices. Mesh or curve.

Create a mesh or curve object, create an object, hold down shift and select the mesh object, make parent ...

## Make Parent without Inverse

With normal parenting the child object keeps its world transformation.

Without inverse parenting the child object uses the coordinate system of the parent object. As one of the effects you will see that the child objects will jump to the origin of the parent object when parenting.

## Make Parent without Inverse (Keep Transform )

Set the object's parenting without setting the inverse parent connections and applies all transform before the operation. Without inverse parenting the child object uses the coordinate system of the parent object. By keeping the transform, the origin of the parent and child object stay in position.

## Object (Attach Curves to Surface)

Parent a Hair Curve to the surface of a new object.

## Last Operator Make Parent

### Type

Choose the make parent method again. This last operator counts for most of the parent actions.

### Keep Transform

Apply transform before parenting.

## Clear Parent

Clear Parent clears the parent relation completely, including involved modifiers.

### Clear and Keep Transformation

Clear Parent clears the parent relation completely, including involved modifiers.

But keeps the current visual transformation.

### Clear Parent Inverse

Clear Parent Inverse resets the transform corrections applied to the parenting relationship. It does not remove the parenting itself.

### Last Operator Clear Parent

Change the type of clearing.

## Move to Collection

Moves the selected object to a collection. The object is removed from the collection it was in.

By clicking at this menu item a popup will appear choose the new collection. Allows also to create a new collection. Once done, the object will be moved to this new created collection.

This operator can also be found in the Header Object menu.

## Last Operator Move to Collection

### Name

Set a name for your new collection. When you haven't created a new collection, then this name stays blank.

## Toggle Local View

Toggles local view isolating the selection in the viewport. You can find this operator in the Header View menu.

## Remove from Local

Removes the selection from the Local View keeping the unselected items in the viewport.

You can find this operator in the Header View menu.

**Note:** This is a conditional operator that only shows when the context of the 3D View editor is in the Local View mode.

## Insert Key frame

Calls the Insert Key frame menu

The keying set defines what kind of key frames gets recorded. When you start with an

animation, and your object does not have a keying set yet, then you will be prompted with a menu choose the proper keying set. The Insert Key frame menu.

Note that this just adds a keying set to the current key frame. And not to the whole object. That's why the keying set menu down right stays empty when you add a key frame. this way.

## Delete

Deletes the selected object(s).

## Show/Hide

Sub-menu with shows or hide selection, unselected or hidden operators.

## Show Hidden

Makes all geometry in the scene visible again.

## Hide Selected

Hides the selected geometry.

## Last Operator Hide Selected

### Unselected

Hides the not selected geometry.

## Hide Unselected

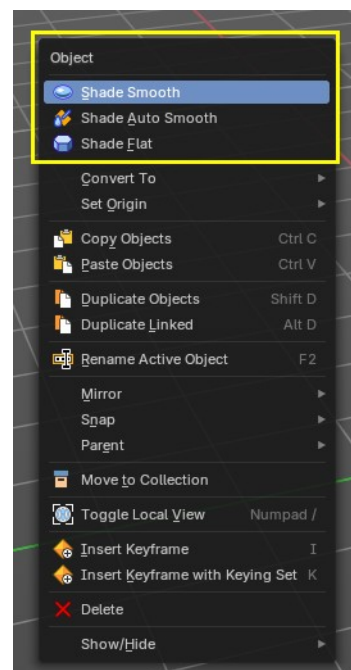

Hides the not selected geometry. The selected geometry stays visible.

# Mesh object

## Shade Smooth

Sets the shading for the object to smooth. Smooth means that the sharp edges are no longer seen.

## Shade Auto Smooth

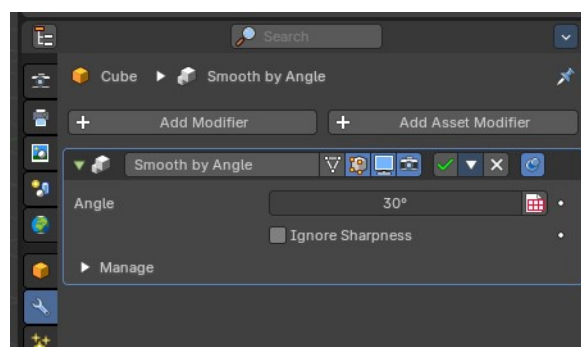

Sets the shading for the object to smooth with Autosmooth activated. Autosmooth means that sharp edges above an angle threshold will have sharp faceted faces, meanwhile angles under the threshold will be smooth.

## Last Operator Shade Smooth by angle

## Auto Smooth

Creates a auto smooth modifier for auto smoothing in the modifier stack. Where you can adjust the settings at any further step. Else it applies the current auto smooth to the mesh normals.

## Angle

Maximum angle between face normals that will be considered as smooth.

## Shade Flat

Sets the shading for the object to flat. Flat means that every face of the object shows faceted, with a sharp edge.

---

## Convert to

### Curve

Converts a selected Mesh or Text Object to a Curve Object.

### Mesh

Converts a selected object to a Mesh Object.

### Grease Pencil

Converts a selected curve to a grease pencil stroke.

### Point Cloud

Converts a selected object to a point cloud object.

## Last Operator Convert to

### Target

Target is a drop-down box that allows you to choose the convert method again.

### Keep Original

With this option ticked the original object gets kept. And a new object gets created.

---

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

## Origin to 3D cursor

Sets the origin to the 3D cursor.

## Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

## Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

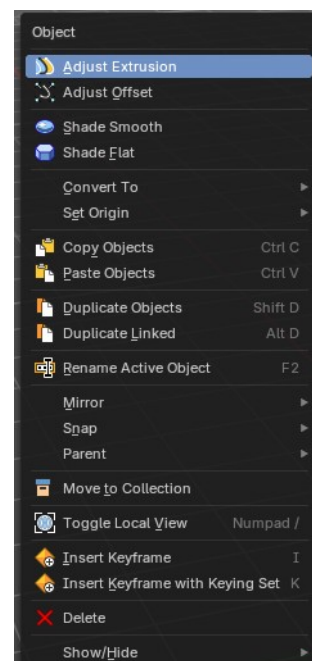

### *Type*

Choose the method again.

### *Center*

Use the median center or the bounds center for calculation.

## Curve object

## Adjust Extrusion

Extrudes a surface out of a curve or text object.

In the header you can see the height of the extrusion. In the Transform panel in the sidebar you can adjust this height also afterwards. The Z value.

## Adjust Offset

Adjust Offset is just of interest when you have an extruded surface at the curve. It scales the surface size in x and z direction.

## Shade Smooth

Sets the shading for the object to smooth. Smooth means that the sharp edges are no longer seen.

## Shade Flat

Sets the shading for the object to flat. Flat means that every face of the object shows faceted, with a sharp edge.

## Convert to

### Curve

Converts a selected Mesh or Text Object to a Curve Object.

### Mesh

Converts a selected object to a Mesh Object.

### Grease Pencil

Converts a selected curve to a grease pencil stroke.

### Point Cloud

Converts a selected object to a point cloud object.

## Last Operator Convert to

### Target

Target is a drop-down box that allows you to choose the convert method again.

### Keep Original

With this option ticked the original object gets kept. And a new object gets created.

---

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

### Type

Choose the method again.

### Center

Use the median center or the bounds center for calculation.

## Surface object

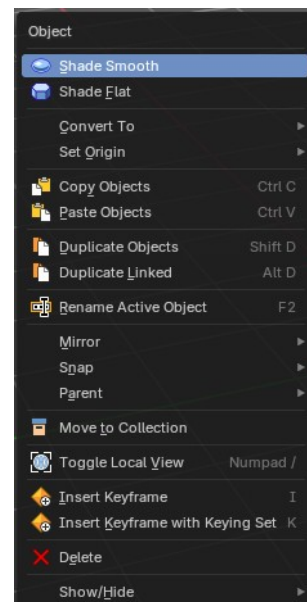

## Shade Smooth

Sets the shading for the object to smooth. Smooth means that the sharp edges are no longer seen.

## Shade Flat

Sets the shading for the object to flat. Flat means that every face of the object shows faceted, with a sharp edge.

## Convert to

### Curve

Converts a selected Mesh or Text Object to a Curve Object.

### Mesh

Converts a selected object to a Mesh Object.

### Grease Pencil

Converts a selected curve to a grease pencil stroke.

### Point Cloud

Converts a selected object to a point cloud object.

## Last Operator Convert to

### Target

Target is a drop-down box that allows you to choose the convert method again.

### Keep Original

With this option ticked the original object gets kept. And a new object gets created.

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

### Type

Choose the method again.

### Center

Use the median center or the bounds center for calculation.

## Metaball object

## Convert to

### Curve

Converts a selected Mesh or Text Object to a Curve Object.

### Mesh

Converts a selected object to a Mesh Object.

### Grease Pencil

Converts a selected curve to a grease pencil stroke.

### Point Cloud

Converts a selected object to a point cloud object.

## Last Operator Convert to

### Target

Target is a drop-down box that allows you to choose the convert method again.

### Keep Original

With this option ticked the original object gets kept. And a new object gets created.

---

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

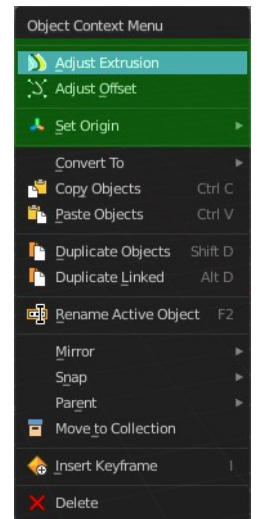

### Type

Choose the method again.

### Center

Use the median center or the bounds center for calculation.

## Text object

## Adjust Extrusion

Extrudes a surface out of a curve or text object.

In the header you can see the height of the extrusion. In the Transform panel in the sidebar you can adjust this height also afterwards. The Z value.

## Adjust Offset

Width size is just of interest when you have an extruded surface at the curve. It scales the surface size in x and z direction.

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

## Origin to Geometry

Sets the origin to geometry.

## Origin to 3D cursor

Sets the origin to the 3D cursor.

## Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

## Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

### Type

Choose the method again.

### Center

Use the median center or the bounds center for calculation.

## Volume object

Just default settings.

## Grease Pencil object

### Convert to

#### Path

Converts a grease pencil stroke to a path.

#### Bezier Curve

Converts a grease pencil stroke to a bezier curve.

#### Polygon Curve

Converts a grease pencil stroke to a polygon curve.

### Last Operator Convert Grease Pencil

#### Type

Type is a drop-down box that allows you to choose the convert method again.

#### Bevel Depth

A curve can have a extruded geometry with bevel. Adjust the bevel depth.

#### Bevel Resolution

A curve can have a extruded geometry with bevel. Adjust the bevel resolution.

#### Normalize Weight

Normalize the weight, set from stroke width.

## **Radius Factor**

Multiplier for the points radii, set from stroke width.

## **Link Stroke**

Link strokes with zero radius sections of curves.

---

## **Set Origin**

### **Geometry to Origin**

Sets the geometry to origin.

### **Origin to Geometry**

Sets the origin to geometry.

### **Origin to 3D cursor**

Sets the origin to the 3D cursor.

### **Origin to Center of Mass(Surface)**

Sets the origin to the center of mass, calculating it from the center of the surface area.

### **Origin to Center of Mass(Volume)**

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## **Last Operator Set Origin**

The last operator is the same for all set origin methods.

### **Type**

Choose the method again.

### **Center**

Use the median center or the bounds center for calculation.

# Armature

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

### Last Operator Set Origin

The last operator is the same for all set origin methods.

#### **Type**

Choose the method again.

#### **Center**

Use the median center or the bounds center for calculation.

# Lattice

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

### Type

Choose the method again.

### Center

Use the median center or the bounds center for calculation.

## Empty + Image object

The Image object types is a special kind of an empty. So they have the same entry in the context menu.

### Adjust Empty Display Size

Scale the size of the empty in the viewport.

Note, this value does not show elsewhere. And there is no way to reset it to the default size except to scale it again with Empty Draw Size. The value in the header will help you.

## Speaker object

Just default settings.

## Camera object

### Adjust Focal Length

Changes the focal length of the camera. You can adjust it afterwards in the properties editor.

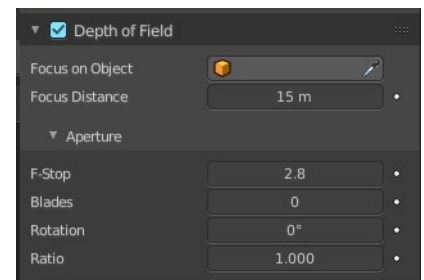

Camera Lens Scale: 6.690

### Adjust Focus Distance

Changes the focus distance for depth of field. You can adjust it afterwards in the properties editor. The values in the depth of field are not as exact as the dof distance values though.

Focus Distance: 7.820

## Object specific - Light object

There are four different light types. Each light type has its own settings. Power is the same in all. When you adjust the values then you will see a string with the values in the header.

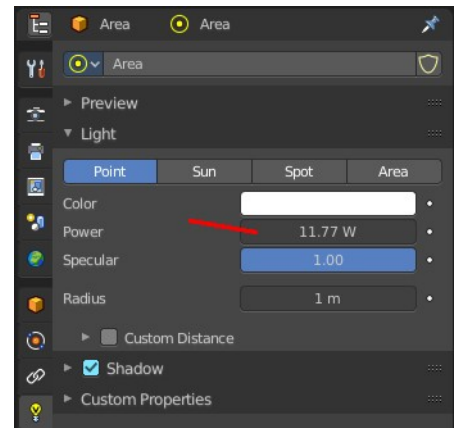

## Point light

### Adjust Light Power

Adjust the power of the light. The light power setting is in the properties editor in the light panel in the object data properties tab.

Light Energy: 11.770

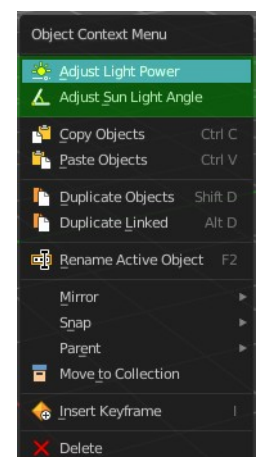

### Adjust Light Radius

Adjust the radius of the point light.

Light Radius: 1.620

## Sun light

## Adjust Light Power

Adjust the power of the light. The light power setting is in the properties editor in the light panel in the object data properties tab.

Light Energy: 11.770

## Adjust Sun Light Angle

Adjust the angle of the sun light.

Light Angle: 0.319

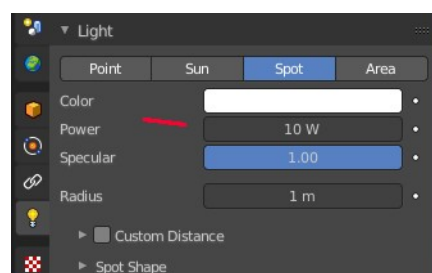

## Spot light

## Adjust Light Power

Adjust the power of the light. The light power setting is in the properties editor in the light panel in the object data properties tab.

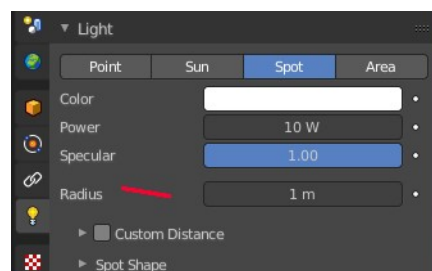

Light Energy: 11.770

## Adjust Light Radius

Adjust the radius of the light.

Light Radius: 1.620

## Adjust Spot Light Size

Adjust the angle of the spotlight beam. Note that the value in the header is in radians, while the value in the panel is in degrees.

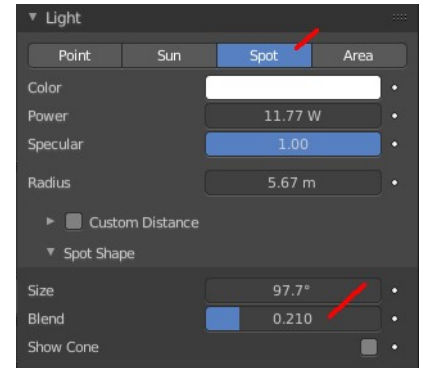

Spot Size: 1.63

## Adjust Spot Light Blend

Adjust softness of the spotlight edge.

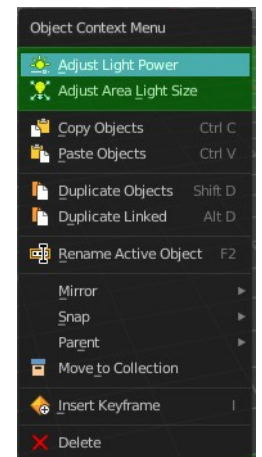

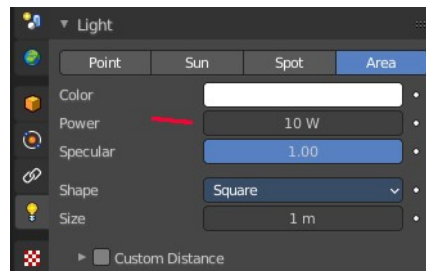

Spot Blend: 0.21

## Area light

### Adjust Light Power

Adjust the power of the light. The light power setting is in the properties editor in the light panel in the object data properties tab.

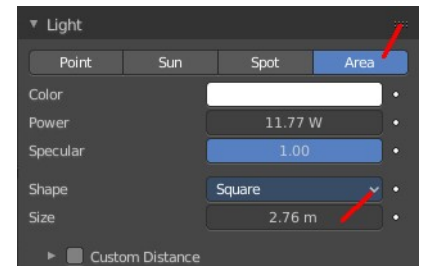

### Adjust Area Light Size

Area light only.

Scale the size of the area light. Size Y appears with Shape Rectangle.

Light Size X: 2.760

## Light Probe object

Just default settings.

## Force Field

The force field is displayed as an empty.

### Adjust Empty Display Size

Scale the size of the empty in the viewport.

Note, this value does not show elsewhere. And there is no way to reset it to the default size except to scale it again with Empty Draw Size. The value in the header will help you.

## Collection Instance

## Adjust Empty Display Size

Scale the size of the empty in the viewport.

Note, this value does not show elsewhere. And there is no way to reset it to the default size except to scale it again with Empty Draw Size. The value in the header will help you.

## Set Origin

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normal's.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

### Type

Choose the method again.

### Center

Use the median center or the bounds center for calculation.

# Vertex Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a Mesh object. And in selection mode Vertice to see all its content.

Select geometry to reveal all content.

## Subdivide

Subdivide divides the selected edges. It subdivides the involved faces too, and can create new vertices.

A more unknown functionality is that it can also randomize the result with the Fractal slider in the Last operator panel.

## Last Operator Subdivide

### Number of Cuts

The number of cuts defines the amount of subdivisions.

### Smoothness

This value defines how smooth the subdivision result is. From flat to bent.

### Create N-Gons

Create N-Gons if required. Else subdividing N-Gons creates Tris.

### Quad Corner Type

Adjust the corner type.

## ***Fractal***

Randomize the selected vertices.

## ***Along Normal***

When randomized, this value defines how strong the subdivision follows the normals of the initial vertices.

## ***Random Seed***

Randomizing value for fractal randomizing.

---

## **Extrude Vertices**

Extrudes out the selected vertices by moving the mouse.

### **Last Operator Extrude Only *Vertices* and Move**

#### ***Move X Y Z***

The coordinates for the extruded geometry.

#### ***Orientation***

Choose the type of orientation, in which coordinate system the action should happen.

#### ***Constraint Axis***

#### ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

#### ***Proportional Falloff***

Adjust the falloff methods.

#### ***Proportional Size***

See and adjust the falloff radius.

#### ***Connected***

The proportional falloff gets calculated for connected parts only.

#### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bevel Vertices

Adds a bevel at the selected vertices.

## Last Operator Bevel

### Offset

The Bevel amount. This text changes, dependent of the chosen width type.

### Width type

Which measure type to choose for the bevel action. Offset, Width, Depth or Percent.

### Vertex only

Bevel Vertices only.

### Clamp Overlap

Do not allow beveled geometry to overlap each other.

### Loop Slide

Prefer slide along edge to even widths.

### Mark Seams

Mark the edges of the new created geometry as seams.

### Mark Sharp

Mark the edges of the new created geometry sharp.

### Harden Normals

When enabled, the per-vertex face normals of the bevel faces are adjusted to match the surrounding faces, and the normals of the surrounding faces are not affected. This will keep the surrounding faces flat (if they were before), with the bevel faces shading smoothly into them. For this effect to work, custom split normals need to be enabled, which requires Auto Smooth to be enabled (see Normals). As a convenience, that option will be enabled for you if it is not already when you enable Harden Normals here.

### Segments

How many segments gets created.

## **Profile**

Controls the Profile shape. 0.5 means round.

## **Material**

Material for beveled faces. -1 is the surrounding material.

## **Miter Type**

### **Outer Miter**

How the outer miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Patch**

This replaces the outside vertex of a miter with 3 vertices. And uses a patch pattern there.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

### **Inner Miter**

How the inner miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

### **Spread**

Belongs to inner miter method Arc. Adjust how strong the inner radius is bent.

## Face Strength Mode

Set Face Strength on the faces involved in the bevel, according to the specified mode. This can be used in conjunction with a Weight Normals Modifier (with the Face Influence option checked).

### None

Do not set face strength.

### New

Set the face strength of new faces along edges to Medium, and the face strength of new faces at vertices to Weak.

### Affected

In addition to those set for the New case, also set the faces adjacent to new faces to have strength Strong.

### All

In addition to those set for the Affected option, also set all the rest of the faces of the model to have strength Strong.

## Intersection type

The method to use to create meshes at intersections. Bevel can create self intersecting geometry.

## Make Edge/Face

Adds a face when you have edges selected. And Edges when you have Vertices selected. It's a Bridge tool.

You can have either the one method or the other. When you select two adjacent vertices, then you select the edge too. And the tool works in edge mode then. In this case just the possible faces gets created. Not edges between single vertices.

First select the edges or Vertices that you want to bridge. Then click the New Edge/Face from Vertices Button.

## Connect Vertex Path

Connect Vertex path connects selected vertices, but takes the vertex order into account in which you selected the vertices. It just creates edges between vertices that are not connected in this order.

## Connect Vertex Pair

Connect Vertex pair connects selected vertices and makes a face of the pairs.

---

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

### Last Operator Push/Pull

#### *Factor*

Adjust the strength of influence of the tool.

#### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

#### **Proportional Falloff**

Adjust the falloff methods.

#### **Proportional Size**

See and adjust the falloff radius.

#### **Connected**

The proportional falloff gets calculated for connected parts only.

#### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Shrink/Fatten

Shrink/Fatten scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

## Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

### Offset

Offset is the strength of the offset for Shrink/Fatten.

### Offset Even

Offset Even scales the selection to give more thickness in even areas.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Shear

Shear shears the selection.

## Last Operator Shear

### Offset

Adjust an offset.

### Shear Axis

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

### **Axis**

Defines one axis of the imaginary shear axis plane.

### **Axis Ortho**

Defines the other axis of the imaginary shear axis plane.

### **Orientation**

Choose the orientation for the shear action.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Randomize Vertices**

This tool allows randomizes the positions of the selected vertices.

### **Last Operator Randomize**

#### **Amount**

Adjust the amount.

#### **Uniform**

The uniform offset distance.

#### **Normal**

Align the offset direction to the normals.

## Random Seed

The seed value for randomization.

---

## Smooth Laplacian

Laplacian Smooth Vertex smooths out the angles between the selected vertices. It is a tool to reduce noise at the mesh. It works a bit different than the normal Smooth Vertex tool. And gives a different result. The Laplacian method allows you to preserve the volume, and to adjust border smoothing.

### Last Operator Laplacian Smooth Vertex

#### Number of Iterations

Number of Iterations is the number of iterations that the smoothing action gets repeated. With 1 the smoothing is just performed once. With 10 it is performed ten times.

#### Lambda Factor

Lambda Factor is the strength of the smoothing.

#### Lambda Factor in border

Lambda Factor is the strength of the smoothing in border areas.

#### Smooth Axis

The Smooth Axis check boxes allows you to limit the smoothing to specific world axis.

#### Preserve Volume

Preserve Volume preserves the volume of the object.

---

## Snap Vertices

Choose several methods to snap one element to another. The menu items should be self explaining.

### Last Operator Snap

Some snap operations shows a last operation panel, some not.

#### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

---

## Mirror Vertices

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Vertex Crease

When you use a Subdivision Surface Modifier, then you can define the sharpness of selected vertices with this tool. Crease vertices will be marked colored in edit mode.

You will see a value in the header that indicates the current strength when you activate the tool. Move with the mouse to increase or decrease the value. Or type in a value while you are in this mode. You can also scale into negative range.

A negative crease value will subtract from the current active crease value in case it exists already from a former crease operation. A Crease value of -1 removes the crease from this edge.

## Last Operator Vertex Crease

### Factor

Adjust the crease factor.

## Merge Vertices

Merges the geometry.

### At Center, At Cursor, Collapse

Merges the geometry with the given methods.

## Last Operator Merge

### Type

Choose the merge method again.

### UV's

Move the UV's according to the merge.

## By Distance

Merge the vertices by their distance to each other. This tool is meant to remove double vertices at the same location.

## Last Operator Merge by Distance

### Merge Distance

Adjust the distance below which the vertices gets merged.

Merge selected vertices to unselected vertices.

## Split

Splits the edges between the selected vertices. It creates two edges out of one. And splits the edge by that.

## Separate

Separate separates the selected geometry, and creates a new object. The

geometry becomes uneditable, since it is now a new object. You will have to leave the Edit mode, select the new object, and re-enter Edit mode when you want to edit it.

## Selection

Selection separates the current selection.

## By Material

By Material separates all geometry that has the same material than the current selection.

## By Loose Parts

By Loose parts separates all geometry that is connected by edges to the current selection.

---

## Dissolve Vertices

Dissolve Vertices dissolves the selected Vertices.

Note that pressing DEL in Vertice select mode calls Dissolve Vertices already. It's the same operator. But you don't get the Last operator that way.

## Last Operator Dissolve Vertices

### *Face Split*

Split off Face corners to maintain surrounding geometry

### *Tear Boundary*

Split off Face corners instead of merging faces.

---

## Delete Vertices

Deletes the selected vertices.

## Edge Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a Mesh object. And in selection mode Edge.

Select geometry to reveal all content.

## Subdivide

Subdivide divides the selected edges. It subdivides the involved faces too, and can create new vertices.

A more unknown functionality is that it can also randomize the result with the Fractal slider in the Last operator panel.

## Last Operator Subdivide

### Number of Cuts

The number of cuts defines the amount of subdivisions.

### Smoothness

This value defines how smooth the subdivision result is. From flat to bent.

## Create N-Gons

Create N-Gons if required. Else subdividing N-Gons creates Tris.

## Quad Corner Type

Adjust the corner type.

## Fractal

Randomize the selected vertices.

## Along Normal

When randomized, this value defines how strong the subdivision follows the normals of the initial vertices.

## Random Seed

Randomizing value for fractal randomizing.

## Extrude Edges

Extrudes out the selected edges by moving the mouse.

## Last Operator Extrude Only Edges and Move

### Flip Normals

Flip the normals at the involved faces.

### Move X Y Z

The coordinates for the extruded geometry.

### Orientation

Choose the type of orientation, in which coordinate system the action should happen.

### Constraint Axis

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bevel Edges

Adds a bevel at the selected edges.

## Last Operator Bevel

### Offset

The Bevel amount. This text changes, dependent of the chosen width type.

### Width type

Which measure type to choose for the bevel action. Offset, Width, Depth or Percent.

### Vertex only

Bevel Vertices only.

### Clamp Overlap

Do not allow beveled geometry to overlap each other.

### Loop Slide

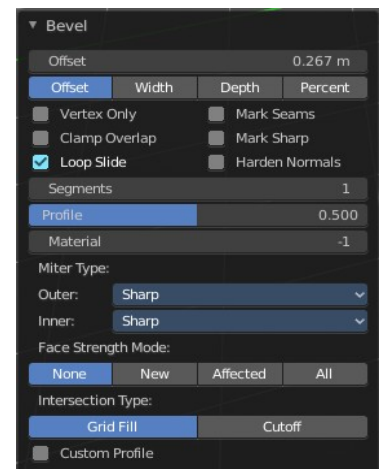

Prefer slide along edge to even widths.

### Mark Seams

Mark the edges of the new created geometry as seams.

### Mark Sharp

Mark the edges of the new created geometry sharp.

## ***Harden Normals***

When enabled, the per-vertex face normals of the bevel faces are adjusted to match the surrounding faces, and the normals of the surrounding faces are not affected. This will keep the surrounding faces flat (if they were before), with the bevel faces shading smoothly into them. For this effect to work, custom split normals need to be enabled, which requires Auto Smooth to be enabled (see Normals). As a convenience, that option will be enabled for you if it is not already when you enable Harden Normals here.

## ***Segments***

How many segments gets created.

## ***Profile***

Controls the Profile shape. 0.5 means round.

## ***Material***

Material for beveled faces. -1 is the surrounding material.

## ***Miter Type***

### ***Outer Miter***

How the outer miter is set. Miter is how the bevel rounding at a corner is done.

#### ***Sharp***

Creates a sharp miter.

#### ***Patch***

This replaces the outside vertex of a miter with 3 vertices. And uses a patch pattern there.

#### ***Arc***

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

### ***Inner Miter***

How the inner miter is set. Miter is how the bevel rounding at a corner is done.

#### ***Sharp***

Creates a sharp miter.

#### ***Arc***

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## ***Spread***

Belongs to inner miter method Arc. Adjust how strong the inner radius is bent.

## ***Face Strength Mode***

Set Face Strength on the faces involved in the bevel, according to the specified mode. This can be used in conjunction with a Weight Normals Modifier (with the Face Influence option checked).

### **None**

Do not set face strength.

### **New**

Set the face strength of new faces along edges to Medium, and the face strength of new faces at vertices to Weak.

### **Affected**

In addition to those set for the New case, also set the faces adjacent to new faces to have strength Strong.

### **All**

In addition to those set for the Affected option, also set all the rest of the faces of the model to have strength Strong.

## ***Intersection type***

The method to use to create meshes at intersections. Bevel can create self intersecting geometry.

## **Make Edge/Face**

Adds a face when you have edges selected. And Edges when you have Vertices selected. It's a Bridge tool.

You can have either the one method or the other. When you select two adjacent vertices, then you select the edge too. And the tool works in edge mode then. In this case just the possible faces gets created. Not edges between single vertices.

First select the edges or Vertices that you want to bridge. Then click the New Edge/Face from Vertices Button.

## Bridge Edge loops

The Bridge edge loops tool bridges selected edges, and adds a polygon between them. You need to have at least two edges selected.

## Last Operator Bridge Edge loops

### **Connect Loops**

Choose the method how to deal with bridging multiple loops.

### **Merge**

With merge ticked it will not create a bridge face, but merge the selected edges.

### **Merge Factor**

The merge factor determines at which distance between the selected edges the merge happens. 0.5 is the middle of the selected edges.

### **Twist**

The twist offset for closed loops.

### **Number of Cuts**

Adds cuts to the bridge face.

### **Interpolation**

Choose the interpolation mode for the cuts.

### **Smoothness**

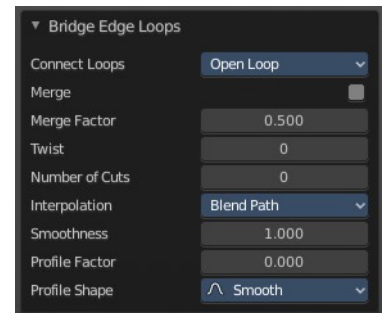

Adjust the smoothness for the cuts.

### **Profile Factor**

Adjust the profile factor for the cuts.

### **Profile shape**

Adjust the profile shape for the cuts.

---

## Fill

Fill closes holes in the selected mesh geometry, and triangulates the faces.

## Last Operator Fill

### **Beauty**

Uses the best possible triangulation.

## Loop Cut and Slide

Loop Cut and Slide adds edge loops to divide faces

When you click once, then this edge gets created. When you click and hold, then you can move this edge to a new location.

Loop cut and Slide ignores selections. It will try to divide the face under the mouse, and continue the loop until it is closed, or until it cannot continue.

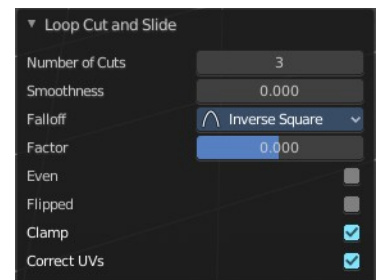

## Last Operator Loop Cut and Slide

Note that all settings here just changes the latest added loop. Not all added loops in the current session.

### **Number of Cuts**

The number of cuts that gets added. It can be more than one loop at once.

### **Smoothness**

This value defines how smooth the loop cut gets added. From flat to bent.

### **Falloff**

Adjust the Falloff type for smoothness.

### **Factor**

Change the center of the added loop.

### **Even**

Make the edge loop match the shape of the adjacent edge loop

### **Flipped**

When Even mode is active, flips between the two adjacent edge loops.

## ***Clamp***

Clamp within the edge extend.

## ***Correct UV's***

Corrects the UV's when modifying the geometry.

## **Offset Edge Slide**

Adds left and right an edge from the selected edge and slides it outwards.

## **Last Operator Offset Edge Slide**

### ***Cap Endpoint***

Connects the endpoints of the slided edges.

### ***Factor***

The amount of sliding.

### ***Even***

Make the edge loop match the shape of the adjacent edge loop

### ***Flipped***

Connected with Even. When even mode is active then flips between the two adjacent edge loops.

### ***Clamp***

Clamp within the edge extends.

### ***Correct UV's***

Correct UV coordinates when transforming.

---

## **Knife Topology**

The Knife tool cuts the geometry, and adds edges. When it crosses existing

geometry then it adds a vertice at the crossing point.

Usage: activate the tool, left click to define the starting point. This can also be a point in the middle of a face. But ideally you choose an existing vertice or an edge as the start and endpoints. The knife tool tries to snap to them when you get close with the mouse cursor.

When done press Enter or Space bar to confirm. Right click abandons the operation.

When you create a vertice in the middle of a face, then the knife tool will try to connect this vertice by an existing vertice of this face when you confirm with space bar.

### **Hotkey functionality in the footer text**

Have a look at the footer when you work with this tool. Here you will find further instructions and hotkeys.

Enter, Pad Enter, Space bar - confirm

Esc key, RMB - cancel the operation

LMB start the cut

Double LMB - close the cut

E - create new cut

Ctrl or Shift while dragging - Snap to the middle of an edge

Z - cut through the whole geometry, also the back faces.

MMB - pan the view.

Alt MMB - rotate the view.

---

## **Rotate Edge CW**

Rotate Edge rotates the selected edge clockwise.

## **Last Operator Rotate Selected Edge**

### **Counter Clockwise**

Rotate selected edges counter clockwise.

---

## **Edge Split**

Splits selected edges so that each neighbor face gets its own copy. You have two methods here.

## Last Operator Edge Split

### Type

Choose the method again.

## Edge Crease

When you use a Subdivision Surface Modifier, then you can define the sharpness of selected edges with this tool. Crease edges will be marked colored in edit mode.

You will see a value in the header that indicates the current strength when you activate the tool. Move with the mouse to increase or decrease the value. Or type in a value while you are in this mode. You can also scale into negative range.

A negative crease value will subtract from the current active crease value in case it exists already from a former crease operation. A Crease value of -1 removes the crease from this edge.

Crease: -0.150

## Last Operator Edge Crease

### Factor

Adjust the crease factor.

## Edge Bevel Weight

This tool adjusts the edge bevel weight for selected edges when you use the Bevel modifier at the mesh.

You need to have set the limit method to Weight. This way you can achieve a bevel weight for every individual selected edge if you want, and achieve different bevel strengths at the mesh.

You will see a value in the header that indicates the current strength when you activate the tool. Move with the mouse to increase or decrease the value. Or type in a value while you are in this mode. You can also scale into negative range.

A negative Edge Bevel Weight value will subtract from the current active crease value in case it exists already from a former crease operation. An Edge Bevel Weight value of -1 removes the weight from this edge.

Bevel Weight: -0.329

## Last Operator Edge Bevel Weight

### **Factor**

Adjust the Edge Bevel Weight factor.

## Mark Sharp

Mark Sharp is a tool that you need for the Edge Split modifier. Marked edges are displayed and rendered as sharp edges.

## Last Operator Mark Sharp

### **Vertices**

Calculate by the selected vertices instead of edges to mark the edges.

## Clear Sharp

Clears formerly as sharp marked selected edges.

## Last Operator Mark Sharp

### **Vertices**

Calculate by the selected vertices instead of edges to mark the edges.

## Mark Freestyle Edge

Mark the selected edges as a Freestyle feature edges.

## Clear Freestyle Edge

Clears formerly as freestyle feature edges marked edges.

## Un-Subdivide

Decimates the geometry by trying to make one quad out of four quads. But can also end in Tris where this is not possible.

### Last Operator Un-Subdivide

#### Iterations

Number of iterations. This means how deep the calculation should go. One level of SDS, two levels, three levels, etc. . Down to the point where you cannot decimate any geometry anymore.

## Split

Splits the edges between the selected vertices. It creates two edges out of one. And splits the edge by that.

## Separate submenu

Separate separates the selected geometry, and creates a new object. The geometry becomes uneditable, since it is now a new object. You will have to leave the Edit mode, select the new object, and re-enter Edit mode when you want to edit it.

### Selection

Selection separates the current selection.

### By Material

By Material separates all geometry that has the same material than the current selection.

### By Loose Parts

By Loose parts separates all geometry that is connected by edges to the current selection.

## Dissolve Vertices

Dissolve Vertices dissolves the selected Vertices.

Note that pressing DEL in Vertice select mode calls Dissolve Vertices already. It's the same operator. But you don't get the Last operator that way.

### Last Operator Dissolve Vertices

#### Face Split

Split off Face corners to maintain surrounding geometry

## ***Tear Boundary***

Split off Face corners instead of merging faces.

---

## **Dissolve**

Dissolves the selected edges, which unions the involved faces to one.

---

## **Delete Edges**

Deletes the selected Edges.

---

## **Show/Hide**

Sub-menu with shows or hide selection, unselected or hidden operators.

## **Show Hidden**

Makes all geometry in the scene visible again.

## **Hide Selected**

Hides the selected geometry.

## ***Last Operator Hide Selected***

### **Unselected**

Hides the not selected geometry.

### **Hide Unselected**

Hides the not selected geometry. The selected geometry stays visible.

# Face Context Menu

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a Mesh object. And in selection mode Edge.

Select geometry to reveal all content.

## Subdivide

Subdivide divides the selected edges. It subdivides the involved faces too, and can create new vertices.

A more unknown functionality is that it can also randomize the result with the Fractal slider in the Last operator panel.

## Last Operator Subdivide

### Number of Cuts

The number of cuts defines the amount of subdivisions.

### Smoothness

This value defines how smooth the subdivision result is. From flat to bent.

### Create N-Gons

Create N-Gons if required. Else subdividing N-Gons creates Tris.

### Quad Corner Type

Adjust the corner type.

## **Fractal**

Randomize the selected vertices.

## **Along Normal**

When randomized, this value defines how strong the subdivision follows the normals of the initial vertices.

## **Random Seed**

Randomizing value for fractal randomizing.

# **Extrude Faces**

Extrudes out the selected faces into the face direction by moving the mouse. When it's more than one face, then the middle will be used.

## **Last Operator Extrude Region and Move**

### **Flip Normals**

Flips the normals of the extruded faces.

### **Move X, Y Z**

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

### **Orientation**

The widget can have different orientations. The menu items should be self explaining.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extrude Along Normals**

Extrudes the selection along local normals.

Shrink/Fatten: 0.3453, (R or Alt) Even Thickness OFF

### **Header Value**

This tool works like a shrink fatten extrude. And so you will see a corresponding set of values in the header.

## **Last Operator Extrude Region and Shrink/Fatten**

### **Flip Normals**

Flips the normals of the extruded faces.

### **Offset**

The current extrude amount.

### **Offset Even**

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

## **Connected**

The proportional falloff gets calculated for connected parts only.

## **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extrude Individual**

Extrudes the selection along local normals of each individual face.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

Shrink/Fatten: 0.3453, (R or Alt) Even Thickness OFF

## **Header Value**

This tool works like a shrink fatten extrude. And so you will see a corresponding set of values in the header.

## **Last Operator Extrude *Individual Faces and Move***

### **Offset**

The current extrude amount.

### **Offset Even**

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

## **Connected**

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Inset Faces**

Inset insets edges into the selected faces. Think of it as an extrude inwards the face.

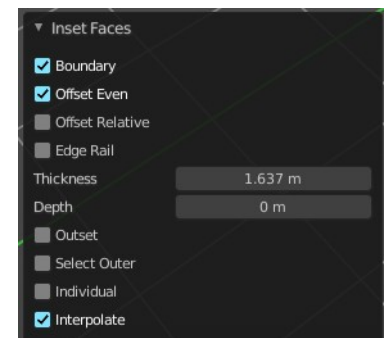

Activate the tool, drag the mouse. But carefully. The control is not the best. You better adjust the amount in the last operator.

## **Last Operator Inset Faces**

### ***Boundary***

With Boundary ticked you will get the connect edges in the corners. Without the edges ends straight.

### ***Offset Even***

Scales the offset to give more even thickness.

### ***Offset Relative***

Scales the offset by surrounding geometry.

### ***Edge Rail***

Inset the region along existing edges.

### ***Thickness***

Thickness adjusts the thickness of the inset geometry.

### ***Depth***

With depth you can bevel the inset geometry. It is then not longer co planar to the initial face.

### ***Outset***

With outset ticked the Inset will not extrude inwards but outwards.

## **Select Outer**

With Select Outer the outer ring will be selected after the Inset.

## **Individual**

Inset every face individually.

## **Interpolate**

Blend Face Data across the inset.

---

## **Bridge Faces**

The Bridge Faces tool bridges selected faces, and adds polygons between them. You need to have at least two faces selected.

This tool is basically the Bridge Edge Loops tool, just that it operates in Face mode.

Note that this tool just shows when you are in Face Select Mode.

## **Last Operator Bridge Edge loops**

### **Connect Loops**

Choose the method how to deal with bridging multiple loops.

### **Merge**

With merge ticked it will not create a bridge face, but merge the selected edges.

### **Merge Factor**

The merge factor determines at which distance between the selected edges the merge happens. 0.5 is the middle of the selected edges.

### **Twist**

The twist offset for closed loops.

### **Number of Cuts**

Adds cuts to the bridge face.

### **Interpolation**

Choose the interpolation mode for the cuts.

### **Smoothness**

Adjust the smoothness for the cuts.

### **Profile Factor**

Adjust the profile factor for the cuts.

## Profile shape

Adjust the profile shape for the cuts.

## Poke Faces

Splits the selected faces to create a triangulated geometry.

### Last Operator Poke Faces

#### Poke Offset

Normally the center vertice of the poke operation is planar with the rest. Adjust an offset.

#### Offset Relative

Scale the offset by surrounding geometry.

#### Poke Center

Poke Center is a drop-down box choose what the center of the poke operation should be. You can choose between weighted mean, mean and bounds.

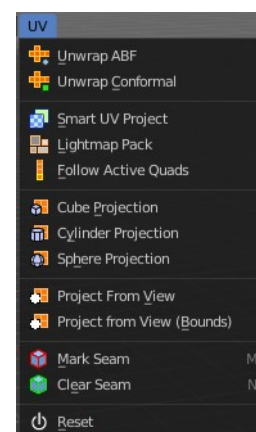

## UV Unwrap Faces submenu

The UV menu from the header.

Here you find the UV mapping methods and some further functionality. You use it best in the U Editing layout. There you can see the result in the UV Editor then.

The UV menu is just available for Mesh objects

## Unwrap ABF

Unwrap ABF unwraps the selected geometry with the method Angle based. ABF stands for Angle Based Flattening. ABF can give a bit better result than LSCM when unwrapping organic shapes.

## Unwrap Conformal

Unwrap Conformal unwraps the selected geometry with the method LSCM, which is the short for Least Square Conformal Mapping. LSCM can give a bit better results than ABF with geometric shapes.

## Last Operator Unwrap

Unwrap ABF and Unwrap LSCM shares the same Last Operator.

### **Method**

Method is a drop down box where you can choose between Unwrap method Angle Based and Conformal.

### **Fill Holes**

Fill holes in the mesh before unwrapping.

### **Correct Aspect**

Take the Image Aspect Ratio into account.

### **Use Subsurf Modifier**

Unwraps an existing Subsurf Modifier. You need to add a Subsurf Modifier first.

### **Margin**

The distance between the single UV patches.

## Smart UV Project

Smart UV Project projects the UV mapping from different angles.

### **Smart UV Project Settings dialogue**

#### **Angle Limit**

The Angle Limit defines after which angle the mapping happens from the next side. With an angle of 66 you have around six sides to map from. The calculation is  $360/66$ .

#### **Island Margin**

Island Margin defines the distance between the UV patches.

#### **Area Weight**

Weight Projection Vector by faces with larger areas.

#### **Correct Aspect**

Take the Image Aspect Ratio into account.

## Last Operator Smart UV Project

The Last Operator for Smart UV Project contains the same settings than the Smart UV Project Settings dialogue.

---

## Light map Pack

Light map Pack maps each face individually, and puts the result into the UV space. Without margin.

Light map Pack has no Last Operator.

### Settings

#### Selection

Selection is a drop-down box where you can choose what will be packed.

#### Share Tex Space

Map all objects into one light map.

#### New UV Map

Create a new UV map for every new mesh.

#### New Image

Assign new Image to every new mesh.

#### Image Size

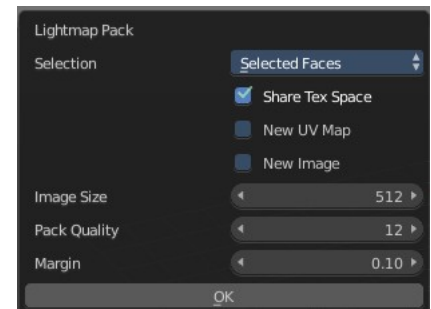

The size for new images.

#### Pack Quality

The pack quality.

#### Margin

The distance between the single UV patches.

---

## Follow Active Quads

Follow Active quads maps UV coordinates starting from an active face, and maps all adjacent faces in quad shape then. This way you can for example unwrap a pipe or a road. You first need to have a face selected. Then select everything. And then click at Follow Active Quads.

## Settings

### Edge Length Mode

Edge Length Mode is a drop-down box where you can choose the Length method.

### Last Operator Follow Active Quads

The Last Operator contains the same settings than the Settings dialogue.

## Cube Projection

Cube Projection maps the mesh from six sides, means cubic.

### Last Operator Cube Projection

#### Cube Size

Cube Size defines the size of the UV mesh in the UV space.

#### Correct Aspect

Take Image Aspect ratio into account.

#### Clip to Bounds

Clip UV Coordinates to bounds after unwrapping.

#### Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

## Cylinder Projection

Cylinder Projection tries to map the geometry cylindric.

### Last Operator Cylinder Projection

#### Direction

Direction is a drop-down box where you can choose in which direction the cylindric projection will be mapped.

#### Align

Align is a drop-down box where you can choose the Align method.

#### Radius

Radius defines the Polar size of the UV mesh in the UV space.

#### Correct Aspect

Take Image Aspect ratio into account.

## Clip to Bounds

Clip UV Coordinates to bounds after unwrapping.

## Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

---

## Sphere Projection

Sphere Projection tries to map the geometry spherical.

### *Last Operator Sphere Projection*

#### Direction

Direction is a drop-down box where you can choose in which direction the spherical projection will be mapped.

#### Align

Align is a drop-down box where you can choose the Align method.

#### Correct Aspect

Take Image Aspect ratio into account.

#### Clip to Bounds

Clip UV Coordinates to bounds after unwrapping.

#### Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

---

## Project from View

Project from View projects the UV from the current 3D view.

### *Last Operator Project from View*

#### Orthographic

User orthographic projection.

#### Camera Bounds

Map UV's to the camera region taking resolution and aspect into account.

#### Correct Aspect

Take Image Aspect ratio into account.

#### Clip to Bounds

Clip UV Coordinates to bounds after unwrapping.

## Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

---

## Project from View (Bounds)

Project from View projects the UV from the current 3D view.

Same as Project from View, but with Scale to Bounds ticked in the Last operator. And so it scales to the bounds.

---

## Mark Seam

The unwrap algorithms Angle based and Conformal requires to have edges marked as seams. Think of it as a cutting pattern for a trouser for example. Such a trouser is also made of fabric patterns.

Same goes for the UV patches when you use Angle based or conformal unwrapping. You need to cut your mesh into parts and mark edges as seams, so that the algorithm knows where the seams are.

Mark seam marks the currently selected edge(s) as a seam. Seam edges will be displayed as red in the 3D viewport.

---

## Clear Seam

Clear seam removes the seam from the currently selected edge(s).

---

## Reset

Resets the UV Projection.

---

## Triangulate Faces

Triangulate Faces triangulates the faces of the selected geometry.

## Last Operator Triangulate Faces

### *Quad Method*

Choose how quads should be triangulated.

### **Shortest diagonal**

Splits the quads based on their distance between vertices.

### Fixed Alternate

Splits the quads on the second and fourth vertice.

### Fixed

Splits the quads on the first and third vertice.

### Beauty

Tries to optimize the triangulation.

### Polygon Method

Choose how N-Gons should be triangulated.

### Clip

Splits the polygons with an ear clipping algorithm.

### Beauty

Tries to optimize the triangulation.

## Tris to Quads

Tris to quads tries to convert triangulated geometry back to a quad geometry by removing the edges inside of the quads.

### Last Operator Tris to Quads

#### Max Face Angle

Adjust the threshold to adjacent triangles.

#### Max Shape Angle

Adjust the shape angle limit.

#### Compare UV's

Takes the UV patches for the calculation into account. Border geometry will not be calculated.

#### Compare VCols

Takes the Vertex colors for the calculation into account. Border geometry will not be calculated.

#### Compare Seam

Takes the Vertex colors for the calculation into account. Border geometry will not be calculated.

#### Compare Sharp

Takes the as sharp marked edges for the calculation into account. Border geometry will not be calculated.

## Compare Materials

Takes the Materials colors for the calculation into account. Border geometry will not be calculated.

---

## Shade Smooth

Sets the shading for the object to smooth. Flat means that every face of the object shows facettet, with a sharp edge. Smooth means that the edges are not longer to see.

## Shade Flat

Sets the shading for the object to flat. Flat means that every face of the object shows facettet, with a sharp edge. Smooth means that the edges are not longer to see.

## Un-Subdivide

Decimates the geometry by trying to make one quad out of four quads. But can also end in Tris where this is not possible.

## Last Operator Un-Subdivide

### Iterations

Number of iterations. This means how deep the calculation should go. One level of SDS, two levels, three levels, etc. . Down to the point where you cannot decimate any geometry anymore.

## Split

Splits the edges between the selected vertices. It creates two edges out of one. And splits the edge by that.

---

## Separate submenu

Separate separates the selected geometry, and creates a new object. The geometry becomes uneditable, since it is now a new object. You will have to leave the Edit mode, select the new object, and re-enter Edit mode when you want to edit it.

## Selection

Selection separates the current selection.

## By Material

By Material separates all geometry that has the same material than the current selection.

## By Loose Parts

By Loose parts separates all geometry that is connected by edges to the current selection.

---

## Dissolve Faces

Dissolves the selected faces, which unions the involved faces to one.

## Last Operator Dissolve Vertices

### *Dissolve Verts*

Dissolve remaining vertices.

## Delete Faces

Deletes the selected faces.

### 7.0.5 Editors - 3D Viewport - Mesh Object - Sculpt Mode - Brushes context menus

## Brushes context menus

Call this menu with double right click in the 3D viewport. You need to be in Sculpt mode with a mesh object.

In Sculpt mode you will call a context menu with the sliders from the Brush settings. The content depends of the chosen brush. Every brush has different settings. We just cover the usual ones here. For the brush specific settings see the chapter Editors - 3D View - Tool Shelf - Mesh - Sculpt Mode

### Radius

The Radius edit box allows you to adjust the radius of the brush.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

## Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

---

## Strength

The Strength edit box allows you to adjust the strength of the brush.

## Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

## Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

---

## Auto smooth

The auto smooth edit box allows you to adjust the amount of smoothing that gets automatically applied to each stroke.

## Tablet Pressure

The button behind the edit box enables tablet pressure sensitivity for auto smooth.

---

## Plane Offset

Clay brush setting. Adjust the plane on which the brush acts towards or away from the objects surface. Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Distance

Adjust the plane trim distance.

---

## Height

Layer brush setting. The height that can be affected by the layer brush.

---

## Magnify

Magnify 0.500

Blob Brush setting. The Crease Brush Pinch Factor.

---

## Pinch

Pinch 0.500

Crease Brush setting. The Crease Brush Pinch Factor.

---

## Normal Weight

Normal Wei... 0.000

Various brushes like Grab or Elastic Deform. How much grab will pull vertexes out of surface during grab.

---

## Magnify

Magnify 0.500

Blob Brush setting. The Crease Brush Pinch Factor.

---

## Rake

Rake 1.000

Snake Hook brush setting. How much grab will follow cursor rotation.

## 7.0.6 Editors - 3D Viewport - Mesh Object - Vertex Paint Mode - Brushes context menus

### Table of content

Brushes context menus.....	1

## Brushes context menus

Call this menu with double right click in the 3D viewport. You need to be in Vertex Paint mode with a mesh object.

In Vertex Paint mode you will call a context menu with the sliders from the Brush settings and the color dialog.

### Color dialog

Define the color for your brush.

Up left is the active color. Change the color in the color dialog.

## Blend

Define how the stroke will blend. You can choose between various blend modes.

---

## Radius

The Radius edit box allows you to adjust the radius of the brush.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

### Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

---

## Strength

The Strength edit box allows you to adjust the strength of the brush.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

### Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## Brushes context menus

Call this menu with double right click in the 3D viewport. You need to be in Weight Paint mode with a mesh object.

In Weight Paint mode you will call a context menu with the sliders from the Brush settings.

### Weight

Adjust the strength of the weight painting.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

### Radius

The Radius edit box allows you to adjust the radius of the brush.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

## **Use Unified Radius**

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

---

## **Strength**

The Strength edit box allows you to adjust the strength of the brush.

## **Size Pressure**

The first button behind the edit box enables tablet pressure sensitivity for radius.

## **Use Unified Radius**

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## Curve context menus

Call this menu with double right click in the 3D viewport. You need to be in Edit mode with a Curve or a Surface object.

With a surface object some options are greyed out.

### Subdivide

Subdivides the selected curve geometry, and adds more control points.

### Last Operator Subdivide

#### Number of Cuts

Number of subdivision cuts.

### Extrude Curve

Extrudes the selected curve point(s).

### Last operator Extrude Curve and Move

## Mode

A drop-down box where you can choose between different extrude modes.

Default is Translation. Most other methods has no effect.

## Move X , Y , Z

The position of the extruded point(s).

## Orientation

Adjust the orientation of the extrusion. It usually starts with Normal.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Make Segment

Joins two curves by adding a segment between the end of the one and the beginning of the other. You can also create a closed curve that way.

---

## Duplicate

Duplicates the current selection. This can be a single control point or a whole curve.

The copy sticks to the mouse until you release it. A Right click while moving will reset the position of the duplicate. The duplicated part will be part of the same object.

When you drag the duplicate around you will see the position values in the header.

## Last Operator Duplicate

### *Move X , Y , Z*

### *Orientation*

Choose the orientation.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Radius

Scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

## Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

## **Offset**

Offset is the strength of the offset for Shrink/Fatten.

## **Offset Even**

Offset Even scales the selection to give more thickness in even areas.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

## **Proportional Falloff**

Adjust the falloff methods.

## **Proportional Size**

See and adjust the falloff radius.

## **Connected**

The proportional falloff gets calculated for connected parts only.

## **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Tilt**

Modifies the Mean Tilt.

Activate the tool, and drag the mouse. You will see a value in the header now. The selected curve path will rotate by dragging the mouse.

The Tilt angle always starts at zero. It is relative. To modify the Mean Tilt use the edit box in the Transform panel.

## **Last Operator Tilt**

### **Angle**

The Tilt angle.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

## **Proportional Falloff**

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Clear Tilt

Sets the Mean Tilt to zero.

---

## Smooth

Flattens the angles of the selected control point(s).

---

## Smooth Curve Tilt

Smooths the curve tilt of the selected control point(s).

---

## Smooth Curve Radius

Smooths the curve radius of the selected control point(s).

---

## Mirror

Mirror mirrors the selected geometry along the defined axis.

### Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

### X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

### Last Operator Snap

Some snap operations shows a last operation panel, some not.

### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Set Spline Type

With set Spline Type you can set the type of the curve.

Poly is a straight line between the control points. Bezier has curve handlers. A nurbs curve has a control cage.

## Last Operator Set Spline Type

### Type

Type is a drop-down box choose the spline type

### Handles

Use Handles when converting Bezier curves into polygons.

## Set Handle Type

Handles defines the type of handle for the knots of the curve. You have the choice between Auto, Vector, Align and Free. And the Last Operator gives you a fifth possibility to toggle between Free and Align.

### Auto

Auto aligns the handles automatically.

### Vector

Set Handle type to Vector.

### Align

Set Handle type to Align.

### Free

Set Handle type to Free.

### Toggle Free/Aligned

Toggle Free/Aligned.

## Last Operator Set Handle Type

### Type

Type is a drop-down box where you can set the handle type. You have the choice between Auto, Vector, Align,

Free. And the fifth possibility toggles between Free and Align.

---

## Toggle Cyclic

Toggle Cyclic closes or opens the curve.

### Last Operator Toggle Cyclic

#### *Direction*

Direction is a drop-down box choose the direction in which the curve gets closed.

---

## Switch Direction

Just for Bezier Curve object type. Surface Nurbs curves doesn't have a direction. Switches the direction in which the curve is pointing.

## Recalc Normals

Recalculates the normals of the selected curve.

### Last Operator Recalc Normals

#### *Length*

Recalculates the handle length too.

---

## Set Goal Weight

Sets the curve's Weight for the selected control point to the specified value. If more than one control point is selected this will set the Mean Weight.

## Set Curve Radius

Sets the curve radius for the selected curve point to the specified value.

## Split

Splits the curve at the selected control point(s). You need to select two control points to select the segment between it.

## Decimate Curve

Decimates the currently selected geometry. It starts with a Ratio of 1. Which means no decimation. The lower the ratio the more decimation you will get.

## Last Operator Decimate Curve

### *Ratio*

Adjust the strength of decimation.

## Separate

Separates the selected control points, and creates a new curve object out of it. You need to select two control points to select the segment between it.

## Dissolve Vertices

Dissolves the selected vertices. When removing vertices in between then the curve stays intact and connected.

## 1Delete Segment

Removes the segment between the selected vertices.

## Delete Point

Dissolves the selected vertices. When removing vertices in between then the curve stays intact and connected.

## Delete

Deletes the current selection.

---

## Show/Hide

Sub-menu with shows or hide selection, unselected or hidden operators.

## Show Hidden

Makes all geometry in the scene visible again.

## Hide Selected

Hides the selected geometry.

## *Last Operator Hide Selected*

## Unselected

Hides the not selected geometry.

## Hide Unselected

Hides the not selected geometry. The selected geometry stays visible.

# Edit Mode - Vertex Menu

The Vertex menu just exists for mesh objects. It provides you with tools that are designed to modify vertices.

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Bevel

The Bevel Tool adds a bevel to the selected geometry.

Usage: first select the geometry that you want to bevel. Then activate the tool. Don't wonder that the mouse movement does nothing until you move the mouse really really far away. That's by design. Best is to adjust the amount in the Last Operator Bevel panel.

### Last Operator Bevel

#### Affect

What geometry to bevel. Vertices or Edges.

#### Width type

Which measure type to choose for the bevel action. Offset, Width, Depth or Percent.

#### Segments

How many segments gets created.

#### Shape

Controls the profile shape strength. A value close to 0 bends the roundness to inside. A value towards 1 bends the curve to outside. A value of 0.5 defines a radius around the center point of the bevel.

## Material Index

The material for bevel faces. -1 means to use the material from the adjacent faces.

## Harden Normals

Match normals of new faces to adjacent faces.

## Clamp Overlap

Do not allow beveled geometry to overlap each other.

## Loop Slide

Prefer slide along edge to even widths.

## Mark Seams

Mark the edges of the new created geometry as seams.

## Mark Sharp

Mark the edges of the new created geometry sharp.

## Outer Miter

How the outer miter is set. Miter is how the bevel rounding at a corner is done.

### *Sharp*

Creates a sharp miter.

### *Patch*

This replaces the outside vertex of a miter with 3 vertices. And uses a patch pattern there.

### *Arc*

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## Inner Miter

How the inner miter is set. Miter is how the bevel rounding at a corner is done.

### *Sharp*

Creates a sharp miter.

### *Arc*

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## Spread

Belongs to inner miter method Arc. Adjust how strong the inner radius is bent.

## Intersections

The method to use to create meshes at intersections. Bevel can create self intersecting geometry.

## Face Strength Mode

Set Face Strength on the faces involved in the bevel, according to the specified mode. This can be used in conjunction with a Weight Normals Modifier (with the Face Influence option checked).

### **None**

Do not set face strength.

### **New**

Set the face strength of new faces along edges to Medium, and the face strength of new faces at vertices to Weak.

### **Affected**

In addition to those set for the New case, also set the faces adjacent to new faces to have strength Strong.

### **All**

In addition to those set for the Affected option, also set all the rest of the faces of the model to have strength Strong.

## Rip Vertices

Rip splits the edges between the selected vertices. It creates two edges out of one.

This tool works similar to the Edge Split tool. It also selects the outer edges so that you immediately move them. Right click will snap them back to the initial space.

## Last Operator Rip

### Move X , Y , Z

Adjust the position.

## Constraint Axis

Limit the position relative to the source object.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Rip Vertices and Fill

Rip splits the edges between the selected vertices. It creates two edges out of one. But fills the gap.

The last operator is the same than for the rip vertices tool above.

## Rip Vertices and Extend

This tool is the same tool than the Rip Edge tool from the tool shelf.

Rip Vertices and Extend extrudes out the selected vertices. When you do this operation at an edge then you will create N-Gons that way.

## Last Operator Extend Vertices

### Move X , Y , Z

Adjust the position.

## Constraint Axis

Limit the position relative to the source object.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Vertex Slide

Same tool than the Vertex Slide in the Tool Shelf. Vertex Slide slides the selected vertice along the edge that it is part of. This is for the corner vertice at a cube into three possible directions.

### **Last Operator Vertex Slide**

#### **Factor**

Factor is a sliding box Adjust the slide strength numerically. The width of the face is the 0-1 range.

#### **Even**

Make the Edge loop match the shape of the adjacent edge loop.

#### **Flipped**

When Even Mode is active, flips between the two adjacent edge loops.

#### **Clamp**

Clamp within the edge extend.

#### **Correct UV's**

Correct UV's corrects the UV's while editing the geometry.

## Smooth

Same tool than in the tool shelf. Smoothens the selected vertices.

### *Last Operator Smooth Vertices*

#### Smoothing

The smoothing factor.

#### Repeat

How often the smoothing should be applied.

#### X Axis, Y Axis, Z Axis

Which axis to affect.

---

## Extrude to Cursor or Add

Hotkey only tool. Extrude to the mouse position.

### *Last Operator Extrude to Cursor or Add*

#### Location X Y Z

The location to extrude to.

---

## Make Edge/Face

Adds a face when you have edges selected. And Edges when you have Vertices selected. It's a Bridge tool.

You can have either the one method or the other. When you select two adjacent vertices, then you select the edge too. And the tool works in edge mode then. In this case just the possible faces gets created. Not edges between single vertices.

First select the edges or Vertices that you want to bridge. Then click the New Edge/Face from Vertices Button.

## Connect Vertex Path

Connect Vertex path connects selected vertices, but takes the vertex order into account in which you selected the vertices. It just creates edges between vertices that are not connected in this order.

## Connect Vertex Pair

Connect Vertex pair connects selected vertices and makes a face of the pairs.

## Smooth Laplacian

Laplacian Smooth Vertex smooths out the angles between the selected vertices. It is a tool to reduce noise at the mesh. It works a bit different than the normal Smooth Vertex tool. And gives a different result. The Laplacian method allows you to preserve the volume, and to adjust border smoothing.

## Last Operator Laplacian Smooth Vertex

### ***Number of Iterations***

Number of Iterations is the number of iterations that the smoothing action gets repeated. With 1 the smoothing is just performed once. With 10 it is performed ten times.

### ***Lambda Factor***

Lambda Factor is the strength of the smoothing.

### ***Lambda Factor in border***

Lambda Factor is the strength of the smoothing in border areas.

### ***Smooth Axis***

The Smooth Axis check boxes allows you to limit the smoothing to specific world axis.

### ***Preserve Volume***

Preserve Volume preserves the volume of the object.

## Vertex Crease

When you use a Subdivision Surface Modifier, then you can define the sharpness of selected vertices with this tool. Crease vertices will be marked colored in edit mode.

You will see a value in the header that indicates the current strength when you activate the tool. Move with the mouse to increase or decrease the value. Or type in a value while you are in this mode. You can also scale into negative range.

A negative crease value will subtract from the current active crease value in case it exists already from a former crease operation. A Crease value of -1 removes the crease from this edge.

Crease: -0.150

## Last Operator Vertex Crease

### Factor

Adjust the crease factor.

## Blend from Shape

This tool requires to have a shape key at the mesh. It blends the selected shape key into the mesh.

### Last Operator Blend from Shape

#### Drop-down box

Define which shape key should be used.

#### Blend edit box

Adjust the blend factor between the current shape and the shape that you want to blend here.

#### Add

Add to blend shape instead of blending in.

## Propagate to Shapes

This tool requires to have a shape key at the mesh. It applies the current vertex locations for the selected vertices to all other shape keys at the mesh.

## Merge Vertices

Merge vertices together. When you pick a vertice, and add more vertices to the selection, then you get two more tools, to merge to the first or last vertice. When you box select, or use select all, then you get just the other three tools.

### At First

Merges the current selected vertices at the first selected vertice.

### At Last

Merges the current selected vertices at the last selected vertice.

### At Center

Merges the geometry at the center of the selected vertices.

### At Cursor

Merges the geometry at the 3D Cursor.

### Collapse

Merges the geometry at the center of the selected vertices.

### Last Operator Merge

#### Type

Type is the drop-down box again where you can choose what method to use for merge.

#### UV's

With UV's ticked the UV mapping will update with changes at the geometry.

## By Distance

Merges vertices that are very close to each other. The merge happens at the center. When you need more control then you should use the Merge Vertices tool.

### Last Operator Merge by Distance

#### Merge Distance

Adjust the distance in which the vertices gets merged.

#### Unselected

Merge selected vertices also with other unselected vertices.

## Vertex Groups

Vertex groups is a menu around vertex group functionality. The vertex groups can be found in the Object data tab in the Properties editor.

When there is no vertex group assigned yet then you can only see one menu item. The Assign To New Group button.

Once you have a vertex group assigned you will see the full functionality.

### Assign to New Group

Assigns the mesh selection to a new vertex group.

### Assign to active Group

Assigns the mesh selection to the currently active vertex group.

### Remove from Active Group

Removes the mesh selection from the currently active vertex group.

### Remove from All

Removes the mesh selection from all vertex groups.

### Set Active Group

Select a vertex group to be the active one.

### Remove Active Group

Removes the currently active vertex group.

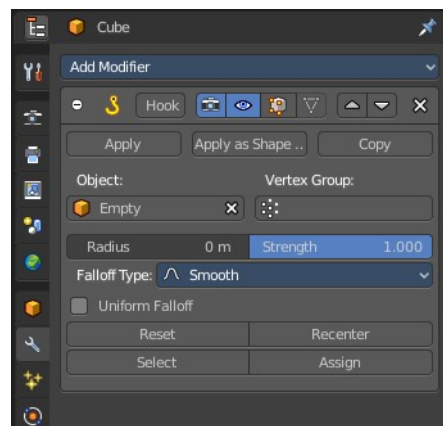

## Remove All Groups

Removes all vertex groups from the mesh.

---

## Hooks

Hooks is a menu with tools around the hook modifier. You could also adjust the hook modifier from the Properties editor. But the menu items are more accessible.

When there is no hook modifier at the mesh then you just see three menu items. When there is minimum one hook modifier applied, then you will see an extended menu.

## Hook to New Object

Creates a new Hook Modifier for the active object and assigns it to the selected vertices. It also creates an empty at the center of those vertices, which are hooked to it.

---

## Hook to Selected Object

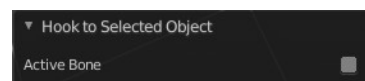

Does the same as *Hook to New Object*, but instead of hooking the vertices to a new empty, it hooks them to the selected object (if it exists). There should be only one selected object (besides the mesh being edited).

## Last Operator Hook to Selected Object

### Active Bone

Hook to the object(s) of the active bone.

---

## Hook to Selected Object Bone

Does the same as *Hook to New Object*. But it sets the last selected bone in the also selected armature as a target.

---

## Assign to Hook

Assign the selected vertices to the chosen hook modifier. Existing hooks gets overwritten. One vertex can be

assigned to more than one hook.

---

## **Remove Hook**

Removes the chosen Hook Modifier from the object.

---

## **Select Hook**

Selects all vertices assigned to the chosen Hook Modifier.

---

## **Reset Hook**

Resets the chosen Hook Modifier.

---

## **Recenter Hook**

Recenter the Hook Modifier.

---

## **Make Vertex Parent**

Parents another object to the selected vertice(s).

### **Workflow:**

In Object mode select the object that you want to parent to a vertex. Shift select the parent object so that both are selected. Enter Edit mode. Then select one vertex for a single point. Or three for an area. Then click the Make Vertex Parent button to make the relation.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to

call them again in case you want to repeat the tool.

## Bevel Edges

The Bevel Tool adds a bevel to the selected Edges.

Usage: first select the geometry that you want to bevel. Then activate the tool and drag the mouse. You need to drag quite a bit outwards until you see an effect. So don't wonder when the mouse movement seem to do nothing. You can also adjust the amount in the Last Operator Bevel panel afterwards.

In the header you can see further advice. And the current values for the bevel.

Enter/PadEnter/LMB: confirm, Esc/RMB: cancel, M: mode (Offset), A: width (0.172 m), S: segments (1), P: profile (0.500)

## Last Operator Bevel

### Width type

Width Type is a drop-down box choose the Amount type for the bevel action.

### Width

The Bevel amount.

### Segments

How many segments gets created

### Profile

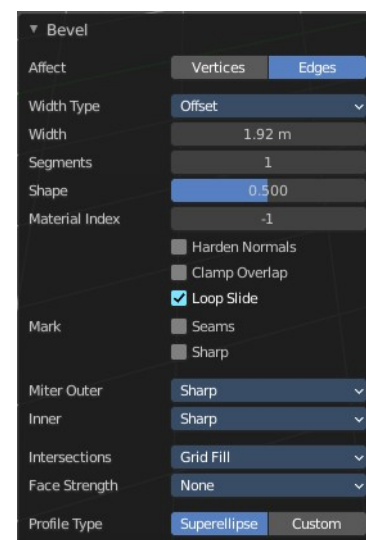

Controls the Profile shape. 0.5 means round.

### Vertex only

Bevel Vertices only.

### Clamp Overlap

Do not allow beveled geometry to overlap each other.

## Loop Slide

Prefer slide along edge to even widths.

## Mark Seams

Mark seams along the beveled edges.

## Mark Sharp

Mark the beveled edges sharp.

## Material

Material for beveled faces. -1 is the surrounding material.

## Harden Normals

Match the normals of the new faces to the adjacent faces.

## Face Strength Mode

Face Strength Mode can be used in conjunction with Weight Normals Modifier (with the 'Face Influence' option checked). Set if and how the face strength at creation gets set.

### **None**

Don't set face strength.

### **New**

Set the face strength of new faces along edges to Medium. And the face strength of new edges at vertices to Weak.

### **Affected**

In addition to those set for the New case, also set the faces adjacent to new faces to have strength Strong.

### **All**

In addition to those set for the Affected case, also set all the rest of the faces of the model to have strength Strong.

## Outer Miter

How the outer miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Patch**

This replaces the outside vertex of a miter with 3 vertices. And uses a patch pattern there.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## Inner Miter

How the inner miter is set. Miter is how the bevel rounding at a corner is done.

### Sharp

Creates a sharp miter.

### Arc

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

### Spread

Belongs to inner miter method Arc. Adjust how strong the inner radius is bent.

## Edge Slide

Same tool than in the tool shelf. Edge Slide slides the selected edge along the face that it is part of. This is for the edge at a cube into two possible directions.

This tool requires to have at least one edge selected.

### Header Values

The header values shows you the current transformation. But also hints towards a hotkey.

Holding down ALT will allow you to slide the edges behind the limits of the guide edge. Yellow infinite guide lines appears.

### Last Operator Edge Slide

#### Factor

Factor is a sliding box Adjust the slide strength numerically. The width of the face is the 0-1 range.

#### Even

Make the Edge loop match the shape of the adjacent edge loop.

## Flipped

When Even Mode is active, flips between the two adjacent edge loops.

## Clamp

Clamp within the edge extend.

## Correct UV's

Correct UV's corrects the UV's while editing the geometry.

## Offset Edge Slide

The tool is called Offset Edge Loop Cut in the tool shelf. Slides the selected edge(s).

Usage: select the edges that you want to slide. Click to confirm.

You can adjust the sliding amount in the Last Operator Offset Edge Slide.

## Last Operator Offset Edge Slide

### Cap Endpoint

Cap Endpoint caps the loose edges.

### Edge Slide Factor

Adjust the slide amount.

### Even

Make the edge loop match the shape of the adjacent edge loop

### Flipped

When Even mode is active, flips between the two adjacent edge loops.

### Clamp

Clamp within the edge extend.

### Correct UV's

Corrects the UV's when modifying the geometry.

## Bridge Edge loops

The Bridge edge loops tool bridges selected edges, and adds a polygon between them. You need to have at least two edges selected.

## Last Operator Bridge Edge loops

### **Connect Loops**

Choose the method how to deal with bridging multiple loops.

### **Merge**

With merge ticked it will not create a bridge face, but merge the selected edges.

### **Merge Factor**

The merge factor determines at which distance between the selected edges the merge happens. 0.5 is the middle of the selected edges.

### **Twist**

The twist offset for closed loops.

### **Number of Cuts**

Adds cuts to the bridge face.

### **Interpolation**

Choose the interpolation mode for the cuts.

### **Smoothness**

Adjust the smoothness for the cuts.

### **Profile Factor**

Adjust the profile factor for the cuts.

### **Profile shape**

Adjust the profile shape for the cuts.

---

## Subdivide

Subdivide divides the selected edges. It subdivides the involved faces too, and can create new vertices.

A more unknown functionality is that it can also randomize the result with the Fractal slider in the Last operator panel.

## Last Operator Subdivide

### Number of Cuts

The number of cuts defines the amount of subdivisions.

### Smoothness

This value defines how smooth the subdivision result is. From flat to bent.

### Create N-Gons

Create N-Gons if required. Else subdividing N-Gons creates Tris.

### Quad Corner Type

Adjust the corner type.

### Fractal

Randomize the selected vertices.

### Along Normal

When randomized, this value defines how strong the subdivision follows the normals of the initial vertices.

### Random Seed

Randomizing value for fractal randomizing.

## Subdivide Edge ring

Subdivides the selected edge ring(s).

### Last Operator Subdivide Edge ring

#### Number of Cuts

Adjust the number of cuts for the subdivision.

#### Interpolation

Choose an interpolation method for the new geometry.

Linear ends in an equal division and a flat result. Blend Surface interpolates the surrounding geometry. And can end in a curvy result.

## Smoothness

The Smoothness factor for the interpolation.

## Profile Factor

The profile strength.

## Profile Shape

A drop-down box where you can define a profile for the generated geometry.

## Un-Subdivide

Decimates the geometry by trying to make one quad out of four quads. But can also end in Tris where this is not possible.

## Last Operator Un-Subdivide

### Iterations

Number of iterations. This means how deep the calculation should go. One level of SDS, two levels, three levels, etc.. Down to the point where you cannot decimate any geometry anymore.

## Rotate Edge CW

Rotate Edge rotates the selected edge clockwise.

## Last Operator Rotate Selected Edge

### Counter Clockwise

Rotate selected edges counter clockwise.

## Rotate Edge CCW

Rotate Edge rotates the selected edge counter clockwise.

## Last Operator Rotate Selected Edge

### Counter Clockwise

Rotate selected edges counter clockwise.

## Edge Crease

When you use a Subdivision Surface Modifier, then you can define the sharpness of selected edges with this tool. Crease edges will be marked colored in edit mode.

You will see a value in the header that indicates the current strength when you activate the tool. Move with the mouse to increase or decrease the value. Or type in a value while you are in this mode. You can also scale into negative range.

A negative crease value will subtract from the current active crease value in case it exists already from a former crease operation. A Crease value of -1 removes the crease from this edge.

Crease: -0.150

## Last Operator Edge Crease

### Factor

Adjust the crease factor.

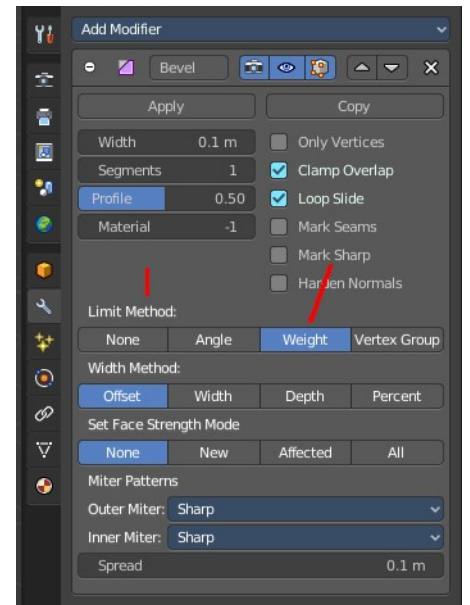

## Edge Bevel Weight

This tool adjusts the edge bevel weight for selected edges when you use the Bevel modifier at the mesh.

You need to have set the limit method to Weight. This way you can achieve a bevel weight for every individual selected edge if you want, and achieve different bevel strengths at the mesh.

You will see a value in the header that indicates the current strength when you activate the tool. Move with the mouse to increase or decrease the value. Or type in a value while you are in this mode. You can also scale into negative range.

A negative Edge Bevel Weight value will subtract from the current active crease value in case it exists already from a former crease operation. An Edge Bevel Weight value of -1 removes the weight from this edge.

Bevel Weight: -0.329

## Last Operator Edge Bevel Weight

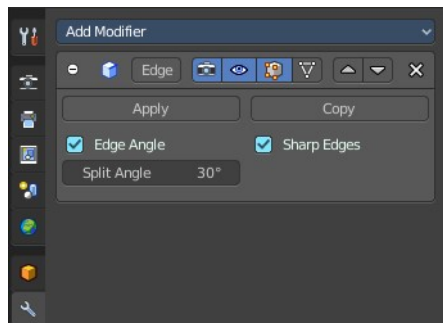

### Factor

Adjust the Edge Bevel Weight factor.

## Mark Sharp

Mark Sharp is a tool that you need for the Edge Split modifier. Marked edges are displayed and rendered as sharp edges.

## Last Operator Mark Sharp

### Vertices

Calculate by the selected vertices instead of edges to mark the edges.

## Clear Sharp

Clears formerly as sharp marked selected edges.

## Last Operator Mark Sharp

### Vertices

Calculate by the selected vertices instead of edges to mark the edges.

## Mark Sharp from Vertices

Same as Mark Sharp, but with Vertices already ticked in the Adjust Last Operation panel. The calculation happens from the selected vertices instead of the selected edges.

## Clear Sharp from Vertice

Same as Clear Sharp, but with Vertices already ticked in the Adjust Last Operation panel. The calculation happens from the selected vertices instead of the selected edges.

## Mark Freestyle Edge

Freestyle is a comic renderer that is included in Bforartists. Mark Freestyle Edges marks

the selected edges as Freestyle feature edges.

---

## Set Sharpness by Angle

Set edge sharpness based on the angle between neighboring faces.

## Last Operator Set Sharpness by Angle

### *Angle*

Sets the angle the sharp edges will be defined by. Any edge angle over this angle will be marked.

### *Extend*

Add new sharp edges without clearing the existing sharp edges.

---

## Clear Freestyle Edge

Freestyle is a comic renderer that is included in Bforartists. Clear Freestyle Edges unmarks the selected edges as Freestyle feature edges.

## Edit Mode - Faces menu

The faces menu is just visible for Mesh objects. It provides tools to work with faces.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already.

It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

Or, in case of the Bridge Faces tool, is a double to another existing tool. The Bridge Faces tool is nothing else than the Bridge Edge Loops tool from the Edge menu. Just with another name, and working in Face selection mode. We promised to provide the same functionality than Blender. And so we have to provide this tool too.

### Inset Faces

Inset insets edges into the selected faces. Think of it as an extrude inwards the face.

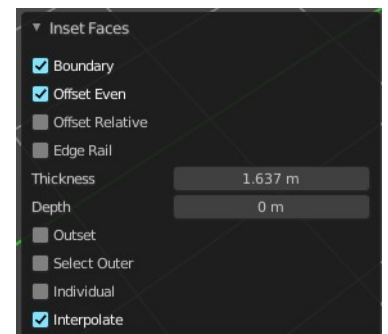

Activate the tool, drag the mouse. But carefully. The control is not the best. You better adjust the amount in the last operator.

### Last Operator Inset Faces

#### Boundary

With Boundary ticked you will get the connect edges in the corners. Without the edges ends straight.

#### Offset Even

Scales the offset to give more even thickness.

## Offset Relative

Scales the offset by surrounding geometry.

## Edge Rail

Inset the region along existing edges.

## Thickness

Thickness adjusts the thickness of the inset geometry.

## Depth

With depth you can bevel the inset geometry. It is then not longer co planar to the initial face.

## Outset

With outset ticked the Inset will not extrude inwards but outwards.

## Select Outer

With Select Outer the outer ring will be selected after the Inset.

## Individual

Inset every face individually.

## Interpolate

Blend Face Data across the inset.

---

## Bridge Faces

The Bridge Faces tool bridges selected faces, and adds polygons between them. You need to have at least two faces selected.

This tool is basically the Bridge Edge Loops tool, just that it operates in Face mode.

Note that this tool just shows when you are in Face Select Mode.

### ***Last Operator Bridge Edge loops***

#### **Connect Loops**

Choose the method how to deal with bridging multiple loops.

#### **Merge**

With merge ticked it will not create a bridge face, but merge the selected edges.

#### ***Merge Factor***

The merge factor determines at which distance between the selected edges the merge happens. 0.5 is the middle of the selected edges.

#### **Twist**

The twist offset for closed loops.

## Number of Cuts

Adds cuts to the bridge face.

## Interpolation

Choose the interpolation mode for the cuts.

## Smoothness

Adjust the smoothness for the cuts.

## Profile Factor

Adjust the profile factor for the cuts.

## Profile shape

Adjust the profile shape for the cuts.

---

## Poke Faces

Splits the selected faces to create a triangulated geometry.

## Last Operator Poke Faces

### *Poke Offset*

Normally the center vertice of the poke operation is planar with the rest. Adjust an offset.

### *Offset Relative*

Scale the offset by surrounding geometry.

### *Poke Center*

Poke Center is a drop-down box choose what the center of the poke operation should be. You can choose between weighted mean, mean and bounds.

---

## Triangulate Faces

Triangulate Faces triangulates the faces of the selected geometry.

## Last Operator Triangulate Faces

### **Quad Method**

Choose how quads should be triangulated.

### **Shortest diagonal**

Splits the quads based on their distance between vertices.

### **Fixed Alternate**

Splits the quads on the second and fourth vertice.

### **Fixed**

Splits the quads on the first and third vertice.

### **Beauty**

Tries to optimize the triangulation.

### **Polygon Method**

Choose how N-Gons should be triangulated.

### **Clip**

Splits the polygons with an ear clipping algorithm.

### **Beauty**

Tries to optimize the triangulation.

## Tris to Quads

Tris to quads tries to convert triangulated geometry back to a quad geometry by removing the edges inside of the quads.

## Last Operator Tris to Quads

### **Max Face Angle**

Adjust the threshold to adjacent triangles.

### **Max Shape Angle**

Adjust the shape angle limit.

### **Compare UV's**

Takes the UV patches for the calculation into account. Border geometry will not be calculated.

### **Compare VCols**

Takes the Vertex colors for the calculation into account. Border geometry will not be calculated.

## ***Compare Seam***

Takes the Vertex colors for the calculation into account. Border geometry will not be calculated.

## ***Compare Sharp***

Takes the as sharp marked edges for the calculation into account. Border geometry will not be calculated.

## ***Compare Materials***

Takes the Materials colors for the calculation into account. Border geometry will not be calculated.

---

## **Solidify Faces**

Gives the selected faces a thickness, and makes it solid.

There is also a Solidify modifier available.

### **Last Operator Solidify**

#### ***Thickness***

Adjust the thickness. You can scale also into the negative range.

## **Wire Frame**

Wire frame grabs the edges of the faces and turns them into tubes.

### **Last Operator Wire Frame**

#### ***Boundary***

Inset Face Boundaries.

#### ***Offset Even***

Scales the offset to give more even thickness.

#### ***Offset Relative***

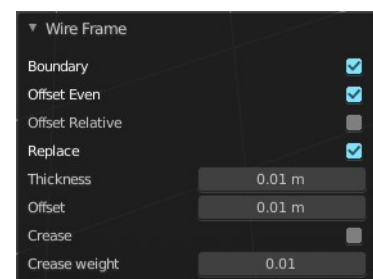

Scales the offset by surrounding geometry.

#### ***Replace***

Removes the source geometry.

#### ***Thickness***

Adjust the thickness of the tubes.

## **Offset**

Adjust the offset of the tubes.

## **Crease**

Crease adds close edges so that you have sharp corners when you use Subdivision Surface.

## **Crease Weight**

Adjust the crease weight.

---

## **Fill**

Fill closes holes in the selected mesh geometry, and triangulates the faces.

## **Last Operator Fill**

### **Beauty**

Uses the best possible triangulation.

---

## **Grid Fill**

Grid Fill allows you to fill two edge loops with quad geometry that follows the surrounding geometry.

Usage: select two opposite edge loops. Then perform the tool.

## **Last Operator Grid Fill**

### **Span**

Number of sides.

### **Offset**

Define an offset

### **Simple Blending**

Uses a simple interpolation. Faster but less accurate.

## Beautify Faces

Beautify faces tries to optimize triangulation.

### Last Operator Beautify Faces

#### Max Angle

Set an angle limit.

## Intersect (Knife)

Intersect creates edges where geometry intersects.

This operation happens in Edit mode, and so all parts must be in the same mesh.

### Last Operator Intersect

#### Source

**Source** is a drop-down box choose at which mesh part you want to operate.

**Selected/Unselected** works between the selected and unselected geometry.

**Self Intersect** works on the overlapping geometry of the mesh.

#### Separate Mode

Separate mode is a drop-down box choose the separation mode.

**All** splits the geometry at the new edge.

**Cut** keeps each side of the intersection separate without splitting the faces in half.

**Merge** merges all the geometry from the intersection.

#### Merge Threshold

Adjust the merge threshold. Increase it when some geometry is not calculated. But keep it small for fast calculation.

## Intersect ( Boolean )

Intersect (Boolean) performs a Boolean operation between the selected and unselected mesh parts.

This operation happens in Edit mode, and so all parts must be in the same mesh.

## Last Operator Intersect (Boolean)

### *Boolean*

Choose the Boolean method.

Difference subtracts the source geometry from the target geometry.

Union unions the source geometry with the target geometry. Geometry inside the source and target geometry gets removed.

Intersect removes all geometry but the overlapping geometry.

### *Swap*

Inverts source and target geometry.

### **Merge Threshold**

Adjust the tolerance for the Boolean operation. Increase it when some geometry is not calculated. But keep it small for fast calculation.

## Weld Edges into Faces

This tool incorporates loose wire edges into selected faces.

You need a loose edge geometry to get it to work. By converting a curve to a Mesh geometry for example. You need to join the edge into the mesh where you want to use it. The operation happens in Edit mode.

In edit mode select the edge and the face where you want it to join. And then perform the tool.

## Face Data

### Rotate Colors

Rotates the vertex colors for the selected geometry. This tool requires to have vertex colors painted at the mesh.

Note that there is no way to display vertex colors in Edit mode. So you need to switch to Vertex paint mode to see the result.

### Last Operator Rotate Colors

#### Counter Clockwise

The tool rotates clockwise by default. With this option ticked the rotation happens counter clockwise.

### Reverse Colors

Reverses the vertex colors.

Note that there is no way to display vertex colors in Edit mode. So you need to switch to Vertex paint mode to see the result.

## Rotate UV's

Rotates the UV space for the selected geometry by 90 degrees. This tool requires to have a working UV mapping.

### *Last Operator Rotate UV's*

The tool rotates clockwise by default. With this option ticked the rotation happens counter clockwise.

---

## Flip Quad Tessellation

Flips the tessellation of the selected quads.

---

## Reverse UV's

Reverses the UV Space for the selected geometry. This tool requires to have a working UV mapping.

---

## Mark Freestyle Face

Mark selected Faces for exclusion from Freestyle Feature edge detection. Freestyle is a cartoon renderer that is also included in Bforartists.

---

## Clear Freestyle Face

Unmark selected Faces for exclusion from Freestyle Feature edge detection. Freestyle is a cartoon renderer that is also included in Bforartists.

---

## Edit Mode - UV Menu

Here you find the uv mapping methods and some further functionality. You use it best in the U Editing layout. There you can see the result in the UV Editor then.

The UV menu is just available for Mesh objects.

### Unwrap ABF

Unwrap ABF unwraps the selected geometry with the method Angle based. ABF stands for Angle Based Flattening. ABF can give a bit better result than LSCM when unwrapping organic shapes.

### Unwrap Conformal

Unwrap Conformal unwraps the selected geometry with the method LSCM, which is the short for Least Square Conformal Mapping. LSCM can give a bit better results than ABF with geometric shapes.

### Last Operator Unwrap

Unwrap ABF and Unwrap LSCM shares the same Last Operator.

#### **Method**

Method is a drop down box where you can choose between Unwrap method Angle Based and Conformal.

#### **Fill Holes**

Fill holes in the mesh before unwrapping.

#### **Correct Aspect**

Take the Image Aspect Ratio into account.

#### **Use Subsurf Modifier**

Unwraps an existing Subsurf Modifier. You need to add a Subsurf Modifier first.

#### **Margin**

The distance between the single UV patches.

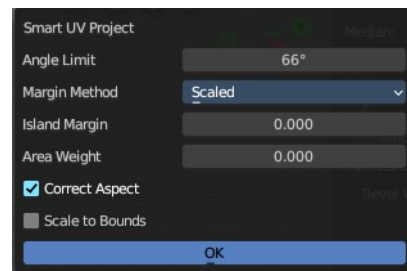

## Smart UV Project

Smart UV Project projects the UV mapping from different angles.

### Smart UV Project Settings dialogue

#### *Angle Limit*

The Angle Limit defines after which angle the mapping happens from the next side. With an angle of 66 you have around six sides to map from. The calculation is  $360/66$ .

#### *Margin Method*

##### **Scaled**

Use the scale of existing UV to multiply margin.

##### **Add**

Just add the margin and ignore any existing UV.

##### **Fraction**

Specify a precise fraction of specific UV.

#### *Island Margin*

Island Margin defines the distance between the UV patches.

#### *Area Weight*

Weight Projection Vector by faces with larger areas.

#### *Correct Aspect*

Take the Image Aspect Ratio into account.

### Last Operator Smart UV Project

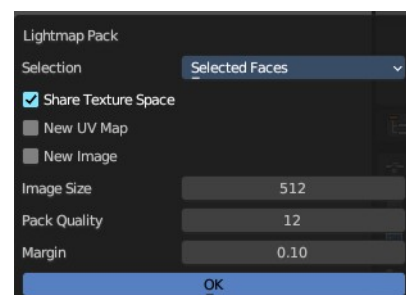

The Last Operator for Smart UV Project contains the same settings than the Smart UV Project Settings dialogue.

## Lightmap Pack

Lightmap Pack maps each face individually, and puts the result into the UV space. Without margin.

Lightmap Pack has no Last Operator.

## Settings

### ***Selection***

Selection is a drop-down box where you can choose what will be packed.

### ***Share Tex Space***

Map all objects into one lightmap.

### ***New UV Map***

Create a new UV map for every new mesh.

### ***New Image***

Assign new Image to every new mesh.

### ***Image Size***

The size for new images.

### ***Pack Quality***

The pack quality.

### ***Margin***

The distance between the single UV patches.

---

## Follow Active Quads

Follow Active quads maps UV coordinates starting from an active face, and maps all adjacent faces in quad shape then. This way you can for example unwrap a pipe or a road. You first need to have a face selected. Then select everything. And then click at Follow Active Quads.

## Settings

### ***Edge Length Mode***

Edge Length Mode is a drop-down box where you can choose the Length method.

### **Last Operator Follow Active Quads**

The Last Operator contains the same settings than the Settings dialogue.

---

## Cube Projection

Cube Projection maps the mesh from six sides, means cubic.

## Last Operator Cube Projection

### **Cube Size**

Cube Size defines the size of the UV mesh in the UV space.

### **Correct Aspect**

Take Image Aspect ratio into account.

### **Clip to Bounds**

Clip UV Coordinates to bounds after unwrapping.

### **Scale to Bounds**

Scale UV Coordinates to bounds after unwrapping.

---

## Cylinder Projection

Cylinder Projection tries to map the geometry cylindric.

## Last Operator Cylinder Projection

### **Direction**

Direction is a drop-down box where you can choose in which direction the cylindric projection will be mapped.

### **Align**

Align is a drop-down box where you can choose the Align method.

### **Radius**

Radius defines the Polar size of the UV mesh in the UV space.

### **Correct Aspect**

Take Image Aspect ratio into account.

### **Clip to Bounds**

Clip UV Coordinates to bounds after unwrapping.

### **Scale to Bounds**

Scale UV Coordinates to bounds after unwrapping.

---

## Sphere Projection

Sphere Projection tries to map the geometry spherical.

## Last Operator Sphere Projection

### **Direction**

Direction is a drop-down box where you can choose in which direction the spherical projection will be mapped.

### **Align**

Align is a drop-down box where you can choose the Align method.

### **Correct Aspect**

Take Image Aspect ratio into account.

### **Clip to Bounds**

Clip UV Coordinates to bounds after unwrapping.

### **Scale to Bounds**

Scale UV Coordinates to bounds after unwrapping.

## Project from View

Project from View projects the UV from the current 3D view.

### Last Operator Project from View

#### **Orthographic**

User orthographic projection.

#### **Camera Bounds**

Map UV's to the camera region taking resolution and aspect into account.

#### **Correct Aspect**

Take Image Aspect ratio into account.

#### **Clip to Bounds**

Clip UV Coordinates to bounds after unwrapping.

#### **Scale to Bounds**

Scale UV Coordinates to bounds after unwrapping.

## Project from View (Bounds)

Project from View projects the UV from the current 3D view.

Same as Project from View, but with Scale to Bounds ticked in the Last operator. And so it scales to the bounds.

---

## Mark Seam

The unwrap algorithms Angle based and Conformal requires to have edges marked as seams. Think of it as a cutting pattern for a trouser for example. Such a trouser is also made of fabric patterns.

Same goes for the UV patches when you use Angle based or conformal unwrapping. You need to cut your mesh into parts and mark edges as seams, so that the algorithm knows where the seams are.

Mark seam marks the currently selected edge(s) as a seam. Seam edges will be displayed as red in the 3D viewport.

---

## Clear Seam

Clear seam removes the seam from the currently selected edge(s).

---

## Reset

Resets the UV Projection.

## Sculpt Mode - Sculpt Menu

This group of operators contain act-once operators to assist in every day sculpting workflows.

## Legacy submenu

The legacy menu contains operators from the old act-once tool system that already exists in the tool shelf that use the new mode based tool system.

## Move

Activates the old move tool. The old move tool does not show a widget!

Note that the hotkey for this tool is not displayed correctly. But can't be fixed by us. The hotkey is ctrl W

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

D: 0.1529 m (0.1529 m) along global Z

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

D: 0.7057 m D: -0.2678 m (0.7548 m) global

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

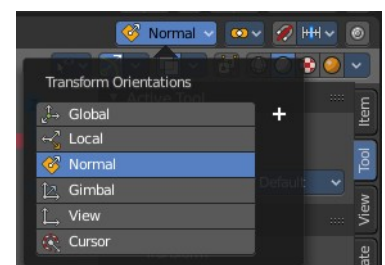

When you move the object, and hold down the mouse and type in a value, like 20, then the movement will be performed by the value that you have typed in. In this case by 20 units in direction of the selected axis.

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

D: 0.1529 m (0.1529 m) along global Z

By holding down the mouse button and pressing the X, Y or Z key twice you

can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and global.

This can be combined with the numerical input. Type in X, type in X again to use the local space, type in 20 to move by 20 units in local orientation. Release the mouse to confirm.

## Orientation

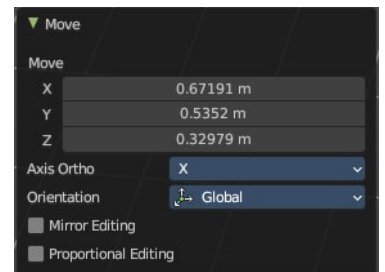

The widget can have different orientations. The menu items should be self explaining.

## Last Operator Move

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Rotate**

Activates the old Rotate tool. This tool has no widget!

## ***Snapping***

Holding down Ctrl activates temporary global snapping. It snaps then by 5 degrees steps.

When you use the white circle to rotate, then the widget also shows a division circle around the widget. This divisions shows even finer when

you do precision rotation.

## ***Precision rotation***

When you hold down shift, then you will have a much slower but also much preciser rotation.

## ***Header Values***

When you rotate your object then you will see some values in the header, which defines the current rotation of the object. The rotation is shown in degrees.

Rot: -3.57 global

## ***Numerical Input***

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in. In this case by 20 degree around the selected axis.

## ***Limit Axis***

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

Rot: -0.08 along normal X

By holding down the mouse button and pressing the X, Y or Z key twice you

can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

This can be combined with the numerical input. Type in X, type in X again to use the local space, type in 20 to rotate by 20 degree. Release the mouse to confirm.

## Orientation

The 3d cursor can have different orientations. The menu items should be self explaining.

## Last Operator Rotate

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Mirror Editing

Enable mirror editing.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius,

then it gets calculated.

## Scale

Activates the old Scale tool. This tool has no widget!

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision Scale

When you hold down shift, then you will have a much slower but also much preciser scale.

## Header Values

When you scale your object then you will see some values in the header, which defines the current scale of the object.

These values are always relative to the starting point. You always start with 1, regardless of the real world scale.

## Numerical Input

When you scale the object, and hold down the mouse and type in a value, like 20, then the scale will be performed by the value that you have typed in. In this case by factor 20 along the selected axis.

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the scale to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

This can be combined with the numerical input. Hold down mouse, type in X, type in X again to use the local space, type in 20 to scale by 20 units. Release the mouse to confirm.

## Orientation

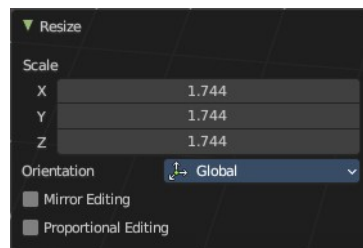

The 3d cursor can have different orientations. The menu items should be self explaining.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Mirror Editing

Enable mirror editing.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Box Hide

Calls a rectangle tool that allows you to hide away mesh parts.

## Box Show

Calls a rectangle tool that allows you to reveal hidden mesh parts.

---

## Lasso Hide

Calls a lasso tool that allows you to hide away mesh parts.

## Lasso Show

Calls a lasso tool that allows you to reveal hidden mesh parts.

---

## Line Hide

Calls a line tool which hides the vertices at the one side away.

## Line Show

Calls a line tool that allows you to reveal hidden mesh parts.

---

## Polyline Hide

Calls a poly line tool which hides the vertices at the one side away after you draw and confirm the polyline shape.

## Polyline Show

Calls a poly line tool that allows you to reveal hidden mesh parts after you draw and confirm the polyline shape.

---

## Box Trim

Calls a rectangle tool that cuts away mesh parts, dependent of the view.

## Lasso Trim

Calls a rectangle tool that cuts away mesh parts, dependent of the view.

## Line Trim

Calls a line tool that cuts away mesh parts based on an underside of a line that you can draw from the first click to a second click. The line will show a gradient, any part of the mesh on that side of the gradient will be

booleaned.

---

## Line Project

Calls a rectangle tool that cuts away mesh parts, dependant of the view.

---

## Transform submenu

### Sphere

Adds a mesh filter that casts the mesh to a sphere shape.

Activate the tool, click at the mesh, and adjust the sphere shape in the last operator panel.

### *Last operator Filter Mesh*

#### Strength

The strength of the sphere casting

#### Repeat

How often to repeat the casting.

#### *Orientation*

The orientation of the tool.

#### Axis

Which axis to affect.

---

## Fair Positions

Edits the current active face set.

Creates a smooth as possible geometry patch from the face set, minimizing changes in vertex positions.

## Fair Tangency

Edits the current active face set.

Creates a smooth as possible geometry patch from the face set, minimizing changes in vertex tangents.

## Last Operator Edit Face Sets

### **Mode**

The face set modification mode.

### **Strength**

How strong the operation should be applied.

### **Modify Hidden**

Also modify hidden geometry.

## Box Add

Calls a rectangle tool that adds mesh parts, dependant of the view.

## Lasso Add

Calls a rectangle tool that adds mesh parts, dependant of the view.

## Smooth

An act-once operator that smoothens the object.

## Surface Smooth

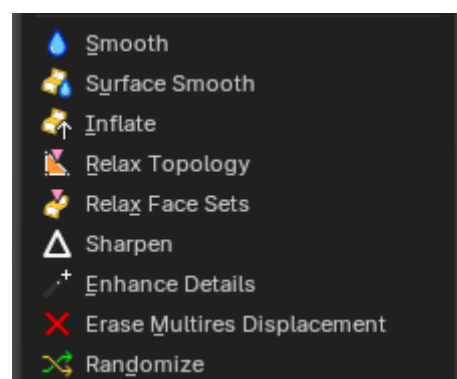

An act-once operator that smoothens the surface while preserving volume.

## Inflate

An act-once operator that inflates the surface volume.

## Relax Topology

An act-once operator that relaxes the topology of the mesh.

## Relax Face Sets

An act-once operator that relaxes the face sets and smooths them out.

## Sharpen

An act-once operator that sharpens the face sets.

## Enhance Details

An act-once operator that enhances the details of the mesh.

## Erase Multires Displacement

An act-once operator that erases multiresolution displacement.

## Randomize

An act-once operator that randomizes the mesh topology.

## Last operator Filter Mesh

### *Strength*

The strength of the sphere casting

### *Repeat*

How often to repeat the casting.

### *Orientation*

The orientation of the tool.

### *Axis*

Which axis to affect.

## Subdivide submenu

Subdivide is a menu where you can quickly set the subdivision level of the selection. What it does is to add a SDS modifier in the Properties Editor if required. And set the SDS level to the needed value. Ctrl 0 sets SDS to level 0. Ctrl 1 sets SDS level to 1, and so on.

SDS happens at Object mode level. Even when you apply it in the Sculpt Mode! And it happens at the whole object. The sculpting though still happens at the base mesh.

## Last Operator Subdivision Set

### Level

Adjust the SDS level.

### Relative

Applies the Subsurf Level as an offset relative to the current level.

## Sample Color

Samples the vertex color attribute of the active vertex.

## Set Pivot

Sets the pivot to the chosen location. The menu items should be self explaining. So we don't repeat them here.

### Last operator Set Pivot Position

#### Mode

How to set the pivot to.

## Show / Hide submenu

### Toggle Visibility

Toggles the visibility of face sets.

### Last operator Face Sets Visibility

#### Mode

The show hide modes for face sets.

### Hide active Face Sets

Makes the active face sets invisible.

### Last operator Face Sets Visibility

#### Mode

The show hide modes for face sets.

## Show All

Makes all invisible mesh parts visible again.

## Invert Visible

Toggles the visibility of the selected face sets.

## *Last operator Face Sets Visibility*

### Mode

The show hide modes for face sets.

## Hide Masked

Hides the masked mesh part.

## Rebuild BVH

Recalculate the sculpt BVH to improve performance.

## Transfer Sculpt Mode

Switch to another object in Sculpt mode. The tool calls an object picker with which you can choose the object that you want to switch to.

There is also a hardcoded hotkey D, which works directly. Hover with the mouse over the object, and press D

## 7.1.15 Editors - 3D Viewport - Header - Mesh - Sculpt mode - Brush menu

### Table of content

Sculpt Mode - Brush Menu.....	1

### Sculpt Mode - Brush Menu

#### Reset Brush

Resets the brush in case you have customized it.

#### Brush Radius

Adjust the brush size. Hotkey tool! This menu entry is just there so that you are able to change the hotkey if you want, and to remind you that this hotkey exists.

#### Brush Strength

Adjust the brush strength. Hotkey tool! This menu entry is just there so that you are able to change the hotkey if you want, and to remind you that this hotkey exists.

#### Texture Brush Angle

Adjust the texture brush angle when you work with stencil maps and textures. Hotkey tool! This menu entry is just there so that you are able to change the hotkey if you want, and to remind you that this hotkey exists.

Random Mask.....	3

## Sculpt Mode - Mask Menu

### Invert Mask

Inverts the mask.

### Fill Mask

Fills the mask with a given value, or inverts its values.

### Clear Mask

Clears the mask.

### Smooth Mask

Smoothens the mask selection.

## Sharpen Mask

Sharpens the mask selection.

## Grow Mask

Grows the mask

## Shrink Mask

Shrinks the mask.

## Increase Contrast

Increases the contrast between masked parts and not masked parts.

## Decrease Contrast

Decreases the contrast between masked parts and not masked parts.

## Expand Mask by Topology

Expands the mask from the initial active vertex under the mouse. Starts with a new mask.

Watch the tool tip in the footer for further instructions.

## Expand Mask by Curvature

Expands the mask from the initial active vertex under the mouse. Keeps the previous mask.

Watch the tool tip in the footer for further instructions.

---

## Mask Extract

Creates a new object out of the masked mesh part.

This operation cannot be undone!

### Threshold

The sharpness of the mask border.

### Add Boundary Loop

Add a boundary loop at the border of the new created geometry. This can help to make the geometry more stable.

### Smooth Iterations

How many iterations to smooth the new created geometry.

## Project to Sculpt

Project the extracted mesh into the original sculpt.

## Extract as Solid

Extract the new created mesh as a solid mesh.

## OK

Apply the Mask Extract tool.

## Mask Slice

Slices the paint mask from the mesh.

## Mask Slice and fill Holes

Slices the paint mask from the mesh. And fills existing holes.

## Mask Slice to new Object

Slices the paint mask from the mesh, and creates a new object out of it.

---

## Mask from Cavity

Creates a mask based on cavity and pointiness of the mesh.

---

## Random Mask

Masks out random parts of the mesh by the chosen method.

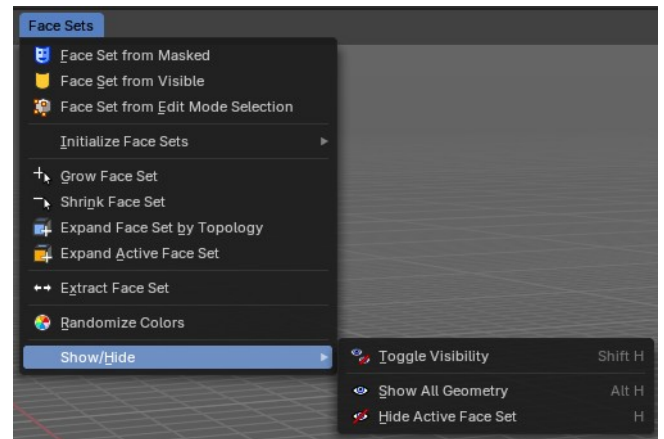

## 7.1.16 Editors - 3D Viewport - Header - Mesh - Sculpt mode - Face Sets menu

### Table of content

Sculpt Mode - Face Sets Menu.....	1
Face Sets from Mask.....	1
Face Sets from Visible.....	1
Face Sets from Edit Mode Selection.....	2

Initialize Face Sets.....	2
Randomize Colors.....	2
Show/Hide submenu.....	3
Toggle Visibility.....	3
Show all Geometry.....	3
Hide Active Face Set.....	3

## Sculpt Mode - Face Sets Menu

Face Sets is a kind of a mask that shows in different colors to assist in sculpting regions and running different sculpt brush effect. The colors are random.

In the Face Sets menu you can create and manage Face Sets.

### Face Sets from Mask

Creates a face set from the current mask.

### Face Sets from Visible

Creates a face set from the visible geometry.

## Face Sets from Edit Mode Selection

Creates a face set from the selection that you do in edit mode.

## Grow Face Sets

Grows the face sets.

## Shrink Face Sets

Shrinks the face sets.

## Expand Face Set by Topology

Expands a face set from a starting point on the topology. Click and drag on the mesh once you start the operator.

## Expand Active Face Set

Expands a face set from the active face set under the mouse cursor. Click and drag on the face set once you start the operator.

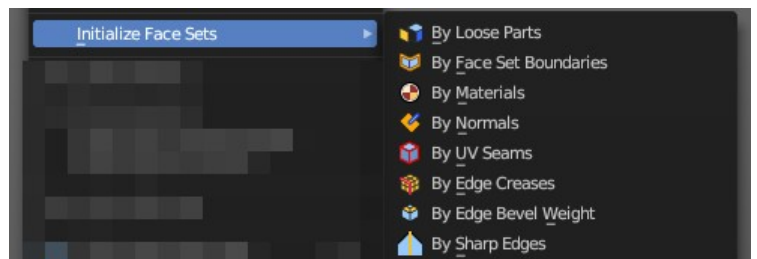

## Extract Face Set

Creates a new mesh object from the selected face set. The mouse turns into a color picker to pick the face set when you activate this too.

## Initialize Face Sets

A menu with various methods to initialize the face sets. These methods include the following:

- By Loose Parts
- By Face Set Boundaries
- By Materials
- By Normals
- By UV Seams
- By Edge Creases
- By Edge Bevel Weight
- By Sharp Edges

## Randomize Colors

Generates a new set of random colors to render the face sets.

## Show/Hide submenu

Note that these operators are best used by Hotkey. When you use them from the menu then you need to confirm the action by a mouse click. You will see a corresponding warning in the header.

You need to click at the face set that you want to hide. Same goes for the toggle.

Toggle is meant for the case that you have two or more face sets. And then it toggles between the invisible and the face set that you click at.

## Toggle Visibility

Toggles the visibility of the active face set.

## Show all Geometry

Reveals all hidden geometry.

## Hide Active Face Set

Hides the active face set.

Contrast.....	4

## Vertex paint Mode - Paint Menu

The Paint menu contains tools for vertex painting in Vertex paint mode.

### Set Vertex Colors

Flood fills the vertex colors with the current vertex color value.

#### *Affect Alpha*

Set color to completely opaque instead of reusing existing alpha.

### Smooth Vertex Colors

Smooths out the vertex colors.

### Dirty Vertex Colors

Dirty vertex colors is a special tool for aging meshes. Let's for example imagine we have a relief. Edges that are outstanding are often touched, and tends to become brighter. While areas in the inner side of a relief are not so often touched. And here the relief collects dirt too. So this areas becomes darker.

And that's what the tool simulates. It makes the outer edges brighter, and the inner edges darker. This calculation is somehow similar to Ambient Occlusion. Ambient Occlusion makes corners darker. The dirty tool makes edges brighter too. And it calculates with the vertices. Not Texel positions like AO.

You need to convert this result to a texture to use it in your texturing, as a mask for example. This conversion can be done by baking.

The tessellation of the mesh should not be too high for this operation. Since it calculates the angles of the mesh edges.

### Last Operator Dirty Vertex Colors

#### *Blur strength*

How strong the result should be blurred

#### *Blur Iterations*

The number of iterations for the blur.

#### *Highlight Angle*

The angle for the bright areas. Angles higher as this value will not be recognized as an edge to highlight.

#### *Dirt Angle*

The angle for the dark areas. Angles lower as this value will not be recognized as a corner to darken.

## ***Dirt only***

Ignore the highlight areas, just calculate the dirt angles.

## **Vertex Color from Weight**

This tool requires to have Weight Painting at the mesh. It converts the weight paint colors into greyscale vertex colors.

---

## **Invert**

Inverts the vertex colors.

---

## **Levels**

This tool allows you to level the values of the vertex painting. You adjust the settings in the last operator.

### **Last Operator Vertex Paint Levels**

#### ***Offset***

Adjust the Offset of the vertex colors.

#### ***Gain***

Adjust the Gain of the vertex colors.

---

## **Hue Saturation Value**

This tool allows you to adjust the hue, saturation and value values of the vertex painting. You adjust the settings in the last operator.

### **Last Operator Vertex Paint Hue Saturation Value**

#### ***Hue***

Adjust the Hue of the vertex colors.

#### ***Saturation***

Adjust the Saturation of the vertex colors.

## ***Value***

Adjust the Value of the vertex colors.

---

## **Bright / Contrast**

This tool allows you to adjust the brightness and the contrast of the vertex painting. You adjust the settings in the last operator.

### **Last Operator Vertex Paint Bright/Contrast**

#### **Brightness**

Adjust the brightness of the vertex colors.

#### **Contrast**

Adjust the contrast of the vertex colors.

## Introduction

The header in the 3D view contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

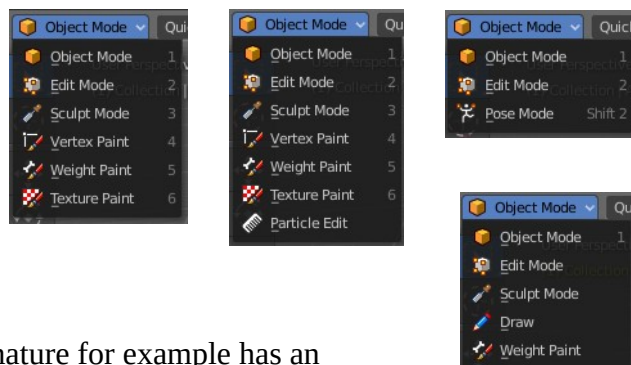

The text menus are covered in a own chapter each. They vary too much, dependent of mode and object type.

## Mode Drop-down Box

The Mode drop-down box allows you to switch between the different modes.

Modes are object states that allows you to edit and manipulate objects at different levels with different tool sets and goals. The sculpt mode for example allows you to sculpt a mesh object. Edit Mode allows to manipulate the mesh of the object, and so on.

The available modes can differ from object to object. An armature for example has an additional pose mode. And when you work with a grease pencil object, then several grease pencil modes becomes available.

## Object Mode

This mode allows to manipulate objects at Object level. Like move it around, rotate it, etc. This mode is available for all object types.

## Edit Mode

The edit mode allows to edit the object. With a mesh object this means that you are able to modify and to change the geometry. With an armature you build your skeleton. And with a text object you can type in text, and choose the font etc.

Not all objects has an edit mode.

## Sculpt Mode

In this mode you can sculpt the mesh. This mode is available for mesh and grease pencil objects.

## Vertex Paint

Vertex Paint is a mesh object only mode. In this mode you can paint vertices with colors.

## Weight Paint

In this mode you can adjust weight painting for an armature for example. But Weight Painted mesh objects can also be used in conjunction with particles. Also a grease pencil stroke can be weight painted.

## Texture Paint

Weight Paint is a mesh object only mode. In this mode you can paint at the texture of a mesh directly. This mode requires to have a working UV mapping and a texture at the mesh object.

## Edit Strokes

Edit Strokes is a Grease Pencil only mode. It allows to manipulate the curves at a mesh level.

## Particle Edit

Particle edit is a Particle System mode only. When you apply a particle system to a mesh object then this mode becomes available. It allows you to manipulate the particle system at a mesh level. You can comb hair particles for example.

## Draw

Draw is a grease pencil object only mode. In this mode you draw grease pencil strokes.

## Mesh Object Sub Modes

The different modes can have some sub modes. For example different selection methods in mesh edit mode. Or a mask mode for texture painting. The sub mode settings can be found right from the Modes drop down box.

### Edit Mode - Mesh Select Modes

When you enter the edit mode with a mesh object then you will see the mesh select modes. They allows you to switch between the three available selection modes Vertice select, Edge Select and Face Select.

Vertex Select allows you to select vertices.

Edge Select allows you to select edges.

Face select allows you to select faces.

The mesh display changes, dependent of the mode. When you have for example select vertices active, then the vertices highlights at the mesh.

You can have more than one mode active by shift clicking at the other mesh select modes.

The standard Bforartists has hotkeys to switch between the modes. X, C and V. You cannot see or edit them at the header element. There is however a sub menu in the mesh menu, called Mesh Select Mode. Here you can see and edit the hotkeys.

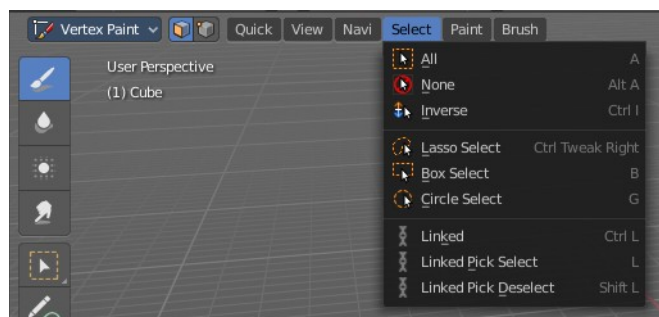

## Vertex Paint - Mask and Vertex Selection

### Paint Mask

When you activate this tool then you reveal a Select menu in the header. And you can select the mesh parts that you want to manipulate. Note that you may first want to deselect all. By default everything is selected ...

The select menu is explained in the chapter Vertex Paint modes. The menu items should be pretty self explaining though.

When you have selected a part of the mesh, then you can just paint the faces at this selected part. The edges are the border.

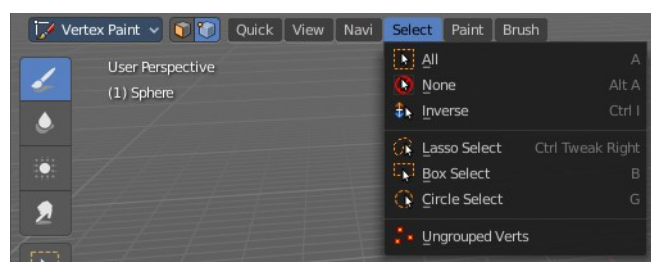

### Vertex Selection

When you activate this tool then you reveal a Select menu in the header. And you can select the mesh parts that you want to manipulate. This tool is meant for Weight Painting. And so the mesh displays the vertices too.

Note that you may first want to deselect all. By default everything is selected ...

The select menu is explained in the chapter Vertex Paint modes. The menu items should be pretty self explaining though.

When you have selected a part of the mesh, then you can just paint the vertices at this selected part. The difference to the Paint mask method is that here the edges are not the border of the color. But there is a gradient between the vertices.

## Weight Paint - Mask and Vertex Selection

### Paint Mask

Mesh Object.

When you activate this tool then you reveal a Select menu in the header. And you can select the mesh parts that you want to manipulate. Note that you may first want to deselect all. By default everything is selected ...

The select menu is explained in the chapter Vertex Paint modes. The menu items should be pretty self explaining though.

When you have selected a part of the mesh, then you can just paint the faces at this selected part. The edges are the border.

### Vertex Selection

Mesh Object.

When you activate this tool then you reveal a Select menu in the header. And you can select the mesh parts that you want to manipulate. This tool is meant for Weight Painting. And so the mesh displays the vertices too.

Note that you may first want to deselect all. By default everything is selected ...

The select menu is explained in the chapter Vertex Paint modes. The menu items should be pretty self explaining though.

When you have selected a part of the mesh, then you can just paint the vertices at this selected part. There is no real difference to the faces method. The selection is the same.

## Texture Paint - Mask Selection

## Paint Mask

Mesh Object.

When you activate this tool then you reveal a Select menu in the header. And you can select the mesh parts that you want to manipulate. Note that you may first want to deselect all. By default everything is selected ...

The select menu is explained in the chapter Vertex Paint modes. The menu items should be pretty self explaining though.

When you have selected a part of the mesh, then you can just paint the faces at this selected part. The edges are the border.

## Particle Edit - Select Modes

Mesh Object with a particle system. You can just have one method active at a time.

### Path

No key points are visible, you can select/deselect only all particles.

### Point

You can see, select and edit all key points of the particle paths.

### Tip

You can only see, select and edit the tip of the particles. This includes the brushes. The comb brush is a special case here. The other pat key points bends of course still in this mode. But affected by the brush is just the tip key.

## Grease Pencil Sub Modes

The different modes can have some sub modes. For example different selection methods in mesh edit mode. Or a mask mode for texture painting. The sub mode settings can be found right from the Modes drop down box.

## Edit Mode

The edit mode allows you to edit the grease pencil strokes.

### Select Modes

You can only have one method active at a time.

#### Select Only Points

When you for example border select some points of the stroke, then just this points gets selected.

#### Select all Stroke Points

When you for example border select some points of the stroke, then the whole stroke gets selected.

#### Select all Stroke Points between other strokes

When you for example border select some points of the stroke, and this stroke crosses another stroke, then the part of the stroke up to the crossing point gets selected.

## Curve Editing

Edit Strokes by using Curve handles.

### Curve Editing panel

The settings for Curve Editing.

#### Curve Resolution

Number of segments generated between control points

#### Threshold

The curve conversion error threshold

#### Corner Angle

Angle threshold to be treated as corners. The resolution is the number of points generated per unit distance.

#### Adaptive Resolution

Set the resolution for each segment dynamically based on its length.

## Multi frame

When this mode is active, then you can edit strokes from multiple grease pencil frames at once. The key frames must be selected to be included.

## Use Falloff

Multi frame has a setting, which becomes visible when the mode is active.

Use Falloff when edit in Multi frame mode to compute brush effect by frame.

---

## Sculpt Mode

The sculpt mode allows you to sculpt the grease pencil strokes.

## Selection Mask

When you activate this mode, then just the selected parts gets sculpted.

## Multi frame

When this mode is active, then you can edit strokes from multiple grease pencil frames at once. The key frames must be selected to be included.

## Use Falloff

Multi frame has a setting, which becomes visible when the mode is active.

Use Falloff when edit in Multi frame mode to compute brush effect by frame.

## View

Relative to which plane to draw the strokes. Default orientation is view.

## Draw Mode

The draw mode is the mode in which you draw the grease pencil strokes.

## Multi frame

When this mode is active, then you can edit strokes from multiple grease pencil frames at once. The key frames must be selected to be included.

## Origin

Where the stroke is placed.

## View

Relative to which plane to draw the strokes. Default orientation is view.

## Use Guides

Guides allows you to draw geometric shapes with the grease pencil.

### ***Circular***

Draw a circle around the origin.

### ***Radial***

Draw a straight line through the origin.

### **Angle**

Doesn't do anything.

### ***Parallel***

Draw parallel horizontal lines.

### ***Grid***

Draw parallel horizontal and vertical lines.

### ***Isometric***

Draw parallel lines in an specific angle.

### ***Use Snapping***

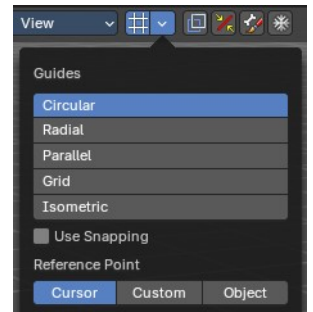

Enable snapping to guides angles or spacing options.

### **Spacing**

The guide spacing. This is the distance between the strokes.

### **Reference Point**

What point to use as the reference for the strokes.

## Draw Strokes on Back

Usually a new stroke is drawn on top of existing strokes. Draw Strokes on Back adds the new strokes below the existing strokes.

## Add Weight Data for new strokes

Add Weight data for new strokes, according to the current vertex group and weight. When no vertex group is selected, then no weight is added.

## Use Additive Drawing

When creating new frames, then the strokes from the previous or active frame gets included as the base for the new stroke.

## Automerge

Join last drawn strokes by distance with previous strokes in the active layer.

---

## Weight Paint Mode

### Multi frame

When this mode is active, then you can edit strokes from multiple grease pencil frames at once. The key frames must be selected to be included.

### Use Falloff

Multi frame has a setting, which becomes visible when the mode is active.

Use Falloff when edit in Multi frame mode to compute brush effect by frame.

---

## Vertex Paint Mode

### Select Modes

You can only have one method active at a time.

### Select Only Points

When you for example border select some points of the stroke, then just this points gets selected.

### Select all Stroke Points

When you for example border select some points of the stroke, then the whole stroke gets selected.

### Select all Stroke Points between other strokes

When you for example border select some points of the stroke, and this stroke crosses another stroke, then the part of the stroke up to the crossing point gets selected.

### Multi frame

When this mode is active, then you can edit strokes from multiple grease pencil frames at once. The key frames must be selected to be included.

### Use Falloff

Multi frame has a setting, which becomes visible when the mode is active.

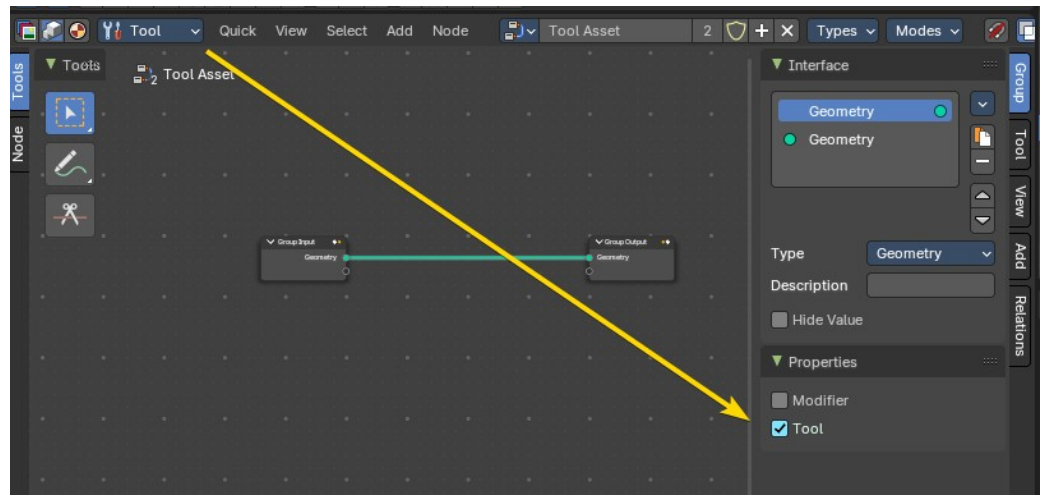

Use Falloff when edit in Multi frame mode to compute brush effect by frame.

## Geometry Node Group Tools

This header button menu with the tool icon is a container for Geometry Node Groups that have been set as “Tools” in the Geometry Nodes editor. These are act-once operators that now can be placed in the Geometry Node Group Tools or in custom entries in the 3D View header entries.

**Example:** here the Geometry Nodes has been switched to the Tool mode, and the node group Properties have been set to Tool. This node group will now show in the Geometry Node Group Tools header menu.

### Marked Assets

A marked Geometry Nodes node group set as an asset and a tool will display here. To mark, right click on the geometry node selector in the Geometry Nodes editor, and mark as asset.

### Unmarked Assets

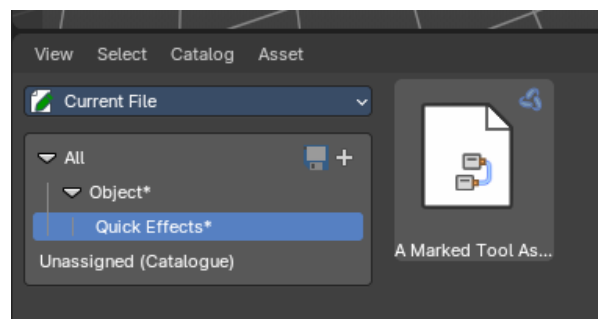

A local unmarked Geometry Nodes node group set as a tool will display under the “Unmarked Assets:” label.

### Marked Assets with assigned Asset Browser Category

A marked node group set as a tool and as an asset and assigned to an Asset Browser category with the same category structure as the menu entry names will display as nested act-once operators.

**Example:** This is a marked-as-asset geometry node group with the name “A Marked Tool Asset” in the category “Object” then sub-category “Quick Effects”.

## Object settings

The object settings just appears when the Tool Settings are hidden. This can be done in the View menu. Parts of the object settings are just visible in Object and Edit Mode. Parts in other modes.

## Transform Orientations

You can display Transform Manipulators at your object or selection by activating them in the tool shelf. They allow you to scale, rotate or move objects by grabbing their controls, and moving your mouse in the corresponding axis. The widget can be oriented in different ways by using another method in this drop down box. The names should be self explaining.

### ***View***

The transform orientation aligns to the current view.

### ***Gimbal***

Aligns each axis to the Euler rotation axis as used for input.

### ***Normal***

This is of interest for bones for example. Aligns the transformation axis to average normal of the selected elements. Bone Y axis for Pose mode.

### ***Local***

Uses the local orientation of the selected elements.

## **Global**

Uses the global orientation for the selected elements.

## **Cursor**

Uses the orientation of the 3D cursor.

## **Parent**

Uses the orientation of the parent object.

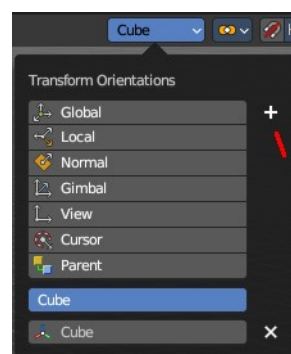

---

## **Create Orientation**

The create orientation button at the right adds a new orientation from the current mode and view. You can rename it.

This view is scene specific only. It does save and load with the current scene. But you cannot transfer it into another scene. When you create a new scene then this custom orientation is gone.

You can create more than one user orientation.

## **Last Operator Create Orientation**

Create Orientation has some settings.

### **Name**

Rename the orientation.

### **Use View**

Use the current view instead of the active object to create the new orientation.

### **Use after creation**

Use this orientation after creation.

### **Overwrite Previous**

Overwrite previous created orientation in case it has the same name.

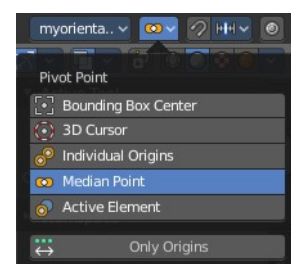

## **Pivot Point**

The Pivot Point is the center of your object or your selection. When you rotate or scale an object, or a group of vertices/edges/faces, you may want to shift the pivot point in 3D space. The names should be self explaining.

## **Only Origins**

When this option is enabled, then the transformation will change the positions of the object's origins, but will not affect the object itself.

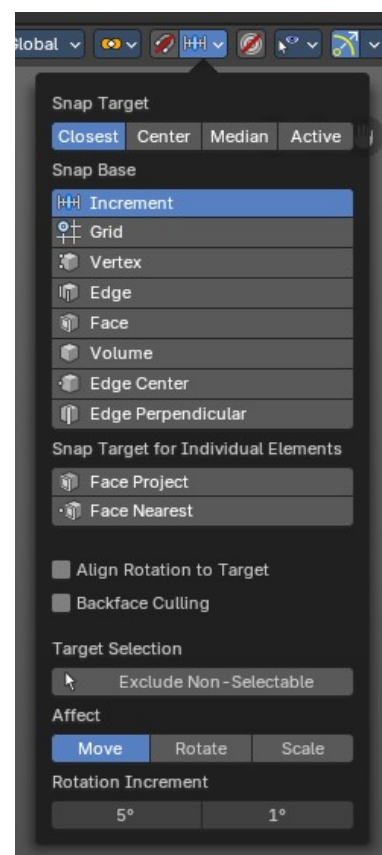

## Snapping

Activate snapping when transforming an element.

Snapping can be temporarily activated by holding CTRL key. So no need to turn snapping on and off all the time.

You can snap to various scene elements in Object, Edit and Pose mode. And you can activate more than one snapping method by holding down CTRL and clicking at the next snapping element.

## Multiple Snap Targets

When you move the mouse with snapping on and the element to snap selected (This does not work with holding CTRL), then you can press hotkey A to mark the current snapping point, then proceed to mark as many other snapping points as you wish. And the element that you want to snap will then be in the center of these marked snapping points. Marked snapping points will have a circle around.

Marking a point more than once will give it more weight in the averaged location.

## Snap With

Which part to snap onto the target.

### Closest

Snap closest point onto the target.

### Center

Snap transformation center onto the target.

## **Median**

Snap median onto the target.

## **Active**

Snap active onto the target.

## **Snap to**

To which part of the target to snap.

## **Increment**

Incremental grid snapping. In Orthographic view the snapping increment changes depending on zoom level.

**Note:** You can selected multiple by holding down the *SHIFT* key and selecting additional snap base modes.

## **Grid**

Snap to a grid.

## **Vertex**

Snap to a vertice.

## **Edge**

Snap to an edge.

## **Face**

Snap to a face.

## **Volume**

Snaps to regions within the volume of the first object found below the mouse cursor.

## **Edge Center**

Snaps to the center of an edge.

## **Edge Perpendicular**

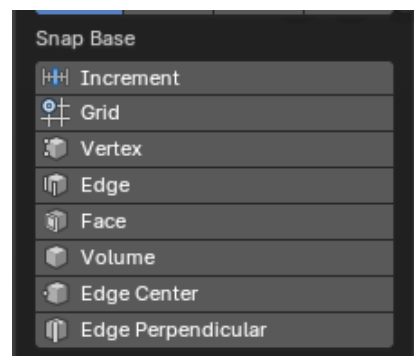

Snap to the nearest point of an edge.

## **Snap Individual Elements to**

Type of element for individual transformed elements to snap to.

## **Face Project**

Snap by projecting onto faces.

## Face Nearest

Snap to nearest point on faces.

## Snap Peel Object

Only available with the Snap to Method Volume. Consider objects as whole when finding a volume center.

## Snap to Same Target

Only available with the Snap Face Nearest. Snap only to target that the source was initially near.

## Back face Culling

Exclude back facing geometry from snapping.

## Target Selection

Align rotation with the snapping target.

## Exclude Non-Selectable

Snap only onto objects that are selectable. This will ignore any objects that have been marked as un-selectable from the Outliner Editor.

## Affect

Adjust what transform methods should be affected by snapping.

**Note:** You can selected multiple by holding down the *SHIFT* key and selecting additional transforms.

## Move

Move the affected by snapping settings.

## Rotate

Rotate the affected by snapping settings.

## Scale

Scale the affected by snapping settings.

## Rotation Increment

Snap in adjustable incremental steps.

## Rotation Increment Slider

Angle used for rotation increments in the 3D editors.

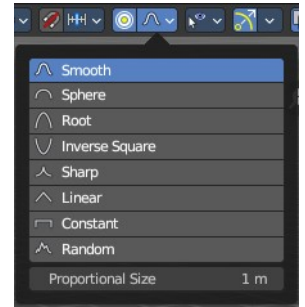

## Precision Rotation Increment Slider

Precision angle used for rotation increments in the 3D editors.

## Proportional Editing

Enables proportional editing.

Proportional Editing is a way of transforming selected elements (such as vertices) while having that transformation affect other nearby elements with a falloff. For example, moving a single vertex will move unselected vertices within a given range. And the falloff means that selected vertices that are closer to the selected vertex will move more than those farther from it.

## Settings

The settings appears when you activate Proportional Editing. Choose between different falloff methods for the proportional editing.

## Proportional Size

The influence of the proportional editing is defined by a radius. It is by default one standard unit.

You can change the influence radius for proportional editing with the mouse wheel or the Page up Page down arrows **while keeping the mouse button pressed down** and do the translation.

The exact radius value can be read in the header while transformation.

And it can also be read and edited at the Proportional Size slider in the Proportional Editing panel.

## Last Operator Proportional Editing

When you translate an object, move it around or rotate or scale it, then the last operator contains also proportional editing settings.

### *Proportional Editing*

Enable proportional editing.

### *Proportional Falloff*

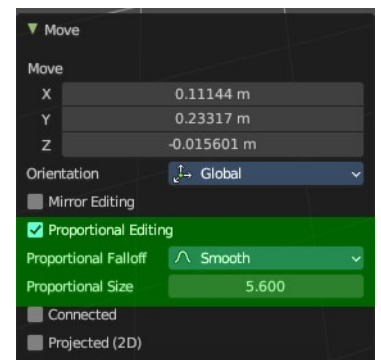

Adjust the falloff methods again.

### *Proportional Size*

Adjust the falloff radius. Note that the white circle is not displayed when using this slider.

### *Connected*

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

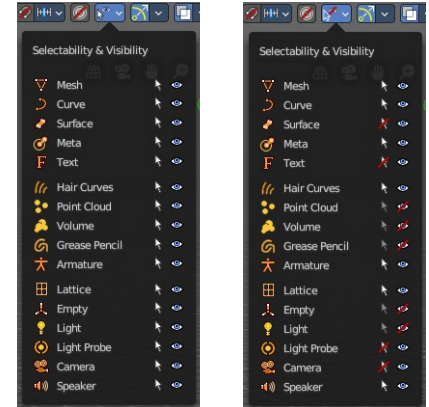

In depth direction along the view the radius is ignored. It selects as deep as there is something to select.

## Selectability & Visibility

In this drop down box you can set specific elements in the scene to either not selectable or invisible.

When the elements are invisible then they are also not selectable.

When you have set some objects to not selectable or invisible, then the icon in the menu header changes.

## Viewport Gizmo

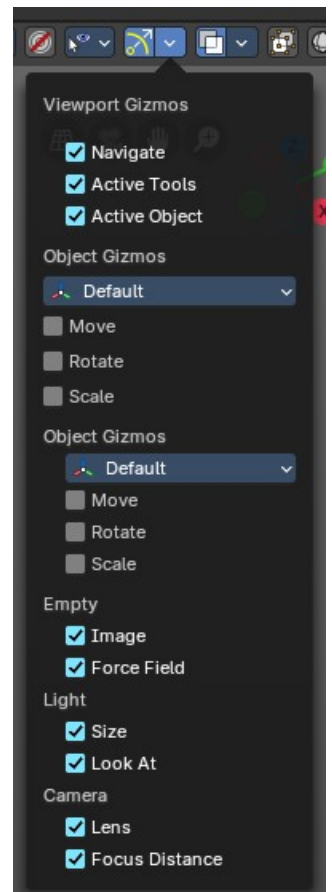

This menu allows you to adjust what gizmos shows. The button at the left turns off or on all of them.

### Show Gizmo

Shows or hides all available gizmos at once.

### Gizmo Options

Turn on or off specific widgets.

## Viewport Gizmos

### Navigate

Turn on or off the navigate widget. The navigate gizmo is the block of buttons and the widget up right.

### Active Tools

Turn on or off the active tool widget. When you activate one of the transformation buttons in the tool shelf, then a gizmo will appear at the object.

### Active Object

Turn on or off the Object Gizmos. The Object Gizmos is an extra set of translate gizmos, similar to the active tool widget that shows when you activate one of the transform buttons in the tool shelf. But it shows permanent as long as you don't have another tool selected that overrides this widget.

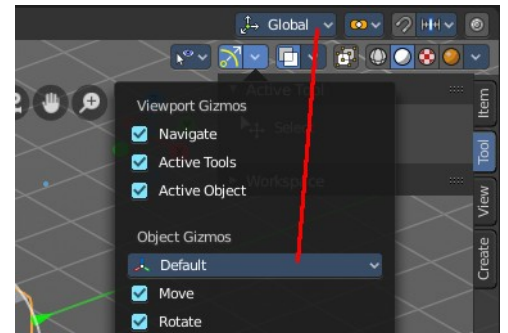

## Object Gizmos

### Transformation Orientation

Adjust the orientation of the widget. By default it uses the transform orientation from the viewport. This set can override the transform orientation.

You can have all transform methods on at once.

### Move

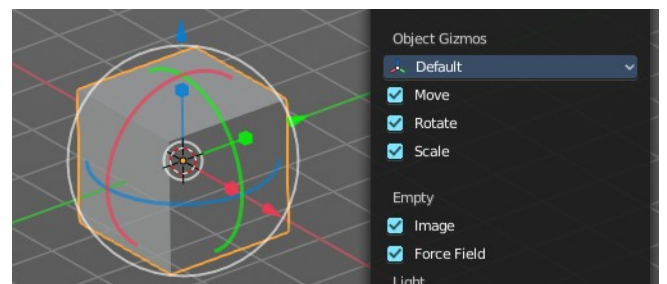

Shows the move part of the widget.

### Rotate

Shows the rotate part of the widget.

### Scale

Shows the scale part of the widget.

## Empty

### Image

Shows the transform gizmo at an empty of type Image. You need to hover with the mouse over the object to reveal the yellow gizmo.

### Force Field

Some force field types have a gizmo. Shows the transform gizmo at a force field.

## Light

### Size

Show the gizmo to adjust the size of lights. That's the blue arrow here.

### Look At

Show the gizmo to adjust the direction of the light. That's the yellow dot in the middle of the circle.

## Camera

### Lens

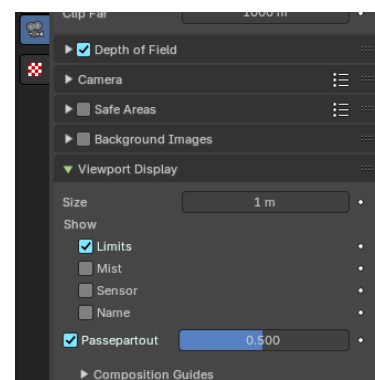

Show the gizmo to adjust the lens and orthographic size. The yellow square.

### Focus Distance

Shows the gizmo to adjust the focus distance.

You first need to turn on the Limits gizmo in the camera settings in the Viewport Display panel. Then you can turn off the focus distance gizmo part with Focus Distance.

## Mesh Object - Sculpt Paint mode

### Color Attributes panel

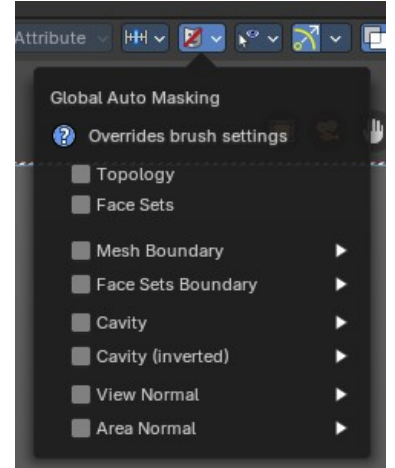

This panel also exists in the properties editor.

Currently this panel is greyed out and dysfunctional in Sculpt mode. It is WIP.

### Global Auto Masking

These override all brush settings, but you can also set these auto masking features per brush.

### Topology

Affect only vertices that are connected to the current active vertex under the brush.

### Face Sets

Affect only vertices that share face sets with the active vertex.

### Mesh Boundary

Do not affect non manifold boundary edges.

The setting that appears on activation and is valid for both, Mesh Boundary and Face Sets Boundary.

### Face Sets Boundary

Do not affect vertices that belong to a face set boundary.

The setting that appears on activation and is valid for both, Mesh Boundary and Face Sets Boundary.

## Steps

Distance where boundary edge automasking is going to protect vertices from the fully masked edge.

---

## Cavity

Do not affect vertices on peaks. This feature is based on the surface curvature.

The setting that appears on activation and is valid for both, Cavity, and Cavity (Inverted).

## Cavity (Inverted)

Do not affect vertices in valleys. This feature is based on the surface curvature.

The setting that appears on activation and is valid for both, Cavity, and Cavity (Inverted).

## Create Mask

Creates a mask based on the curvature of the surface.

## Factor

The contrast of the cavity mask.

## Blur

The number of times the cavity mask is blurred

## Custom Curve

Use a custom falloff curve for the cavity mask.

## Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

## Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Clipping Options

Set up clipping for the stroke.

### *Use Clipping*

Turns clipping on or off.

### **Min and Max X Y**

The values for the clipping area.

---

## Tools

Tools is a menu where you can find some curve related tools.

### *Reset View*

Resets the curve windows zoom.

### *Extend horizontal*

Extends the curve before the first curve point and after the last curve point horizontally.

### *Extend extrapolated*

Extends the curve before the first curve point and after the last curve point extrapolated.

### *Reset Curve*

Resets the curve to the initial shape.

---

## Handle Types

Sets the handle type for the current selected curve point.

## X Y Position

The position of the current active curve point.

## Delete Points

Deletes the current active curve point.

## View Normal

Affect only vertices with a normal that faces the viewer.

## Occlusion

Only affect vertices that are not occluded by other faces. With Occlusion on the Limit and Falloff options are not available.

## Limit

View normal limit. The range of angles that will be affected.

## Falloff

Extend the angular range with a falloff gradient.

## Area Normal

Affect only vertices with a similar normal to where the stroke starts.

## Limit

Area normal limit. The range of angles that will be affected.

## Falloff

Extend the angular range with a falloff gradient.

# Mesh Object - Vertex Paint mode

## Color Attributes panel

This panel also exists in the properties editor.

In vertex paint mode and sculpt mode you can paint vertices of a mesh with a color. This will create a vertex color index. You can see and manage this vertex color indexes in the Vertex Colors panel.

Vertex colors can for example be used to mix shaders together. Or also directly render them. In the shader editor color attributes can be used by the Attribute node.

A mesh can have more than one vertex color index and type. But just one index can be the active one.

## Active Color Index

A List of the vertex color indexes for this mesh.

### **Color index name**

The name of the vertex color index. It can be renamed by double clicking at it.

### **Active Render**

Set this vertex color index as the one to render. Just one vertex color index can be active at a time. But you can use another vertex color index in a material.

### **Drag Handler**

The two vertical lines at the end is a handler with which you can expand the list.

### **Search Field**

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

### **Invert**

Exclude the search term instead of searching for it.

### **Sort by Name**

Sort the List by name.

### **Add +**

Create a vertex color index.

## Add Color Attribute Popup

### **Name**

The name of the color attribute index.

### **Domain**

The domain of the color attribute.

- **Vertex** stores the color attribute data in the vertices of the mesh data
- **Face Corner** stores the color attribute data in the face corners of the mesh data

### **Data Type**

The the color attribute type.

- **Color** stores RGBA color 32-bit floating point values
- **Byte Color** stores RGBA color 32-bit positive integer values

### **Color**

The Default fill colour

## Ok

Confirm to apply

## Remove -

Delete the selected vertex color index.

## Adjust last operator Add Color Attribute

This is basically the same content as above. Minus the OK button.

## Specials menu

### Duplicate Color Attribute

Duplicates the selected color attribute

### Convert Color Attribute

Convert a color attribute domain and data type. This tool calls a popup where you can choose what to convert.

# Mesh Object - Weight Paint mode

## Vertex Groups

This panel also exists in the properties editor.

A Vertex group is a group of vertices, a selection of the mesh. It is for example used to weight a specific mesh part to a bone. Or to control the growth of hair particles.

This panel allows you to manage and edit vertex groups. Weight painting creates vertex groups automatically.

In Edit mode this panel shows some further controls.

Vertex groups exists for mesh and lattice objects.

## Active Vertex Group list

A List of the vertex groups for this mesh.

## **Group name**

The name of the group. It can be renamed by double clicking at it.

## **Lock**

The lock icon at the end of a group name locks the group from being editable.

## **Drag Handler**

The two vertical lines at the end is a handler with which you can expand the list.

## **Search Field**

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## **Invert**

Exclude the search term instead of searching for it.

## **Sort by Name**

Sort the List by name.

## **Add +**

Create an empty vertex group.

## **Remove -**

Deletes the active vertex group.

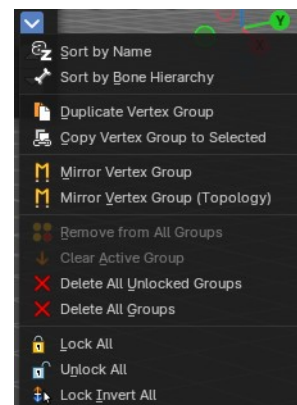

## **Specials menu**

### **Sort by Name**

Sorts the vertex groups alphabetically by name.

### **Sort by Bone Hierarchy**

Sorts the vertex groups by the hierarchy of the assigned bones.

## **Duplicate Vertex Group**

Add a copy of the active vertex group as a new group. The new group will be named like the original group with “\_copy” appended at the end of its name. And it will contain associations to exactly the same vertices with the exact same weights as in the source vertex group.

## **Copy Vertex Group to Selected**

Copy all vertex groups to other selected objects provided they have matching indices (typically this is true for

copies of the mesh which are only deformed and not otherwise edited).

### ***Mirror Vertex Group***

Mirrors weights and/or flips group names from one side of a symmetrical mesh to the other.

Only mirroring along local X axis is supported. Vertices that have no corresponding vertex on the other side will not be affected. Note, the weights are not transferred to the corresponding opposite bone weight group.

### ***Mirror Vertex Group (Topology)***

Performs the Mirror Vertex Group with the Topology Mirror option enabled.

### ***Remove from All Groups***

Unassigns the selected vertices from all groups. Even locked.

### ***Clear Active Group***

Remove all assigned vertices from the active group. The group is made empty. Note that the vertices may still be assigned to other vertex groups of the object. This feature does not affect locked groups.

### ***Delete All Unlocked Groups***

Remove all vertex groups from the object that are not locked.

### ***Delete All Groups***

Remove all vertex groups from the object.

### ***Lock All***

Lock all groups.

### ***Unlock All***

Unlock all groups.

### ***Lock Invert All***

Invert group locks.

### ***Move Vertex Group Up / Down***

Moves the selected vertex group up or down in the list.

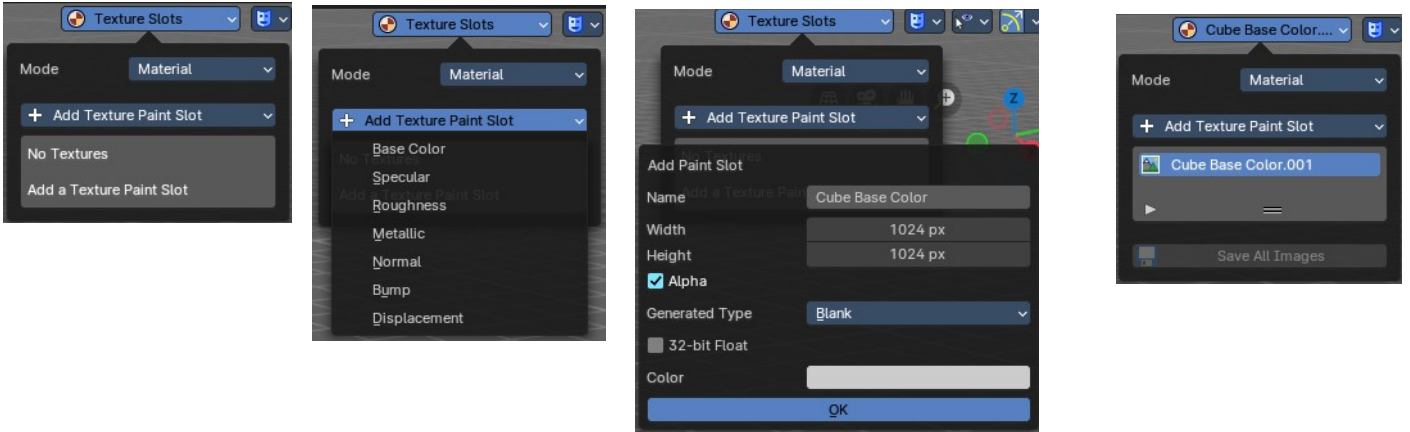

## **Mesh Object - Texture Paint mode**

### **Texture Slots**

The texture slots panel allows you to manage the textures that you use for texture painting. When the mesh doesn't have a texture yet to paint at, then you get a hint about a missing texture. No Textures. The Add Texture

Paint Slot button allows you to add one. Base Color allows you to create a diffuse map.

## Mode

Choose in which mode you want to paint. Single Image just works with a single image, without any material.

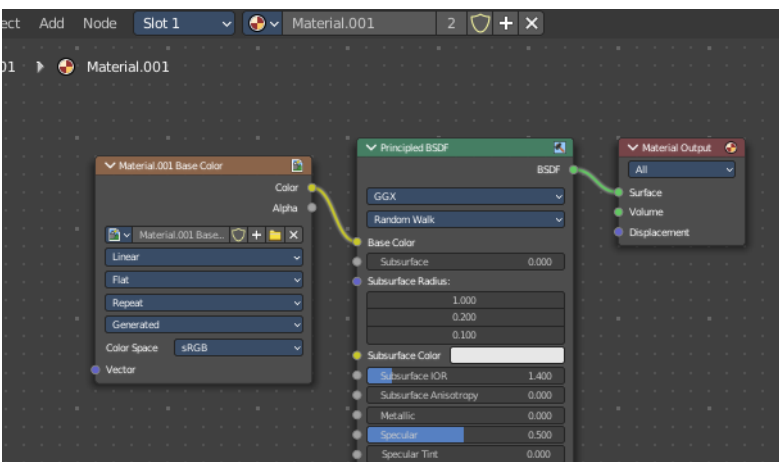

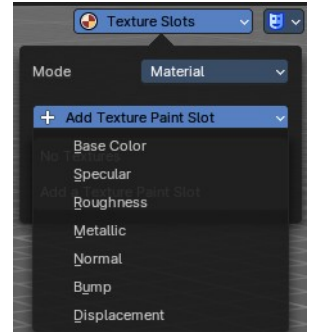

Material works with a material and a texture. The texture is here part of the material.

## Add Texture Paint Slot

Here you can choose what type of texture you want to add for texture painting.

The texture gets added to the shader, and connected to the correct node. A base color is meant for diffuse, and so it connects with the base color slot.

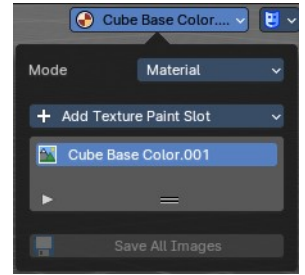

## Paint Slot with mode Material

### **Material Paint Slot**

A list of the available paint slot materials.

### **Add Texture Paint Slot**

The + button at the right. Add more materials to the Material Paint Slot.

## Paint Slot with Mode Single Image

### **Image List**

A list of the available images, which allows you choose one in case one exists.

### **New/Open**

When no image is loaded then you can create a new image here, or load a new image.

### **Edit Box**

See the name of the image, and edit the name.

### **Fake User**

When enabled then this image will be stored internally. But not the painted changes at it!!

### **New Image**

Create a new image.

### **Open Image**

Open an image

### **Unlink Data Block**

Delete the Image when saving the scene, closing and reopening Bforartists. Note that the number of Users must be zero. Or the image comes back.

### **UV Map**

Choose a UV map to work with. Usually there is just one. But there can be more than one UV map. You can add and manage more in the Object data tab in the UV Map panel.

### **Interpolation**

Set the interpolation type. Linear or Closest.

## Save all Images

Saves all images. Internal images needs to be saved manually first. They don't have a path yet to which they could be saved. You will get an invalid path warning.

## Stencil Mask

Stencil mask allows mask painting with a stencil map. It is a sub menu tab. In expanded state it shows the falloff curve, which can be edited.

### Activate Stencil map

Activates the stencil map.

### Stencil Image

Choose or load your stencil texture.

### Texture browser

Here you will find a list of currently loaded textures.

### Edit Box

The currently active stencil texture.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**The shield icon button** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

### UV Layer

At which UV map the stencil texture is active.

### Display Color

The stencil color in the viewport.

### Invert the stencil color

Inverts the stencil color.

## Cavity Mask

Cavity mask allows mask painting according to mesh geometry cavity. It is a sub menu tab. In expanded state it shows the falloff curve, which can be edited.

### **Activate Cavity mask**

Activates the Cavity mask.

### **Navigation elements**

The navigation elements at the top are described from left to right.

### **Zoom in and out**

The two buttons with the magnifying glass at it zooms in and out in the curve window.

### **Zoom in and out**

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

### **Reset Curve**

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke.

### **Delete Points**

Deletes selected curve points.

## Curve Object - Edit Mode

### Set Handle Type

Handles defines the type of handle for the control points of the curve. You have the choice between Auto, Vector, Align and Free. And the Last Operator gives you a fifth possibility to toggle between Free and Align.

#### Auto

Auto aligns the handles automatically.

#### Vector

Set Handle type to Vector.

#### Align

Set Handle type to Align.

#### Free

Set Handle type to Free.

#### Toggle Free/Aligned

Toggle Free/Aligned.

#### Last Operator Set Handle Type

##### Type

Type is a drop-down box where you can set the handle type. You have the choice between Auto, Vector, Align, Free. And the fifth possibility toggles between Free and Align.

# Viewport Overlays - all modes

Turn on or off all overlays. This includes the ground grid, things like relationship lines, and several other elements in the viewport. Some content is available in all modes. Some content is changing, dependent of the mode you are in. In Edit mode with a mesh object you will get some normal functionality for example.

## Guides

### Grid

Show the whole ground grid, including axes. You can also show the grid in orthographic mode of the viewport.

### Floor

Show the ground grid, the white part of it.

### Axes

Show the colored axis lines in the 3d view  
( now works in both perspective / orthographic Views).

### Scale

Scale the ground grid. This works in perspective and orthographic view.

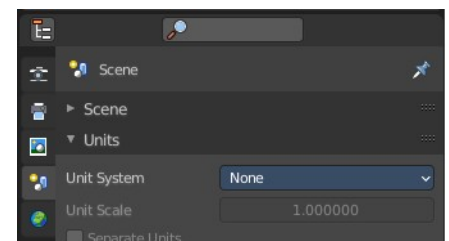

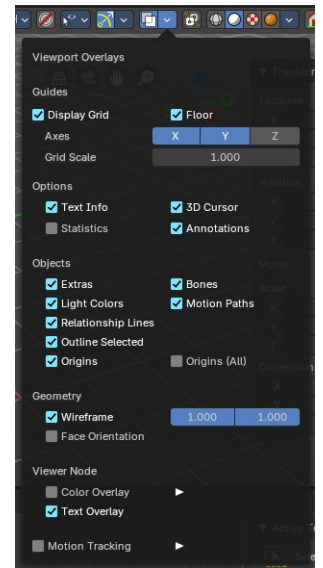

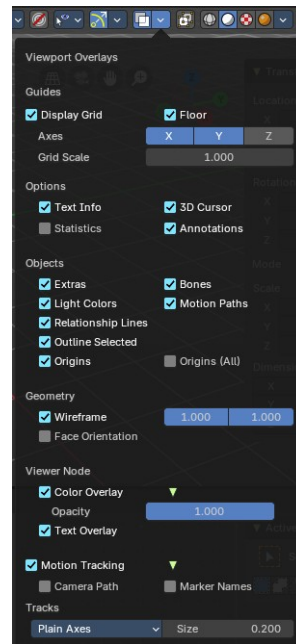

### Subdivisions

Subdivisions just shows with a Unit system of None. It allows you to subdivide the ground grid.

## Options

### Text Info

In the upper left corner of the 3D view there is a text info string, which can be hidden here. It

tells you in what view you are, what is selected, and things like frames per second when you play an animation

## Annotations

Show or hide annotations. Annotations can be drawn at the 3D View with the annotation tool in the tool shelf.

## Statistics

Displays statistical informations in the upper left corner of the 3d viewport. Object count, vertices, and so on.

## 3D Cursor

Show or hide the 3D cursor. That's the white red circle in the center of the viewport.

## Camera Guides

Just in Camera mode.

Display the dotted line around the inside of the passepoutout.

## Objects

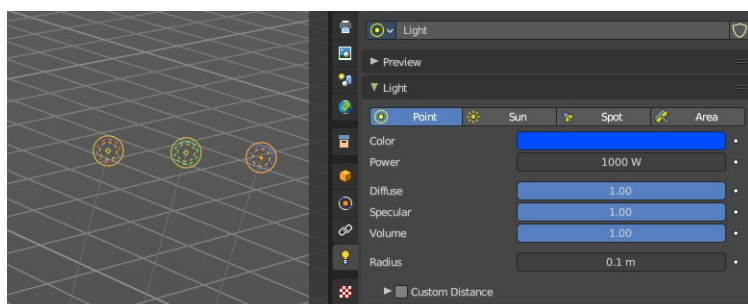

### Extras

Show or hide object details. Including things like empty wires like lights, cameras, and other visual guides.

### Light Colors

Displays the light widget in the color of the light.

### Relationship Lines

Show or hide relationship lines. When you for example parent one object to another then you will see a dotted line. The relationship line.

## Outline Selected

Show the selected object with an outline

## Bones

Show or hide bones.

## Motion Paths

Show or hide motion paths. Motion paths can be calculated in the Motion Paths panel. You need an animation for that.

## Origins

Show or hide the origin of the selected object. The origin is the center point of the object, and represented by an orange dot.

## Origins(All)

Show or hide the origin of all objects. Even from hidden ones. The not selected objects shows the center point with a white dot.

## Geometry

Geometry related settings.

## Wire frame

Show the wire frame in object mode.

## Wireframe Threshold

With a wire frame value of 1 all edges are drawn. The lower the value, the more edges will disappear.

## Opacity

The opacity of the displayed edges.

## Face Orientation

This mode allows to check for faces with flipped normals, which cannot be seen with the defaults. Blue is pointing outwards, red is pointing inwards.

## Fade inactive Geometry

Edit mode feature, does not show in other modes. Fades the not active geometry, the not selected scene objects, towards a plain grey. In Object mode this setting has no effect.

## Viewer Node

Viewer node related settings.

### Color Overlay

Enable color overlay in viewport for geometry attributes that are connected to an enabled Geometry Nodes' viewer node.

### Opacity

The opacity of the color overlay mentioned above.

### Text Overlay

Show geometry attribute values that are connected to an enabled Geometry Nodes' viewer node as text in viewport. This option just shows when you have geometry nodes at the object, and there is a viewer node in the tree. Example with index values:

## Motion Tracking

Motion tracking related settings. When you turn it on, then some further options appears. These features just shows before you bake the solution. Not with the resolved solution.

### Camera Path

Shows the camera path.

## Marker Names

Shows the marker names.

## Track display type

How to display the tracks.

## Track size

Adjust the display size of the tracks of reconstructed data

# Viewport Overlays - Mesh Object - Edit Mode

The Viewport Overlays panel shows different content, dependent of mode and object type. This is with mesh object in edit mode.

## Mesh Edit Mode

### Faces

Highlight faces by using a face overlay that applies to both selected and unselected faces.

This affects all selection modes.

### Center

Show face-center points in solid shading modes. This is disabled in wireframe and xray mode.

Only affects face-select mode.

### Creases

Display edges marked with a crease for the Subdivision Surface Modifier.

### Sharp

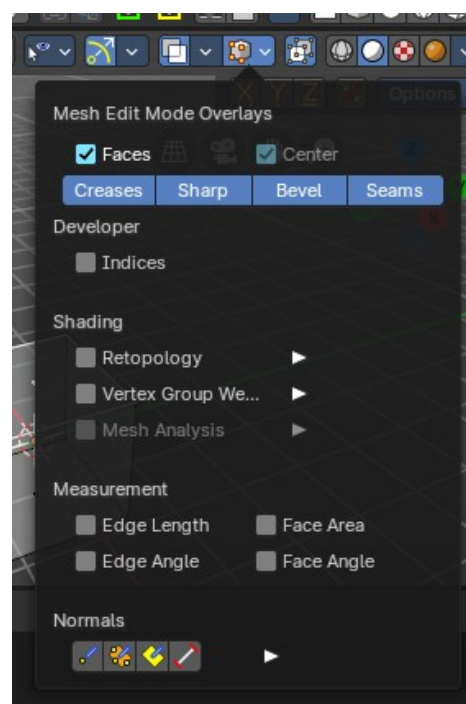

Display sharp edges, used with the edge split modifier.

### Bevel

Display weights created for the Bevel Modifier.

### Seams

Display the UV unwrapping seams.

## Developer

### Indices

Display the indices of selected vertices, edges and faces at the mesh.

## Shading

### Retopology

Hides the solid mesh and offset the overlay towards the view to make retopology easier. The selection is occluded by inactive geometry. You have to enable X-ray.

### Vertex Groups Weights

Display weights in Edit Mode. When you activate this feature then further options appears.

#### Zero Weights

##### None

Don't show the vertices with zero weights with a specific color. They appear blue like vertices with a very low weighting.

##### Active

Zero weights vertices are shown with a black color in the active vertex group.

##### All

Zero weights vertices are shown with a black color in all vertex groups of the mesh.

## Mesh Analysis

Show the mesh analysis overlay and settings. Note that editing may be slow with mesh analysis tools on. And modifiers can make trouble.

### Type

The mesh analysis type.

## Overhang

Extrusion 3D printers have a physical limit to the overhang that can be printed. The Overhang type shows the overhang in different ways. Angle and axis can be adjusted.

### **Minimum/Maximum**

Minimum/Maximum angle to display.

### **Axis**

Choose which angle to calculate.

---

## Thickness

3D Printers have a limited wall-thickness. Too thin areas cannot be printed. This mode displays thin areas as red.

### **Minimum/Maximum**

Minimum/Maximum thickness to display.

### **Samples**

The number of samples to use to calculate the thickness.

---

## Intersections

A mesh can be made of more than one closed sub mesh. Join two spheres and you have one mesh with two closed sub meshes. Such intersections can be a problem with printing. Intersect marks intersecting areas with red.

---

## Distortion

Marks distorted faces.

Distorted geometry, means uneven quads or N-gons, can cause problems with printing. Since the triangulation of a distorted quad or N-gon is undefined. And printing works with tris. With a quad there are already two solutions in which direction the edge to triangulate the face can point.

### **Minimum/Maximum**

Adjust the minimum and maximum values after which a face gets displayed as distorted.

## Sharp Edges

Similar to wall-thickness, sharp edges can be too thin to be able to print.

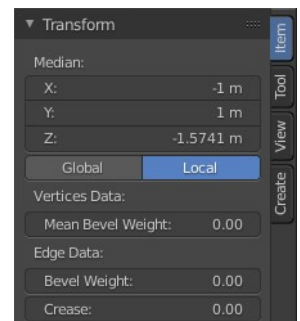

### Minimum/Maximum

Adjust the minimum and maximum values after which an edge gets displayed as sharp.

## Measurement

Shows measure values at the selected elements. The units are displayed as chosen in the preferences. These values respects global/ local in the transform panel. And so the values can differ when you have scaled the mesh in object mode, and the scaling is not applied yet. Use Global to take the object scale into account.

### Edge Length

Shows the length of selected edges.

### Edge Angle

Shows the angle of selected edges between two faces.

### Face Area

Show the area of selected faces.

### Face Angle

Show the angle of selected face corners.

## Normals

Show the normals for the chosen elements. They will be displayed as lines.

### Display vertex normals

Displays the normals of the vertices

### Display split normals

Displays the per vertex face normals

## Display normals

Displays the face normals.

### Constant Screen Size Normals

Display the normals either in size relative to the object. Or constant to the screen size.

Relative to the object is measured in object units. Absolute to the screen size is measured in pixels.

### Size

Adjust the length of the line that represents the normal.

## Freestyle

Freestyle is the line renderer integrated into Bforartists. For freestyle you can mark edges and faces.

### Edge Marks

Display Freestyle edge marks, used with the Freestyle renderer.

### Face Marks

Display Freestyle face marks, used with the Freestyle renderer.

## Viewport Overlays - Mesh Object - Sculpt Mode

### Show Mask

Show mask as overlay on object. The opacity of the overlay can be controlled by the slider.

### Show Face Sets

Show face sets as overlay on object. The opacity of the overlay can be controlled by the slider.

## Viewport Overlays - Mesh Object - Vertex Paint Mode

### Opacity

How strong the painted color gets shown.

## Show Wire

Display the wire at the mesh. Normally the wire is hidden.

# Viewport Overlays - Mesh Object - Weight Paint Mode

## Opacity

The opacity of the color overlay.

## Zero Weights

### None

Don't show the vertices with zero weights with a specific color. They appear blue like vertices with a very low weighting.

### Active

Zero weights vertices are shown with a black color in the active vertex group.

### All

Zero weights vertices are shown with a black color in all vertex groups of the mesh.

## Show Weight Contours

Show contour lines formed by points with the same interpolated weight.

## Show Wire

Display the wire at the mesh. Normally the wire is hidden.

## Show Bone X Ray

This prop just shows when you have both, the bone and the mesh object selected by holding down shift, and switch to weight paint.

This has in general the same effect than draw in front. It shows the bones on top of the mesh geometry.

# Viewport Overlays - Mesh Object - Texture Paint Mode

## Stencil Opacity

How strong the painted color gets shown.

# Viewport Overlays - Hair Object - Sculpt Mode

## Selection Opacity

How solid not selected curves are displayed. Note that you can't make them fully transparent.

## Curves Cage

Highlight the selected curves.

## Cage Opacity

How strong selected curves are highlighted.

# Viewport Overlays - Pose Mode

## Show Bone X Ray

This has in general nearly the same effect than draw in front. It shows the bones on top of the mesh geometry. But you can fade the mesh geometry to black.

## Opacity

The opacity of the object in the background.

# Viewport Overlays - Grease Pencil

## In Object Mode

### Onion Skin

Show ghosts of the key frames before and after the current frame.

### Canvas

Display a grid over Grease Pencil drawing plane. The opacity of the grid can be controlled with a slider.

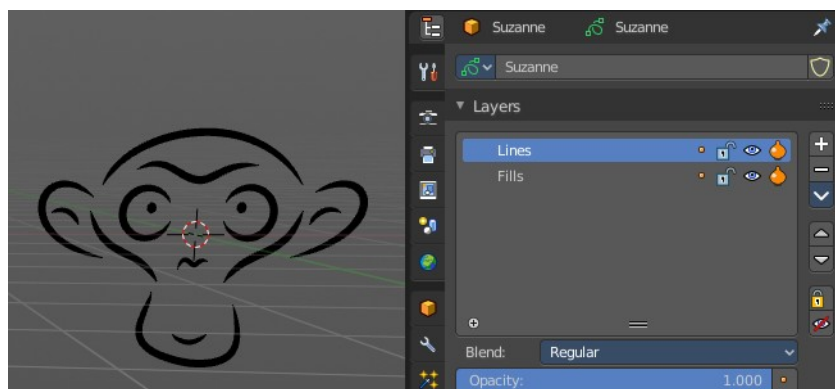

## Canvas X Ray

Show the grid in front of the stroke.

## Fade Layers

Controls the opacity of the not selected layers in the current grease pencil object.

I have set the fade layers opacity to 1 here. When you select the other layer, then the inner part becomes visible again, and the black outlines hides.

## Fade Objects

Fades everything in the viewport but the grease pencil color to black.

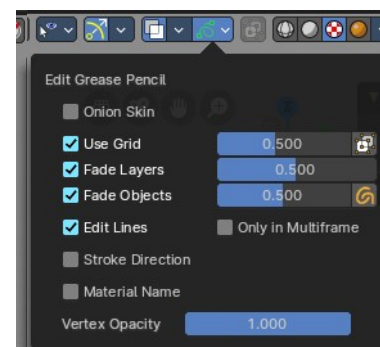

## Fade Grease Pencil Objects

Fades the not active grease pencil objects to black too.

---

## In Edit Mode

## Onion Skin

Show ghosts of the key frames before and after the current frame.

## Canvas

Display a grid over Grease Pencil drawing plane. The opacity of the grid can be controlled with a slider.

## Canvas X Ray

Show the grid in front of the stroke.

## Fade Layers

Control the opacity of the not selected layers in the current grease pencil object.

I have set the fade layers opacity to 1 here. When you select the other layer, then the inner part becomes visible again, and the black outlines hides.

## Fade Objects

Fades everything in the viewport but the grease pencil color to black.

## Fade Grease Pencil Objects

Fades the not active grease pencil objects to black too.

## Edit Lines

Show the edges of the curve when editing strokes.

## Stroke Direction

Shows a red and a green dot at the end of the stroke. Green dot is start. Red dot is end.

## Only in multi frame

Only show edges of the curve while in multi frame edition.

## Material Name

Displays the material name at the start of the stroke.

## Vertex Opacity

With Curve Editing off. How strong the selected vertices of the stroke shows.

## Handles

With Curve Editing on. Limit the display of curve handles in edit mode.

### None

Don't limit the handles.

### Selected

Just limit the selected handles.

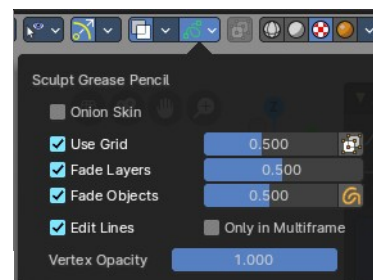

## All

Limit all handles.

## In Sculpt and Weight paint Mode

### Onion Skin

Show ghosts of the key frames before and after the current frame.

### Canvas

Display a grid over Grease Pencil drawing plane. The opacity of the grid can be controlled with a slider.

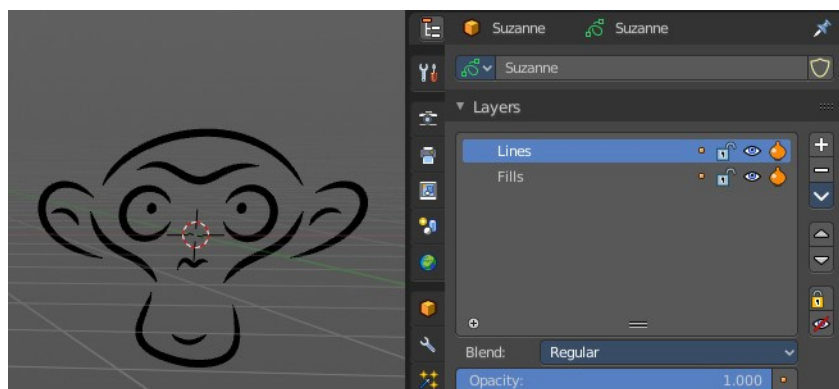

### Canvas X Ray

Show the grid in front of the stroke.

### Fade Layers

Control the opacity of the not selected layers in the current grease pencil object.

I have set the fade layers opacity to 1 here. When you select the other layer, then the inner part becomes visible again, and the black outlines hides.

### Fade Objects

Fades everything in the viewport but the grease pencil color to black.

### Fade Grease Pencil Objects

Fades the not active grease pencil objects to black too.

### Edit Lines

Show the edges of the curve when editing strokes.

### Only in multi frame

Only show edges of the curve while in multi frame edition.

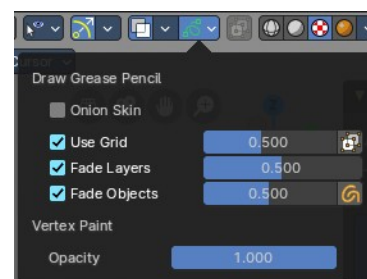

### Vertex Opacity

Sculpt mode only. How strong the selected vertices of the stroke shows.

## In Draw Mode

### Onion Skin

Show ghosts of the key frames before and after the current frame.

### Canvas

Display a grid over Grease Pencil drawing plane. The opacity of the grid can be controlled with a slider.

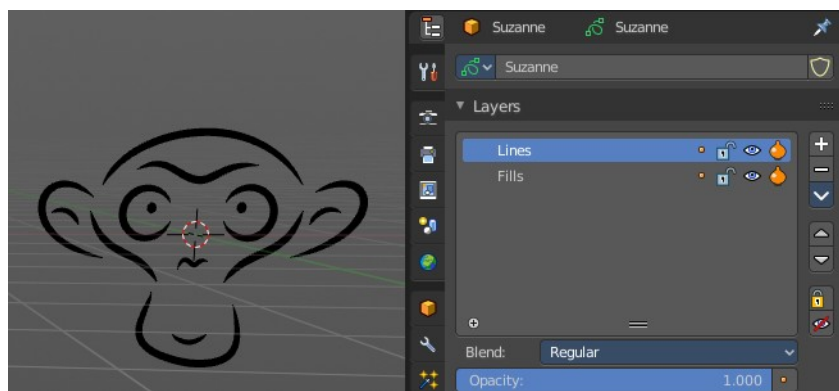

### Canvas X Ray

Show the grid in front of the stroke.

### Fade Layers

Control the opacity of the not selected layers in the current grease pencil object.

I have set the fade layers opacity to 1 here. When you select the other layer, then the inner part becomes visible again, and the black outlines hides.

### Fade Objects

Fades everything in the viewport but the grease pencil color to black.

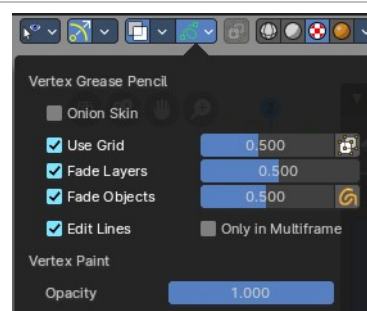

### Fade Grease Pencil Objects

Fades the not active grease pencil objects to black too.

### Vertex Opacity

How strong the selected vertices of the stroke shows.

## In Vertex Paint mode

## Onion Skin

Show ghosts of the key frames before and after the current frame.

## Use Grid

Display a grid over Grease Pencil drawing plane. The opacity of the grid can be controlled with a slider.

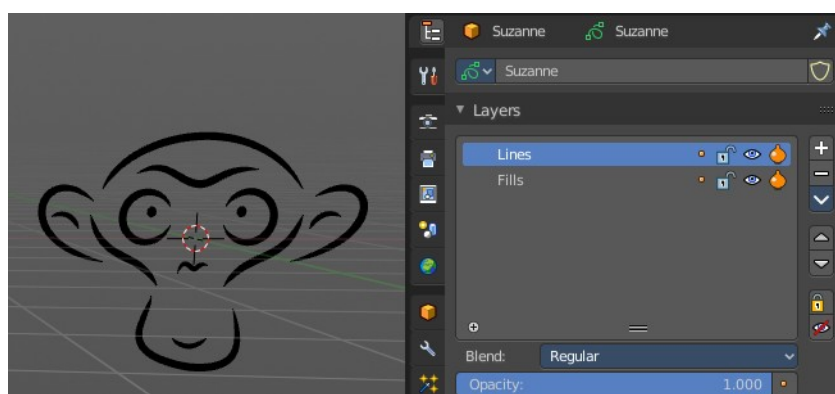

## Canvas X Ray

Show the grid in front of the stroke.

## Fade Layers

Control the opacity of the not selected layers in the current grease pencil object.

I have set the fade layers opacity to 1 here. When you select the other layer, then the inner part becomes visible again, and the black outlines hides.

## Fade Objects

Fades everything in the viewport but the grease pencil color to black.

## Fade Grease Pencil Objects

Fades the not active grease pencil objects to black too.

## Edit Lines

Show the edges of the curve when editing strokes.

## Only in multi frame

Only show edges of the curve while in multi frame edition.

## Vertex Opacity

How strong the selected vertices of the stroke shows.

## Opacity

The vertex paint opacity.

# Viewport Shading

At the very right of the header you can find the viewport shading settings. Here you adjust the display of the viewport. The order goes from left to right.

## Show X Ray

This viewport setting is connected with the viewport shading. It allows you to show and edit the back geometry. Or hide it, so that you can just edit the geometry that points forwards.

## Viewport Shading

Defines how geometry gets displayed in the viewport.

### Wire frame

Displays the content in the viewport as Wire frame.

### Solid

Displays the content in the viewport with a solid white color.

### Material

Displays the content in the viewport with all material settings and with OpenGL rendering. Note that this does not exist when you choose the Workbench renderer.

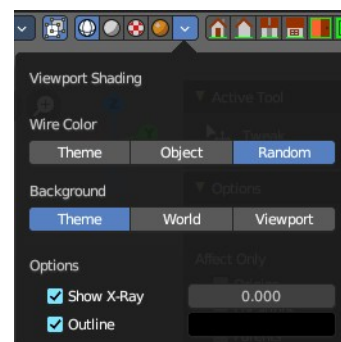

### Rendered

Displays the content in the viewport like you would have rendered it. This mode is dependent of what render engine you have currently active.

## Viewport Shading Settings

The viewport shading panel. Its settings changes, dependent of which viewport shading mode you have activated. And provides you with further settings for it.

### Viewport Shading Settings with Wire frame

### Color

#### Single

The selected object gets highlighted. The wire frame is the color of the selection outline. The not selected objects shows a black wire frame.

## Object

The selected object gets highlighted. The wire frame is white. The not selected objects shows a Grey wire frame.

## Random

The selected object gets highlighted. The wire frame is a random wire frame color. The not selected objects shows a random wire frame color. You cannot influence this random color. It is random.

## Background

### Theme

Uses the viewport background color as defined in the theme.

### World

Uses the world background color as the viewport background color.

### Viewport

Defines a custom color for the viewport background color.

## Options

### Show X Ray

This viewport setting is connected with the viewport shading. It allows you to show and edit the back geometry. Or hide it, so that you can just edit the geometry that points forwards.

### X Ray Alpha

Adjust the amount of transparency.

## Outline

Show the not selected objects with an outline.

### Outline Color

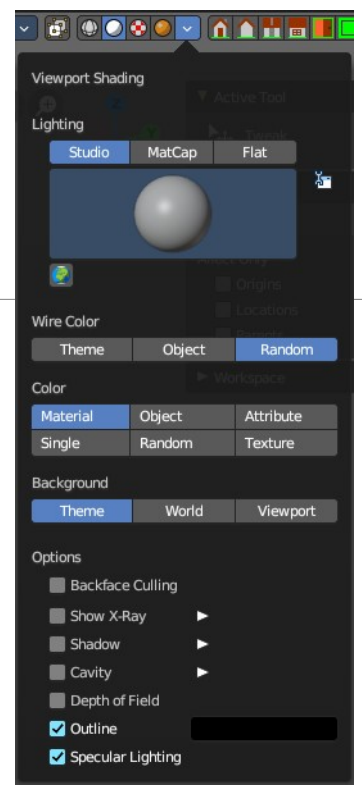

Defines the color of the outline for not selected objects.

## Viewport shading Settings with Solid

### Lighting

Choose between different lighting methods.

Note that this methods are not for rendering the scene. This lighting methods are meant to light the viewport.

## Studio

Uses a studio setup lighting. You can choose between several studio light setups in the library menu below. This library menu is a box with a preview of the currently active light setup.

## World Space Lighting

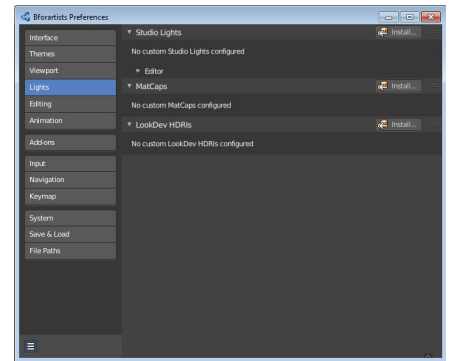

Make the lighting fixed to the world. And not follow the camera when you rotate around the scene.

## Rotation

The rotation of the light setup. This edit box is just active when you use World Space Lighting.

## Show Light Preferences

At the right of the drop down box you will see a tiny button. It will open the preferences, where you can edit the existing studio light setups, or add new Studio light setups. This chapter is explained in the preferences manual part.

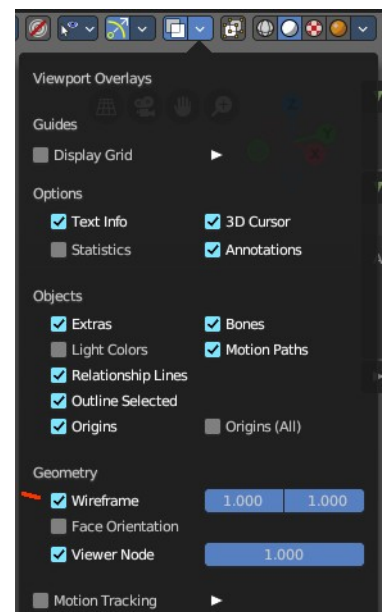

## Wire Color

Allows you to display the wire color in different colors. Note that you need to have Wireframe display activated in the Viewport Overlays to see this effect.

## Theme

Displays the wireframe color as defined in the theme.

## Object

Displays the wireframe color object based.

## Random

Displays the wireframe color in a random color.

## Color

Influence how the objects in the scene are colored. Just one setting can be active at one time.

### Material

Uses the color of the material, in case a material is assigned to the object(s).

### Object

Uses the Object color.

### Vertex

Shows the vertex colors in case vertex colors exists.

### Single

Define a custom color. A color picker box appears when you activate single.

### Random

Colors the objects with a random color

### Texture

Shows the texture in case a material with a texture is assigned to the object(s).

---

## Background

Define the look of the viewport background

### Theme

Uses the background as defined in the theme.

### World

Uses the background as defined in the world settings of the scene.

## Viewport

Use a custom color. When you activate this setting, then a color picker field appears, adjust a custom color.

## Options

### Back face Culling

Use back face culling to hide backsides of faces.

### Show X Ray

This viewport setting is connected with the viewport shading. It allows you to show and edit the back geometry. Or hide it, so that you can just see and edit the geometry that points forwards.

Note that you can either have Show X Ray active. Or Shadow and Cavity.

### X Ray Alpha

Adjust the strength of the transparency effect.

### Shadow

Cast a shadow. Note that the shadow casting light is not part of the chosen studio light. It is an independent light.

### Shadow Intensity

Here you adjust the strength of the shadow. Higher value means darker shadow.

### Light Settings

Adjust some settings of the light.

### Light Direction

Click into the field and drag the mouse to change the direction of the light that casts the shadow.

### Shadow Shift

The shadow termination angle. This can be used to minimize self shadowing artifacts.

### Shadow Focus

The shadow hardness. It controls the falloff near the edge of the shadow.

## Cavity

Show Cavity. Cavity highlights ridges and valleys in the scene geometry. When you activate this setting, then further settings appears.

## Type

The method how to calculate the cavity. In worlds pace, in screen space. Or in both.

## World

Draw the cavity shading in world space.

## World Space / Ridge Valley

Factor for the cavity ridges and valleys.

## Shading Options

Adjust samples, distance and attenuation for the cavity ridges and valleys.

## Screen

Draw the cavity shading in Screen space.

## Screen Space / Ridge Valley

Factor for the curvature ridges and valleys.

## Both

Draw the cavity shading in both, World Space and Screen space.

Settings see above.

---

## Depth of Field

Use depth of field for the viewport. It uses the values from the active camera.

---

## Outline

Show the not selected objects with an outline.

## Outline Color

Define the color of the outline for not selected objects.

## Specular Lighting

Render specular highlights.

---

## Matcap

Matcap stands for material capture. With Matcap you use a special matcap shader at the mesh. This shader is usually something colorful, which makes for example sculpting easier.

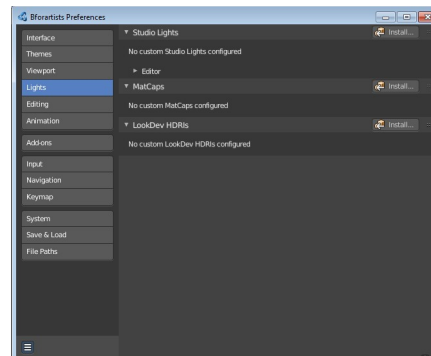

You can choose between several matcap setups in the library menu below. This library menu is a box with a preview of the currently

active matcap setup.

## Show Light Preferences

At the right of the library menu box you will see a tiny button. It will open the preferences, where you can edit the existing studio light setups, or add new Studio light setups. This chapter is explained in the preferences manual part.

## Flip Matcap

Some matcaps have a direction from which the light comes. With Flip Matcap you can flip this direction.

## Color

Influence how the objects in the scene are colored. Just one setting can be active at one time.

## Material

Uses the color of the material, in case a material is assigned to the object(s).

## Object

Uses the Object color.

## Vertex

Shows the vertex colors in case vertex colors exists.

## Single

Define a custom color. A color picker box appears when you activate single.

## Random

Colors the objects with a random color

## Texture

Shows the texture in case a material with a texture is assigned to the object(s).

## Background

This defines the look of the viewport background

### Theme

Uses the background as defined in the theme.

### World

Uses the background as defined in the world settings of the scene.

### Viewport

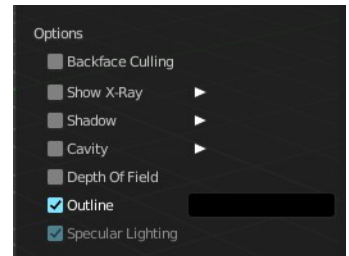

Use a custom color. When you activate this setting, then a color picker field appears, adjust a custom color.

## Options

### Back face Culling

Use back face culling to hide backsides of faces.

### Show X Ray

This viewport setting is connected with the viewport shading. It allows you to show and edit the back geometry. Or hide it, so that you can just see and edit the geometry that points forwards.

Note that you can either have Show X Ray active. Or Shadow and Cavity. When activating Show X Ray, the other two options will be hidden.

### X Ray Alpha

Adjust the strength of the transparency effect.

### Shadow

Cast a shadow. Note that the shadow casting light is not part of the chosen studio light. It is an independent light.

### Shadow Intensity

Here you adjust the strength of the shadow. Higher value means darker shadow.

### Light Settings

Adjust some settings of the light.

## Light Direction

Click into the field and drag the mouse to change the direction of the light that casts the shadow.

## Shadow Shift

The shadow termination angle. This can be used to minimize self shadowing artifacts.

## Shadow Focus

The shadow hardness. It controls the falloff near the edge of the shadow.

## Cavity

Show Cavity. Cavity highlights ridges and valleys in the scene geometry. When you activate this setting, then further settings appears.

### Type

The method how to calculate the cavity. In worlds pace, in screen space. Or in both.

### World

Draw the cavity shading in world space.

### World Space / Ridge Valley

Factor for the cavity ridges and valleys.

### Shading Options

Adjust samples, distance and attenuation for the cavity ridges and valleys.

### Screen

Draw the cavity shading in Screen space.

### Screen Space / Ridge Valley

Factor for the curvature ridges and valleys.

### Both

Draw the cavity shading in both, World Space and Screen space.

Settings see above.

## Outline

Show the not selected objects with an outline.

## **Outline Color**

Define the color of the outline for not selected objects.

## **Specular Lighting**

Render specular highlights.

### **Flat**

Lights the objects plain white.

### **Color**

Influence how the objects in the scene are colored. Just one setting can be active at one time.

### **Material**

Uses the color of the material, in case a material is assigned to the object(s).

### **Object**

Uses the Object color.

### **Vertex**

Shows the vertex colors in case vertex colors exists.

### **Single**

Define a custom color. A color picker box appears when you activate single.

### **Random**

Colors the objects with a random color

### **Texture**

Shows the texture in case a material with a texture is assigned to the object(s).

## **Background**

Define the look of the viewport background.

### **Theme**

Uses the background as defined in the theme.

### **World**

Uses the background as defined in the world settings of the scene.

### **Viewport**

Use a custom color. When you activate this setting, then a color picker field appears, adjust a custom color.

## Options

### Back face Culling

Use back face culling to hide backsides of faces.

### Show X Ray

This viewport setting is connected with the viewport shading. It allows you to show and edit the back geometry. Or hide it, so that you can just see and edit the geometry that points forwards.

Note that you can either have Show X Ray active. Or Shadow and Cavity. When activating Show X Ray, the other two options will be hidden.

### X Ray Alpha

Adjust the strength of the transparency effect.

### Shadow

Cast a shadow. Note that the shadow casting light is not part of the chosen studio light. It is an independent light.

### Shadow Intensity

Here you adjust the strength of the shadow. Higher value means darker shadow.

### Light Settings

Adjust some settings of the light.

### Light Direction

Click into the field and drag the mouse to change the direction of the light that casts the shadow.

### Shadow Shift

The shadow termination angle. This can be used to minimize self shadowing artifacts.

### Shadow Focus

The shadow hardness. It controls the falloff near the edge of the shadow.

### Cavity

Show Cavity. Cavity highlights ridges and valleys in the scene geometry. When you activate this setting, then further settings appears.

## Type

The method how to calculate the cavity. In worlds pace, in screen space. Or in both.

## World

Draw the cavity shading in world space.

## World Space / Ridge Valley

Factor for the cavity ridges and valleys.

## Shading Options

Adjust samples, distance and attenuation for the cavity ridges and valleys.

## Screen

Draw the cavity shading in Screen space.

## Screen Space / Ridge Valley

Factor for the curvature ridges and valleys.

## Both

Draw the cavity shading in both, World Space and Screen space.

Settings see above.

## Outline

Show the not selected objects with an outline.

## Outline Color

This defines the color of the outline for not selected objects.

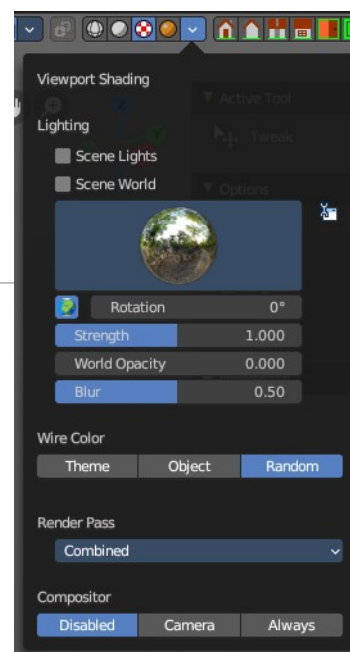

## Specular Lighting

Render specular highlights.

## Viewport Shading with Material Preview

In this mode you can use a hdr file to light the scene.

This mode is just available with Cycles and Eevee renderer. Workspace renderer

does not have this mode.

## **Lighting**

### **Scene Lights**

Use the scene lights instead of the hdr to light the scene.

### **Scene World**

Use the scene world to light the scene. This turns off the hdr. And the further options are not longer available.

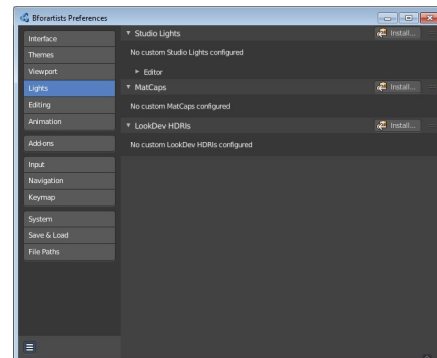

### **hdr file browser**

Pick a hdr file to light the world with.

### **Show light preferences**

At the right of the library menu box you will see a tiny button. It will open the preferences, where you can edit the existing studio light setups, or add new Studio light setups. This chapter is explained in the preferences manual part.

### **World Space Lighting**

Make the hdr rotation fixed, and not follow the camera.

### **Rotation**

The rotation of the hdr file.

### **Background**

Show the studio light in the background. The higher the value the more the studio light gets mixed into the hdr.

### **World Opacity**

Show the studio light in the background

### **Blur**

The blur factor.

## Wire Color

Allows you to display the wire color in different colors. Note that you need to have Wireframe display activated in the Viewport Overlays to see this effect.

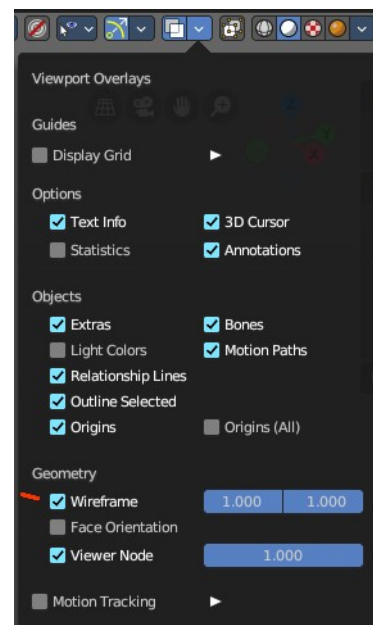

### Theme

Displays the wireframe color as defined in the theme.

### Object

Displays the wireframe color object based.

### Random

Displays the wireframe color in a random color.

## Render Pass

Choose what render passes to calculate.

## Compositor

Allows you to display the compositor result in the viewport. Note that you need to have a active compositor node setup for this to work.

### Disabled

To display the compositor result in the viewport is disabled.

### Camera

Displays the compositor result when you are in camera view.

### Always

Always displays the compositor result.

## Viewport Shading with Rendered

With rendered shading the viewport uses the renderer settings of the chosen render engine. Workbench has no specific shading settings here. And the panel is empty. Cycles and Eevee have some further settings.

### Lighting

#### Scene Lights

Render lights and light probes in the scene.

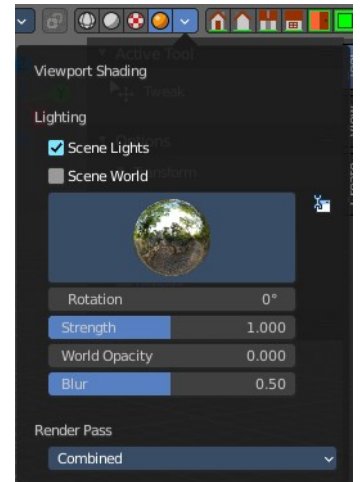

#### Scene World

Use scene world for lighting. When you turn off Scene World then you reveal further settings.

### Studiolight Preview

Displays the current active hdri file to light the scene. A click at the display allows you to pick another hdri file.

#### Show Light preferences

Opens the light preferences in the preferences where you can pick more hdri files.

### Rotation

The rotation of the studio light.

### Strength

The strength of the studio light.

### World Opacity

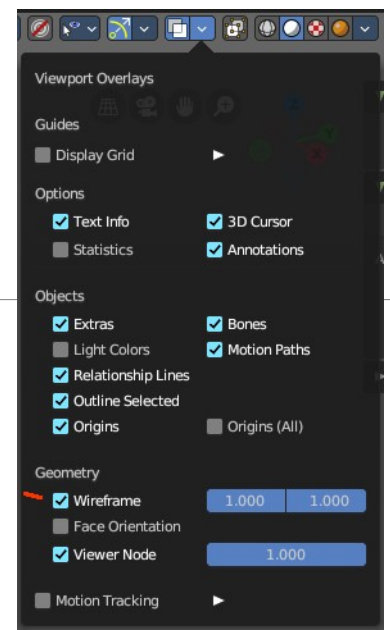

The opacity of the hdri.

### Blur

Eevee. Blur the studiolight in the background.

### Wire Color

Allows you to display the wire color in different colors. Note that you need to

have Wireframe display activated in the Viewport Overlays to see this effect.

### Theme

Displays the wireframe color as defined in the theme.

### Object

Displays the wireframe color object based.

### Random

Displays the wireframe color in a random color.

### Render Pass

Choose what render passes to calculate.

### Compositor

Allows you to display the compositor result in the viewport. Note that you need to have a active compositor node setup for this to work.

### Disabled

To display the compositor result in the viewport is disabled.

### Camera

Displays the compositor result when you are in camera view.

### Always

Always displays the compositor result.

### Pause Preview

When you choose the Cycles renderer and set the viewport shading mode to rendered, then it reveals one more button at the right. Pause Preview pauses the rendering in the viewport when Cycles is chosen as the viewport renderer.

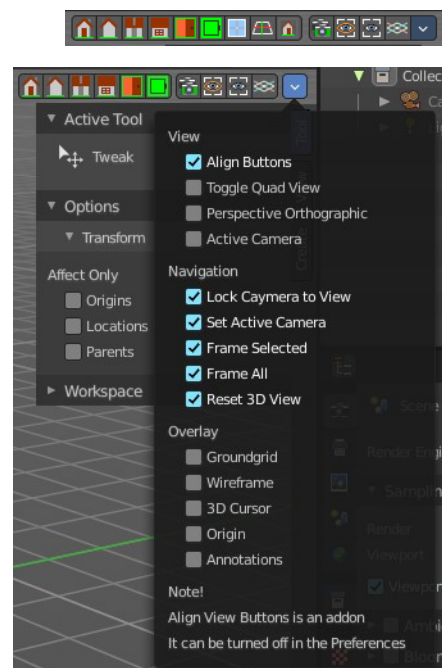

## Align View Buttons

Align View Buttons is an addon. The buttons allows you to align the view to the orthographic views. And brings further functionality from the View menu and other hard to reach locations.

The content is all a double entry by purpose, to have these buttons at the top hierarchical position for quick access. And it is already described at the original UI position. So we won't go into detail here.

This addon can be turned off in the Preferences.

## Grease Pencil - all modes - Layer Panel

This panel shows in most of the modes. It is the same content than the Layers panel in the Object Data Properties.

### Layer list

#### Layer name

The name of the layer.

#### Mask Layer

Toggle the Masks visibility in the layer.

#### Onion Skinning

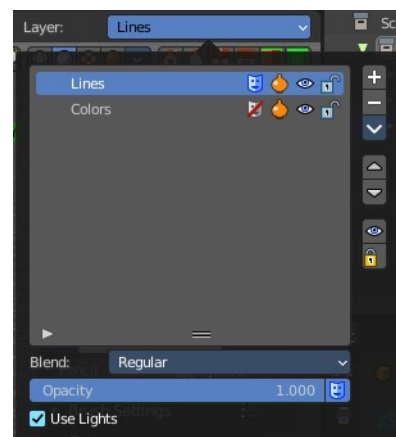

Toggle the use the layer for Onion Skinning.

#### Viewport/Render Visibility

Toggle layer visibility in the viewport and in render.

#### Lock

Toggle layer from being editable.

## Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## Add new layer

Adds a new layer.

## Remove layer

Removes the selected layer.

## Layer Specials

### Duplicate Layer

Makes an exact copy of the selected layer appending a number to differentiate its name.

### Duplicate Empty Keyframes

Makes a copy of the active grease pencil layer.

### Show All

Turns on the visibility of every layer in the list.

### Hide Others

Turns off the visibility of every layer in the list except the active one.

### Lock All

Locks edition of all the layers in the list

### Unlock All

Unlocks edition of all the layers in the list.

### Autolock inactive layer

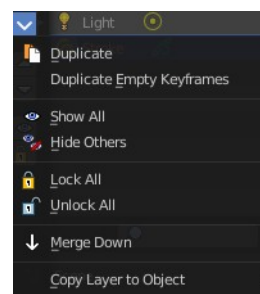

Locks automatically the edition of every layer in the list except the active one. This way you avoid to make unwanted changes in other layers without the need to lock them every time.

### Merge Down

Merge the selected layer with the layer below, the new layer keeps the name of the lower layer.

### Copy Layer to Object

Makes a copy of the layer and move it to the selected Grease Pencil object.

## Isolate Layer

Hide and lock the layer.

## Isolate Layer

Lock the layer.

## Blend

The layer blending operation to perform. See Color Blend Modes.

## Opacity

Used to set the opacity of the layer.

## Use Lights

When enabled, the layer is affected by lights.

## Grease Pencil - Edit mode - Options Panel

### Scale Stroke Thickness

Scale the stroke thickness when transforming strokes.

## Grease Pencil - Sculpt mode - Auto-masking Panel

Automasking settings.

### Stroke

Affect only strokes below the cursor that are the same stroke.

### Layer

Affect only strokes below the cursor that are at the same layer.

### Material

Affect only strokes below the cursor that have the same material.

## **Active Layer**

Affect only the active layer.

## **Active material**

Affect only strokes with the active material.

## Weight Paint Mode - Weights Menu

### Legacy submenu

The legacy sub menu contains legacy menu items. These tools exist in the toolbar.

### Sample Weight

Pick the weight under the mouse by a click.

### Sample Group

Pick the group under the mouse by a click.

### Gradient (Linear)

Allows you to draw a gradient at the mesh. Click, drag the mouse, release. The gradient will be applied linear in drag direction.

### Gradient( Radial)

Allows you to draw a gradient at the mesh. Click, drag the mouse, release. The gradient will be applied radial from the mouse position.

---

### Assign from Bone Envelopes

Weights the vertices from the connected bone envelopes. And takes the distance to the bone envelope into account.

### Assign Automatic from Bones

Weights the vertices connected with the bone. And takes the distance to the bone into account.

## Last Operator Weight from Bones

This last operator is the same for both tools. Assign Automatic from Bones, and Assign from Bone Envelopes.

### **Type**

Choose if you want to Assign from Bone Envelopes, or from Bones.

---

## Normalize All

Normalize all normalizes the weight of all Vertex groups so that the values for the single vertices in the sum is 1.

## Last Operator Normalize all

### **Subset**

Subset is a drop-down menu choose the Subset method.

### **Lock Active**

Normalize just the other groups. Not the active group.

---

## Normalize

Normalize normalizes the weight of the current selected Vertex group so that the values for the single vertices in the sum is 1. Means when there is influence from other groups, then those values are kept, but the one for the current group gets lowered so that the sum is 1.

---

## Mirror

Mirror Vertex Group mirrors Vertex Groups and flips weights and/or names. It only edits selected Vertices. It flips when both sides are selected. Otherwise it copies from Unselected.

## Last Operator Mirror Vertex Group

### **Mirror Weights**

With Mirror Weights ticked it mirrors the weights.

### **Flip Group Names**

With Flip Group Names ticked it flips the Group names

### **All Groups**

Mirrors all Vertex Groups.

## ***Topology Mirror***

Uses topology based mirroring. This requires matching mirrored topology.

---

## **Invert**

Invert inverts the weight painting for the selected vertex group.

### **Last Operator Invert Vertex Group**

#### ***Subset***

Subset is a drop-down menu choose the Subset method.

#### ***Add Weights***

Add Vertices from Groups that have zero Weighting before inverting.

#### ***Remove Weights***

Remove Vertices from Groups that have zero weight after inverting.

---

## **Clean**

Removes Vertex group assignments that are not required from the active vertex group.

### **Last Operator Clean Vertex Group**

#### ***Subset***

Subset is a drop-down menu choose the Subset method.

#### ***Limit***

Remove weights that are below or equal to the limit value.

#### ***Keep Single***

Keep Vertices assigned to at least one vertex group when cleaning.

## **Quantize**

Quantize quantizes the weight paint values. It starts with 4 steps. With a step of 1 you have a single vertex color, no matter how you have painted it before.

## Last Operator Quantize Vertex Weights

### **Subset**

Subset is a drop-down menu choose the Subset method.

### **Steps**

Here you adjust in how many steps the weight paint colors should be divided.

---

## Levels

Adds some offset to the Weight paint, and multiplies it with some gain.

## Last Operator Levels

### **Subset**

Subset is a drop-down menu choose the Subset method.

### **Offset**

Here you adjust the offset.

### **Gain**

Here you adjust the gain.

---

## Smooth

Smooths the weight for selected vertices.

## Last Operator Smooth Vertex Weights

### **Subset**

Subset is a drop-down menu choose the Subset method.

### **Factor**

Here you adjust the factor.

### **Iterations**

Here you adjust how many iterations you use.

### **Expand/Contract**

Expand or contract the weights.

---

## Transfer Weights

Transfer weights allows you to transfer weights from one object to another object in the same space. For example to copy the weight of a body shape to a covering cloth.

### Usage

Make sure the target part is at its location.

In Object mode Select the source object(s). Then shift click to select the target object too. This makes the target object the active object

Switch to Weight Paint mode.

Click the Transfer Weight Button, and the weighting should be transferred to the target object.

You can adjust the result in the Last Operator Transfer Mesh Data panel.

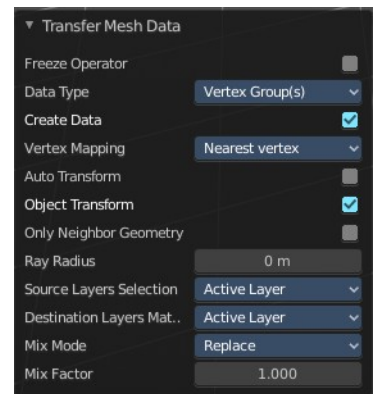

## Last Operator Transfer Mesh Data

### Freeze Operator

Prevent the operator to rerun when you tweak the settings. So that you can tweak many settings at once, then untick to run the operator again.

### Data Type

A drop down box choose the data type to work with.

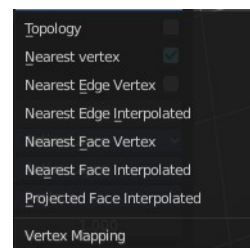

## Create Data

Add Data layers on target object if needed.

## Vertex Mapping

A drop down box choose the vertex mapping method.

## Auto Transform

Automatically compute transformation to get the best possible match between source and target object.

## Object Transform

Calculate the objects in Global space. Unticked means the transfer happens from and to the origin of the objects.

## Only Neighbor Geometry

Source Objects must be closer than given distance to the target objects.

## Ray Radius

The ray distance for Only Neighbor Geometry.

## Source Layers Selection

A drop down box choose the Source Layer selection method.

## Destination Layers Matching

A drop down box choose the Destination Layers matching.

## Mix Mode

A drop down box choose the mix mode. That's how the mapping gets transferred into the target object.

## Mix Factor

The strength of the chosen mix mode.

---

## Limit Total

Limit the number of deform weights for a vertex by removing the lowest weights. For example when five vertex groups are assigned to one vertice, and you set the limit to 4, then the vertice will just be assigned to the

four vertex groups with the highest weight. This is useful for game content where the game engine has a limit for how much bones can be connected to one vertice.

## Last Operator Limit Number of Weights

### **Subset**

A drop down box choose to work with the Active Group or All Groups.

### **Limit**

Set the limit.

## Set Weight

This tool is just active when you have either Face Selection Masking or Vertex Selection Masking activated.

The tool fills the selection with the current active weight color that you have adjusted in the Brush panel in the Tools tab in the Tool shelf.

## Locks

Locks is a sub menu with which you can modify the vertex group locks in the properties editor.

The names should be self explaining.

## Last Operator Change Lock

### **Action**

Choose the locking method again.

### **Mask**

Choose what vertex groups should be affected.

## 7.1.22 Editors - 3D Viewport - Header - Mesh - Texture Paint mode - Brush menu

### Table of content

Texture Paint Mode - Brush Menu.....	1
Color Picker.....	1

## Texture Paint Mode - Brush Menu

With texture mapping type stencil you will see the navigation controls to navigate the stencil map. Same for the texture mask mapping type stencil. These navigation types are hotkey only tools.

### Color Picker

Allows you to pick a color in the 3D view. Hotkey tool!

Move, Rotate Scale Stencil Texture.

## Edit Mode - Curve Menu

The curve menu just exists for curve objects.

## Transform

### To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape. This also works with curves in the same way.

### Last Operator To Sphere

#### Factor

The factor to transform the selection into a shape form.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## ***Proportional Falloff***

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Shear**

Shear shears the selection.

### **Last Operator Shear**

#### ***Offset***

Adjust an offset.

#### ***Shear Axis***

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

#### ***Axis***

Defines one axis of the imaginary shear axis plane.

#### ***Axis Ortho***

Defines the other axis of the imaginary shear axis plane.

#### ***Orientation***

Choose the orientation for the shear action.

## ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Bend**

Bends the selection.

---

## **Push/Pull**

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

### **Last Operator Push/Pull**

#### ***Factor***

Adjust the strength of influence of the tool.

#### ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Warp

Warp a mesh selection between two defined points. This also works with curves.

## Last operator Warp

### *Warp Angle*

The strength of the warp effect.

### *Offset Angle*

An offset angle to bend side wards.

### *Min*

The start point.

### *Max*

The end point.

## Randomize Transform

This tool allows randomizes the positions of the selected vertices.

## Last Operator Randomize Transform

### *Amount*

Adjust the amount.

### *Uniform*

The uniform offset distance.

### *Normal*

Align the offset direction to the normals.

### *Random Seed*

The seed value for randomization.

---

## Radius

Scales the selected curve point along its normals.

A positive value pushes the vertices width outwards. A negative value pushes the vertices width inwards.

**Notes:** Transform orientation and Pivot point gets ignored. To see the result, make sure you have geometry radius applied, without this will be set into the Radius attribute.

## Move Texture Space

Move Texture space is meant for mesh objects, but has also functionality with a curve object.

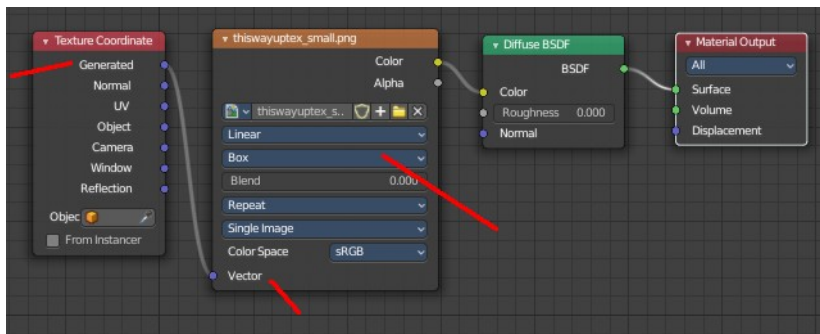

This tool relies at the move tool. With the difference that it moves the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Translate

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box . Choose the type of orientation for the mirroring action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Texture Space

Scale Texture space is meant for mesh objects, but has also functionality with a curve object.

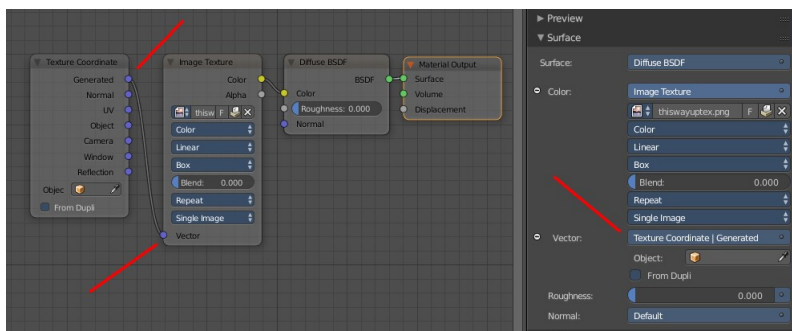

This tool relies at the scale tool. With the difference that it scales the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Resize Texture

### Move X, Y Z

Limit the position relative to the source object.

## Orientation

Orientation is a drop-down box . Choose the type of orientation for the mirroring action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Set Dimensions

Edit Mode Only!

Normally all scale operations in Bforartists are relative to the current selection and dimensions. And you always start with a relative value of 1.

Set dimensions allows to scale mesh selections in absolute world values. No matter how the initial values are. The new values gets set in the Last Operator.

Set dimensions is an add-on. You can turn it off in the add-ons section of the user preferences when you want.

## Last Operator Set Dimensions

### New Dimensions

When you activate the tool then you will see the world coordinates of the selection. Change the values to other world coordinates.

# Mirror

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box . Choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

### Last Operator Snap

Some snap operations shows a last operation panel, some not.

### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Operators

### Duplicate

Duplicates the current selection. This can be a single control point or a whole curve.

The copy sticks to the mouse until you release it. A Right click while moving will reset the position of the duplicate. The duplicated part will be part of the same object.

When you drag the duplicate around you will see the position values in the header.

### Last Operator Duplicate

#### Move X, Y, Z

#### Orientation

Choose the orientation.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Split

Splits the curve at the selected control point(s). You need to select two control points to select the segment between it.

---

## Separate

Separates the selected control points, and creates a new curve object out of it. You need to select two control points to select the segment between it.

---

## Toggle Cyclic

Toggle Cyclic closes or opens the curve.

## Last Operator Toggle Cyclic

### Direction

Direction is a drop-down box . Choose the direction in which the curve gets closed.

---

## Decimate Curve

Decimates the currently selected geometry. It starts with a Ratio of 1. Which means no decimation. The lower the ratio the more decimation you will get.

## Last Operator Decimate Curve

### Ratio

Adjust the strength of decimation.

---

## Set Spline Type

With set Spline Type you can set the type of the curve.

Poly is a straight line between the control points. Bezier has curve handlers. A nurbs curve has a control cage.

## Last Operator Set Spline Type

### Type

Type is a drop-down box . Choose the spline type

### Handles

Use Handles when converting Bezier curves into polygons.

## Show / Hide

### Show Hidden

Makes all curve geometry in the scene visible again.

### Hide Selected

Hides the selected curve geometry.

### Last Operator Hide Selected

#### Unselected

Hides the not selected curve geometry.

### Hide Unselected

Hides the not selected curve geometry. The selected geometry stays visible.

## Delete

### Vertices

Dissolves the selected vertices. When removing vertices in between then the curve stays intact and connected.

## **Segment**

Removes the segment between the selected vertices.

---

## **Dissolve Vertices**

Dissolves the selected vertices. When removing vertices in between then the curve stays intact and connected.

## Edit Mode - Curve Menu

The Surface menu just exists for Surface objects.

Greyed out menu items are not available for surface objects. They are meant for curve objects of type Bezier. Those menu items are not covered here.

## Transform

### To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape. This also works with curves in the same way.

### Last Operator Add Ico Sphere Panel

#### Factor

The factor to transform the selection into a shape form.

## ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

## ***Proportional Falloff***

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Shear**

Shear shears the selection.

## **Last Operator Shear**

### ***Offset***

Adjust an offset.

### ***Shear Axis***

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

### ***Axis***

Defines one axis of the imaginary shear axis plane.

### ***Axis Ortho***

Defines the other axis of the imaginary shear axis plane.

### ***Orientation***

Choose the orientation for the shear action.

## ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Bend**

Bends the selection.

## **Push/Pull**

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

### **Last Operator Push/Pull**

#### ***Factor***

Adjust the strength of influence of the tool.

#### ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Warp

Warp a mesh selection between two defined points. This also works with curves.

## Last operator Warp

### *Warp Angle*

The strength of the warp effect.

### *Offset Angle*

An offset angle to bend side wards.

### *Min*

The start point.

### *Max*

The end point.

## Randomize Transform

This tool allows randomizes the positions of the selected vertices.

## Last Operator Randomize Transform

### *Amount*

Adjust the amount.

### *Uniform*

The uniform offset distance.

### *Normal*

Align the offset direction to the normals.

### *Random Seed*

The seed value for randomization.

## Shrink/Fatten

Shrink/Fatten scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

### Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

#### Offset

Offset is the strength of the offset for Shrink/Fatten.

#### Offset Even

Offset Even scales the selection to give more thickness in even areas.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

#### Proportional Size

See and adjust the falloff radius.

#### Connected

The proportional falloff gets calculated for connected parts only.

#### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Move Texture Space

Move Texture space is meant for mesh objects, but has also functionality with a curve object.

This tool relies at the move tool. With the difference that it moves the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Translate

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Texture Space

Scale Texture space is meant for mesh objects, but has also functionality with a curve object.

This tool relies at the scale tool. With the difference that it scales the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Resize Texture

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Set Dimensions

Edit Mode Only!

Normally all scale operations in Bforartists are relative to the current selection and dimensions. And you always start with a relative value of 1.

Set dimensions allows to scale mesh selections in absolute world values. No matter how the initial values are. The new values gets set in the Last Operator.

Set dimensions is an add-on. You can turn it off in the add-ons section of the user preferences when you want.

## Last Operator Set Dimensions

### New Dimensions

When you activate the tool then you will see the world coordinates of the selection. Change the values to other world coordinates.

## Mirror

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

# Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

# Operators

## Duplicate

Duplicates the current selection. This can be a single control point or a whole curve.

The copy sticks to the mouse until you release it. A Right click while moving will reset the position of the duplicate. The duplicated part will be part of the same object.

When you drag the duplicate around you will see the position values in the header.

## Last Operator Duplicate

### *Move X , Y , Z*

### *Orientation*

Choose the orientation.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Split

Splits the curve at the selected control point(s). You need to select two control points to select the segment between it.

## Separate

Separates the selected control points, and creates a new curve object out of it. You need to select two control points to select the segment between it.

## Toggle Cyclic

Toggle Cyclic closes or opens the curve.

### Last Operator Toggle Cyclic

#### Direction

Direction is a drop-down box. Choose the direction in which the curve gets closed.

## Set Spline Type

With set Spline Type you can set the type of the curve.

Poly is a straight line between the control points. Bezier has curve handlers. A nurbs curve has a control cage.

### Last Operator Set Spline Type

#### Type

Type is a drop-down box. Choose the spline type

#### Handles

Use Handles when converting Bezier curves into polygons.

## Set Handle Type

Handles defines the type of handle for the knots of the curve. You have the choice between Auto, Vector, Align and Free. And the Last Operator gives you a fifth possibility to toggle between Free and Align.

#### Auto

Auto aligns the handles automatically.

## Vector

Set Handle type to Vector.

## Align

Set Handle type to Align.

## Free

Set Handle type to Free.

## Toggle Free/Aligned

Toggle Free/Aligned.

## Last Operator Set Handle Type

## Type

Type is a drop-down box where you can set the handle type. You have the choice between Auto, Vector, Align, Free. And the fifth possibility toggles between Free and Align.

## Show / Hide

### Show Hidden

Makes all curve geometry in the scene visible again.

### Hide Selected

Hides the selected curve geometry.

### Last Operator Hide Selected

#### Unselected

Hides the not selected curve geometry.

### Hide Unselected

Hides the not selected curve geometry. The selected geometry stays visible.

## Delete

### Vertices

Dissolves the selected vertices. When removing vertices in between then the curve stays intact and connected.

## **Segment**

Removes the segment between the selected vertices.

## Edit Mode - Control Points menu

The control points menu exists for Curve and Surface objects in edit mode.

For the surface object type there are not this much operators available.

### Extrude Curve

Extrudes the selected curve point(s).

### Last operator Extrude Curve and Move

### Mode

A drop-down box where you can choose between different extrude modes.

Default is Translation. Most other methods has no effect.

### Move X , Y , Z

The position of the extruded point(s).

### Orientation

Adjust the orientation of the extrusion. It usually starts with Normal.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Extrude to Cursor or Add

Hotkey only tool. Extrude to the mouse position.

## Last Operator Extrude to Cursor or Add

### *Location X Y Z*

The location to extrude to.

---

## Make Segment

Joins two curves by adding a segment between the end of the one and the beginning of the other. You can also create a closed curve that way.

---

## Tilt

Modifies the Mean Tilt.

Activate the tool, and drag the mouse. You will see a value in the header now. The selected curve path will rotate by dragging the mouse.

The Tilt angle always starts at zero. It is relative. To modify the Mean Tilt use the edit box in the Transform panel.

## Last Operator Tilt

### *Angle*

The Tilt angle.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Clear Tilt

Sets the Mean Tilt to zero.

---

## Recalculate Handles

Recalculates the normals of the selected curve and adjusts the handles accordingly.

## Last Operator Recalc Normals

### *Length*

Recalculates the handle length.

---

## Make Segment

Surface Object only. Join two curves by their selected ends. You need to select the end points of the curves that you want to join. A new segment will then be added in the gap.

---

## Smooth

Flattens the angles of the selected control point(s).

---

## Smooth Curve Tilt

Smooths the curve tilt of the selected control point(s).

---

## Smooth Curve Radius

Smooths the curve radius of the selected control point(s).

---

## Smooth Curve Weight

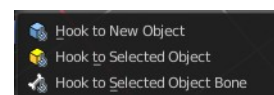

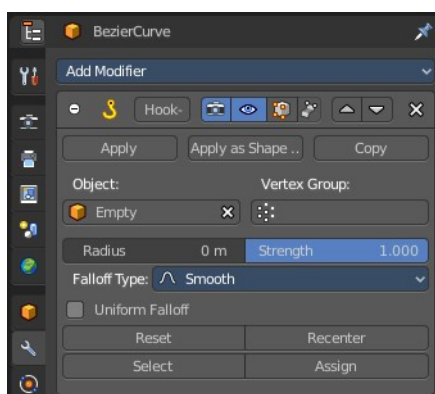

Interpolates the weight of the selected control point(s).

---

## Hooks

Hooks is a menu with tools around the hook modifier. You could also adjust the hook modifier from the Properties editor. But the menu items are more accessible.

When there is no hook modifier at the mesh then you just see three menu items. When there is minimum one hook modifier applied, then you will see an extended menu.

### Hook to New Object

Creates a new Hook Modifier for the active object and assigns it to the selected vertices. It also creates an empty at the center of those vertices, which are hooked to it.

---

### Hook to Selected Object

Does the same as *Hook to New Object*, but instead of hooking the vertices to a new empty, it hooks them to the selected object (if it exists). There should be only one selected object (besides the mesh being edited).

### *Last Operator Hook to Selected Object*

#### Active Bone

Hook to the object(s) of the active bone.

---

### Hook to Selected Object Bone

Does the same as *Hook to New Object*. But it sets the last selected bone in the also selected armature as a target.

---

### Assign to Hook

Assign the selected vertices to the chosen hook modifier. Existing hooks gets overwritten. One vertex can be assigned to more than one hook.

## **Remove Hook**

Removes the chosen Hook Modifier from the object.

---

## **Select Hook**

Selects all vertices assigned to the chosen Hook Modifier.

---

## **Reset Hook**

Resets the chosen Hook Modifier.

---

## **Recenter Hook**

Recenter the Hook Modifier.

---

## **Make Vertex Parent**

Parents another object to the selected vertice(s).

### **Workflow:**

In Object mode select the object that you want to parent to a vertex. Shift select the parent object so that both are selected. Enter Edit mode. Then select one vertex for a single point. Then click the Make Vertex Parent button to make the relation.

## 7.1.26 Editors - 3D Viewport - Header - Curve & Surface - Edit mode - Segments menu

### Table of content

Edit Mode - Segments Menu.....	1
Subdivide.....	1
Last Operator Subdivide.....	1
Number of Cuts.....	1
Switch Direction.....	1

## Edit Mode - Segments Menu

The Segments menu exists for Curve and Surface object types. They are both curve types, but of different kind.

The added objects in edit mode becomes part of the current object geometry.

### Subdivide

Subdivides the selected curve geometry, and adds more control points.

### Last Operator Subdivide

#### Number of Cuts

Number of subdivision cuts.

### Switch Direction

Just for Bezier Curve object type. Surface Nurbs curves doesn't have a direction. Switches the direction in which the curve is pointing.

## Edit Mode - Metaball Menu

The Metaball menu just exists for Metaball objects.

## Transform

### To Sphere

Shapes a selection of Meta elements into the shape of a sphere. The calculation happens with the object origins.

### Usage

Select the elements, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape. This also works with meta elements in the same way.

### Last Operator To Sphere

#### Factor

The factor to transform the selection into a shape form.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Shear**

Shear shears the selection. You need more than one meta element.

### **Last Operator Shear**

#### ***Offset***

Adjust an offset.

#### ***Shear Axis***

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

#### ***Axis***

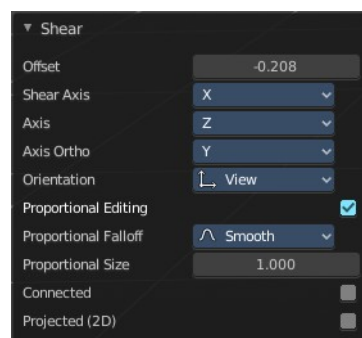

Defines one axis of the imaginary shear axis plane.

#### ***Axis Ortho***

Defines the other axis of the imaginary shear axis plane.

#### ***Orientation***

Choose the orientation for the shear action.

### ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bend

Bends the selection. You need more than one meta element.

---

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

You need more than one meta element.

## Last Operator Push/Pull

### *Factor*

Adjust the strength of influence of the tool.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Warp

Warp a selection between two defined points. This also works with Metaballs. You need more than one metaball element.

### Last operator Warp

#### *Warp Angle*

The strength of the warp effect.

#### *Offset Angle*

An offset angle to bend side-wards.

#### *Min*

The start point.

#### *Max*

The end point.

---

## Randomize Transform

This tool allows randomizes the positions of the selected meta elements.

### Last Operator Randomize Transform

#### *Amount*

Adjust the amount.

#### *Uniform*

The uniform offset distance.

#### *Normal*

Align the offset direction to the normals.

#### *Random Seed*

The seed value for randomization.

---

## Shrink/Fatten

Shrink/Fatten scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

## Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

### Offset

Offset is the strength of the offset for Shrink/Fatten.

### Offset Even

Offset Even scales the selection to give more thickness in even areas.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Move Texture Space

Move Texture space is meant for mesh objects, but has also functionality with a meta object.

This tool relies at the move tool. With the difference that it moves the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Translate

### *Move X, Y Z*

Limit the position relative to the source object.

### *Orientation*

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Texture Space

Scale Texture space is meant for mesh objects, but has also functionality with a meta object.

This tool relies at the scale tool. With the difference that it scales the texture space instead of the object. It has also a very special use case, and just works with a material

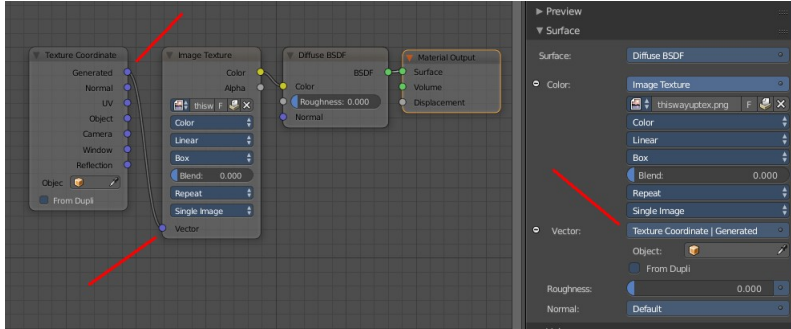

with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Resize Texture

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Set Dimensions

Edit Mode Only!

Normally all scale operations in Bforartists are relative to the current selection and dimensions. And you always start with a relative value of 1.

Set dimensions allows to scale object selections in absolute world values. No matter how the initial values are. The new values gets set in the Last Operator.

Set dimensions is an add-on. You can turn it off in the add-ons section of the user preferences when you want.

## Last Operator Set Dimensions

### New Dimensions

When you activate the tool then you will see the world coordinates of the selection. Change the values to other world coordinates.

# Mirror

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

### Last Operator Snap

Some snap operations shows a last operation panel, some not.

### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Operators

### Duplicate

Duplicates the current selection.

The copy sticks to the mouse until you release it. A Right click while moving will reset the position of the duplicate. The duplicated part will be part of the same object.

When you drag the duplicate around you will see the position values in the header.

## Last Operator Duplicate

### *Move X , Y , Z*

### *Orientation*

Choose the orientation.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Show / Hide

### *Show Hidden*

Makes all geometry in the scene visible again.

### *Hide Selected*

Hides the selected geometry.

### *Last Operator Hide Selected*

### *Unselected*

Hides the not selected geometry.

### *Hide Unselected*

Hides the not selected geometry. The selected geometry stays visible.

## **Delete**

Deletes the current selection.

---

## Edit Mode - Text Menu

### Cut

Cuts the selection.

### Copy

Copies the selection.

### Paste

Pastes a copied selection.

### Paste File

Opens the file browser where you can choose a text file to paste the text from. It needs to be UTF8.

### To Uppercase

Sets the selected text to be uppercase letters.

### To Lowercase

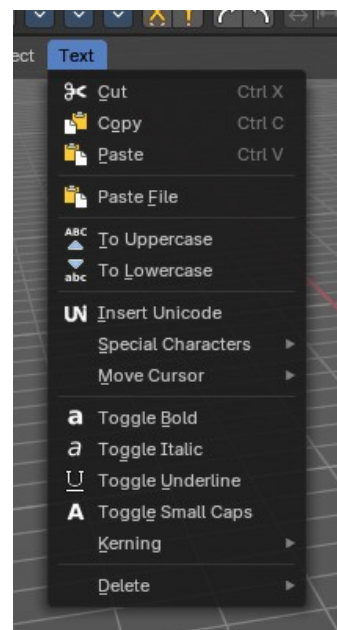

Sets the selected text to be uppercase letters.

### Last Operator Set Case

Set Case has one Last Operator for all items.

### Insert Unicode

Inserts a Unicode character. When you use the operator, a dialogue box will prompt you to enter a Unicode codepoint hex value to insert the character.

## Special Characters

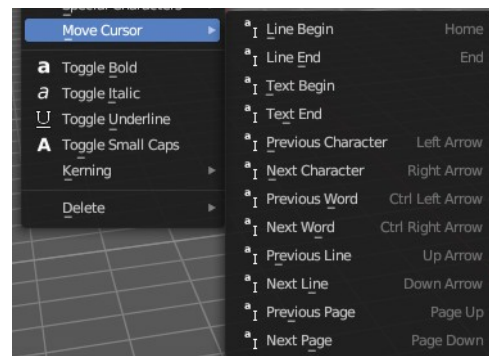

Special characters is a sub menu that contains some special text characters, like copyright, which you can insert into the text.

- Copyright ©
- Registered Trademark ™
- Degree °
- Multiplication ×
- Circle ○
- Superscript <sup>1</sup>
- Superscript <sup>2</sup>
- Superscript <sup>3</sup>
- Guillemet Left «
- Guillemet Right »»
- Per Mile ‰
- Euro €
- Florin ₣
- Pound £
- Yen ¥
- German Eszett ß
- Inverted Question Mark ¿
- Inverted Exclamation Mark ¡

## Move Cursor

Set the cursor at specific positions in the text.

## Toggle Bold

Bold sets the selected letters to be displayed as bold letters.

## Toggle Italic

Italic sets the selected letters to be displayed as italic letters.

## Toggle Underline

Underline sets the selected letters to be displayed as underlined letters.

## Toggle Small Caps

Toggle small caps sets the selected letters to be displayed as if they were upper case letters, but with lower case size.

## Kerning

Kerning is the distance between letters. Increase, decrease and reset the kerning.

## Decrease Kerning

Decreases the distance between the letters.

## Increase Kerning

Increases the distance between the letters.

## Reset Kerning

Resets the distance between the letters to the default values from the font.

## Last Operator Change Spacing

### *Delta*

Adjust the spacing. The range goes from -20 to 20.

## Delete

Deletes the selected text.

## 7.1.2 Editors - 3D Viewport - Header - Quick Menu

### Table of content

Quick Menu.....	1
Adding an operator to the Quick menu.....	1
Adding a menu to the Quick menu.....	1
Order.....	2
Removing an operator from the Quick menu.....	2
Context and mode dependent content.....	2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header of the 3D view, But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## Edit Mode - Grease Pencil Menu

## Transform

### Bend

Bends the selection.

### Shear

Shear shears the selection.

### Last Operator Shear

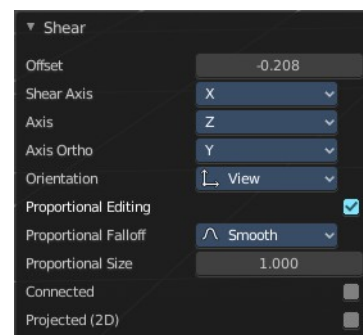

#### Offset

Adjust an offset.

#### Shear Axis

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis

Ortho items below.

## Axis

Defines one axis of the imaginary shear axis plane.

## Axis Ortho

Defines the other axis of the imaginary shear axis plane.

## Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

## Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

## Last Operator To Sphere Panel

### **Factor**

The factor to transform the selection into a shape form.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Shrink/Fatten

Shrink/Fatten scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

### Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

### **Offset**

Offset is the strength of the offset for Shrink/Fatten.

### **Offset Even**

Offset Even scales the selection to give more thickness in even areas.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

# Mirror

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored.

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

# Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

# Animation

## Insert Blank Key frame ( Active Layer )

Inserts a key frame into the active layer.

## Insert Blank Key frame ( All Layers )

Inserts a key frame into all layers.

## Last Operator Insert Blank Frame

Some snap operations shows a last operation panel, some not.

## All Layers

Insert into active layer or into all layers.

## Duplicate Active Key frame ( Active Layer )

Duplicates the active key frame in the active layer.

## Duplicate Active Key frame ( All Layers )

Duplicates the active key frame in all layers.

## Last Operator Insert Blank Frame

Some snap operations shows a last operation panel, some not.

### Mode

Duplicate the active key frame in the active layer or in all layers.

## Delete Active Key frame ( Active Layer )

Deletes the active key frame in the active layer.

## Delete Active Key frame ( All Layers )

Deletes the active key frame in all layers

## Single Operators

### Interpolate Sequence

Interpolate strokes between the previous and next keyframe by adding multiple keyframes. When you are on a frame between two keyframes and click the sequence button, then a breakdown keyframe will be added on every frame between the previous and next keyframe.

### Duplicate

Duplicates the current selection.

When you duplicate a selection, then it sticks to the mouse until you left click. And moves around. A right click repositions the duplicated geometry at its original location.

## Last Operator Duplicate

### Mode

Not to find out. No tool tip, no entry in the Blender manual. Good Job Blender Developers.

### Move X, Y, Z

Adjust the position.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Duplicate Active Frame

Duplicates the active frame in the active layer.

## Duplicate Active Frame All Layers

Duplicates the active frame in all layers.

## Last Operator Duplicate Frame

### Mode

Choose between Duplicate Active Frame and Duplicate Active Frame All Layers.

---

## Split

Splits the selection.

---

## Copy

Copies the selection.

---

## Paste

Pastes a copied selection to active layer. You can have more than one layer.

## Paste by Layer

Pastes a copied selection to same, original layer. You can have more than one layer.

## Last operator Paste Strokes

### Type

Choose between the paste methods again.

---

## Delete

### Points

Delete selected stroke points.

### Strokes

Delete the stroke where the current selection belongs to.

### Frame

Delete the grease pencil frame where the current selection belongs to.

## Last Operator Delete

### Type

Choose what you want to delete.

## Delete Active Key frame(Active Layer)

Deletes the active key frame in the current active layer.

## Delete Active Key frame(All Layers)

Deletes the active key frame in all layers.

## Dissolve

Dissolve is a union operation. Two edges becomes one edge by removing the vertice in between.

### Dissolve

Dissolves the selection.

### Dissolve Between

Dissolves the vertices between the selected vertices.

### Dissolve Unselect

Dissolves the vertices that are not selected.

## Last Operator Dissolve

### Type

Choose how you want to dissolve.

## Cleanup

## Boundary Strokes

Removes boundary "No Fill" strokes in the current active frame.

## Boundary Strokes all Frames

Removes boundary "No Fill" strokes in the all frames.

### *Last Operator Clean Fill Boundaries*

#### Mode

Current active frame or all frames.

## Delete Loose Points

Deletes not connected stroke geometry that is made of loose points.

### *Last Operator Clean Loose Points*

#### Limit

The number of vertices below which a stroke gets counted as a loose point.

## Merge by Distance

Merges vertices that are close to each other.

### *Last Operator Clean Loose Points*

#### Threshold

The distance.

#### Unselected

Merge also unselected geometry.

## Delete Duplicated Frames

Deletes all duplicated frames.

### *Last Operator Clean Duplicated Frames*

#### Type

Delete just in the selected frames or in all frames.

## Recalculate Geometry

Update all internal geometry data.

## Re project Strokes

Re project the selected strokes onto a new plane from the current viewport. So that all strokes are on one plane.

### *Re project Strokes menu*

Using this tool opens a popup menu. Choose the projection type method.

### *Last Operator Re project Strokes*

#### Projection Type

A popup menu. Choose the projection type method.

## Show / Hide

### Show Hidden Layer

Makes all layers in the scene visible again.

### Hide Selected Layer

Hides the selected layer.

### *Last Operator Hide Layers*

#### Unselected

Hides the not selected layers.

### Hide Unselected

Hides the not selected layers. The selected layers stays visible.

### Toggle Opacity

Toggles the opacity of the stroke. With opaque stroke the vertices are hidden behind the stroke, and can't be seen.

## Separate

Separates the selection into a new grease pencil object.

### Selected Points

Separate the selected points with its edges.

## **Selected Strokes**

Separate the whole stroke of the current selection.

## **Active Layer**

Separate all the strokes at the current active layer.

## **Last Operator Separate Strokes**

### ***Mode***

#### **Active Layer**

Separate all the strokes at the current active layer.

#### **Selected Strokes**

Separate the whole stroke of the current selection.

#### **Selected Points**

Separate the selected points with its edges.

## Edit Mode - Stroke Menu

In Edit Mode you will also see a add menu for some object types. The number of objects that you can add is limited to the same object type that you are in edit mode with. You can just add mesh geometry to a mesh geometry. And just curve geometry to curve geometry.

The added objects in edit mode becomes part of the current object geometry.

### Subdivide

Subdivides the selected grease pencil geometry.

## Last Operator Subdivide

### **Number of Cuts**

Number of subdivision cuts.

### **Smooth**

Smoothen the stroke, not just the new added vertices

### **Repeat**

The number of times to repeat the procedure.

### **Selected Points**

Limits the effect to only the selected points within the stroke.

### **Position**

The operator affects the points location.

### **Thickness**

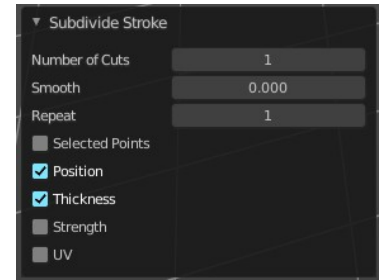

The operator affect the points thickness.

### **Strength**

The operator affect the points strength (alpha).

### **UV**

The operator affect the UV rotation on the points.

---

## Simplify

Simplifies the stroke.

### **Fixed**

Deletes every second point in the stroke, except the start and end points.

### **Last Operator Simplify Fixed Stroke**

#### **Steps**

How much levels of simplifying.

### **Adaptive**

This method uses an algorithm called RDP algorithm (Ramer-Douglas-Peucker algorithm) for points deletion. The algorithm tries to keep the shape with the remaining points.

## ***Last Operator Simplify Stroke***

### **Factor**

How strong the simplification should be performed.

### **Sample**

Samples points along the shape of the stroke, and increases the length of the edges.

## ***Last Operator Sample Stroke***

### **Factor**

How long the edges between the points should be.

---

## **Trim**

Trims down selected stroke geometry to first loop or intersection.

---

## **Join**

Join selected strokes by connecting points.

## **Join and copy**

Join selected strokes by connecting points in a new stroke.

## **Last Operator Join Strokes**

### **Type**

Join or Join and Copy.

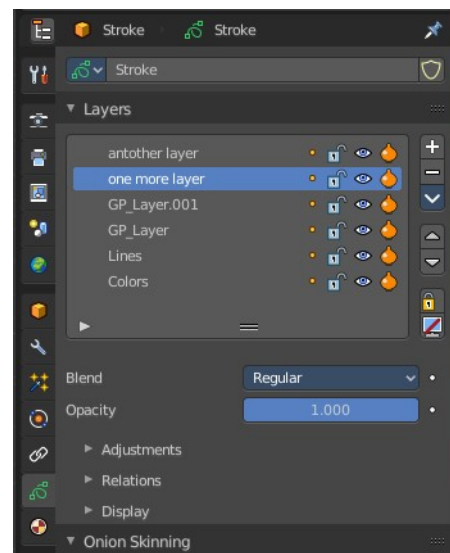

### ***Leave Gaps***

Don't connect the strokes by geometry.

---

## Move to Layer

Move the current selected stroke to another grease pencil layer. It lists the current layers.

## New Layer

New Layer button adds a new grease pencil layer.

## Last Operator Move Strokes to Layer

### Grease Pencil Layer

Internal the layers are enumerated. So here you move by number.

The number of a layer can be found out in the tool tip, in the Python part of it.

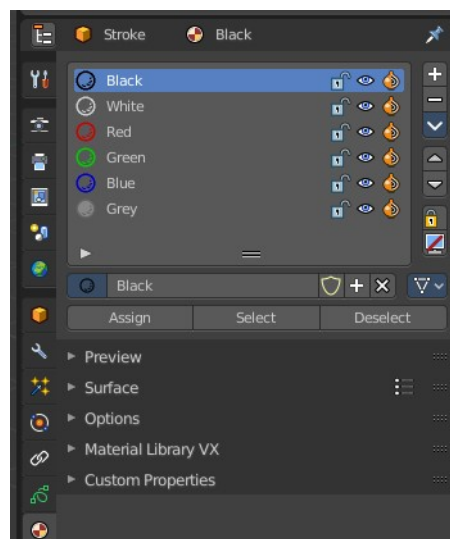

## Assign Material

Assign a new material to the current selected stroke geometry.

The materials can be found and edited in the Properties editor. Here you can also create new materials.

## ***Last Operator Change Stroke Color***

### **Material**

The materials are defined by its name. So when you want to use another material, then change the name here.

---

## **Set as active material**

Sets the current selected material as the active material.

---

## **Arrange**

Changes the drawing order of the strokes in the 2D layer.

## **Bring Forward**

Moves the selected points/strokes upper the next one in the drawing order.

## **Send Backward**

Moves the selected points/strokes below the previous one in the drawing order.

## **Bring to Front**

Moves to the top the selected points/strokes.

## **Send to Back**

Moves to the bottom the selected points/strokes.

## ***Last Operator Arrange Stroke***

### **Direction**

Choose the method again.

---

## **Close**

Closes the current stroke by connecting the first vertice with the last vertice by a stroke. See also Toggle Cyclic.

## **Toggle Cyclic**

When the curve is open, then it Closes the current stroke by connecting the first vertice with the last vertice by a stroke. When the curve is closed, then it removes the connection between first and last vertice, and makes the curve open.

## Last Operator Set Cyclical State

### Type

Choose the method again.

### Close all

Close all open selected strokes.

### Open all

Open all closed selected strokes.

### Toggle

Close or Open selected strokes as required.

### Create geometry

When enabled, points are added for closing the strokes like when using the Close tool. If disabled, the stroke is closed with just one edge.

## Toggle Caps

Toggles if the start and endpoints of the strokes are rounded or flat.

### Default

Sets stroke start and end points to rounded (default).

### Both

Toggle stroke start and end points caps to flat or rounded.

### Start

Toggle stroke start point cap to flat or rounded.

### End

Toggle stroke end point cap to flat or rounded.

## Last Operator Set Caps Mode

### Type

Choose the method again.

## Switch Direction

Switches the direction of the stroke geometry.

## Set Start Point

Just for cyclic strokes. Sets the start point of the cyclic stroke.

How to: select the vertice that should be the new start point. Then perform tool.

---

## Re project Strokes

Re projects the selected stroke points in the selected view method.

## Last Operator Re project Strokes

### *Projection Type*

Choose the method again.

---

## Normalize Thickness

Adjust the thickness of the stroke.

## Normalize Opacity

Adjust the opacity of the stroke.

## Last operator Normalize Stroke

This last operator works for both tools, Normalize Thickness and Normalize Opacity.

### *Mode*

Adjust thickness or opacity.

### *Value*

The value to adjust the opacity or thickness.

---

## Reset Fill Transform

Reset any UV transformation back to default values.

## Outline

Converts the outline of the stroke to a new stroke and removes the original stroke.

This tool requires to have a **ACTIVE** camera in the scene, since the outline is created from this active camera. And the outline is created from exact this view of the camera. So better switch to camera view to check if the view fits.

The active camera has the active orange triangle above the widget. You can also see the active camera in the Scene properties.

## Last operator Convert Stroke to Outline

### **View**

From which view to calculate the outline.

### **Material Mode**

What material to assign to the new stroke.

### **Thickness**

The thickness of the new stroke

### **Keep Shape**

Try to keep global shape when the stroke thickness changes.

### ***Subdivisions***

How many subdivisions the new stroke has

### ***Sample Length***

Sample length of the stroke.

## Edit Mode - Point Menu

### Extrude

Extrudes out the selected points. The new points stay connected with the original points of the stroke.

### Smooth

Smoothens out the selected geometry.

### Last Operator Smooth Stroke

#### Repeat

How often to repeat the procedure.

## **Factor**

The amount of the smoothness to apply.

## **Selected points**

When enabled, limits the effect to only the selected points within the stroke.

## **Position**

When enabled, the operator affect the points location.

## **Thickness**

When enabled, the operator affect the points thickness.

## **Strength**

When enabled, the operator affect the points strength (alpha).

## **UV's**

When enabled, the operator affect the UV rotation on the points.

---

## **Merge**

Allows you to paint a new stroke between the selected vertices. The selected points are not merged though, but a new stroke is created.

## **Last Operator Merge Strokes**

### **Mode**

Choose between stroke or point mode.

This feature is not documented in the Blender manual, there is no explanation in the tool tip, and it is not to find out what the difference is. Both do the same.

### **Draw on back**

Draw the new stroke below all other strokes.

### **Additive drawing**

Add to previous drawing

### **Cyclic**

Close the new stroke

### **Dissolve Points**

Dissolve the old selected points.

## **Delete Strokes**

Deletes the old selected strokes.

## **Vertex Groups**

This menu contains just the Add New Group button as long as no vertex group exists.

## **Add New Group**

Adds a new group.

## **Assign**

Assign the current selected geometry to the current active group.

## **Remove**

Removes the current selected geometry from the current active group.

## **Select**

Select the geometry of the current active group.

## **Deselect**

Deselect the geometry of the current active group.

## Draw Mode - Draw Menu

### Active Layer

Set and show the active grease pencil layer. The layer with the pencil is the active layer for drawing.

### New Layer

Add a new draw layer.

### Interpolate

Interpolates strokes between the previous and next keyframe by adding a single keyframe. When you are on a frame between two keyframes and click the Interpolate button a new breakdown keyframe will be added. This way you define the final interpolation for the new stroke.

### Interpolate Sequence

Interpolate strokes between the previous and next keyframe by adding multiple keyframes. When you are on a frame between two keyframes and click the sequence button, then a breakdown keyframe will be added on every frame between the previous and next keyframe.

### Animation

#### Insert Blank Keyframe ( Active Layer )

Inserts a keyframe into the active layer.

#### Insert Blank Keyframe ( All Layers )

Inserts a keyframe into all layers.

#### Last Operator Insert Blank Frame

Some snap operations shows a last operation panel, some not.

#### All Layers

Insert into active layer or into all layers.

#### Duplicate Active Keyframe ( Active Layer )

Duplicates the active keyframe in the active layer.

## Duplicate Active Keyframe ( All Layers )

Duplicates the active keyframe in all layers.

### *Last Operator Insert Blank Frame*

Some snap operations shows a last operation panel, some not.

### Mode

Duplicate the active keyframe in the active layer or in all layers.

---

## Delete Active Keyframe ( Active Layer )

Deletes the active keyframe in the active layer.

## Delete Active Keyframe ( All Layers )

Deletes the active keyframe in all layers

---

## Show/Hide

### Show all Layers

Makes all layers in the scene visible .

### *Last Operator Hide Layers*

### Select

Shows just selected layers.

## Hide Active Layer

Hides the active layer.

## Hide inactive Layers

Hides the not selected layers. The selected layers stays visible.

### *Last Operator Hide Layers*

### Unselected

Hides the not selected layers.

---

## Clean Up

## Boundary Strokes

Remove "no fill" boundary strokes from the active frame.

## Boundary Strokes all Frames

Remove "no fill" boundary strokes from all frames.

## *Last Operator Clean Fill Boundaries*

### Mode

Choose if you want to remove the "no fill" boundary strokes just from the active frame, or from all frames.

---

## Delete loose Points

Deletes loose stroke points.

## *Last Operator Clean loose points*

### Limit

Adjust with how much vertices a stroke gets count as loose geometry.

## Delete Duplicated Frames

Deletes all duplicated frames.

## *Last Operator Clean Duplicated Frames*

### Type

Delete just in the selected frames or in all frames.

## Recalculate Geometry

Update all internal geometry data.

Sets the color of all selected vertices to the current active vertex color.

### Last operator Vertex Paint Set Color

## **Mode**

What vertex colors to affect.

## **Factor**

How strong the color is set compared to the old color.

## **Reset Vertex Color**

Resets all vertex color to white.

## **Last operator Reset Vertex Color**

### **Mode**

What vertex colors to affect.

## **Invert**

Inverts the stroke colors.

## **Last operator Vertex Paint Invert**

### **Mode**

What vertex colors to affect.

## **Levels**

Adjust the levels of the vertex colors.

## **Last operator Vertex Paint Levels**

### **Mode**

What vertex colors to affect.

### **Offset**

Value to add to the colors.

### **Gain**

Value to multiply colors by.

## **Hue Saturation Value**

Adjust the HSV colors of the vertex colors.

## Last operator Vertex Paint Hue Saturation Value

### **Mode**

What vertex colors to affect.

### **Hue**

The hue value

### **Saturation**

The saturation value.

### **Value**

The value value.

## Bright Contrast

Adjust the brightness and contrast of the vertex colors.

## Last operator Vertex Paint Bright/Contrast

### **Mode**

What vertex colors to affect.

### **Brightness**

The brightness value

### **Contrast**

The contrast value.

## Weight Paint Mode - Weights Menu

## Sample Weight

Pick the weight under the mouse by a click.

## Normalize All

Normalizes the weight of all Vertex groups so that the values for the single vertices in the sum is 1.

## Last Operator Normalize all Vertex Group

### *Lock Active*

Keep the values of the active group while normalizing others.

---

## Normalize

Normalize normalizes the weight of the current selected Vertex group so that the values for the single vertices in the sum is 1. Means when there is influence from other groups, then those values are kept, but the one for the current group gets lowered so that the sum is 1.

---

## Invert

Invert inverts the weight painting for the selected vertex group.

---

## Clean

Remove vertex group assignments which are not required.

## Adjust last operator Clean Vertex Group Weights.

### *Subset*

Which group should be used.

### *Limit*

Add vertices from groups that have zero weight before inverting.

### *Keep Single*

Keep vertices that are assigned to at least one group when cleaning.

---

## Quantize

Set the weights to a fixed number of steps. Going from 0 to 1.

### Adjust last operator Quantize Vertex Group

#### **Subset**

Which group should be used.

#### **Steps**

The number of steps between 0 and 1.

---

## Levels

Add some offset and multiply with some gain the weights of the active vertex group.

### Adjust last operator Clean Vertex Group Weights.

#### **Subset**

Which group should be used.

#### **Offset**

The offset value to add to the weights.

#### **Gain**

Value to multiply weights by.

---

## Smooth

Smooths the weight for selected vertices.

### Last Operator Smooth Vertex Group

#### **Factor**

Here you adjust the factor.

#### **Iterations**

Here you adjust how many iterations you use.

---

## Generate Weights sub menu

The content of this sub menu requires to have the grease pencil object parented to an armature. Which is somehow odd. Since then these operators are not longer needed. The content is already properly parented. And the parenting process needs to happen in object mode anyways.

However, you can change from empty groups to with automatic weights and vice versa here. So this is a convenient way to remove all vertex groups, or to reset the automatic weighting to restart the weight painting.

### With empty Groups

Parent the grease pencil to the armature with empty vertex groups.

### With Automatic Weights

Parent the grease pencil to the armature with empty vertex groups.

## Adjust last operator Generate Automatic Weights

### Mode

Add empty vertex groups without any weighting, or assign the vertex groups automatically to the available bones.

### Armature

Which armature to use. A armature can have sub armatures ...

Default means the default armature.

### Ratio

The ratio between bone length and influence radius.

### Decay

The factor to reduce the influence depending of distance to bone axis.

## Edit Mode - Armature Menu

The Edit Mode for Armature objects has a number of operators in this header submenu to change and edit the default bone orientation, relationships and structure before using the Armature in Pose Mode for animation.

## Transform - Submenu

### To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape. With a skeleton the to sphere operation is everything but accurate though. The bones gets stretched or compressed

## Last Operator To Sphere Panel

### **Factor**

The factor to transform the selection into a shape form.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Shear

Shear shears the selection.

### Last Operator Shear

#### **Offset**

Adjust an offset.

#### **Shear Axis**

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

#### **Axis**

Defines one axis of the imaginary shear axis plane.

## Axis Ortho

Defines the other axis of the imaginary shear axis plane.

## Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bend

Bends the selection.

---

## Push/Pull

It pushes or pulls the object positions relative to the centre of the selection.

In Object mode this tool requires to have more than one object selected.

## Last Operator Push/Pull

### Factor

Adjust the strength of influence of the tool.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Warp

Warp a mesh selection between two defined points.

## Last operator Warp

### *Warp Angle*

The strength of the warp effect

### *Offset Angle*

An offset angle to bend sideways.

### *Min*

The start point.

### *Max*

The end point.

---

## Randomize Transform

This tool allows randomizes the positions of the selected vertices.

## Last Operator Randomize Transform

### *Amount*

Adjust the amount.

### *Uniform*

The uniform offset distance.

## **Normal**

Align the offset direction to the normals.

## **Random Seed**

The seed value for randomization.

## **Align Bones**

Aligns the selected bones to the orientation of the active bone.

# Mirror

Mirror mirrors the selected geometry along the defined axis.

## **Interactive Mirror**

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored

## **X Global, Y Global etc.**

Mirrors the selection around the chosen axis.

## **Last Operator Mirror**

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## **Orientation**

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## **Constraint Axis**

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

# Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

# Recalculate Bone Roll - Submenu

Recalculate Bone Roll Recalculate Roll is a menu where you can recalculate the bone roll in various ways.

The menu items are pretty self explaining. So we will not repeat the descriptions here.

## Last Operator Recalculate Roll

### Type

Type is a drop-down box. Choose the recalculation method again.

### Flip Axis

Negates the alignment axis.

### Shortest Rotation

Ignore the axis direction, and use the shortest rotation to align the bone(s)

## Set Bone Roll

This operation is relative to the starting value, and starts always with zero. It does not display the Bone Roll value from the Transform panel. It adds or subtracts the amount of the operation to/from the Roll value then.

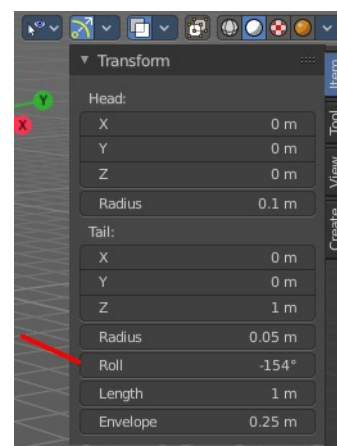

While operating you will see the current relative Roll value in the header.

## Last Operator Transform

The only interesting value is the X value right at the top. The other settings here are simply dysfunctional. You cannot turn on proportional editing, axis and orientation doesn't play any role since it always rotates around the bone orientation. And so we will not go into detail here.

Unfortunately even the X value to display the amount of the roll is broken. It displays the amount in Radians, while the Bone roll is in degrees.

## Clear Roll

Set the bone roll value directly.

## Last Operator Clear Roll

### Roll

Set the bone roll.

## Single Operators

### Extrude

Extrudes out a bone from the selected joints.

### Last Operator Extrude

#### *Forked*

You need to tick X Axis Mirror. When you tick Forked, then the bone that you extrude to the one side will now be extruded to the other side too. The extrude gets mirrored along the x axis. This allows you to create a symmetrical armature.

#### *Move X , Y, Z*

The transform values for the new created joint(s)

#### *Orientation*

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

#### *Proportional editing*

Proportional editing is dysfunctional. You cannot activate it.

### Extrude to Cursor

Hotkey only tool. Extrude to the mouse position.

### Last Operator Extrude to Cursor or Add

#### *Location X Y Z*

The location to extrude to.

## Duplicate

Duplicates selected bones.

You are automatically in grab mode, and so you can easily move the object out of position. Which is sometimes wanted, since you can position the duplicate then. But sometimes this is unwanted. A right click after releasing the mouse lets the object snap back into its creation position.

When you drag the duplicate around you will see the position values in the header.

## Last Operator Duplicate

### *Duplicate Objects*

#### Flip Names

Tries to flip the names of the bones. This is a name convention feature. When you have a bone called mybone.R, then it tries to become mybone.L

#### *Move X, Y, Z*

The Position of the duplicated object.

#### *Orientation*

Orientation is a drop-down box. Choose the type of orientation for the duplicate action.

#### *Proportional editing*

This checkbox has no use here. You cannot activate it.

## Fill between Joints

Fill between joints fills a bone between two selected joints.

When there is just one joint selected, then the bone is created between this selected joint and the 3D cursor.

## Split

Split splits the selected bone(s) from connected bones. They are still part of the armature. But the bone is now floating. And you can pull this bone(s) around without pulling the rest of the armature around.

The Last operator for Split has no content.

## Separate Bones

Separate separates the selected bone(s) from the armature. And creates a new, independent, armature.

The Last operator for Separate has no content.

## Symmetrize

Creates a symmetrical mirrored copy of the currently selected bones along the X axis. The mirror centre is the pivot of the armature.

The bones that you want to symmetrize needs to follow the left right name conventions for bones. Bones without this left right naming are not affected by the tool. If there is a lower or upper “L”, “R”, “left” or “right” with a separating dot in the bone name, then this tool creates and renames the bones names to its counter part. Bone.L becomes Bone.R.

## Last Operator Symmetrize

### Direction

Define the calculation direction. From -X to + X or from +X to -X

## Subdivide

Subdivide subdivides the current selection.

## Last Operator Subdivide Multi

### Number of Cuts

Adjust the number of subdivisions.

## Switch Direction

Switches the direction in which the selected bones are pointing.

## Names - Submenu

Bforartists has some internal name conventions for a symmetrical armature. Bones are for example named mybone.L or mybone.R, dependant at which side of the mirror axis they are. The Names items allows you to rename the bone names to this name convention.

### Autoname Left/Right

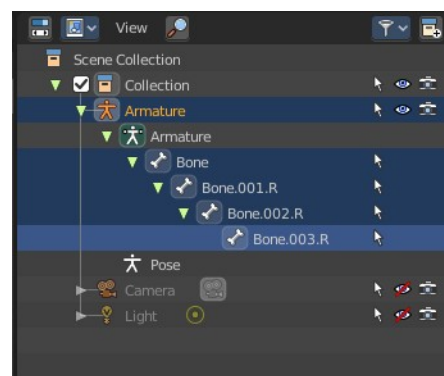

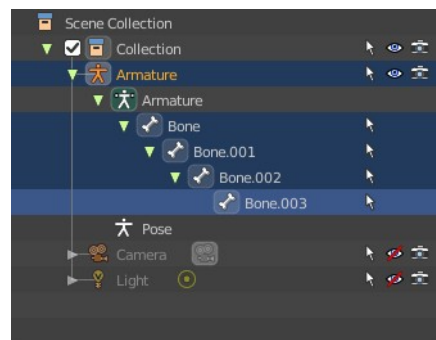

Renames the bones from left to right.

### Autoname Front/Back

Renames the bones from front to back.

### Autoname Top/Bottom

Renames the bones from top to bottom.

### *Last operator Autoname by Axis*

#### Axis

Choose the autoname axis again. Left/Right is X axis, Front/Back is Y axis, and Top/Bottom is Z axis.

### Flip Names

When you mirror a half of an armature you end in names like Bone.001.R.001. But what we need is Bone.001.L for a symmetrical armature. Flip names flips the names to follow the left right name conventions.

### *Last operator Flip Names*

#### Strip Numbers

Tries to remove the numbers in the names if possible.

## About Bone Collections

Bone Collections is a menu to handle bone collection functionality from within a menu in the 3D View editor. The bone collections themselves can be found in the Properties editor then in the Armature tab.

## Move to Bone Collection

Armature and bones have their own collection system. This menu item opens a popup where you can put the selected bones into a New Collection or an existing Bone Collection.

## New Bone Collection

Assigns the selected bones to a new Bone Collection. This will prompt to name the new collection.

## Bone List

Assigns or unassigns the selected bones to or from the collection. The green + icon and red – icon show if you can remove or add a bone to the listed collection.

## Bone Collections – Sub Menu

Armature and bones has its own collection system.

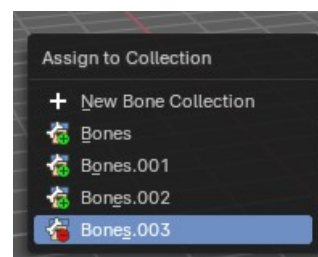

### Add

Add or remove the bone from the listed bone collections. The green + icon and red – icon show if you can remove or add a bone to the listed collection. A bone can be in multiple collections at the same time.

### New

Assigns the selected bones to a new Bone Collection. This will prompt to name the new collection.

### Bone List

Assigns or unassigns the selected bones to or from the collection. The green + icon and red – icon show if you can remove or add a bone to the listed collection.

### Show All

Show all bone collections.

## Assign to New

Add selected bones to a new collection with a new name.

### *Last Operator Add Selected Bones to Collection*

#### Bone Collection

Change name of the new collection.

## Make Parent

Adds a parent relationship.

Select a bone, hold down shift, select the bone that you want to parent it to. Perform Make Parent. In the pop-up choose the method that you want to use.

### Connected

The child bone will jump to the position of the tail joint of the parent bone.

### Keep Offset

The bone will remain in its original position. The relationship will be displayed by a black dotted line.

### *Last Operator Make Parent*

#### Parent Type

Choose between Connected and Keep Offset method again.

## Clear Parent

Clears the parent relationship of the selected bone(s). It calls a pop-up menu. Choose between two methods.

## Clear Parent

Clears the parent relationship of the selected bone(s).

## Disconnect Bone

The parent ship is kept. Turns a Connected parent relationship into a Keep Offset parent relationship. You can move the disconnected bone around without to pull the parent with it.

## Last Operator *Clear Parent*

### *Clear Type*

Choose between Clear Parent and Disconnect Bone method again.

## Bone Settings - Submenu

Bone Settings is a menu with menu items to toggle special checkboxes in the Properties editor. But here you can do it for a selection too, and not just one object.

## Last Operator Collection Boolean Set

Each of the menu items uses the same Last Operator. With different strings for the booleans.

## Show/Hide – Submenu

Show or hide the selected bones in the viewport.

### Show Hidden

Makes all bones visible again.

### Hide Selected

Hides the selected bones.

### Hide Unselected

Hides the not selected bones. The selected bones stays visible.

## Delete Selected Bone(s)

Deletes the selected bones. The hierarchy is kept. The involved bones becomes disconnected.

## Dissolve Selected Bone(s)

Merges the selected bone or joint with its hierarchical neighbour bones.

## Pose Mode - Pose Menu

The Pose menu contains the tools to work with Armature objects in Pose mode. This means here you find all the tools that you need to pose and animate your armature.

## Transform - Submenu

This submenu contains transform operators to help pose a selection of bones. For more information, refer to the transform operators in the **3D Viewport - Header - Armature - Edit mode - Armature menu** chapter

### Move (Legacy)

A legacy transform operation where you activate once then click to apply. This is useful in Weight Painting mode to pose an armature while painting weights.

### Rotate (Legacy)

A legacy rotate operation where you activate once then click to apply. This is useful in Weight Painting mode to pose an armature while painting weights.

### Scale (Legacy)

A legacy scale operation where you activate once then click to apply. This is useful in Weight Painting mode to pose an armature while painting weights.

## To Sphere

Shapes a selection of bones into the shape of a sphere. This tool requires to have more than one bone selected.

## Shear

Shear shears the selection. This tool requires to have more than one bone selected.

## Bend

Bends the selection. This tool requires to have more than one bone selected.

## Push/Pull

It pushes or pulls the bone positions relative to the center of the selection. This tool requires to have more than one bone selected.

## Clear Transform - Submenu

### Clear Transform

Clear transform is a menu with some Clear functionality. You need to have the bones selected where you want to perform the operation. Unselected bones will not be calculated.

### All

Resets location, rotation and scale back to the Rest pose.

### Clear User Transforms

Resets Pose of selected bones back to keyframe state.

### Location

Resets location back to the Rest pose.

### Rotation

Resets rotation back to the Rest pose.

## Scale

Resets scale back to the Rest pose.

## Reset Unkeyed

Resets the pose for the selected bones back to the state of the latest keyframe.

## Last Operator Clear User Transforms

### Only Selected

Clear User transform for selected armature part, or for the whole armature.

## Apply - Submenu

Apply is a menu with some Apply functionality.

## Apply Pose as Rest Pose

You need a rest pose where you can reset the pose back to. With this tool you can set the current pose to be the new Rest pose.

## Apply Selected as Rest Pose

You need a rest pose where you can reset the pose back to. With this tool you can set the current pose of the selected bones to be the new Rest pose.

## Last Operator Apply Pose as Rest Pose

### Selected only

Just apply the pose to the selected part.

## Apply Visual Transform to Pose

Apply final constrained position of posed bones to their transform.

## Assign Custom Property Values as Default

Assigns the current values of custom properties as their defaults. This allows to use them as part of the rest pose state in NLA track mixing.

## Last Operator Assign Custom Property Values as Default

### Process data properties

Include the process data properties.

## Process bone properties

Include the process bone properties.

## Snap - Submenu

Choose several methods to snap one element to another. The menu items should be self explaining.

### Last Operator Snap

Some snap operations shows a last operation panel, some not.

### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Animation - Submenu

Animation is a sub menu around animation functionality. You need to have an object in the scene.

### Insert Keyframe

Opens a menu where you can insert a keyframe with a defined keying set.

### Delete Keyframes

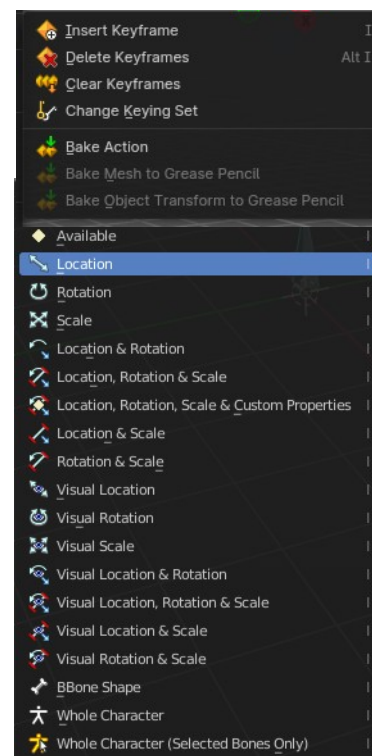

Deletes keyframes at the current frame.

### Clear Keyframes

Deletes all keyframes.

### Change Keying Set

Opens a menu where you can change the keying set. It is basically the same than the insert keyframe menu.

### Bake Action

Bake all selected objects location/scale/rotation animation to an action.

## Bake Mesh to Grease Pencil

Only works on Mesh objects

## Bake Object Transform to Grease Pencil

Only works on Mesh objects

## In-Between - Submenu

### In Between

In Between are tools to influence the look of the pose between the keyframes.

For example, record a keyframe at frame 1, then record a keyframe at frame 20. Then go to frame 10, and activate one of the tools. Now you can play around with the settings. And when you are satisfied with the result then you can record a keyframe at this position.

### Header values

When you activate one of the tools, then you will see a percentage slider in the header. This slider is not interactive. It just displays the percentage of the exaggeration.

### Footer hotkey display

In the footer you will see some hotkeys for further options. These hotkeys are hard coded, and cannot be changed in the input manager.

Breakdown: W/E/R/B/C - Limit to Transform/Property Set | S - Enable overshoot | Shift - Hold for precision | Ctrl - Hold for 10% increments | [H] - Toggle bone visibility

The hotkeys W, E and R stands for the usual transform modes move, rotate or scale. Hotkey B stands for Bendy Bones. And C is for a custom property.

Overshoot allows you to go over the 0 -100 per cent range. The header values shows a bigger range then.

The rest of the hotkeys should be self explaining.

### Push Pose from Rest Pose

Exaggerates the current pose. Pushes the current pose further away from the rest pose.

## Last Operator Push Pose from Rest Pose

### **Percentage**

The percentage of exaggeration.

### **Previous Keyframe**

The keyframe position before the current frame.

### **Next Keyframe**

The keyframe position after the current frame.

### **Channels**

Limit the push effect to specific channels.

### **Axis Lock**

Limit the push effect to specific axis.

## Relax Pose to Rest Pose

Relaxes the current pose towards the Rest pose.

## Last Operator Relax Pose to Rest Pose

### **Percentage**

The percentage of relaxing.

### **Previous Keyframe**

The keyframe position before the current frame.

### **Next Keyframe**

The keyframe position after the current frame.

### **Channels**

Limit the relax effect to specific channels.

### **Axis Lock**

Limit the relax effect to specific axis.

## Push Pose from Breakdown

Exaggerates the current pose. Pushes the current pose further away from the previous pose.

### Last Operator Push Pose

#### **Percentage**

The percentage of exaggeration.

#### **Previous Keyframe**

The keyframe position before the current frame.

#### **Next Keyframe**

The keyframe position after the current frame.

#### **Channels**

Limit the push effect to specific channels.

#### **Axis Lock**

Limit the push effect to specific axis.

## Relax Pose to Breakdown

Relaxes the current pose.

### Last Operator Relax Pose to Breakdown

#### **Percentage**

The percentage of relaxing.

#### **Previous Keyframe**

The keyframe position before the current frame.

#### **Next Keyframe**

The keyframe position after the current frame.

## Channels

Limit the relax effect to specific channels.

## Axis Lock

Limit the relax effect to specific axis.

## Pose Breakdowner

Creates a suitable breakdowner pose on the current frame.

### Last Operator Pose Breakdowner

#### Percentage

The percentage of exaggeration.

#### Previous Keyframe

The keyframe position before the current frame.

#### Next Keyframe

The keyframe position after the current frame.

## Channels

Limit the breakdowner pose to specific channels.

## Axis Lock

Limit the breakdowner pose to specific axis.

## Blend to Neighbour

Blends the current pose with the neighbouring poses.

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending.

Move the mouse to position the blend pose where you need it.

## Last Operator Blend to Neighbour

### Factor

The blend factor.

### Previous Keyframe

The keyframe to calculate from before the current position.

### Next Keyframe

The keyframe to calculate from after the current position.

### Channels

### Axis Lock

Lock the transformation along an axis.

## Propagate - Submenu

The Propagate tool automates the process of copying and pasting between keyframes. It copies the pose of the selected bones on the current frame over to the keyframes by the chosen Termination mode in the Last Operator Propagate Pose.

The different Propagate methods can be adjusted in the Last operator too. Here you will find even more methods. The menu just lists the common ones.

The methods are quite self explaining, but are explained in the last operator section.

Usage example with Termination mode "On Selected Keyframes".

1. Create a little armature.
2. Set a keyframe at frame 0.

3. Set a keyframe at frame 20.
4. Pose frame 20.
5. Set a keyframe at frame 40. It will most probably be identical with Frame 20.
6. Now select those Keyframes at position 40 in the Dope Sheet Editor.
7. Set position to Frame 0.
8. Press Propagate, and in the Last operator Propagate Pose choose On Selected Keyframes.  
The selected keyframes at frame 40 will now turn into the corresponding keyframes from position 0.

## Last Operator Propagate Pose

### Terminate Mode

A drop down box where you can choose between different termination modes for Propagate.

#### **To Next Keyframe**

Copies the pose to the first keyframe after the current frame.

#### **To Last Keyframe**

Replaces the last keyframe.

#### **Before Frame**

Copies to all keyframes between current frame and the End frame option.

#### **Before Last Keyframe**

To all keyframes from current frame until no more are found.

#### **On Selected Keyframes**

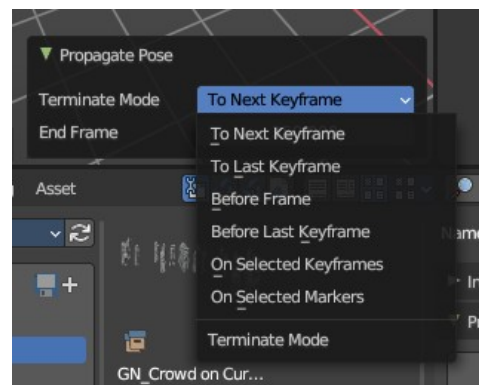

Applies the pose of the selected bones to all selected keyframes.

#### **On Selected Markers**

Copies to all keyframes on frames with Scene Markers after the current frame.

### End Frame

Defines the end frame for the Propagate.

## Single Operators

## Copy Pose

Copies the current pose. You copy what you have selected.

## Paste Pose

Pastes a previous copied pose.

## Paste Pose Flipped

Pastes a previous copied pose, but flipped along X axis.

## Last Operator Paste Pose

### *Flipped on X Axis*

Paste the pose flipped along X Axis.

### *On Selected Only*

Paste just on the selected bones. Not on the unselected.

## Motion Paths - Submenu

Objects can be animated. Let's say you send them from a to b to c. The object will move to b, then to c. Some kind of a path. This path is not visible by default.

With motion paths you can calculate this path, and make it visible.

## Calculate

Calculates the motion path of the selected object. It opens a panel to define the start and end frame of the calculation.

### *Last Operator Calculate Object Path*

#### Start

Defines the start frame of the calculation.

#### End

Defines the end frame of the calculation.

#### Bake Location

Where to draw the curve. At the head or at the tail of the bone(s)

## Clear

Clear remove the motion path from the object.

## Update Armature Motion Paths

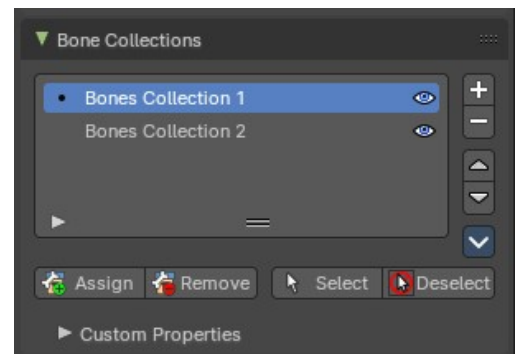

Updates the motion paths of the armature.

## Update All Motion Paths

Updates the motion paths of all objects.

## About Bone Collections

Bone Collections is a menu to handle bone collection functionality from within a menu in the 3D View editor. The bone collections themselves can be found in the Properties editor then in the Armature tab.

## Move to Bone Collection

Armature and bones have their own collection system. This menu item opens a popup where you can put the selected bones into a New Collection or an existing Bone Collection.

## New Bone Collection

Assigns the selected bones to a new Bone Collection. This will prompt to name the new collection.

## Bone List

Assigns or unassigns the selected bones to or from the collection. The green + icon and red – icon show if you can remove or add a bone to the listed collection.

## Bone Collections – Sub Menu

Armature and bones has its own collection system.

## Add

Add or remove the bone from the listed bone collections. The green + icon and red – icon show if you can remove or add a bone to the listed collection. A bone can be in multiple collections at the same time.

## New

Assigns the selected bones to a new Bone Collection. This will prompt to name the new collection.

## Bone List

Assigns or unassigns the selected bones to or from the collection. The green + icon and red – icon show if you can remove or add a bone to the listed collection.

## Show All

Show all bone collections.

## Assign to New

Add selected bones to a new collection with a new name.

## Last Operator add Selected Bones to Collection

### Bone Collection

Change name of the new collection.

## Parent - Submenu

Parenting the skin or other armatures happens in Object mode. You can also parent in Pose Mode. It just does not make much sense since you need to enter Object mode for one of the objects anyways. The only somehow relevant settings in the parenting menu here is clear parent. But even this is better done in Object Mode.

The parenting menu is already explained in the Object menu in Object mode. So we won't repeat the whole description here.

## Inverse Kinematics - Sub Menu

Inverse Kinematics is a menu with two isolated items from the whole bone constraints menu. The Inverse Kinematics. You could also add an Inverse Kinematics bone

constraint by the Constraints / Add (With Targets) menu item from above. It is in the list. But this menu allows quick access without big search.

## Add IK to Bone

Add IK to bone adds an IK bone constraint to the selected bone. When you add an IK constraints with just the bone selected, then it adds an empty as a handler too, and fills it in as a target.

Add IK calls a popup. When you have just one bone selected then you can choose between adding an empty as the target or to create the bone constraint without target.

When you have more than one bone selected then you can just add the constraint to the active bone.

You can define an own target object too. The armature needs to be in pose mode. Let's create a cube or another primitive. Select it. Now hold down Shift, and click at the bone where you want to add the constraint too. Then choose Add (with Targets), and choose your constraint method. The cube will now be chosen as the target object.

## Last Operator Add IK to Bone

### With Targets

Define if you want to add the IK constraints with or without a target.

## Remove IK

Removes all IK bone constraint(s) at the selected bone(s).

## Constraints - Submenu

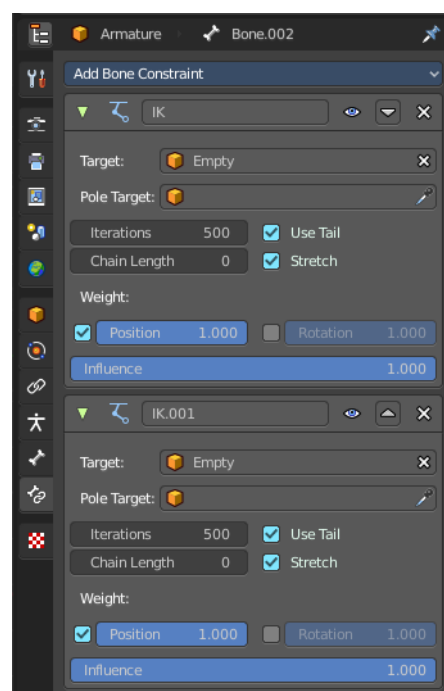

Constraints is a menu that contains some tools around constraints.

### Add (With Targets)

Add (With Targets) calls the Constraints menu where you can choose the constraint that you want to add. When you add an IK constraints with just the bone selected, then it adds an empty as a handler too, and fills it in as a target. Which is similar to what you can do with the Add IK to Bone from the IK menu.

But you can add more than just the IK constraint. It is the same menu that you can open by clicking at the Add Bone Constraint drop down menu in the Properties editor.

You can define an own target object too. The armature needs to be in pose mode. Let's create a cube or another primitive. Select it. Now hold down Shift, and click at the bone where you want to add the constraint too. Then choose Add (with Targets), and choose your constraint method. The cube will now be chosen as the target object.

### Copy Constraints to selected Bones

Copies the constraints with all its settings to the selected bone.

## Usage:

Select the bone where you want to copy the constraints to. Hold down shift, then select the bone that contains the constraints. Then perform the tool. The constraints will be copied.

## Clear Pose Constraints

Removes all bone constraints modifiers from the bone.

## Names - Submenu

Bforartists has some internal name conventions for a symmetrical armature. Bones are for example named mybone.L or mybone.R, dependant at which side of the mirror axis they are. The Names items allows you to rename the bone names to this name convention.

### Autoname Left/Right

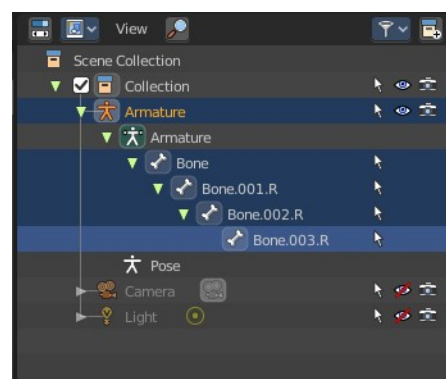

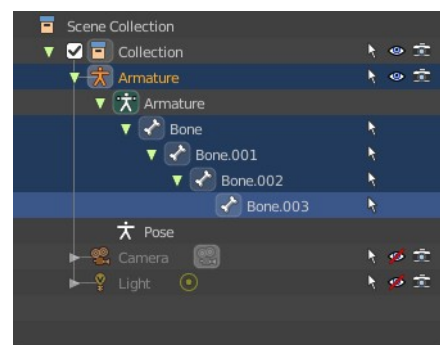

Renames the bones from left to right.

### Autoname Front/Back

Renames the bones from front to back.

### Autoname Top/Bottom

Renames the bones from top to bottom.

## Last operator Autoname by Axis

### Axis

Choose the autoname axis again. Left/Right is X axis, Front/Back is Y axis, and Top/Bottom is Z axis.

## Flip Names

When you mirror a half of an armature you end in names like Bone.001.R.001. But what we need is Bone.001.L for a symmetrical armature. Flip names flips the names to follow the left right name conventions.

## Last operator Flip Names

### Strip Numbers

Tries to remove the numbers in the names if possible.

## Flip Quats

This feature flips the quaternion rotation values of the currently selected bone(s). Positive values becomes negative, and negative values becomes positive.

## Show/Hide - Submenu

Show or hide the selected geometry

### Show Hidden

Makes all hidden geometry visible again.

### Hide Selected

Hides the selected geometry.

### Hide Unselected

Hides the not selected geometry. The selected geometry stays visible.

## Bone Settings - Submenu

Bone Settings is a menu with menu items to toggle special check boxes in the Properties editor. But here you can do it for a selection too, and not just one object.

## Last Operator Collection Boolean Set

Each of the menu items uses the same Last Operator. With different strings for the booleans.

# View Menu

The View menu contains all View related tools. The range goes from tools to maximize the current window across align view tools up to rendering related tools for the viewport like Render Border.

## Toolbar

Shows or hides the toolbar at the left in the 3D view.

## Sidebar

Shows or hides the sidebar at the right in the 3D view.

## Tool Settings

Shows or hides the tool settings above the header in the 3D view.

## Adjust Last Operation

Shows or hides the Adjust Last Operation panel down left in the 3D view.

Note that the Adjust Last Operation panel can also be called from the edit menu at the top. And from the toolbar at the right. Here you can also add a hotkey to call it with a hotkey.

## Tool Shelf Tabs

Shows or hides the tool shelf tabs. This tool shelf tabs contains tools from the header menus, and are a double menu entry by design. Here you can turn them off if you don't want to work

with this tool set.

Note that you need to adjust the width of the tool shelf manually afterwards since it does not automatically update the width of the tool shelf area.

Note that you need to save the startup.blend to save the state of this checkbox.

---

## Legacy

### Set 3D Cursor

The old legacy operator to set the position of the 3D cursor in the viewport. This method is especially with rigging the much faster method. So we keep this operator. It is up to you if you want to work with the old operator or with the tool in the tool shelf.

Hotkey only tool. The menu entry just exists to show that this operator exists!

---

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet. d

**Note:** *These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.*

### ***Draw Annotation***

Starts the annotation free hand draw tool in the editor.

### ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

### ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

### ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

### ***Add Annotation Layer***

Starts a new annotation layer.

## ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

---

## **OpenGL Render Animation**

Renders an animation, using the Viewport OpenGL renderer. This can be useful for preview renderings.

### **Note**

Note that this menu item is a double menu entry. The same menu item exists in the Render menu in the Info Header. But this is required when you work with more than one 3D view. When you use the entry in the Render menu, then it picks an arbitrary 3D view. When you use the menu entry in the 3D view, then it renders from this 3D view.

---

## **OpenGL Render Image**

Renders an Image, using the Viewport OpenGL renderer. This can be useful for preview renderings.

### **Note**

Note that this menu item is a double menu entry. The same menu item exists in the Render menu in the Info Header. But this is required when you work with more than one 3D view. When you use the entry in the Render menu, then it picks an arbitrary 3D view. When you use the menu entry in the 3D view, then it renders from this 3D view.

---

## **Clipping Border**

With clipping you can draw a rectangle that excludes the display of everything outside of this rectangle. That way you can look inside the geometry when you rotate the viewport. To clear the clipping use the tool again. It is a toggle.

## **Render Region**

Cycles only!

With the Render Region tool you can drag a rectangle at the viewport to define a portion of the screen to render.

The benefit here is to have much faster preview renderings. You just render what you want to judge, and not the whole image.

It has two use cases. The one is with the rendering through the camera. Just what is marked gets rendered. The other is directly in the viewport, with the Viewport shading method Rendered. Render border works with all renderers.

You can have both render border cases active at the same time. When you remove it then just the render border from the current case gets deleted. Either you are in camera view, or you are in viewport view.

## Clear Render Region

Removes the Render Region rectangle from the viewport.

## Cameras sub menu

### Set Active Object as Camera

With this tool you can set any object to be the active camera where you render from.

### Set Active Camera

Set the current camera as the active camera.

### Active Camera

Switches to Camera view and back to Viewport Camera.

### View Camera Center

This tool is of use when you are in camera view. Else it is greyed out and inactive. There is a Grey passepartout around the camera view. It can be that this passepartout does not fit into the viewport. It can be too big or too small. And so you might want to zoom out or in.

Normally when you are in camera view, then you zoom in or out the view with the zoom tool. Not this passepartout. But with lock camera off you can zoom the

passthrough to reach geometry that is not in the camera view.

The other way is View Camera Center. It fits the camera view into the viewport.

## Align View

Align View is a menu where you can choose between different view align methods. The view gets aligned at the world coordinates. Here we also find a few more align methods.

### Align Active Camera to View

Aligns the active camera to the current view. This means you can navigate with the viewport camera, select the render camera, and align it with this tool, so that the render camera has the same position and angle than the viewport camera.

### Align Active Camera to Selected

Aligns the active camera to the current selected object. This means you can navigate with the viewport camera, select the render camera, and align it with this tool, so that the render camera has the same position and angle than the selected object.

### Center View to Cursor

Centers the view at the 3D cursor position.

### View Lock to Active

Locks the view to the currently active object.

### View Lock Center

Centers the view to the currently active and locked object. This tool is just active when you have performed a View Lock to Active before.

### View Lock Clear

Removes the View Lock to Active from the object.

## Perspective/Orthographic

Toggles between perspective and orthographic view in the 3D viewport. Perspective view acts like a real camera with the perspective distortions. Orthographic view acts like a mathematical display of an object, without distortions.

## Top, Bottom, etc.

Switches to Top view, Bottom View, etc.

## Align View to Active

Align View to Active is a menu where you can choose between different view align methods. The view gets aligned relative to the rotation of the currently active object. Not in World coordinates. The menu items should be self explaining. So we won't list them one by one.

## Toggle Local View

Toggle Local View zooms in or out until the Selection is displayed fitting in the viewport. And hides all other objects but the Selection.

## Remove from local View

It can be that you select more than one object, and switch to local view. Then you decide that one of the objects is in the way. With remove from local view you can remove this object without to leave the local view.

This menu item is greyed out when you are not in local view.

## Frame Selected

Zooms in or out in the 3d viewport until the Selection is displayed fitting in the viewport.

## Frame Selected (Quad View)

Just with Quad view. Zooms in or out in the 3d viewport until the Selection is displayed fitting in the viewport of all four views.

## Frame All

Zooms in or out in the 3d viewport until all objects in the scene are displayed fitting in the viewport.

## Frame All (Quad View)

Just with Quad view. Zooms in or out in the 3d viewport until all objects in the scene are displayed fitting in the

viewport of all four views.

## Center Cursor and Frame All

Center Cursor and View all centers the 3D Cursor at 0/0/0, and zooms in or out in the 3d viewport until all objects in the scene are displayed fitting in the viewport.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Toggle Quad view

Displays the 3D View divided into four split screen parts. Note that the orthographic views cannot be switched in this mode. They remain orthographic, you cannot rotate them.

To return to single view reuse the menu item in the View menu.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + space bar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey `ctrl + alt + space bar`.

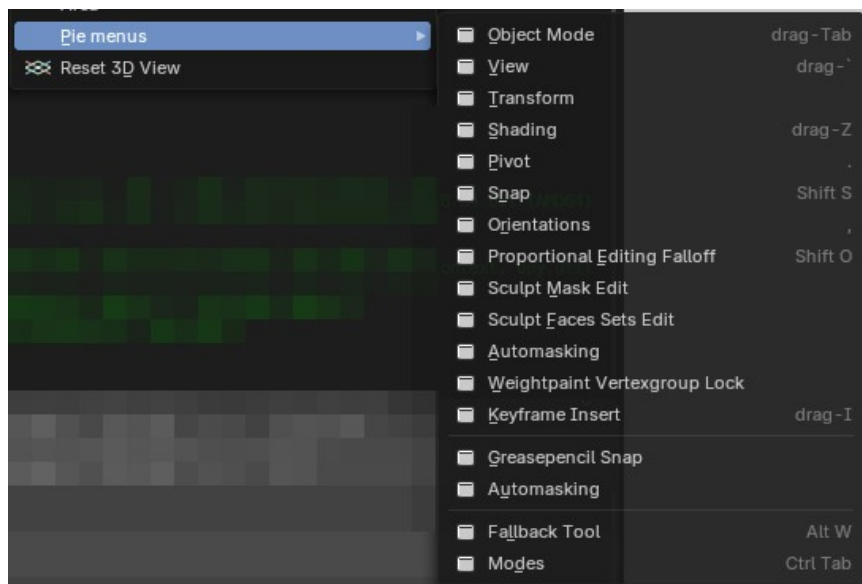

## Close Area

Closes the area window.

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

A pie menu is a radial array of operators that can be used with gestures to quickly use common operators or properties.

## Reset 3D View

Resets the 3D view to the defaults.

Note that this is an add-on, and can be turned off in the addons section of the preferences.

## Edit Mode - Lattice Menu

In Edit Mode you will also see a add menu for some object types. The number of objects that you can add is limited to the same object type that you are in edit mode with. You can just add mesh geometry to a mesh geometry. And just curve geometry to curve geometry.

The added objects in edit mode becomes part of the current object geometry.

## Transform

### To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

### Last Operator To Sphere Panel

#### Factor

The factor to transform the selection into a shape form.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Shear**

Shear shears the selection.

## **Last Operator Shear**

### ***Offset***

Adjust an offset.

### ***Shear Axis***

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

### ***Axis***

Defines one axis of the imaginary shear axis plane.

### ***Axis Ortho***

Defines the other axis of the imaginary shear axis plane.

### ***Orientation***

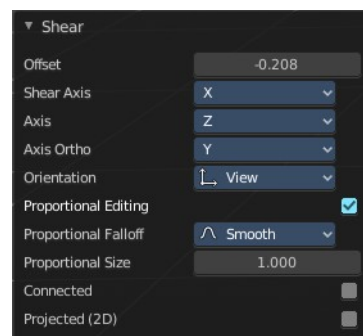

Choose the orientation for the shear action.

### ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bend

Bends the selection.

---

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

## Last Operator Push/Pull

### Factor

Adjust the strength of influence of the tool.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Warp

Warp a mesh selection between two defined points.

### Last operator Warp

#### *Warp Angle*

The strength of the warp effect

#### *Offset Angle*

An offset angle to bend sideways.

#### *Min*

The start point.

#### *Max*

The end point.

---

## Randomize Transform

This tool allows randomizes the positions of the selected vertices.

### Last Operator Randomize Transform

#### *Amount*

Adjust the amount.

#### *Uniform*

The uniform offset distance.

#### *Normal*

Align the offset direction to the normals.

#### *Random Seed*

The seed value for randomization.

---

## Move Texture Space

This tool relies at the move tool. With the difference that it moves the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Translate

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Texture Space

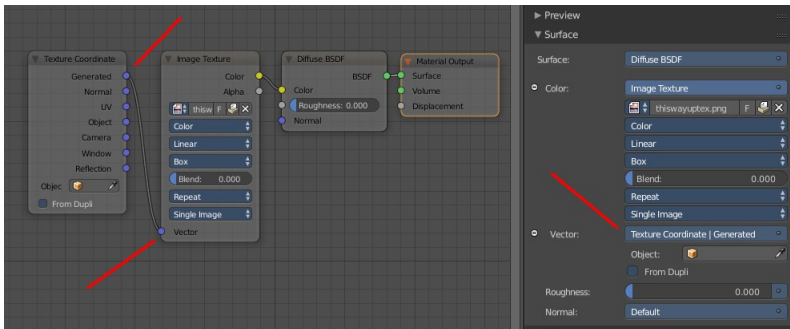

This tool relies at the scale tool. With the difference that it scales the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Resize Texture

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Set Dimensions

Edit Mode Only!

Normally all scale operations in Bforartists are relative to the current selection and dimensions. And you always start with a relative value of 1.

Set dimensions allows to scale mesh selections in absolute world values. No matter how the initial values are. The new values gets set in the Last Operator.

Set dimensions is an add-on. You can turn it off in the add-ons section of the user preferences when you want.

## Last Operator Set Dimensions

### New Dimensions

When you activate the tool then you will see the world coordinates of the selection. Change the values to other world coordinates.

## Mirror

Mirror mirrors the selected geometry along the defined axis.

### Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored

### X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

### Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

## Flip

the lattice object along the world axis X, Y or Z .

## Last Operator Flip (Distortion Free)

### Flip Axis

Flip the lattice object along the world axis X, Y or Z .

## Single Operators

### Make Regular

Set the UVW control points by a uniform distance apart.

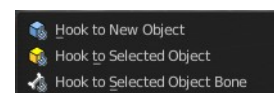

### Hooks

Hooks is a menu with tools around the hook modifier. You could also adjust the hook modifier from the Properties editor. But the menu items are more accessible.

You need to have at least one vertice of the lattice object selected.

When there is no hook modifier at the mesh

then you just see three menu items. When there is minimum one hook modifier applied, then you will see an extended menu.

### Hook to New Object

Creates a new Hook Modifier for the active object and assigns it to the selected vertices. It also creates an empty at the center of those vertices, which are hooked to it.

### Hook to Selected Object

Does the same as *Hook to New Object*, but instead of hooking the vertices to a new empty, it hooks them to the selected object (if it exists). There should be only one selected object (besides the mesh being edited).

## ***Last Operator Hook to Selected Object***

### **Active Bone**

Hook to the object(s) of the active bone.

---

## **Hook to Selected Object Bone**

Does the same as Hook to New Object. But it sets the last selected bone in the also selected armature as a target.

---

## **Assign to Hook**

Assign the selected vertices to the chosen hook modifier. Existing hooks gets overwritten. One vertex can be assigned to more than one hook.

---

## **Remove Hook**

Removes the chosen Hook Modifier from the object.

---

## **Select Hook**

Selects all vertices assigned to the chosen Hook Modifier.

---

## **Reset Hook**

Resets the chosen Hook Modifier.

---

## **Recenter Hook**

Recenter the Hook Modifier.

---

## **Make Vertex Parent**

Parents an object to the selected vertice(s)

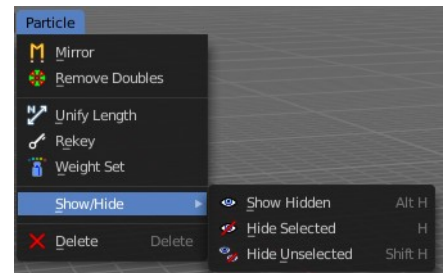

In Object mode select the object that you want to parent to a vertex. Shift select the Lattice object so that both are selected. Enter Edit mode. Then select one vertex for a single point. Or three for an area. Then click the Make Vertex Parent button to make the relation.

## 7.1.41 Editors - 3D Viewport - Header - Particle - Particle mode - Particle menu

Hide Unselected.....	3

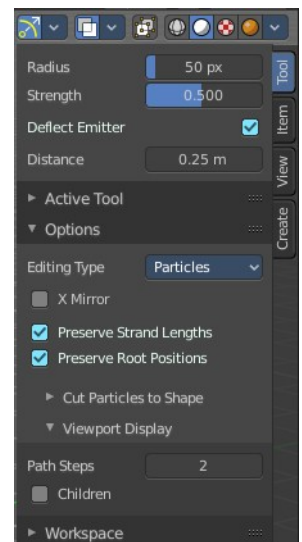

## Particle Mode - Particle Menu

### Mirror

Mirrors the selected particles.

If you want a symmetrical haircut, first select all particles, then mirror the particles, then tick X Mirror in the Particle panel.

## Remove Doubles

Remove double vertices that are very close to each other. This can for example happen when you mirror the particles.

---

## Unify Length

Unifies the length of the selected hair particles. The length is calculated by the average length of the selection.

---

## Rekey

You need to have some hair particles selected.

Rekey changes the number of keys for the selected particles, including root and tip keys. This tool brings up a popup where you can adjust the number of keys. Two means you have only a root and a tip key. Everything more subdivides the selected hair particle with more keys.

## Weight Set

Manually set a weight for the selected keys to interpolate between the current key weight and the brushes weight.

### Last Operator Weight Set

#### *Factor*

The strength of the keys weighting.

## Delete

Delete either the whole particle, or just the selected key of the particle.

## Show/Hide

Show or hide the selected geometry

### Show Hidden

Makes all hidden geometry visible again.

## **Hide Selected**

Hides the selected geometry.

## **Hide Unselected**

Hides the not selected geometry. The selected geometry stays visible.

## Edit mode - Curves menu

### Transform

### To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

#### Usage

Select the objects, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

### Last Operator *To Sphere*

#### Factor

The factor to transform the selection into a shape form.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### *Proportional Falloff*

Adjust the falloff methods.

#### *Proportional Size*

See and adjust the falloff radius.

#### *Connected*

The proportional falloff gets calculated for connected parts only.

#### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Shear

Shear shears the selection.

In Object mode this tool requires to have more than one object selected.

### ***Last Operator Shear***

#### **Offset**

Adjust an offset.

#### **Axis**

Defines one axis of the imaginary shear axis plane.

#### **Axis Ortho**

Defines the other axis of the imaginary shear axis plane.

#### **Orientation**

Choose the orientation for the shear action.

#### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

#### ***Proportional Falloff***

Adjust the falloff methods.

#### ***Proportional Size***

See and adjust the falloff radius.

#### ***Connected***

The proportional falloff gets calculated for connected parts only.

#### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bend

Bends the selection.

In Object mode this tool requires to have more than one object selected.

---

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

### *Last Operator Push/Pull*

#### Distance

Adjust the strength of influence of the tool.

#### Mirror Editing

Enables mirror editing.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### *Proportional Falloff*

Adjust the falloff methods.

#### *Proportional Size*

See and adjust the falloff radius.

#### *Connected*

The proportional falloff gets calculated for connected parts only.

#### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Radius

Scales the selected curves point along its normals.

A positive value pushes the vertices width outwards. A negative value pushes the vertices width inwards.

**Notes:** *Transform orientation and Pivot point gets ignored. To see the result, make sure you have geometry radius applied, without this will be set into the Radius attribute.*

---

## Set Attribute

Set the position attribute of the selected elements. The values can be adjusted in the popup.

## Delete

Deletes the selected hair curves.

---

## Toggle Cyclic

Toggle Cyclic closes or opens the curve.

## Last Operator Toggle Cyclic

### Direction

Direction is a drop-down box . Choose the direction in which the curve gets closed.

---

## Set Curve Type

With set Spline Type, you can set the type of the curve.

- **Catmul Rom** is an interpolated spline system for smooth curves.
- **Poly** is a straight line between the control points.
- **Bezier** has curve handlers.
- A **NURBS** curve has a control cage.

## Last Operator Set Spline Type

### Type

Type is a drop-down box . Choose the spline type

### Handles

Use Handles when converting Bezier curves into polygons.

---

With set Spline Type you can set the type of the curve.

Poly is a straight line between the control points. Bezier has curve handlers. A NURBS curve has a control cage.

## Last Operator Set Spline Type

### **Type**

Type is a drop-down box . Choose the spline type

### **Handles**

Use Handles when converting Bezier curves into polygons.

---

## 7.1.43 Editors - 3D Viewport - Header - Hair Curve - Edit mode – Control Point menu

### Table of content

Edit mode – Control Points menu.....	1
Extrude Curve and Move.....	1
Set Handle Type.....	1
Free.....	1
Auto.....	1
Vector.....	1
Align.....	1
Last Operator Set Handle Type.....	2
Type.....	2

## Edit mode – Control Points menu

### Extrude Curve and Move

Extrudes the selected hair curve points, and moves it.

### Set Handle Type

Handles defines the type of handle for the knots of the curve. You have the choice between Auto, Vector, Align and Free.

#### Free

Set Handle type to Free.

#### Auto

Auto aligns the handles automatically.

#### Vector

Set Handle type to Vector.

#### Align

Set Handle type to Align.

## ***Last Operator Set Handle Type***

**Type**  
Type is a drop-down box where you can set the handle type. You have the choice between Auto, Vector, Align, Free. And the fifth possibility toggles between Free and Align.

# 7.1.44 Editors - 3D Viewport - Header - Hair Curve - Edit mode - Segments menu

## Table of content

Edit Mode - Segments Menu.....	1
Subdivide.....	1
Last Operator Subdivide.....	1
Number of Cuts.....	1
Switch Direction.....	1

## Edit Mode - Segments Menu

The Segments menu exists for Curve and Surface object types. They are both curve types, but of different kind.

The added objects in edit mode becomes part of the current object geometry.

### Subdivide

Subdivides the selected curve geometry, and adds more control points.

### Last Operator Subdivide

#### Number of Cuts

Number of subdivision cuts.

### Switch Direction

Just for Bezier Curve object type. Surface Nurbs curves doesn't have a direction. Switches the direction in which the curve is pointing.

## 7.1.45 Editors - 3D Viewport - Header - Hair Curve - Sculpt mode - Curves menu

### Table of content

Sculpt mode - Curves menu.....	1
Snap to Deformed Surface.....	1
Snap to Nearest Surface.....	1
Convert to Particle System.....	1

## Sculpt mode - Curves menu

### Snap to Deformed Surface

Move curves to the nearest deformed surface so that the first point is exactly on the surface mesh. This re-attaches the curves to a deformed surface using the existing attachment information.

This only works when the topology of the surface mesh has not changed.

### Snap to Nearest Surface

Move curves to the nearest surface so that the first point is exactly on the surface mesh. This finds the closest point of the surface of the root point of every curve and moves the root there.

### Convert to Particle System

Add a new or update an existing hair particle system on the surface object. The new Particle System is the legacy hair system. This does not remove the hair curve object, but creates/updates a new Particle System.

## All Modes - Navigation Menu

The Navigation menu provides you with all tools around viewport navigation. It is available in all modes.

### Legacy

The legacy menu contains operators from the old tool system that already exists in the tool shelf and uses the new tool system.

## Move

Activates the old move tool. The old move tool does not show a widget!

Note that the hotkey for this tool is not displayed correctly. But can't be fixed by us. The hotkey is ctrl W

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you move the object, and hold down the mouse and type in a value, like 20, then the movement will be performed by the value that you have typed in. In this case by 20 units in direction of the selected axis.

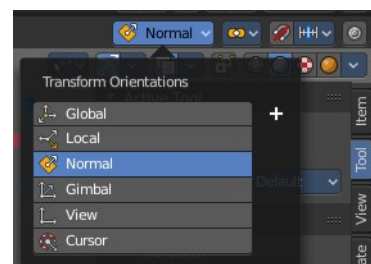

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and global.

This can be combined with the numerical input. Type in X, type in X again to use the local space, type in 20 to move by 20 units in local orientation. Release the mouse to confirm.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Last Operator Move

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

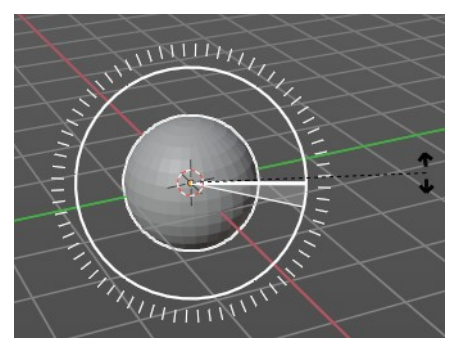

## Rotate

Activates the old Rotate tool. This tool has no widget!

### Snapping

Holding down Ctrl activates temporary global snapping. It snaps then by 5 degrees steps.

When you use the white circle to rotate, then the widget also shows a division circle around the widget. This divisions shows even finer when

you do precision rotation.

### **Precision rotation**

When you hold down shift, then you will have a much slower but also much preciser rotation.

### **Header Values**

When you rotate your object then you will see some values in the header, which defines the current rotation of the object. The rotation is shown in degrees.

### **Numerical Input**

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in. In this case by 20 degree around the selected axis.

### **Limit Axis**

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

This can be combined with the numerical input. Type in X, type in X again to use the local space, type in 20 to rotate by 20 degree. Release the mouse to confirm.

### **Orientation**

The 3d cursor can have different orientations. The menu items should be self explaining.

### **Last Operator Rotate**

#### **Angle**

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

#### **Axis**

Which axis to rotate.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Scale

Activates the old Scale tool. This tool has no widget!

### **Snapping**

Holding down Ctrl activates temporary global snapping.

### **Precision Scale**

When you hold down shift, then you will have a much slower but also much preciser scale.

### **Header Values**

When you scale your object then you will see some values in the header, which defines the current scale of the object.

These values are always relative to the starting point. You always start with 1, regardless of the real world scale.

### **Numerical Input**

When you scale the object, and hold down the mouse and type in a value, like 20, then the scale will be performed by the value that you have typed in. In this case by factor 20 along the selected axis.

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the scale to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

Rot: -0.08 along normal X

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

This can be combined with the numerical input. Hold down mouse, type in X, type in X again to use the local space, type in 20 to scale by 20 units. Release the mouse to confirm.

## Orientation

The 3d cursor can have different orientations. The menu items should be self explaining.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Orbit Down**

Orbits downwards.

## **Orbit Up**

Orbits upwards.

## **Orbit Right**

Orbits to the right.

## **Orbit Left**

Orbits to the left.

## **Orbit Opposite**

Rotates the view by 180 degree.

---

## **Roll Left**

Rolls the viewport counter clockwise.

## **Roll Right**

Rolls the viewport clockwise.

---

## **Pan Down**

Pans the viewpoint downwards. The scene moves up.

## **Pan Up**

Pans the viewpoint upwards. The scene moves down.

## **Pan Right**

Pans the viewpoint to the right. The scene moves to the left.

## **Pan Left**

Pans the viewpoint to the left. The scene moves to the right.

---

## **Zoom Region**

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## **Zoom In**

Zooms into the viewport. Works also in camera view.

## **Zoom Out**

Zooms out of the viewport. Works also in camera view.

## **Zoom Camera 1:1**

Zooms the camera fitting to match the render output size by factor 1:1

## **Dolly View**

Dolly View is a special zoom mode.

Be careful with this navigation method, you can easily trap yourself to not zoom able anymore!

## **Center View to Mouse**

Centers the view to the current mouse position.

---

## **Fly Navigation**

Switches to Fly navigation. In this view mode the camera acts like an air plane. Right click leaves the fly mode.

## **Walk Navigation**

Switches to Walk Navigation. In this view mode the camera acts like a player in a first person shooter. Gravity will pull you down, The ground grid is the ground. And you can move around with WASD keys. Right click leaves the walk mode.

## **View Navigation**

Switches to View Navigation Mode. In this view mode the view gets rotated moved and scaled from the Camera view point. Right Click leaves the view mode.

---

## **Playback Animation**

Plays back an existing animation.

## Select menu

The Select menu provides you with all functionality around selecting. The content differs, dependent in which mode you are, and what object type you have selected. Some select functionality is very special for just one object type in one special mode. But not every mode has a select menu.

## Object Mode - Select menu

The select menu in Object mode is for all object types equal. It provides you with several selection methods.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

### Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

### Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Inverse

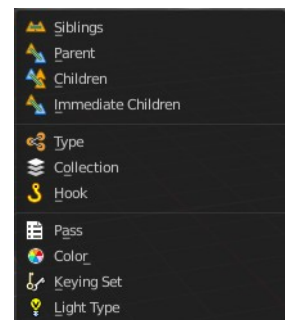

Invert the current selection.

---

## Grouped

Select different types of objects within the group. It requires to have a group selected.

The menu items are pretty self explaining. So we won't go into detail here.

## Last Operator Select Grouped

### Extend

Extends existing selection instead of deselecting everything first.

### Type

Type is a drop-down list choose the Linked type again.

---

## Linked

Linked is a menu select different types.

Select all objects that shares a common data-block with the active object. *Select Linked* uses the active object as a basis to select all others.

## Object Data

Selects every object that is linked to the same Object Data.

## Material

Selects every object that is linked to the same material data-block.

## Instanced Collection

Selects every object that is linked to the instanced collection.

## Particle System

Selects all objects that use the same Particle System.

## Library

Selects all objects that are in the same Library.

## Library (Object Data)

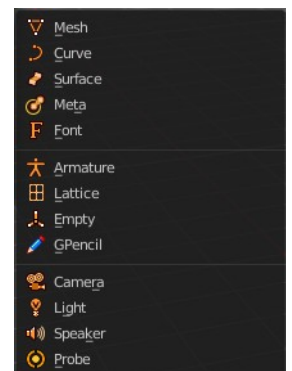

Selects all objects that are in the same Library and limited to object data.

---

## All by Type

Select objects of a specific type.

The menu items are pretty self explaining. So we won't cover every single menu item here.

## Last Operator Select By Type

### Extend

With this option activated the selection does not clear before performing the selection operation, but extends. This means when you have a mesh object selected, and want to select all objects by type curve, then the mesh object is still selected. Without Extend just the curve objects are selected. The mesh object gets deselected.

### Type

Type is a drop-down box choose the object type to select again.

---

## Random

Selects random objects.

## Last Operator Select Random

### **Percent**

The Percentage of objects that should be selected randomly.

### **Random Seed**

The Seed for the random number generator.

### **Action**

Action is a drop-down box choose if you want to select or to deselect random.

---

## Mirror Selection

Select the mirrored parts of an object. For example for L.Sword it selects R.Sword.

## Last Operator Select Mirror

### **Extend**

Extends existing selection instead of deselecting everything first.

---

## By Pattern

Selects all objects whose name matches the entered string. For missing parts you need to add an asterix.

For example, you have four cubes in the scene. Cube, Cube.001, Cube.002 and mycube3. Then the term " Cube " will just select the first cube. While the term " Cube\* " will select the first three. And " \*cube\* " will select all four.

Supported wild-cards:

\* matches everything

? matches any single character

[abc] matches characters in "abc"

[!abc] match any character not in "abc"

The tool operates immediately at entering the string.

### **Pattern**

Type in your string.

### **Case Sensitive**

When ticked then the string comparison happens by taking upper and lower letters into account.

## **Extend**

Extends existing selection instead of deselecting everything first.

### **Last Operator Select Pattern**

The Last Operator Select Pattern contains the same menu items than the pop-up. So see above. Also, it does not appear in the 3D view. But when you call it from the edit menu or with hotkey.

## **Active Camera**

Selects the active camera.

## **More/ Less**

### **More**

More requires to have a parent or child relationship. It expands the selection.

### **Less**

Less requires to have a parent or child relationship. It reduces the selection.

### **Parent**

Parent requires to have a parent or child relationship. It selects the parent object of the currently selected object(s).

### **Child**

Child requires to have a parent or child relationship. It selects the child object(s) of the currently selected object(s).

### **Parent extended**

Parent extended requires to have a parent or child relationship. It selects the parent object of the currently selected object(s). But keeps the active object in the selection, even when it's not currently selected.

### **Child Extended**

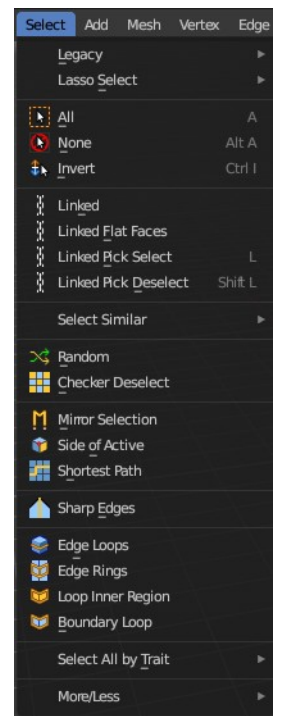

Child Extended requires to have a parent or child relationship. It selects the child object(s) of the currently selected object(s). But keeps the active object in the selection, even when it's not currently selected.

# Mesh - Edit Mode

The select menu for a mesh object in Edit mode.

A few tools here acts different, dependent in which mesh select mode you are. For example, when you are in mesh select method vertices, then the Random operator picks random vertices.

So you might want to check the mesh select mode when something does not work in an expected way.

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Inverse

Invert the current selection.

---

## Linked

Select the geometry that is directly linked with the current geometry. You can for example have a mesh with several closed sub meshes. Those sub meshes are not linked together, but are part of the object.

## Last Operator Select Linked All

### *Delimit*

Add a limit to the selection. For example, just select up to the next seam.

## Linked Flat Faces

Select the geometry that is co planar to the current selection. It works also in other selection modes, but you need to have face geometry selected.

## Last Operator Select Linked Flat Faces

Adjust the angle up to which a face counts as co planar.

## Linked Pick Select

Same as with Linked. But works with what is under the mouse cursor.

## Linked Pick Deselect

Same as with Linked. But works with what is under the mouse cursor. And deselects the selection.

## Last Operator Select Linked

### ***Deselect***

Select or deselect.

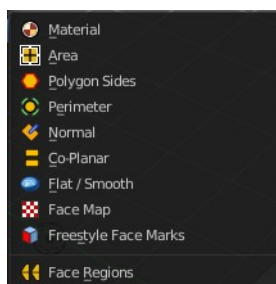

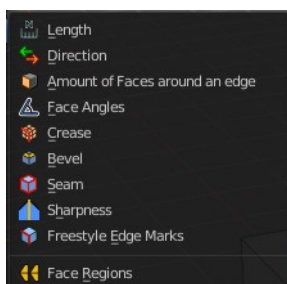

### ***Delimit***

Add a limit to the selection. For example, just select up to the next seam.

## Select Similar

Select geometry based on how similar certain properties are to it. The methods changes, dependent in which mesh selection mode you are. There is a pitfall with having more than one mesh selection method selected. Then you just get the face regions type presented. Vertices, Edges, Faces, more than one ...

## Last Operator Select Similar

### ***Type***

Choose the select similar method again.

### ***Compare***

Compare with method less, greater or equal.

### ***Threshold***

Adjust the threshold value after which the element counts as similar.

## Random

Selects a random group of vertices, edges, or faces, dependent of the mesh selection method.

## Last Operator Select Random

### ***Percent***

How much percent will be random selected.

## **Random Seed**

The random seed value.

## **Action**

Select or deselect.

---

## **Checker Deselect**

Deselect alternating faces, edges or vertices to create a checker like pattern. The result is dependent of the mesh selection method.

### **Last Operator Checker Deselect**

#### ***Nth Element***

Define how much elements gets unchecked. With 2 you have a checker board pattern. Every second element gets deselected.

#### ***Skip***

Skip elements before the checker algorithm deselects again.

#### ***Offset***

Offset the deselected elements.

---

## **Mirror selection**

Requires to have a symmetrical mesh. Selects the mirrored mesh parts from a selection.

### **Last Operator Select Mirror**

#### ***Axis***

The world axis to mirror at.

#### ***Extend***

Keep the current selection. Without extend the current selection gets deselected.

---

## **Side of Active**

Selects all mesh data in direction of a single axis, starting from the current selection.

## Last Operator Side of Active

### Axis mode

The axis orientation to work with.

### Axis Sign

In which direction to work from the current selection.

### Axis

The axis to work with.

### Threshold

Define a threshold to extend the selection.

## Shortest Path

Select the shortest edge path between two selected mesh elements. This can be vertices, edges or faces. A start and an end point must be selected.

## Last Operator Select shortest path

### Face Stepping

Traverse connected faces.

### Topology Distance

Find the minimum number of steps instead of the shortest distance.

## **Fill Region**

Select the region faces too.

## **Nth Element**

Don't select the whole path, but just every nth element of it.

## **Skip**

This is connected to nth element. Number of elements to skip at once.

## **Offset**

This is connected to nth element. Start with an offset.

---

## **Sharp Edges**

Select all edges that are marked as sharp.

## **Last Operator Select Sharp Edges**

### **Sharpness**

The angle after which a sharp edge gets selected.

---

## **Edge Loop**

Selects a loop of edges from a selected edge. The method stops at poles. That's vertices where three or more than four edges comes together. At a UV sphere the north and south pole ...

## **Last Operator Multi Select Loops**

### **Ring**

Select edge ring instead of edge loop.

## **Edge Ring**

Selects edges parallel to a selected edge in the same ring of faces. The method stops at poles. That's vertices where three or more than four edges comes together. At a UV sphere the north and south pole ...

## Last Operator Multi Select Loops

### *Ring*

Select edge ring instead of edge loop.

## Loop Inner-Region

Select everything that is enclosed by an edge loop. When the loop is not closed, then it might select everything ...

By default the smaller enclosed part gets selected. The Inner-Region.

## Last Operator Select Loop Inner-Region

### *Select Bigger*

Select the bigger enclosed part instead of the smaller enclosed part.

## Boundary Loop

Select the edges that encloses a selection of faces.

## Ungrouped Verts

Selects ungrouped Vertices. Just active in vertex selection mode. And requires to have at least one vertex group assigned.

## Last Operator Select Ungrouped

### *Extend*

Extends the current selection.

## Select all by Trait sub menu

### *Non Manifold*

Select non manifold geometry. Enclosed faces inside of a geometry for example.

## Last Operator Select Faces by Side

What exact kind of non manifold geometry should be selected. The options names should be self explaining.

## Loose Geometry

Selects loose geometry.

## Last Operator Select Loose Geometry

### **Extend**

Extend the current selection.

## Interior Faces

Select faces where all edges have more than 2 faces. In the picture here we have inlaying faces by joining two cubes together, then merge the vertices by distance. So the two faces from the former two cubes are now interior faces. That's usually unwanted geometry that you want to select and to remove.

## Faces by Sides

Selects faces that has the same number of edges, or better said vertices. Tris, quads, N-gons.

## Last Operator Select Faces by Side

### **Sharpness**

Extend the current selection.

### **Number of vertices**

How many numbers of vertices the face should have. 4 is a quad.

### **Type**

Selection type.

### **Extend**

Extend the current selection.

## Select by Attribute

This operator selects elements based on the active boolean attribute. Useful for selection of boolean attributes set by Geometry Nodes.

To use, make sure you have a boolean attribute assigned and selected in the Properties Editor - Mesh Data – Attributes tab.

## More / Less

### More

Extends the current selection.

### Less

Reduces the current selection.

### Next Active

Selects the next active element. For example, when you have two vertices selected, then the next vertice in the row with the same distance will be selected as the next active.

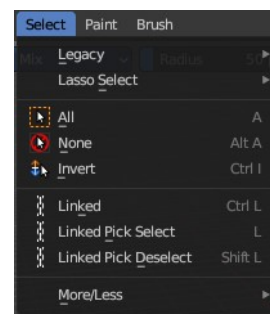

### Previous Active

Like next active, but deselects in the other direction down to the first selected vertice with every step.

## Mesh Object - Vertex and Weight Paint Mode

This select menu shows with the sub modes Paint Mask and Vertex Selection in vertex paint mode and weight paint mode.

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Invert

Invert the current selection.

## Ungrouped Vertices

Vertex Selection Mode. Select vertices that does not belong to a group.

## Select Linked

Vertex Selection Mode. Select the geometry that is directly linked with the current geometry. You can for example have a mesh with several closed sub meshes. Those sub meshes. are not linked together, but are part of the object.

## Last Operator Select Linked All

### Delimit

Add a limit to the selection. For example, just select up to the next seam.

## Linked

Paint Mask mode. Select linked faces. Mouse only tool.

## Linked Pick Select

Paint Mask mode. Select linked faces. Mouse only tool.

## Linked Pick Deselect

Paint Mask mode. Deselect linked faces. Mouse only tool.

## More/Less submenu

### More

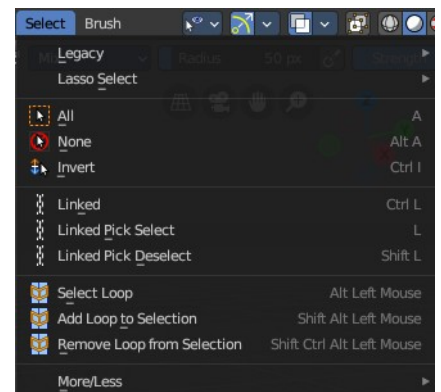

Increase the selection.

### Less

Decrease the selection.

## Mesh Object - Texture Paint Mode

This select menu shows with the sub mode Paint Mask.

## Legacy

The legacy sub menu contains tools that exist in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Invert

Invert the current selection.

## Ungrouped Vertices

Vertex Selection Mode. Select vertices that does not belong to a group.

## Select Linked

Vertex Selection Mode. Select the geometry that is directly linked with the current geometry. You can for example have a mesh with several closed sub meshes. Those sub meshes. are not linked together, but are part of the object.

## Last Operator Select Linked All

### Delimit

Add a limit to the selection. For example, just select up to the next seam.

## Linked

Paint Mask mode. Select linked faces. Mouse only tool.

## Linked Pick Select

Paint Mask mode. Select linked faces. Mouse only tool.

## Linked Pick Deselect

Paint Mask mode. Deselect linked faces. Mouse only tool.

## Select Loop

Selects a face loop. Mouse operator. The result is dependant of thhe face under the mouse. So please use the mouse.

## Add Loop to Selection

Adds a face loop to an existing selection. Mouse operator. The result is dependant of thhe face under the mouse. So please use the mouse.

## Remove Loop from Selection

Subtracts a face loop from an existing selection. Mouse operator. The result is dependant of thhe face under the mouse. So please use the mouse.

## More/Less submenu

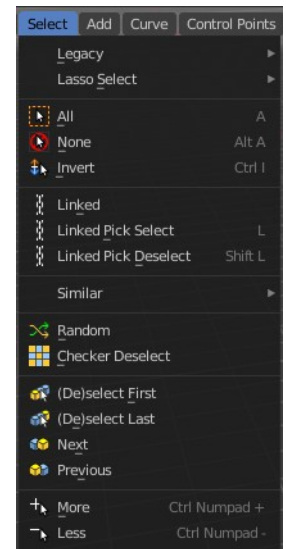

### More

Increase the selection.

### Less

Decrease the selection.

# Curve Object - Edit Mode

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Invert

Invert the current selection.

## Linked

Select the geometry that is directly linked with the current geometry. You can for example have a mesh with several closed sub meshes. Those sub meshes. are not linked together, but are part of the object.

## Last Operator Select Linked All

### *Delimit*

Add a limit to the selection. For example, just select up to the next seam.

---

## Linked Pick Select

Same as with Linked. But works with what is under the mouse cursor.

## Linked Pick Deselect

Same as with Linked. But works with what is under the mouse cursor. And deselects the selection.

## Last Operator Select Linked

### *Deselect*

Select or deselect.

### *Delimit*

Add a limit to the selection. For example, just select up to the next seam.

---

## Similar

Select curve geometry based on how similar certain properties are to it.

## Last Operator Select Similar

### *Type*

Choose the select similar method again.

## **Compare**

Compare with method less, greater or equal.

## **Threshold**

Adjust the threshold value after which the element counts as similar.

---

## **Random**

Selects a random group of curve points.

### **Last Operator Select Random**

#### **Percent**

How much percent will be random selected.

#### **Random Seed**

The random seed value.

#### **Action**

Select or deselect.

---

## **Checker Deselect**

Deselect alternating curve points.

### **Last Operator Checker Deselect**

#### **Nth Element**

Define how much elements gets unchecked. With 2 you have a checker board pattern. Every second element gets deselected.

#### **Skip**

Skip elements before the checker algorithm deselects again.

#### **Offset**

Offset the deselected elements.

---

## **De/Select First**

Select or deselect first curve point.

## De/Select Last

Select or deselect last curve point.

## Next Active

Selects the next active element. For example, when you have two vertices selected, then the next vertice in the row with the same distance will be selected as the next active.

## Previous Active

Like next active, but deselects in the other direction down to the first selected vertice with every step.

## More

Extends the current selection.

## Less

Reduces the current selection.

# Surface Object - Edit Mode

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Linked

Select the geometry that is directly linked with the current geometry. You can for example have a mesh with several closed sub meshes. Those sub meshes are not linked together, but are part of the object.

## Last Operator Select Linked All

### Delimit

Add a limit to the selection. For example, just select up to the next seam.

## Similar

Select curve geometry based on how similar certain properties are to it.

## Last Operator Select Similar

### Type

Choose the select similar method again.

### Compare

Compare with method less, greater or equal.

## ***Threshold***

Adjust the threshold value after which the element counts as similar.

---

## **Random**

Selects a random group of control points.

### **Last Operator Select Random**

#### ***Percent***

How much percent will be random selected.

#### ***Random Seed***

The random seed value.

#### ***Action***

Select or deselect.

---

## **Checker Deselect**

Deselect alternating control points.

### **Last Operator Checker Deselect**

#### ***Nth Element***

Define how much elements gets unchecked. With 2 you have a checker board pattern. Every second element gets deselected.

#### ***Skip***

Skip elements before the checker algorithm deselects again.

#### ***Offset***

Offset the deselected elements.

---

## **Control Point Row**

Selects a row of control points, including the active one.

---

## **More**

Extends the current selection.

## Less

Reduces the current selection.

# Metaball Object - Edit Mode

## Legacy

The legacy sub menu contains tools that exist in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Inverse

Invert the current selection.

## Similar

Select metaball geometry based on how similar certain properties are to it.

### Last Operator Select Similar

#### *Type*

Choose the select similar method again.

#### *Compare*

Compare with method less, greater or equal.

#### *Threshold*

Adjust the threshold value after which the element counts as similar.

---

## Random

Selects a random metaball element.

### Last Operator Select Random

#### *Percent*

How much percent will be random selected.

#### *Random Seed*

The random seed value.

#### *Action*

Select or deselect.

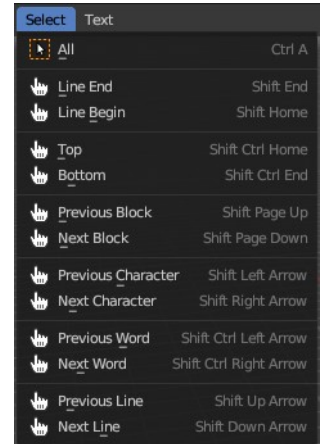

## Text Object - Edit Mode

### All

Select everything.

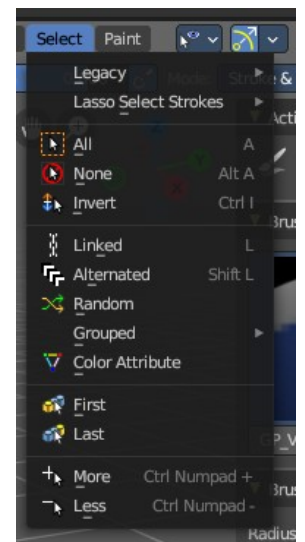

### Line End, Line Begin, etc.

Select corresponding element.

## Grease Pencil Object - Edit Mode, Sculpt Mode, Vertex Paint Mode

This is the select menu for the grease pencil object. You can find this menu in multiple modes.

### Legacy

The legacy sub menu contains tools that exist in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

### Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

### Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the

scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

## Linked

Select the geometry that is directly linked with the current geometry. You can for example have a mesh with several closed sub meshes. Those sub meshes are not linked together, but are part of the object.

## Last Operator Select Linked All

### Delimit

Add a limit to the selection. For example, just select up to the next seam.

## Alternated

Select every second element.

## Last Operator Alternated

### Unselect Ends

The end points are always unselected.

## Grouped

Select grouped strokes by layer or color.

## Last Operator Select Grouped

### Type

Adjust if you want to select by layer or color.

## Color Attribute

Select all points with similar vertex color of current selected vertices. You have to create a vertex selection first.

## Last Operator Select Vertex Color

### Threshold

Tolerance of the selection. Higher values select a wider range of similar colors.

## First

Select the first element in the stroke.

## Last Operator Select First

### Selected Strokes only

Only select the first point of strokes that has already some geometry selected.

### Extend

Extend the current selection.

## Last

Select the last element in the stroke.

## Last Operator Select Last

### Selected Strokes only

Only select the last point of strokes that has already some geometry selected.

### Extend

Extend the current selection.

## More

Extends the current selection.

## Less

Reduces the current selection.

# Armature Object - Edit Mode

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

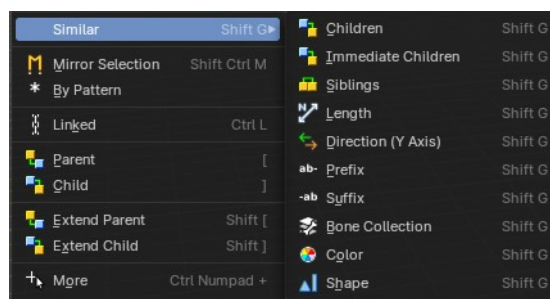

## Inverse

Invert the current selection.

## Similar

Select armature bones based on how similar certain properties are to it.

Most methods are self explaining. Immediate children selects just the direct children of the active object, while Children selects everything downwards the hierarchy.

## Last Operator Select Similar

### Type

Choose the select similar method again.

### Compare

Compare with method less, greater or equal.

### Threshold

Adjust the threshold value after which the element counts as similar.

## Mirror Selection

Select the mirrored parts of an object. For example for L.bone it selects R.bone.

## Last Operator Select Mirror

### Extend

Extends existing selection instead of deselecting everything first.

---

## By Pattern

Selects all objects whose name matches the entered string. For missing parts you need to add an asterix.

For example, you have four cubes in the scene. Cube, Cube.001, Cube.002 and mycube3. Then the term " Cube " will just select the first cube. While the term " Cube\* " will select the first three. And " \*cube\* " will select all four.

Supported wild-cards:

\* matches everything

? matches any single character

[abc] matches characters in "abc"

[!abc] match any character not in "abc"

The tool operates immediately at entering the string.

## Pattern

Type in your string.

## Case Sensitive

When ticked then the string comparison happens by taking upper and lower letters into account.

## Extend

Extends existing selection instead of deselecting everything first.

## Last Operator Select Pattern

The Last Operator Select Pattern contains the same menu items than the pop-up. So see above. Also, it does not appear in the 3D view. But when you call it from the edit menu or with hotkey.

---

## Parent

Parent requires to have a parent or child relationship. It selects the parent object of the currently selected object(s).

## Child

Child requires to have a parent or child relationship. It selects the child object(s) of the currently selected object(s).

## Extend Parent

Extend Parent requires to have a parent or child relationship. It selects the parent object of the currently selected object(s). But keeps the active object in the selection, even when it's not currently selected.

## Extend Child

Extend Child requires to have a parent or child relationship. It selects the child object(s) of the currently selected object(s). But keeps the active object in the selection, even when it's not currently selected.

## More

More requires to have a parent or child relationship. It expands the selection.

## Less

Less requires to have a parent or child relationship. It reduces the selection.

# Armature Object - Pose Mode

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle

select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

---

## Grouped

Select grouped bones by type. Items should be self explaining.

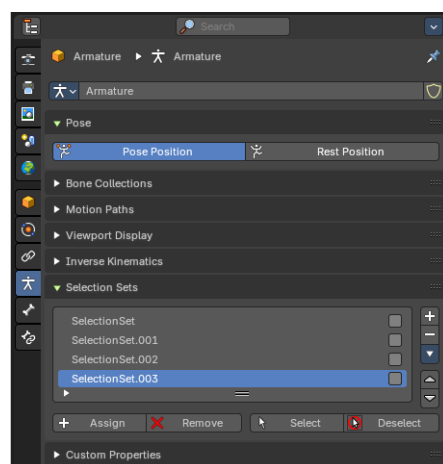

## Linked

Select all bones that are either parent or child of the selected bone.

## Bone Selection Set

Select a bone selection. Bone selections can be created and managed in the Properties editor in the object Data Properties in the Selection Sets Panel.

---

## Constraint Targets

Select the bones used as targets for the currently selected bone.

## By Pattern

Selects all objects whose name matches the entered string. For missing parts you need to add an asterix.

For example, you have four cubes in the scene. Cube, Cube.001, Cube.002 and mycube3. Then the term " Cube " will just select the first cube. While the term " Cube\* " will select the first three. And " \*cube\* " will select all four.

Supported wild-cards:

\* matches everything

? matches any single character

[abc] matches characters in "abc"

[!abc] match any character not in "abc"

The tool operates immediately at entering the string.

## Pattern

Type in your string.

## Case Sensitive

When ticked then the string comparison happens by taking upper and lower letters into account.

## Extend

Extends existing selection instead of deselecting everything first.

## Last Operator Select Pattern

The Last Operator Select Pattern contains the same menu items than the pop-up. So see above. Also, it does not appear in the 3D view. But when you call it from the edit menu or with hotkey.

## Flip Active

Mirrors the bone selection. Works with an armature with mirrored parts.

## Last Operator Flip Active/Selected Bone

### *Active Only*

Only select the mirror part of the active bone.

### *Extend*

Extend the current selection.

## Parent

Parent requires to have a parent or child relationship. It selects the parent object of the currently selected object(s).

## Child

Child requires to have a parent or child relationship. It selects the child object(s) of the currently selected object(s).

## Extend Parent

Extend Parent requires to have a parent or child relationship. It selects the parent object of the currently selected object(s). But keeps the active object in the selection, even when it's not currently selected.

## Extend Child

Extend Child requires to have a parent or child relationship. It selects the child object(s) of the currently selected object(s). But keeps the active object in the selection, even when it's not currently selected.

# Lattice Object - Edit Mode

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

---

## Mirror

Select the mirrored parts to the current selection.

### Last Operator Select Mirror

#### Axis

Choose the world axis to mirror at.

#### Extend

Extends existing selection instead of deselecting everything first.

---

## Ungrouped Verts

Selects ungrouped Vertices. Requires to have at least one vertex group assigned.

### Last Operator Select Ungrouped

#### Extend

Extends the current selection instead of deselecting everything first.

---

## More

Extends the current selection.

## Less

Reduces the current selection.

# Particles - Particle Mode

## Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Inverse

Invert the current selection.

## More

Extends the current selection.

## Less

Reduces the current selection.

## Linked

Selects the linked particles.

## Random

Selects random particles.

## Last Operator Select Random

### *Percent*

The Percentage of objects that should be selected randomly.

### *Random Seed*

The Seed for the random number generator.

### *Action*

Action is a drop-down box choose if you want to select or to deselect random.

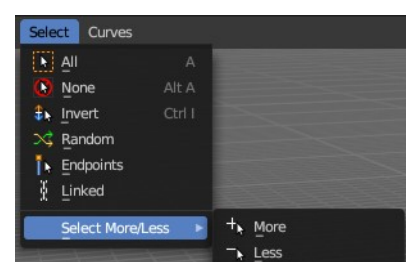

### *Type*

Select the whole hair, or hair points.

## Hair Curve – Edit Mode

The (Empty) Hair Curve object in the Edit mode has a select menu. Here you can select existing curves in different ways to mask selections for tool shelf operators. Selected curves are editable, deselected curves are locked from editing and are visually opaque with dark gray in the 3D View editor.

## All

Selects all the control points of the hair strands.

If you want a want a symmetrical haircut, tick X Mirror in the Symmetry panel or in the Header to the top right.

## None

Deselects all the control points of the hair curves.

## Invert

Deselects all the control points of the hair curves.

## Random

Randomizes existing selection or creates a new random selection of control points of the hair curves.

## Endpoints

Selects the end points of the control points of the hair curves.

## Linked

Select linked control points.

## Select More/Less submenu

Grow or shrink the selection.

# Hair Curve – Sculpt Mode

The (Empty) Hair Curve object in the Sculpt mode has a select menu. Here you can select existing curves in different ways to mask selections for tool shelf operators. Selected curves are editable, deselected curves are locked from editing and are visually opaque with dark gray in the 3D View editor.

## All

Selects all the control points of the hair strands.

If you want a want a symmetrical haircut, tick X Mirror in the Symmetry panel or in the Header to the top right.

## **None**

Deselects all the control points of the hair curves.

## **Invert**

Deselects all the control points of the hair curves.

## **Random**

Randomizes existing selection or creates a new random selection of control points of the hair curves.

## **Endpoints**

Selects the end points of the control points of the hair curves.

## **Grow**

Select curves which are close to curves that are selected already.

## Add Menu

The Add menu contains everything that can be added to the scene. Geometry, camera, lights and so on.

When you create a primitive then the Adjust Last Operator Panel down left shows some settings for this primitive.

Note that the adjust last operator panel does not show when you add a primitive from the toolbar at the top. Then you have to open the adjust last operation panel from the toolbar.

Note also that those settings are not longer available when you perform any operation at the object. And be it to move the primitive. Some of those settings might still be available in the Properties editor. But things like create UV not. So when you want to adjust those settings, then do it immediately after creation.

Several object types can be edited. A Mesh Primitive for example. They have different modes available then. Some not. Like an Empty. There is just the Object mode available for an Empty.

You can add some primitives in edit mode too. In object mode you have the whole range available. In Edit mode you usually just have the object type available with which you are in edit mode.

For example, when you are in edit mode with a mesh, then the add menu just shows the mesh content. When you add geometry in edit mode, then the added geometry becomes part of the current object.

## Add menu – Search...

There is a search menu operator where you can search for specific object types in all categories.

## Add menu – Type to Search

There is also a hidden search menu where you can search for specific object types in all categories with a key press when the menu is open.

Simply expand the add menu by clicking it, and start to type in the term that you want to find – this will automatically trigger the search.

## Mesh

The Mesh section contains the primitives that are made of meshes.

Mesh objects are geometrical objects made of vertices, edges and faces. The geometry can be edited in various ways in edit mode. They can be sculpted in sculpt mode. The vertices can be painted in vertex paint mode. They can be used as a skin for a skeleton, and you can weight paint them so that it deforms with the armature. And you can add textures by UV mapping.

## Plane

Plane creates a simple quad face mesh.

### Last Operator Add Plane Panel

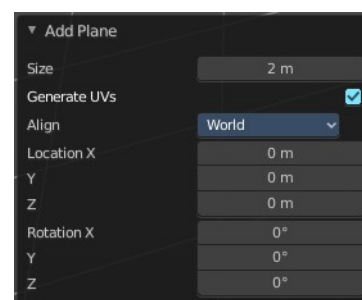

**Size** is in real the size of the plane.

**Generate UV's** creates UV's for this primitive.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

**Location** Adjust the location of the Plane.

**Rotation** defines the rotation of the Plane.

## Cube

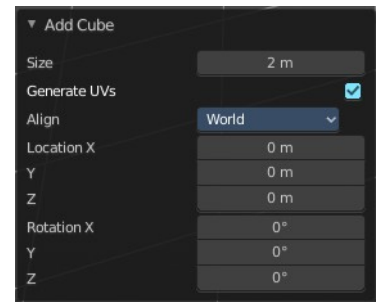

Cube creates a Cube mesh.

### Last Operator Add Cube Panel

**Size** is in real the size of the Cube.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Cube.

**Rotation** defines the rotation of the Cube.

## Circle

Circle creates a Circle mesh.

### Last Operator Add Circle Panel

**Vertices** defines of how much vertices the circle is made.

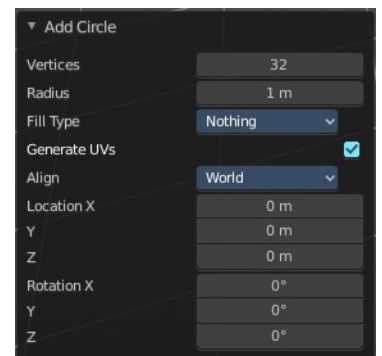

**Radius** defines the radius of the circle.

**Fill Type** defines how the Circle mesh is filled.

- Nothing means you have pure edge geometry.
- N-Gon means that the circle face is a N-Gon face.
- Triangle Fan means that the circle face is triangulated.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Circle.

**Rotation** defines the rotation of the Circle.

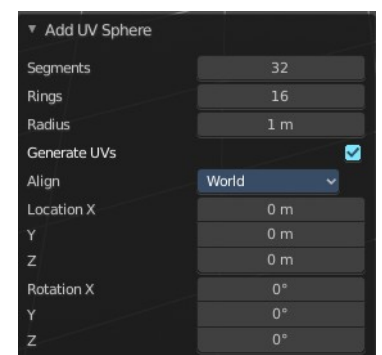

## UV Sphere

UV Sphere creates a sphere mesh.

### Last Operator Add UV Sphere Panel

**Segments** defines of how much segments the sphere has vertically.

**Rings** defines how much rings the sphere has horizontally.

**Size** defines the radius of the UV Sphere.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Sphere.

**Rotation** defines the rotation of the Sphere.

---

## Ico Sphere

Ico Sphere creates a sphere mesh.

### Last Operator Add Ico Sphere Panel

**Subdivisions** defines the subdivision level of the Ico Sphere.

**Size** defines the radius of the Ico Sphere.

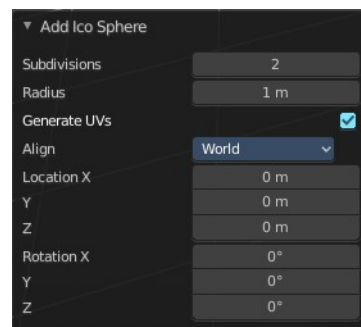

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Sphere.

**Rotation** defines the rotation of the Sphere.

---

## Cylinder

Cylinder creates a Cylinder mesh.

### Last Operator Add Circle Panel

**Vertices** defines of how much vertices the circle is made.

**Radius** defines the radius of the Cylinder.

**Depth** defines the length of the Cylinder.

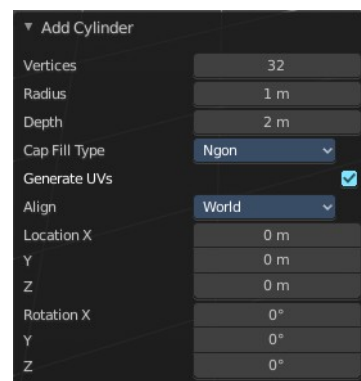

**Cap Fill Type** defines how the cap face is filled.

- Nothing means you have no face at the top and the bottom of the Cylinder.
- N-Gon means that the cap face is an N-Gon face.
- Triangle Fan means that the cap face is triangulated.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Cylinder.

**Rotation** defines the rotation of the Cylinder.

## Cone

Cone creates a Cone mesh

### Last Operator Add Cone Panel

**Vertices** defines of how much vertices the circle is made.

**Radius 1** defines the base radius of the Cone.

**Radius 2** defines the top radius of the Cone.

**Depth** defines the length of the Cone.

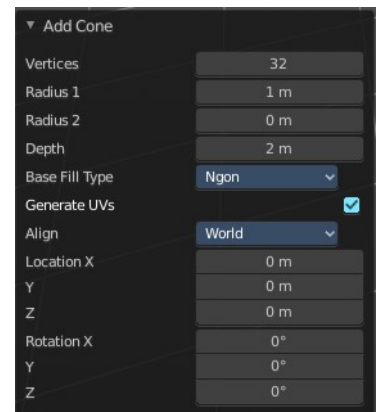

**Base Fill Type** defines how the Base face is filled.

- Nothing means you have no base face.
- N-Gon means that the base face is an N-Gon face.
- Triangle Fan means that the base face is triangulated.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Cone.

**Rotation** defines the rotation of the Cone.

## Torus

Torus creates a Torus mesh

### Last Operator Add Torus Panel

**Operator Presets** allows you to store presets for the Torus. So that you don't have to start from scratch when you need different tori with different setup. This presets are temporary. And cannot be stored between sessions.

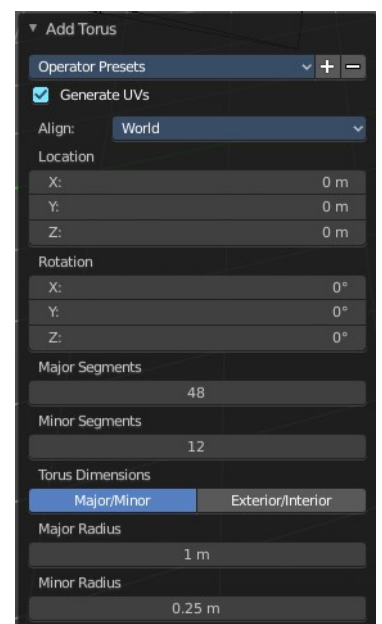

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** defines the location of the Torus.

**Rotation** defines the rotation of the Torus.

**Major segments** defines the segment division of the Torus.

**Minor segments** defines the circle division of the Torus.

**Torus Dimensions** defines the method to use when changing Major and Minor Radius.

**Major Radius** changes the radius of the Torus.

**Minor Radius** changes the thickness of the Torus.

---

## Grid

Grid creates a subdividable plane mesh

### Last Operator Add Grid Panel

**X Subdivisions** defines the number of subdivisions in x direction.

**Y Subdivisions** defines the number of subdivisions in Y direction.

**Size** is in real the size of the plane.

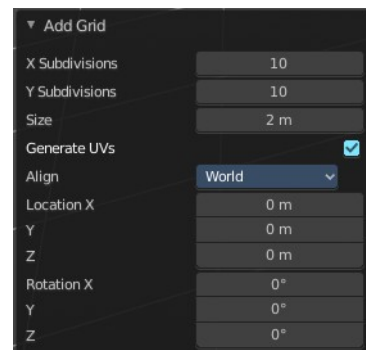

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Plane.

**Rotation** defines the rotation of the Plane.

---

## Monkey

Monkey creates a monkey head mesh.

### Last Operator Add Monkey Panel

**Radius** is in real the size of the object.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Monkey head mesh.

**Rotation** defines the rotation of the Monkey head mesh.

## Curve

Add curves primitives.

Curve objects are mathematical curves that are defined by a start and endpoint. You can edit the shape of the curve by handlers. Curves have several purposes. They can be used as a path. Or you use them as the base for a mesh object.

The curve types are very similar. But do have some small differences. The difference between Bezier and Nurbs is that with Bezier you have handlers at the curve. And with a Nurbs you have a control geometry to influence the curve.

Note that Curves is no mesh data. You have to convert the Curves data to Mesh data when you want to work with it like with a mesh. Note also that you cannot convert it back to curve then.

### Bezier

**Bezier** creates a Bezier type curve.

### Circle

**Circle** creates a Bezier circle type curve.

### Nurbs Curve

**Nurbs Curve** creates a Nurbs type curve.

### Nurbs Circle

**Nurbs Circle** creates a Nurbs type circle curve.

### Path

**Path** creates a Nurbs type curve.

### Last Operator Add Curve

The Last Operator add panel is for all curves equal.

**Radius** is in real the size of the object.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

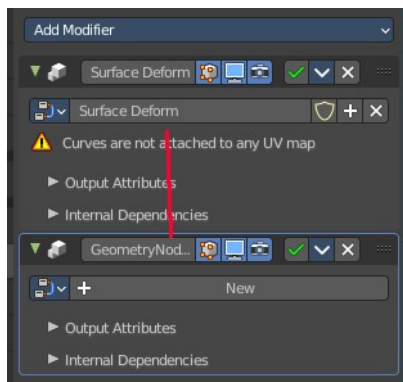

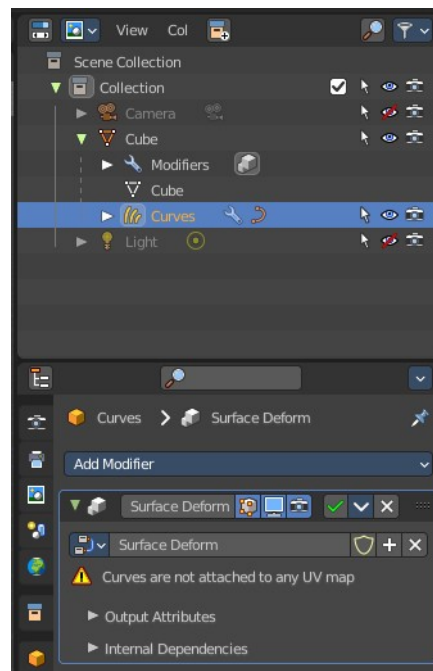

**Location** Adjust the location of the curve.

**Rotation** defines the rotation of the curve.

## Empty Hair

Adds an empty hair system.

This is the new curve based hair system. The old system works with particles. The tool adds a Curves hair system and the corresponding Surface Deform modifier to a mesh. Which is nothing else than a renamed geometry node. The new hair system is a geometry node solution.

You need to have a mesh object selected to set the menu item active.

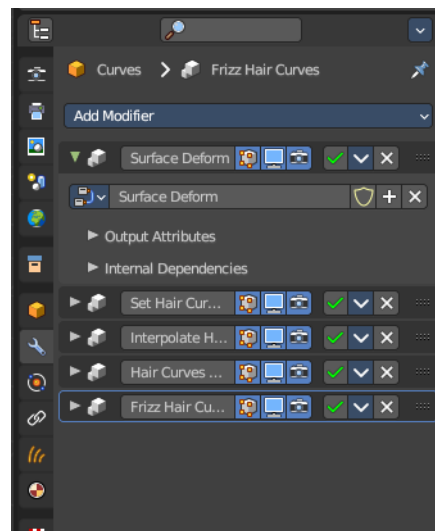

The actual hair then gets added and modified in sculpt mode and by geometry nodes.

A curve radius node is for example needed to control the thickness of the hair. Or you add a resample node to make the hair more detailed. And so on. Further settings can also be found in the Properties editor.

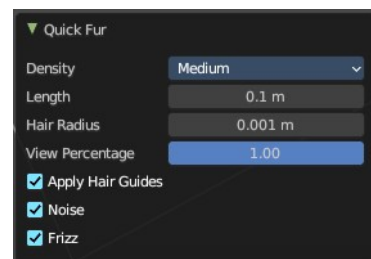

## Quick Fur

Adds a quick fur setup. Similar to Empty Hair, but with content. And all required modifiers.

## Last operator Quick Fur

### **Density**

The fur density.

### **Length**

The fur length.

### **Hair Radius**

The hair radius.

### **View Percentage**

How much percent of the fur to show in the viewport. Does not affect rendering.

### **Apply hair guides**

Apply hair guides if they exist.

### **Noise**

Add some noise to the hair straints.

### **Frizz**

Add some curl to the hair straints.

## Surface

Surfaces are some kind of curves. But curves with which you can construct surfaces.  
Surfaces are all of type Nurbs curves.

Note that Surfaces similar to Curves is no mesh data. You have to convert the Surfaces data to Mesh data when you want to work with it like with a mesh. Note also that you cannot convert it back to Surface then.

### Surface Curve

Surface Curve creates a Nurbs type curve.

### Surface Circle

Surface Circle creates a Nurbs type circle.

### Surface Surface

Surface Surface creates a Nurbs type Surface.

### Surface Cylinder

Surface Cylinder creates a Nurbs type cylinder.

### Surface Sphere

Surface Sphere creates a Nurbs type sphere.

### Surface Torus

Surface Torus creates a Nurbs type Torus.

### Last Operator Add Surface

The Last Operator add panel is for all curves equal.

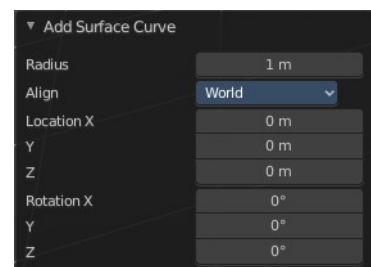

**Radius** is in real the size of the object.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the surface.

**Rotation** defines the rotation of the surface.

## Metaball

Meta-balls are procedural primitives. They are not defined by vertices or curves. The interesting behavior of meta-balls is that you can stick them into each other. And they have one surface then. Like merging two water drops. And this works in Object mode already.

### Ball

**Ball** creates a meta-ball in Sphere shape.

### Capsule

**Capsule** creates a meta-ball in Capsule shape.

### Plane

**Plane** creates a meta-ball in Plane shape.

### Ellipsoid

**Ellipsoid** creates a meta-ball in Ellipsoid shape.

### Cube

**Cube** creates a meta-ball in Cube shape.

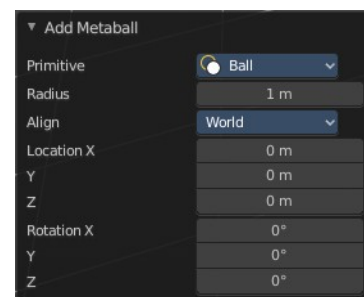

### Last Operator Add Meta ball

The Last Operator add panel is for all Meta-balls equal.

**Primitive** is a drop-down box where you can change the Meta ball type.

**Radius** is in real the size of the object.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the surface.

**Rotation** defines the rotation of the surface.

## Text

Text creates a text object. With a text object you can create a text in the 3D viewport. Text is not mesh geometry. It is a special curve geometry. But you can convert it to a mesh. See Object menu, Convert to.

Text can be cut, copied and pasted in the usual way by ctrl x, ctrl c and ctrl v

There is a limit of characters, which is by 50.000.

## Objects as Fonts

You can also “create” your own “font” inside Bforartists! This is quite a complex process, so let’s detail it:

- First, you must create your chars. Each char is an object of *any type* (mesh, curve, meta...). They all must have a name following the schema: **common prefix** followed by the **char name** (e.g. `ft . a`, `ft . b`, etc.).
- Then, for the *Text* object, you must enable the *Dupli Verts* button (*Object* context - *Anim Settings* panel).
- Back in *Editing* context, in the *Font* panel, fill the *Ob Family* field with the *common prefix* of your “font” objects.

Now, each time a char in your text matches the *suffix part* of a “font” object’s name, this object is duplicated on this char. *The original chars remain visible*. The objects are duplicated so that their center is positioned at the *lower right corner* of the corresponding chars.

### Note

You can enter the Edit mode with the standard hotkey. But you cannot switch back to Object mode with the standard hotkey. Since this hotkey gets count as input for the text object in Edit mode. You have to use the mode drop-down box to leave the Edit mode.

## Editing Text

Editing text is different from other object types in Bforartists. You edit on the one hand a curve type object, but also a text. And so the text editing standards applies. Like hitting backspace to delete parts of the text.

## Inserting Text

You can type in new text. You can also copy text from a text editor and paste it. Or you can load a text file.

To load text from a text file, use the Edit / Paste File tool. This will bring up a *File Browser* window for navigating to a valid UTF-8 file.

## Accent Characters

### WARNING

Note that this feature is broken by Blender design. A Bug report to fix it was rejected.

The hotkey alone is a challenge. Press the keys in the wrong order and it will not work.

And not all UTF8 characters are supported. The default font just supports a fraction. This can partially be fixed by choosing another font. But the underlying code also just works for a fraction. It can be that not even the listed combinations in the manual here are working for you. There is a conflict with different keyboard layouts

involved. And there is no documentation of further possible key combinations available.

When you want to work with special UTF8 characters, then we highly recommend to write this text in a text file and import this text file then.

You have been warned!

Many special characters can be “composed” using a combination of two other characters. The hotkey for it is the character followed by Alt-Backspace followed by the desired key to produce the accent character. Note that the following key combinations works with the US keyboard layout, even when you use the german keyboard layout.

Some examples.

ã - A, Alt-Backspace, ~

á - A, Alt-Backspace, '

à - A, Alt-Backspace, Backslash

â - A, Alt-Backspace, ^

å - A, Alt-Backspace, O

æ - A, Alt-Backspace, E

<sup>a</sup> - A, Alt-Backspace, Minus

ë - E, Alt-Backspace, "

ç - C, Alt-Backspace, Comma

¢ - C, Alt-Backspace, |

ø - O, Alt-Backspace, Slash

§ - S, Alt-Backspace, S

† - |, Alt-Backspace, Minus

‡ - |, Alt-Backspace, =

© - O, Alt-Backspace, C

® - O, Alt-Backspace, R

™ - T, Alt-Backspace, M

½ - 1, Alt-Backspace, 2

÷ - Minus, Alt-Backspace, :

± - Minus, Alt-Backspace, Plus

## Last Operator Add Text

**Radius** is in real the size of the Text object.

**Align** to view aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Text object.

**Rotation** defines the rotation of the Text object.

You can navigate the cursor with the arrow buttons. Enter adds a new paragraph. When you use the navigator you will see a last operator Move Cursor with further options.

## Last Operator Move Cursor

### Type

The different methods to set the cursor.

## Point Cloud

Creates a object of type Point Cloud. Point clouds can represent 3D scans. It is also planned to represent particles in the future. Each point can store data in a set of Attributes. The attributes can be found in the Properties Editor in the Object Data Properties.

At the moment there is not this much that can be done with Point Clouds. But you can convert a object to a point cloud and vice versa.

## Last Operator Add Point Cloud

### Align

How to orient the point cloud at creation.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

## Location X Y Z

The position of the point cloud at creation.

## Rotation X Y Z

The rotation of the point cloud at creation.

# Volume

Add a volume object.

## Import OpenVDB

Imports a volume object of type OpenVDB. This button opens a file browser.

## Empty

Create an empty Volume object.

## Last Operator Add Volume

## Align

How to orient the point cloud at creation.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

## Location X Y Z

The position of the point cloud at creation.

## Rotation X Y Z

The rotation of the point cloud at creation.

# Grease Pencil

With a grease pencil object you can draw in the 3D viewport.

It starts as an object type. By switching into paint mode it becomes a paint feature. And editing turns it into a curve or a mesh object then.

It can be use to make traditional 2D animation, cut-out animation, motion graphics or use it as storyboard tool among other things.

You add a grease pencil object, switch to draw mode, choose the color or add a new one. And when done with drawing you can manipulate the grease pencil object in edit mode or in weight paint mode even further.

The colors are materials.

In the Tools tab you will find all the options and settings for drawing and manipulating the grease pencil object, means your drawing.

## Blank

Adds a blank grease pencil object with just one black color and no geometry.

## Stroke

Adds a grease pencil stroke with some predefined colors.

## Monkey

Adds the drawing of a monkey as an example with some predefined colors.

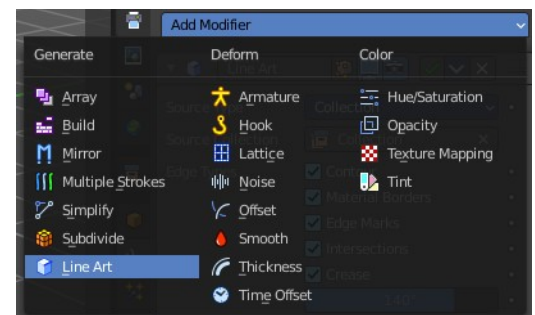

## Scene Line Art

Line Art is a modifier for the grease pencil object. Scene Line Art adds a grease pencil object with the Line Art Modifier set up for the whole scene.

## Collection Line Art

Line Art is a modifier for the grease pencil object. Scene Line Art adds a grease pencil object with the Line Art Modifier set up for a collection.

## Object Line Art

This menu item just shows when you have a mesh object selected. Line Art is a modifier for the grease pencil object. Scene Line Art adds a grease pencil object with the Line Art Modifier set up for the selected mesh object.

## Last Operator Add Grease Pencil

The Last Operator add Grease Pencil panel is for all grease pencil objects equal. **Radius** is in real the size of the object.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the surface.

**Rotation** defines the rotation of the surface.

**Type** Choose the grease pencil type.

Line art types gives you further options.

## In Front

Show the grease pencil line art in front of everything.

## Stroke Depth Order

How to order the strokes.

## Armature

**Armature** adds the first bone of a skeleton. This bone can be further extended in edit mode. And you can animate the created skeleton in pose mode.

A bone has three elements. The start joint is called root or head. The body is called body. And the end joint is called tip or tail.

A bone can also have an influence area. The so called envelope.

The bones of an armature can be edited in Edit mode. And posed in Pose mode.

## Last Operator Add Armature

**Radius** is in real the size of the Armature object.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Armature object.

**Rotation** defines the rotation of the Armature object.

## Lattice

A lattice object is a control cage to control deforming at another object.

## Usage

Create a Lattice object.

Make sure it is bigger than the object that you want to deform, and is around this object.

Add a Lattice Modifier to the object that you want to deform.

In the Object box of the Lattice Modifier add our created Lattice object.

Select Lattice Object. Enter Edit mode. And here you can deform the Lattice Object now, and the object to deform will follow.

## Last Operator Add Lattice object

**Radius** is in real the size of the Lattice object.

**Type** is a drop-down box choose any other object type to create.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Lattice object.

**Rotation** defines the rotation of the Lattice object.

## Empty

An Empty is an object without any data attached. It is basically just a container. It is empty. Empties can be used as anchor objects. Or as visible handlers at a skeleton for example.

The empty types differs just by how they gets displayed in the viewport.

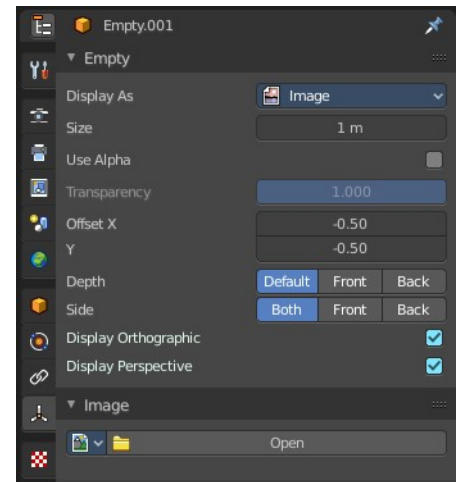

The empty of type image allows you to load an image to display the empty. This image can be adjusted and loaded in the object data panel of the empty object.

The image empty has also a transform widget, presented by the yellow color. It becomes visible when you hover with the mouse over the object.

Empties, no matter what shape, does not render to file.

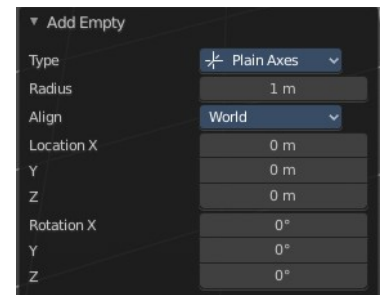

## Last Operator Add Empty

**Type** is a drop-down box where you can define the type of Empty object.

**Radius** is in real the size of the Empty object.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Empty object.

**Rotation** defines the rotation of the Empty object.

## Image

Image objects allows you to import and display images in the viewport. Image objects are nothing else than Empties of type Image. So in the outliner they will show up as empties.

When you create an image object, then the file browser opens, choose the image that you want to use as the reference image. It loads with the correct ratio.

Neither reference images nor background images does render to file. They are just meant to display images in the viewport.

## Reference

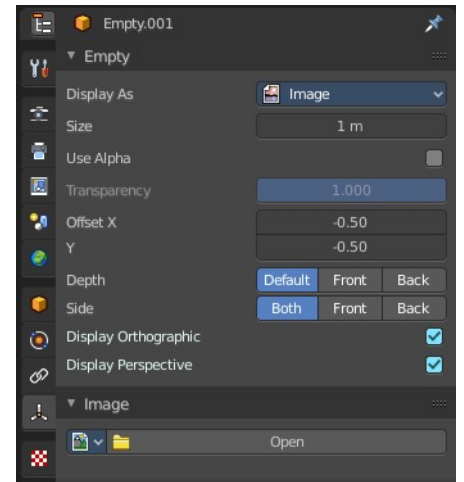

A reference image is for example used to model along the shape of a car at an image.

The image has also a transform widget, presented by the yellow color. It becomes visible when you hover with the mouse over the object.

Important, the reference image loads oriented in the current screen orientation. So when you need the image in the side view, then you should be in the side view when you create a reference image.

This image can be adjusted and changed in the object data panel of the object. Don't wonder about the panel name, which is Empty. As told above, the reference image is in fact nothing else than a special form of the image empty.

## Background

Background images are meant to display images in the background of the viewport, while rendering.

There is just one difference between a Reference and a Background image.

A reference image is double sided. A background image not. When you look from the back side, then it is transparent.

## Mesh Plane

Generates a textured mesh plane object with the correct aspect ratio and the file name of the loaded image. Mesh planes renders with the image.

## Speaker

A speaker object allows you to add a sound source to the scene. This can be used in a movie for example.

### Last Operator Add Speaker

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Speaker object.

**Rotation** defines the rotation of the Speaker object.

## Camera

A camera object allows you to render your scene.

Camera objects can be further adjusted in the properties editor.

### Last Operator Add Camera

**Location** Adjust the location of the Camera object.

**Rotation** defines the rotation of the Camera object.

## Light

Lights lights the scene.

The lights that you add here lights the rendered scene. Not the scene in the viewport. Viewport lighting is managed in the viewport shading panel.

Lights can be further adjusted in the properties editor.

### Point

**Point** creates a Point Light. A point light shines into all directions.

### Sun

**Sun** creates a light that behaves like a sun. It's a directional light.

### Spot

**Spot** creates a Spot light. It's a directional light.

## Area

**Area** creates an Area light. It's a directional light.

## Last Operator Add Light

The Last Operator add panel is for all lights equal.

**Type** is a drop-down box where you can change the light type.

**Radius** is in real the size of the lamp.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the object.

**Rotation** defines the rotation of the object.

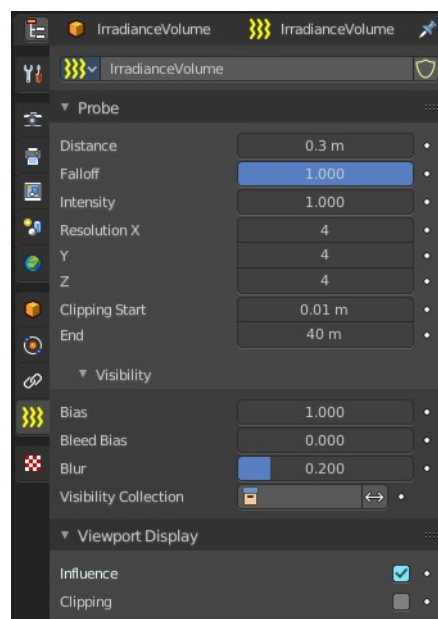

## Light Probe

Light Probe objects are used by the Eevee render engine as support objects. They precompute lighting information locally in order to light the scene using indirect lighting. Which speeds things up.

There are three different light probe types. One for diffuse light lighting, two for specular lighting.

Light probes are a feature for real time render engines. This means Light probes does not work for the other renderers in Bforartists. Just in Eevee.

The light probes can be further adjusted in the Properties Editor.

To work with the light probes you need to bake them. Baking lightprobes happens in the render properties tab in the indirect lighting panel.

## Sphere

Adds a reflective light probe in sphere shape.

## Plane

Adds a reflective light probe in plane shape.

## Volume

Adds a volumetric array light probe.

## Last Operator Add Light Probe

The Last Operator add panel is for all light probes equal.

**Type** is a drop-down box where you can change the light type.

**Radius** is in real the size of the light probe.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the object.

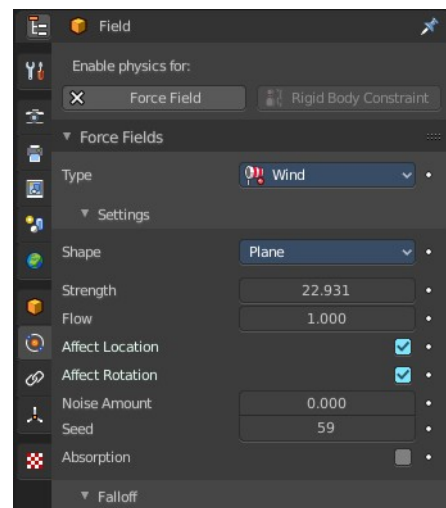

**Rotation** defines the rotation of the object.

## Force Field

A Force Field is for physical simulations. It provides you with tools to add different forces to objects. Wind, Smoke, Gravity, Magnetic, etc. .

The added Force Fields can be further adjusted in the Properties panel.

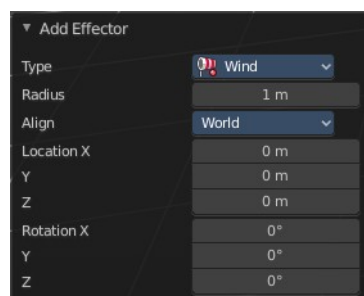

A Force Field is internally also called Effector. So our Last Operator panel has the title Add Effector.

## Last Operator Add Effector

**Type** is a drop-down box where you can define the type of Effector.

**Radius** is in real the size of the Effector.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the Effector.

**Rotation** defines the rotation of the Effector.

## Collection Instance

Add an instance of an existing collection. By default it is just one. But the menu lists all available collections in the scene.

## Last Operator Add Collection Instance

**Name** Name your new collection.

**Radius** A drop down box choose the collection.

**Align** aligns the geometry to the chosen view. World, View or 3D cursor.

*Note that this option is dysfunctional when you call the Adjust Last Operator panel from the Toolbar editor.*

**Location** Adjust the location of the collection.

**Rotation** defines the rotation of the collection.

## Create Isocam

The add menu is also a common menu where addons adds their entries. Create Isocam is such an add-on. It comes with Bforartists, and is activated by default.

Create Isocam is a script that creates an orthographic camera with which you can render isometric views for 2d isometric games. You can of course set the whole thing up by hand. This script saves you the work though.

## True Isocam

Creates a camera that has the mathematical isometric angles compared to the ground plane.

The camera has a rotation of 54.736 degrees.

## Game Isocam

Creates a camera that has the isometric angles for a 2d isometric game. This angle differs a bit from the mathematical angle. With the mathematical angle we would get some not fitting stairs.

With the angle of 60 degrees for the camera we get a fitting result for an isometric game tile with the common 2:1 ratio.

## GameIso4to3cam

There is another special view that fits together like the one with the 2:1 ratio . Here we don't have a base tile of  $64 \times 32$  and a ratio of 2:1, but one with  $64 \times 48$  and a ratio of 4:3. It is of course not a power of two graphics anymore. And far away from the true isometric view. But the old graphics card limits are long gone. And when you need a more top down view, then this is perfect.

For that the camera has a rotation of 41.5 Grad.

## Ground plane

Adds a ground plane that fits into the camera view of the iso cams.

## 7.1.7 Editors - 3D Viewport - Header - Edit mode - Add menu

### Table of content

Edit Mode - Add Menu..... 1  
 Last Operator..... 1  
 Add menu – Type to Search..... 1

## Edit Mode - Add Menu

In Edit Mode you will see a add menu for some object types. The number of objects that you can add in edit mode is limited to the same object type that you are in edit mode with. You can just add mesh geometry to a mesh geometry. And just curve geometry to curve geometry.

The added objects in edit mode becomes part of the current object geometry. It is one object.

### Last Operator

The last operators are the same than in object mode. Please read the add menu chapter in object mode.

## Add menu – Type to Search

There is also a hidden search menu where you can search for specific object types in all categories with a key press when the menu is open.

Simply expand the add menu by clicking it, and start to type in the term that you want to find – this will automatically trigger the search.

## Object menu

The object menu in Object mode provides you with tools to work at Object level.

It contains things like undo redo, copy and paste, delete and other general tools. But also some object specific tools, like the Convert to menu. Or Transform items, and many more.

There are lots of tools in this menu. And some content just shows with specific object types. So we will divide it into sub chapters.

## Transform

The transform sub menu contains functionality for some kind of transformations.

### To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the objects, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

### Last Operator To Sphere

#### Factor

The factor to transform the selection into a sphere form.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Shear

Shear shears the selection.

In Object mode this tool requires to have more than one object selected.

## Last Operator Shear

### Offset

Adjust an offset.

### Shear Axis

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

### Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bend

Bends the selection.

In Object mode this tool requires to have more than one object selected.

---

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

## Last Operator Push/Pull

### *Factor*

Adjust the strength of influence of the tool.

### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

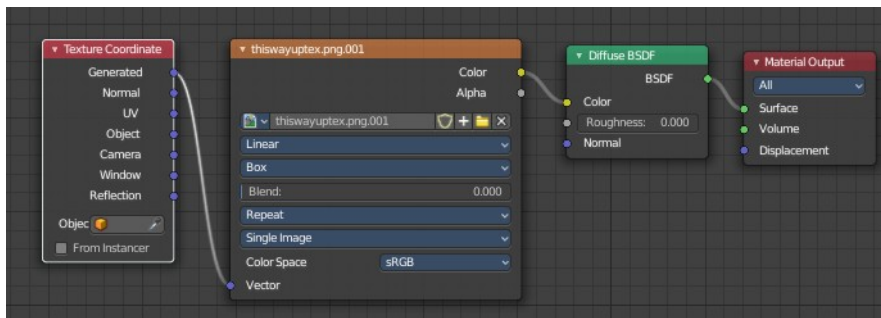

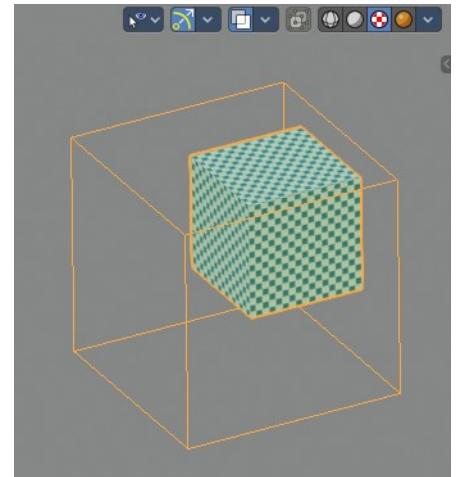

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Move Texture Space

This tool relies at the move tool. With the difference that it moves the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

The yellow cage represents the texture space. The actual UV mapping does not change.

## Last Operator Move

### Move

Adjust in which directions you want to transform.

### Orientation

Choose the orientation.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Scale Texture Space

Scale Texture space is similar to the Move texture Space. With the only difference that it scales the UV space instead of moving it.

## Last Operator Resize

### Move

Adjust in which directions you want to transform.

### Orientation

Choose the orientation.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Align to Transform Orientation

Align to Transform Orientation rotates the selected objects so that their local orientation matches the active transform orientation in the Transform orientation panel or the Orientation selection in the Transform Operator panels.

For example when you have a few cubes that are rotated differently, then perform align to transform orientation with Global coordinates, then the cubes rotations gets set back to 0/0/0

## Last Operator Transform

### Values

These values can't be edited. The tool aligns to zero, so the values turns to zero.

### Axis

These values doesn't matter. Changing them does nothing.

### Orientation

Choose the orientation in which the transform should happen.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Randomize Transform

This tool allows to randomize position rotation and scale of selected objects. Each object gets threaten individually by a random value.

It starts with zeroed values. You need to adjust the values in the last operator.

### Last Operator Randomize Transform

#### **Random Seed**

Adjust the random seed value.

#### **Transform Delta**

Randomize Delta transform values instead of the regular transform values.

#### **Randomize Location checkbox**

With this checkbox ticked the location of the selected objects gets randomize

#### **Location edit boxes**

Adjust the strength of the transform for the single axis.

#### **Randomize Rotation checkbox**

With this checkbox ticked the rotation of the selected objects gets randomize

#### **Rotation edit boxes**

Adjust the strength of the transform for the single axis.

#### **Randomize Scale checkbox**

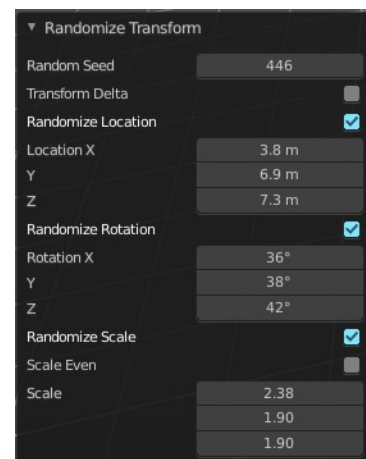

With this checkbox ticked the scale of the selected objects gets randomized.

#### **Scale Even**

Use the same scale values for all axis.

#### **Scale edit boxes**

Adjust the strength of the transform for the single axis.

---

## Align Objects

Align Objects allows you to align the selected objects in various ways. You need to adjust the settings in the Last operator panel. The align operation happens in world coordinates.

## Last Operator Align Objects

### High Quality

When ticked the calculation gets performed in a higher precision.

### Align Mode

Align Mode is a drop-down box choose between different align modes.

### Relative To

Relative to is a drop-down box. Here you adjust in what method the alignment happens.

Relative to the active object, to the center of selection, to the 3D cursor or to the scene origin.

### Align

Turn on or off the single axis for the align operation.

## Set Origin

Set origin sets the origin of the selected objects to a chosen location.

### Geometry to Origin

Sets the geometry to origin.

### Origin to Geometry

Sets the origin to geometry.

### Origin to 3D cursor

Sets the origin to the 3D cursor.

### Origin to Center of Mass(Surface)

Sets the origin to the center of mass, calculating it from the center of the surface area.

### Origin to Center of Mass(Volume)

Sets the origin to the center of mass, calculating from the center of the Volume. It must be manifold geometry with consistent normals.

## Last Operator Set Origin

The last operator is the same for all set origin methods.

### Type

Choose the method again.

## Center

Use the median center or the bounds center for calculation.

# Mirror

Mirrors the selection.

## Interactive Mirror

Mirrors the selection.

## Usage:

Activate the tool. In the header you will now see further instructions. Which is: type in the axis at which you want to mirror. Interactive mirroring starts in Global space. You can change the orientation in the last operator.

## X Y Z Global

Mirrors along the global axis.

## X Y Z Local

Mirrors along the object axis.

## Last Operator Mirror

### Orientation

Choose the orientation in which the transform should happen.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

# Clear

## Clear

Clear Transform is a menu where you can clear the transform for location, rotation, scale and Origin. Clear means in this conjunction that the values gets reset.

When you have for example a cube at X 5, and clear the location, then the cube gets positioned at position X 0.

## Location

Resets the location of the selected object(s).

### *Last Operator Clear Location*

#### Clear Delta

With Clear Delta ticked it clears the delta transform instead of the transform.

## Rotation

Resets the rotation of the selected object(s).

### *Last Operator Clear Rotation*

#### Clear Delta

With Clear Delta ticked it clears the delta transform instead of the transform.

## Scale

Resets the scaling of the selected object(s).

### *Last Operator Clear Scale*

#### Clear Delta

With Clear Delta ticked it clears the delta transform instead of the transform.

## Origin

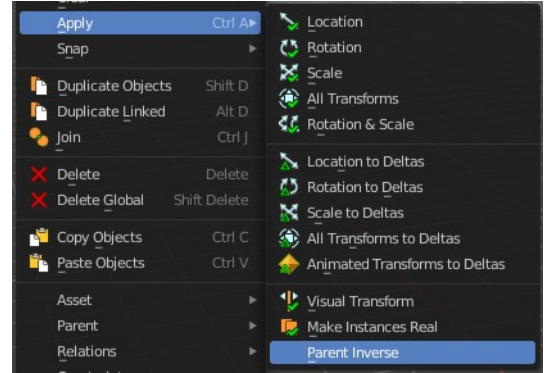

Clear Origin requires to have a parent child relationship selected. It sets the child object to the position of the parent object.

# Apply

## Apply

Apply is a menu where you can apply transforms in various combinations. For example, when you create a cube, then move it to let's say 3, then apply the location, then the origin gets set to 0. The position is "applied". Of special Interest is apply scale, since it resets the scale factor to 1.

Apply just works with single user objects. And it does **not apply to pose position, animation curves or constraints. These tools should be used before rigging and animation.**

## Location, Rotation, Scale, All Transforms and Rotation&Scale

This applies the location, rotation and scale of the object.

### *Last Operator Apply Object Transform.*

#### Location

Applies the position, and resets origin to 0

#### Rotation

Applies the rotation.

#### Scale

Applies the Scale.

#### Apply Properties

Properties such as Curve Vertex Radius. Font Size and bone envelope gets applied.

## Location, Rotation, Scale and All Transforms to Deltas

Transforms are absolute to the world coordinates. Delta Transforms are relative to the current transformation.

The delta transform values can be found in the Object properties, in the Delta Transform Panel.

Example use case:

Key frame a object rotation from 0 to 90 degrees. Rotate the object by 45 degrees. When you play the animation it will still rotate from 0 to 90 degrees.

Now key frame a delta rotation from 0 to 90 degrees and rotate the object by 45 degrees. When you playback the animation it will rotate from 45 to 135 degrees now. (a 90 degree difference from the current state)

### *Last Operator Transforms to Deltas*

#### Mode

Mode is a drop-down box choose the transform mode again.

## Reset Values

Clears the transform values after transferring to Deltas.

---

## Animated Transform to Deltas

Converts the “normal” transformation animations to Delta transforms. This tool requires to have key frames at the object.

---

## Visual Transform

Applies (set) the result of a constraint, and applies this back to the Object’s location, rotation and scale.

---

## Make Instances Real

Make Instances real makes any duplicates attached to this Object real so that they can be edited.

### *Last Operator Make Instances Real*

#### Parent

Parent newly created objects to the original duplicator.

#### Keep Hierarchy

Keep Parent Child relationship.

#### Parent Inverse

Applies the objects parent inverse to its data.

## Snap

### Selection to Cursor

Snaps the currently selected object(s) to the cursor location.

### Selection to Cursor(Keep Offset)

Snaps the currently selected object(s) to the cursor location, but keeps the offset of the selected objects to each other. Means the center of the current selection goes to cursor position. Not every individual object.

## Last operator Snap Selection to Cursor

### Offset

Keep the offset of the selected objects to each other.

## Selection to Active

Snaps the currently selected object(s) to the active object.

## Selection to Grid

Snaps the currently selected object(s) to the nearest grid point.

## Cursor to Selected

Moves the cursor to the center of the selected object(s).

## Cursor to World Origin

Moves the cursor to the world origin.

## Cursor to Active

Moves the cursor to the center of the active object.

## Cursor to Grid

Moves the cursor to the nearest grid point.

## From Duplicate ... to Paste

### Duplicate Objects

Duplicates selected objects. The copy is completely independent. All containing data gets duplicated too. And you can edit the object instances completely independent. then.

You are automatically in grab mode, and so you can easily move the object out of position. Which is sometimes wanted, since you can position the duplicate then. But sometimes this is unwanted. A right click after releasing the mouse lets the object snap back into its creation position.

When you drag the duplicate around you will see the position values in the header.

## Last Operator Duplicate

### *Duplicate Objects*

#### **Linked**

With this option ticked the duplication happens with linked data.

#### *Move X , Y , Z*

The Position of the duplicated object.

#### *Orientation*

Orientation is a drop-down box choose the type of orientation for the duplicate action.

#### *Proportional editing*

Enables proportional editing. Activating proportional editing reveals further settings.

#### **Proportional Falloff**

Adjust the falloff methods.

#### **Proportional Size**

See and adjust the falloff radius.

#### **Connected**

The proportional falloff gets calculated for connected parts only.

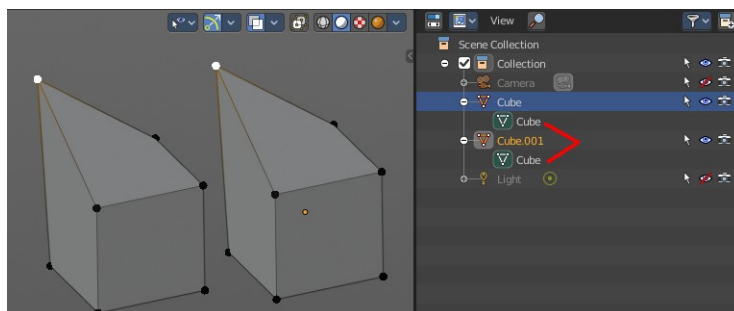

#### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

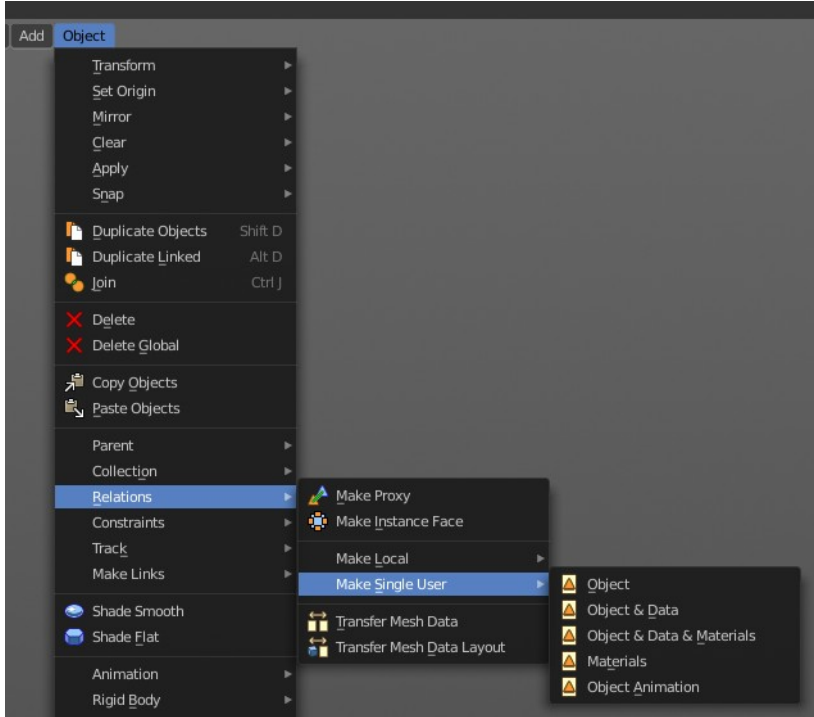

---

## Duplicate Linked

Duplicates selected objects. The instance has its own transforms. But the duplicate shares some data with the first instance. This means when you for example edit the mesh of one of the instances, then the other instance gets modified too. As you can see this in the screenshot. Here you can also see that the mesh name is the same. The object name is different though.

If you want to make changes to an object in the new linked duplicate independently of the original object, then you will have to manually make the object a “single-user”. This can be done for example in the Outliner, in the right click menu of the object. (Currently broken). Or in the Object menu. Choose what attached data you want to make single user.

When you duplicate an object, then you are automatically in grab mode. And so you can easily move the object out of position. which is sometimes wanted, since you can position the duplicate then. But sometimes this is unwanted. A right click after releasing the mouse lets the object snap back into its creation position.

Duplicate linked instances the object data.

Explanation: Each Bforartists object type (mesh, lamp, curve, camera *etc.*) is composed from two parts: an *Object* and *Object Data* (sometimes abbreviated to *ObData*):

**Object** - Holds information about the position, rotation and size of a particular element.

**Object Data** - Holds everything else. For example. Meshes stores geometry, material lists, vertex groups, etc. . Cameras stores focal length, depth of field, sensor size, etc. .

Each object has a link to its associated object-data, and a single object-data, like a material, may be shared by many objects.

## Last Operator Duplicate Linked

### *Duplicate Objects*

#### Linked

With this option ticked the duplication happens with linked data.

## **Move X, Y, Z**

The Position of the duplicated object.

## **Orientation**

Orientation is a drop-down box choose the type of orientation for the duplicate action.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

## **Proportional Falloff**

Adjust the falloff methods.

## **Proportional Size**

See and adjust the falloff radius.

## **Connected**

The proportional falloff gets calculated for connected parts only.

## **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Join**

Joins two independent objects together and makes them one object.

This works with mesh objects and with curve objects. What does not work is to try to join mesh objects with curve objects. They are of different type.

---

## **Delete**

Delete deletes the selected object(s).

---

## **Delete Global**

It can be that you have more than one scene open. Delete deletes the selected object(s) in all scenes.

---

## Copy

Copies the selected object(s).

---

## Paste

Pastes copied object(s).

## Last Operator Paste Selection from Buffer

### *Select*

Select pasted object(s).

### *Active Collection*

Put the pasted objects into the active collection.

## Asset

Asset related menu.

## Mark as asset

Marks the selected object as an asset. It will be inserted in the asset library.

## Clear Asset

Removes the selected object from the asset library.

## Clear Asset( Set Fake User)

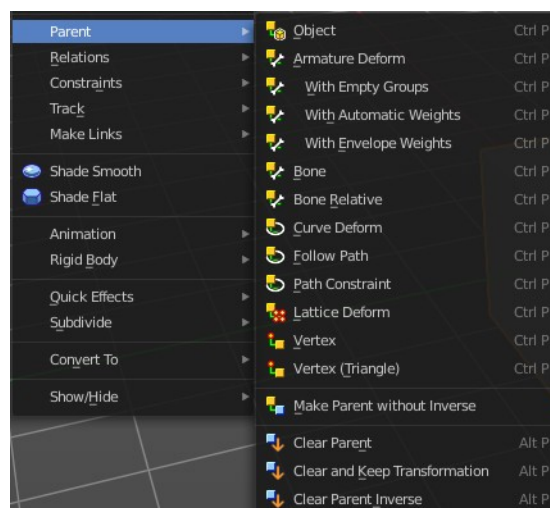

Removes the selected object from the asset library. But adds a fake user to it, so that it remains in the scene.

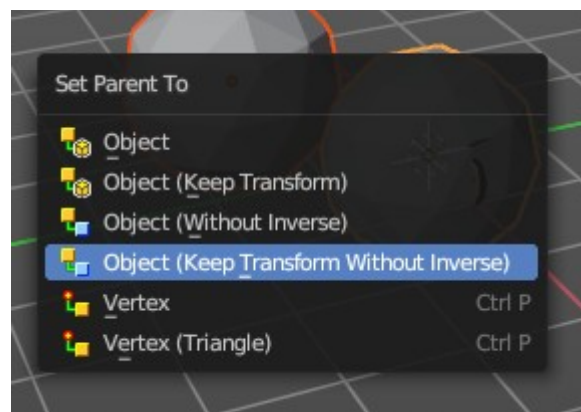

## Parent

The parent menu provides you with all parenting methods at object level.

To use parenting you first have to select the source object, hold down shift, then select the target object so that both are selected. This also works in the outliner (here you can also simply hold down shift and drag the source object at the target object to make it a child). The source object becomes the child object then.

The methods are object type dependent. The armature methods requires to have a mesh and an armature. The path methods a curve. The available methods for the current selection can also be found out by pressing the hotkey ctrl P. This calls the parenting menu with just the available methods.

## Object

Sets the parent to selected object.

## Object ( Keep Transform)

Sets the parent to selected object, but applies all transform before the operation.

## Object (Without Inverse)

Set the object's parenting without setting the inverse parent correction. This preserves all transforms before the operation.

## Object (Keep Transform Without Inverse)

Set the object's parenting without setting the inverse parent connections and applies all transform before the operation.

---

Armature parenting creates an armature modifier at the mesh.

#

## Armature Deform

Sets the parent to selected Armature.

## With empty Groups

Sets the parent to selected Armature, using empty groups.

## With Envelope Weights

Sets the parent to selected Armature, using envelope weights

## With automatic Weights

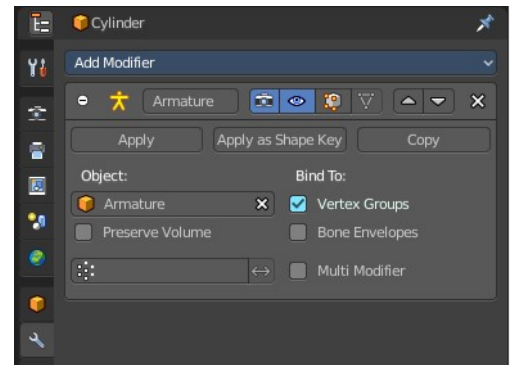

Sets the parent to selected Armature, with automatic weights.

## Bone

Sets the parent absolute to selected Bone.

## Bone Relative

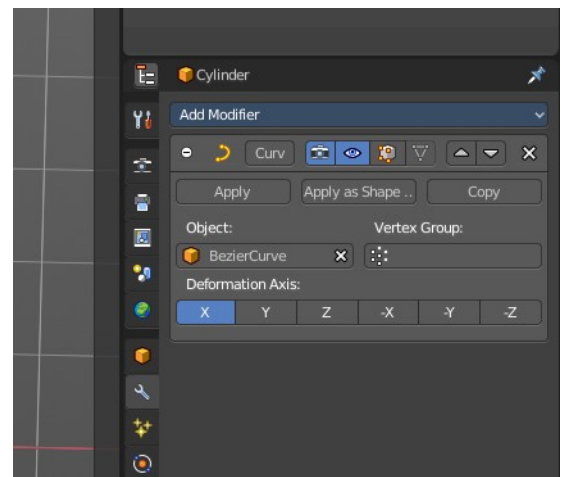

Sets the parent relative to selected Bone.

---

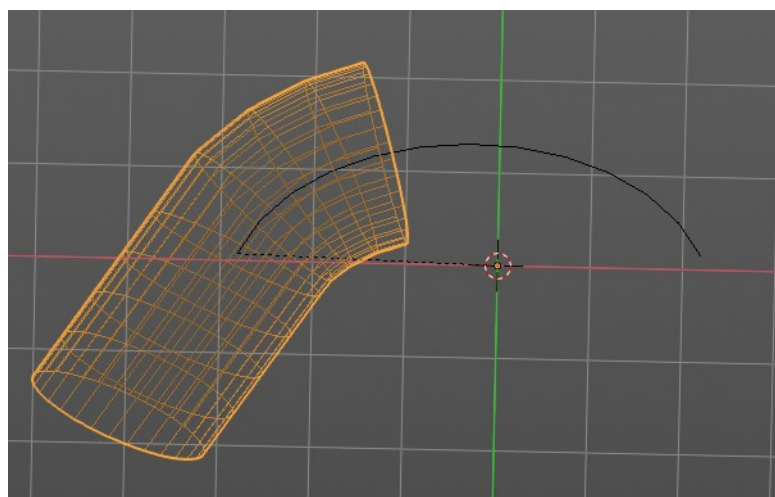

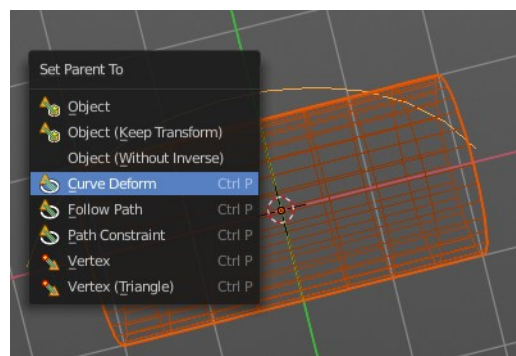

## Curve Deform

Curve Deform allows you to deform a mesh by a curve shape. It adds a curve modifier at the mesh.

Usage:

Create a curve. Bend it in edit mode to your needs. Create a mesh. I have for demonstration purposes created a cylinder with several subdivisions.

To demonstrate the only pitfall, by parenting the center of the object goes to the start point of the curve. So you better put the origin at the bottom of the cylinder before parenting.

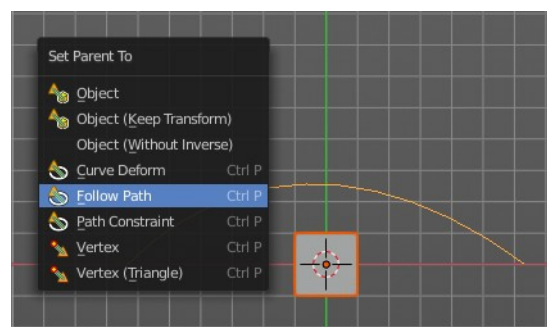

## Follow Path

Attaches an object to a curve. The curve then gets used to animate the object position. Every vertex of the curve is one key frame.

Create a curve, create an object, hold down shift and select the curve, make parent ...

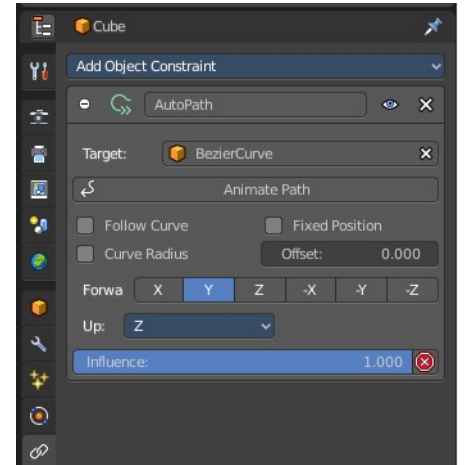

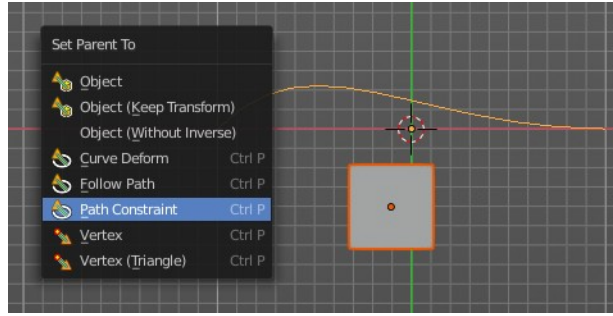

Take care of the position and rotation of the object before parenting it to the curve. It influences how the object behaves.

There is a constraint with the same name and functionality. But parenting with follow path will not create such a constraint.

## Path Constraint

Path constraint adds a AutoPath constraint at the mesh object, which is most probably a wrong labeled path constraint. It is not documented by the Blender developers.

Create a curve, create an object, hold down shift and select the curve, make parent ...

Take care of the position and rotation of the object before parenting it to the curve. It influences how the object behaves.

## Lattice Deform

Parents a lattice object to the object.

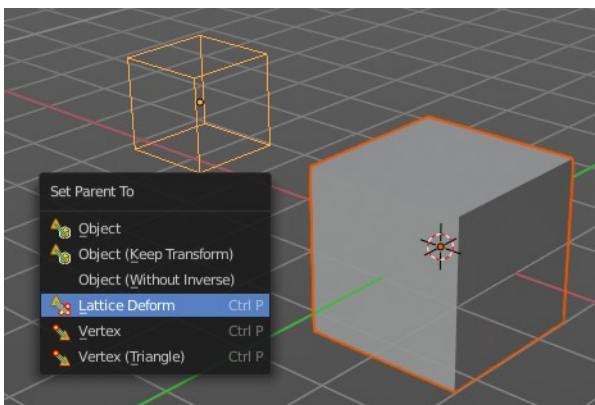

You need a lattice object and a mesh object. Lattice deformations just works with mesh objects.

Create a lattice, create an object, hold down shift and select the lattice, make parent ...

Parent the mesh object to the lattice object with method Lattice Deform. A Lattice Deform constraint will be added at the mesh object.

Take care of the position and size of the lattice object. It influences how the deformation works.

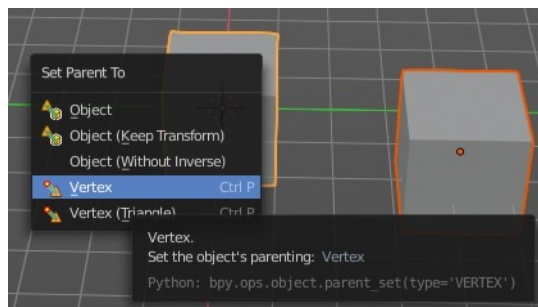

Enter Edit Mode with the lattice object. Deform it. The mesh object will follow the deformation.

## Vertex

Vertex parents the current object to a vertex of the target object. The vertex will be chosen automatically, it's the closest vertice of the parent object. When you want to assign the object to a specific vertice, then you have to do

The vertex parenting in Edit mode. You need to have an object type that has vertices. Mesh or curve.

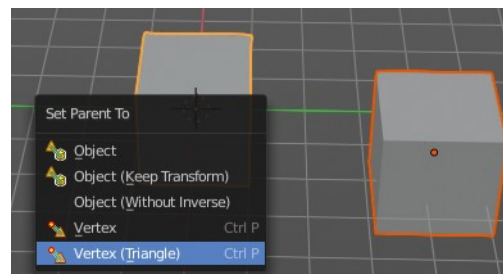

Create a mesh or curve object, create an object, hold down shift and select the mesh object, make parent ...

## Vertex (Triangle)

Vertex (Triangle) parents the current object to a face of the target object. The face will be chosen automatically.

It's the closest face of the parent object. When you want to assign the object to a specific face, then you have to

Do the vertex parenting in Edit mode. You need to have an object type that has vertices. Mesh or curve.

Create a mesh or curve object, create an object, hold down shift and select the mesh object, make parent ...

## Last Operator Make Parent

### Type

Choose the make parent method again. This last operator counts for most of the parent actions.

### Keep Transform

Apply transform before parenting.

## Object (Without Inverse)

With normal parenting the child object keeps its world transformation.

Without inverse parenting the child object uses the coordinate system of the parent object. As one of the effects you will see that the child objects will jump to the origin of the parent object when parenting.

## Object (Keep Transform Without Inverse)

Set the object's parenting without setting the inverse parent connections and applies all transform before the operation. Without inverse parenting the child object uses the coordinate system of the parent object. By keeping the transform, the origin of the parent and child object stay in position.

## Object (Attach Curves to Surface)

Parent a Hair Curve to the surface of a new object.

## Clear Parent

Clear Parent clears the parent relation completely, including involved modifiers.

## Clear and Keep Transformation

Clear Parent clears the parent relation completely, including involved modifiers.

But keeps the current visual transformation.

## Clear Parent Inverse

Clear Parent Inverse resets the transform corrections applied to the parenting relationship. It does not remove the parenting itself.

## Last Operator Clear Parent

Change the type of clearing.

# Library Override

## Make

Add a local library override to this collection or selected object.

This tool works different from Add Override in the outliner. It iterates through the hierarchy of objects and collections based on the selection. And tries to override everything linked.

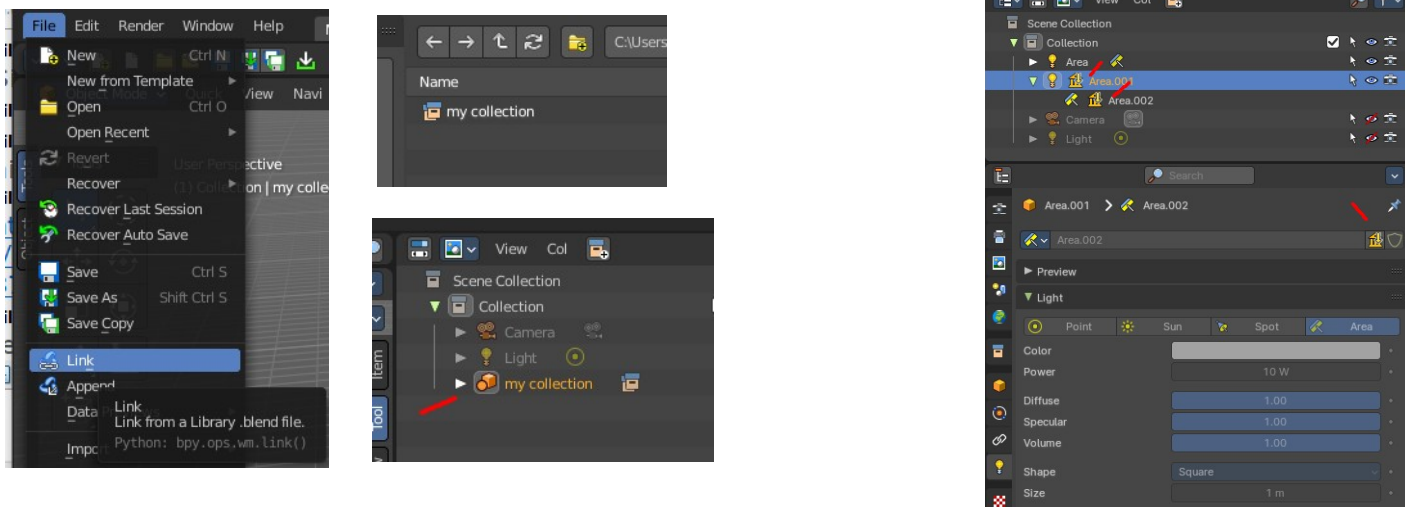

To work properly, it is important that all the collections needed by the character are children of the root object Both, linked and instantiated. Otherwise the automated overriding may fail.

Library Overrides is the new system designed to replace and supersede Proxies. Most types of linked data-blocks can be overridden, and the properties of those overrides can then be edited. When the library data change, unmodified properties of the override one will be updated accordingly.

You need to link a collection or object from another file for example to set the Make Library Override tool active.

Assets with a library override have the override icon in the outliner.

## Reset

Resets the library override to their initial state.

## Clear

Delete the selected local overrides and relink their usages to the linked data if possible. Else reset them and mark them as not editable.

# Relations

This sub menu contains relations related functionality.

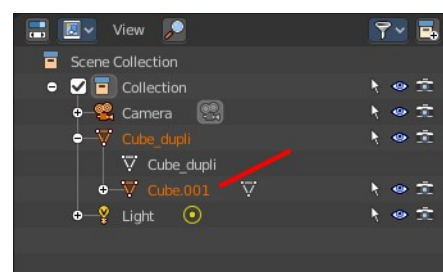

## Make Instance Face

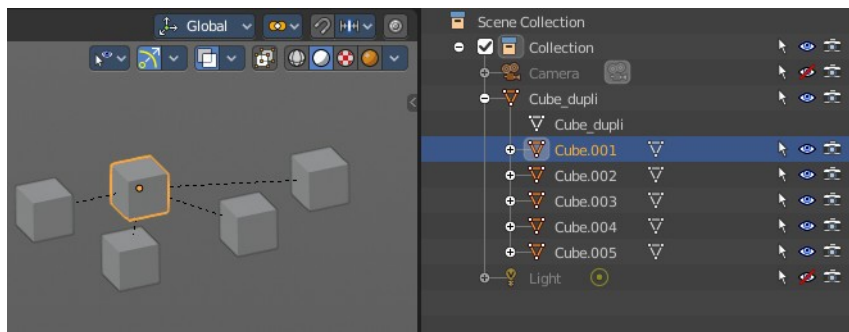

Make Instance Face, formerly Make Dupli Face, is a relict from the past, when there was no instancing or parenting feature available in Blender. When you turn an object into a Dupli Face object, then this object becomes an instancing container for this object. All objects in this container just exists once in ram when you duplicate it. No matter how often you duplicate it. This allows to plant whole forests without to run into a memory problem. Since the tree object just loads once into ram. And gets just drawn at different screen positions then.

## Usage:

Create an object. Make Instance Face. The name will be extended by a `_dupli` term.

Now in the outliner go into the hierarchy of the dupli object. And duplicate the Cube.001 object inside of it. This is the parent object that you can duplicate. You will see that the duplicated copies will now be connected by a dotted line with the parent object.

## Make Local

You need to have a linked object for that. Make library linked data blocks local to this file. The link to the library object will be lost. And the object acts like you would have created it in the current scene.

There are four different methods available. With which you can also make the dependencies of the library object local. Materials for example.

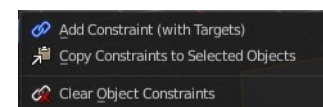

## Make Single User

Make linked data local to each object. Additionally, it can also make single-user copies of its dependencies, like meshes, curves, materials, animations...

## Constraints

The constraints menu contains some functionality that could also be done in the constraints tab in the Properties editor. Those buttons provides a quicker access though.

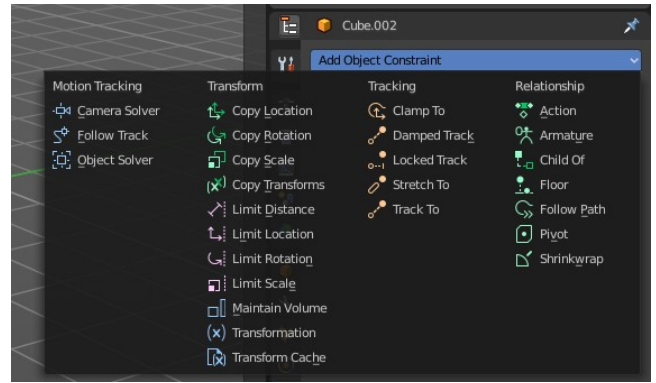

Constraints provides you with various limitation methods connected to a target object. For example, you can limit the X position of an object to the X position of the target object. And when you move the target object, then the object will change its X position too.

## Add Constraints ( With Targets)

Add Constraints ( With Targets) calls a menu choose the constraints type. It's the same content than in the Constraints tab in the Properties editor.

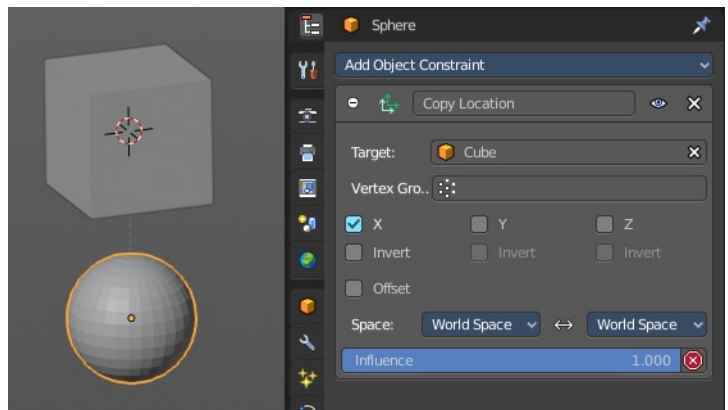

We will not explain every single constraint type here. Please have a look at the constraint types in the manual part for the Properties editor.

**Usage:**

Select the target object. Hold down Shift key. Now select the object where you want to add the constraints to. Both should be selected. Then choose the constraints type in the menu that you want to add.

As a result a constraints panel gets created in the Constraints tab in the Properties editor. Tweak the settings further if required. In our example we wanted to limit the X axis. So we added a Copy Location constraint, and unticked Y and Z axis. And when we move the cube around then the sphere will follow in X axis. But not in Y and Z.

In the 3D view a dotted line indicates the relationship.

**Last Operator Add Constraints (with Target)**

**Type**

Type is a drop-down box choose the constraints type again.

**Copy Constraints to Selected Objects**

Copy Constraints to Selected Objects copies a constraint from one object to another.

**Usage:**

Select the object where you want to copy the constraint to. Hold down Shift and select the object with the constraint. Both should be selected. Then click at Copy Constraints to Selected Objects. This copies the constraint to the object.

## Clear Object Constraints

Removes all constraints from the object.

## Track

Track constraints are constraints. And adding them could also be done in the constraints tab in the Properties editor. Those buttons provides a quicker access though.

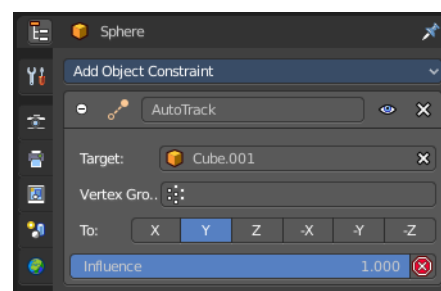

## Damped Track Constraint

The Damped Track constraint constrains one local axis of the owner to always point towards Target. It is a Look At constraint.

Usage: select the source object, hold down shift, select the target object, add Damped Track Constraint.

The wrong constraint name called AutoTrack is a Blender bug.

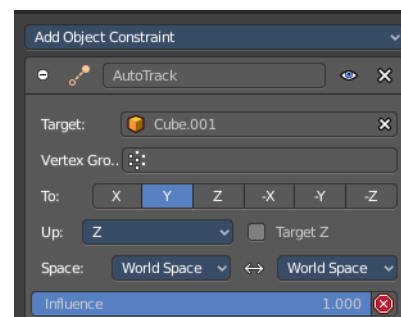

## Track to Constraint

This constraint is similar to Damped Track constraints, but provides some more control.

Usage: select the source object, hold down shift, select the target object, add Damped Track Constraint. Constraint will be added at source object.

The wrong constraint name called AutoTrack is a Blender bug.

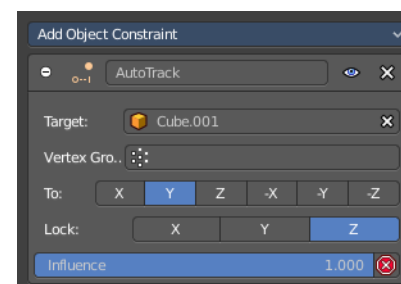

## Lock Track Constraint

The Locked Track constraint is basically a Track To constraint. But with a locked axis. Means an axis that cannot rotate. So the constraint can just follow in one defined axis.

The wrong constraint name called AutoTrack is a Blender bug.

Usage: select the source object, hold down shift, select the target object, add Track Constraint. Constraint will be added at source object.

## Clear Track

You need to have a Track constraint applied. It removes the track constraint.

### Last Operator Clear track

#### Type

Type is a drop-down box choose between Clear Track and Clear Track Keep

## Clear Track - Keep Transformation

This menu item is just relevant when you have a Track constraint applied. Removes the track constraint. But keeps the current position.

### Last Operator Clear track

#### Type

Type is a drop-down box choose between Clear Track and Clear Track Keep

# Link / Transfer Data

Links objects between scenes or data of the active object to all selected objects. In some case (i.e. Object Data, Modifier) the target objects must be of the same type than the active one or capable of receiving the data. If targets already have some data linked to them, it will be unlinked first.

## Link Object to Scene

In Bforartists you can have more than one scene in the blend file. See Scenes tab. The make links menu allows you to link or copy objects between those scenes.

Object to Scene makes the selected object available in the chosen scene. This makes the object exist in two different scenes at once, including position and animation data.

When you want the object not to be shared across two scenes anymore, then you have to make it single user again, which can be done in the relations menu.

## Object Data, Materials .. etc

Link this specific data blocks between selected objects.

Select the source object, hold down shift, select the target objects. Perform the action.

### Last Operator Link Data

#### Type

Choose the data type again that you want to transfer.

## Copy UV Maps

Copies the UV map from one object to another. If the selected object doesn't have any UV maps, then it is created. The Objects must be of type mesh and must have a matching topology.

Select the source object, hold down shift, select the target object. Perform Transfer UV Map.

## Transfer Mesh Data

Transfers mesh data from active to selected object.

Select the object that you want to copy the data to, hold down shift, select the source object with the modifications at it. Choose Transfer Mesh Data. A popup with the available methods will appear. Choose what you want to do.

The caveat here is that the operator works in object mode. When you switch modes then the operator quits. And so you can't check if the UV seam transfer for example arrives as it should. This means that you sometimes end in trial and error with the last operator setting until you have your desired result.

### Last Operator Transfer Mesh Data

#### Freeze Operator

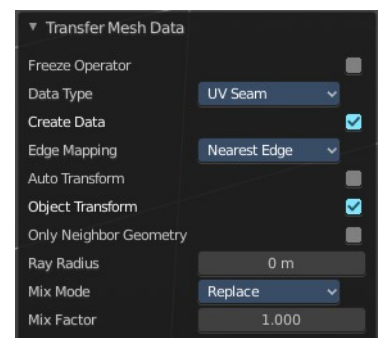

Prevent changes to settings to re-run the operator. This is useful if you are editing several settings at once with heavy geometry.

#### Data Type

The popup from above. Choose again what you want to do.

#### Create Data

Add data layers on destination meshes if needed.

## **Edge Mapping**

Edge mapping determines how edge data gets transferred.

### **Topology**

This method expects to have the same number of items at both objects. Identical objects that got deformed differently for example.

### **Nearest Vertice**

Uses the nearest vertice of the source object for calculation.

### **Nearest Edge**

Uses the nearest edge of the source object for calculation.

### **Nearest Face Edge**

Uses the nearest edge of sources nearest face of the source object for calculation.

### **Projected Edge Interpolation**

A sampling process that casts several rays from along the destination's edge for calculation.

## **Auto Transform**

Automatically computes the transformation to get the best possible match between source and destination meshes.

## **Only Neighbor Geometry**

Source elements must be closer than given distance from destination one. Turning this on reveals further settings.

### **Max Distance**

Maximum allowed distance between source and destination element (for non-topology mappings).

### **Ray Radius**

The width of rays.

## **Mix Mode**

How to affect destination elements with source values.

### **Below Threshold**

Only replaces destination value if it is below given threshold Mix Factor. How that threshold is interpreted depends on data type, note that for Boolean values this option fakes a logical OR.

## Above Threshold

Only replaces destination value if it is above given threshold Mix Factor. How that threshold is interpreted depends on data type, note that for Boolean values this option fakes a logical AND.

## Replace

Replaces everything in destination (note that Mix Factor is still used).

## Mix Factor

How much of the transferred data gets mixed into existing one (not supported by all data types).

# Transfer Mesh Data Layout

Transfers the layout of data layer(s) from active to selected meshes.

Select the object that you want to copy the data to, hold down shift, select the source object with the modifications at it. Choose Transfer Mesh Data Layout. A popup with the available methods will appear. Choose what you want to do.

The menu has basically the same menu items like

Transfer Mesh Data. The difference is in what you can do in the last operator. It transfers the whole data layer.

## Last Operator Transfer Mesh Data Layout

### Data Type

Choose again what you want to do.

### Exact Match

Also Delete some data layers from destination if necessary, so that it matches the source exactly.

### Source Layers Selection

Which layers to transfer, in case of multi-layer types.

### Mygroup

Mygroup is in this case a vertex group i have created for demonstration purposes.

### Active Layer

Only transfer the active data layer.

### All Layers

Transfer all data layers.

## Destination Layers Matching

How to match source and destination layers.

### By Name

Match target data layers to affect by name.

### By Order

Match target data layers to affect by order (indices).

### Active Layer

Only transfer the active data layer.

## Move to Collection

Moves the selected object to a collection. The object is removed from the collection it was in.

By clicking at this menu item a popup will appear choose the new collection. Allows also to create a new collection. Once done, the object will be moved to this new created collection.

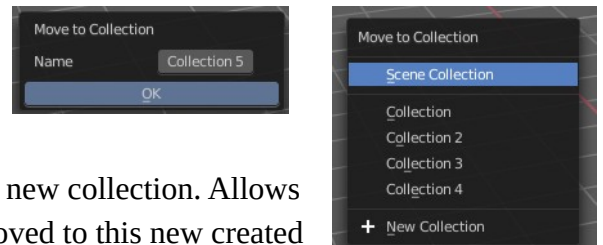

## Collection Menu

### Move to Collection

Moves the selected object to a collection. The object is removed from the collection it was in.

By clicking at this menu item a popup will appear to choose the new collection. Allows also to create a new collection. Once done, the object will be moved to this new created collection.

### Last Operator Move to Collection

#### Name

Set a name for your new collection. When you haven't created a new collection, then this name stays blank.

## Link to Collection

Links the object to a collection. The object remains in the collection it was in.

By clicking at this menu item a popup will appear to choose the collection. Here you can also create a new collection. Once done, the object will be linked to this new created collection.

## Last Operator Link to Collection

### Name

Set a name for your new collection. When you haven't created a new collection, then this name stays blank.

## Remove From Collection

Objects can be in more than one collection. Remove from collection removes the selected object from the current collection.

When the object is in no collection anymore, then it gets removed.

## Remove From all Unlinked Collections

Objects can be in more than one collection. Remove from all unlinked collection removes the selected object from all unlinked collections.

When the object is in no collection anymore, then it gets removed.

## Add selected To Active Collection

Objects can be in more than one collection. Adds the selected object to the active collection.

## Remove Selected From Active Collection

Objects can be in more than one collection. Removes the selected object from the active collection.

When the object is in no collection anymore, then it gets removed.

# Shade Smooth, Shade Smooth and Shade Flat

## Shade Smooth

Shows with a mesh object. Sets the shading for the object to smooth. Smooth means that the sharp edges are no longer seen.

## Shade Auto Smooth

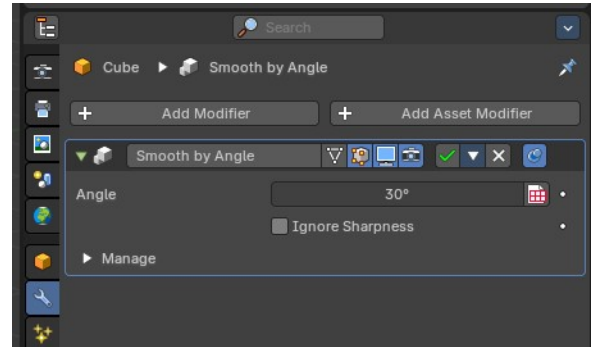

Sets the shading for the object to smooth with Autosmooth activated. Autosmooth means that sharp edges above an angle threshold will have sharp faceted faces, meanwhile angles under the threshold will be smooth.

### Last Operator Shade Smooth by angle

### Auto Smooth

Creates a auto smooth modifier for auto smoothing in the modifier stack. Where you can adjust the settings at any further step. Else it applies the current auto smooth to the mesh normals.

### Angle

Maximum angle between face normals that will be considered as smooth.

## Shade Flat

Sets the shading for the object to flat. Flat means that every face of the object shows faceted, with a sharp edge.

## Animation

### Insert Keyframe

Inserts a key frame.

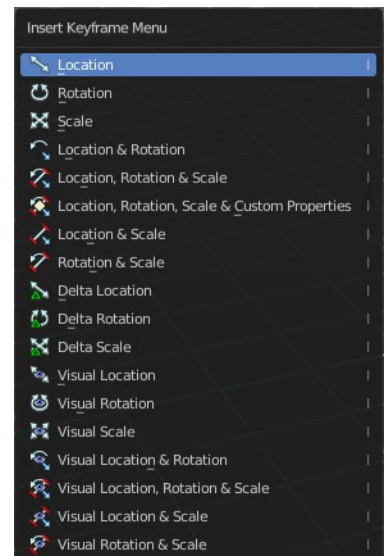

When your object does have a active keying set, then a click at the button inserts the key frame directly. When a keying set is missing then you will see a Insert Key frame menu choose the keying method.

### Insert Keyframe Menu

The keying set defines what kind of key frames gets recorded. When you start with an

animation, and your object does not have a keying set yet, then you will be prompted with a menu choose the proper keying set. The Insert Key frame menu.

Note that this just adds a keying set to the current key frame. And not to the whole object. That's why the keying set menu down right stays empty when you add a key frame this way. And the insert keyframe menu also misses the Whole Character keying set.

## Delete Key frame

Removes the current active key frame for the selected object. You will get a confirmation dialogue.

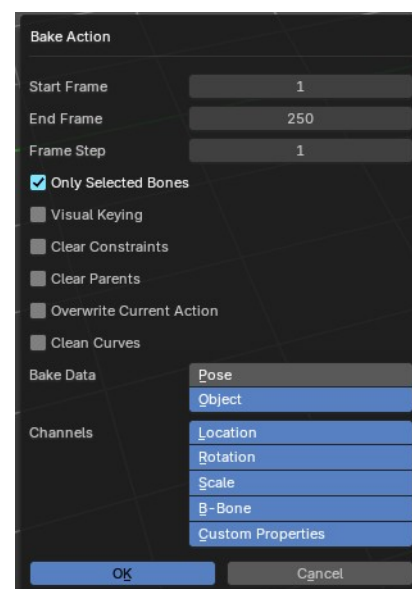

## Clear Key frames

Clears all animation, and removes all key frames for the selected object.

## Bake Action

Bake Action bakes the object animation to a new action. Bake action calls a panel adjust the settings for the new action.

The upcoming panel has the same settings than the last operator panel.

## Last Operator Bake Action

### ***Start Frame***

Defines the start frame for baking.

### ***End Frame***

Defines the end frame for baking.

### ***Frame Step***

Defines the frame step for baking.

### ***Only Selected Bones***

Pose Baking only.

### ***Visual Keying***

Key frame from the final transform.

### ***Clear Constraints***

Remove all constraints from keyed objects / bones, and do visual keying.

### ***Clear Parents***

Bake animation onto the object, then clear parents (objects only)

### ***Overwrite current Action***

Bake Action into current action instead of creating a new one.

### ***Clean Curves***

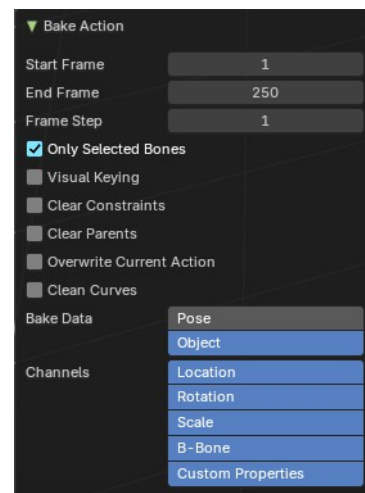

After baking curves, remove redundant keys.

### ***Bake Data***

Which data transformations to bake to. You have the choice between Pose and Object here.

### ***Channels***

Which channels to bake to.

---

## Bake Mesh to Grease Pencil

Bakes mesh animation to grease pencil strokes.

## Bake Mesh Animation to Grease Pencil

When you use the Bake Mesh to Grease Pencil tool then a menu pops up with further settings.

### Target Object

Target grease pencil object. Leave empty to create a new stroke.

### Start Frame

The start frame of the animation.

### End Frame

The end frame of the animation.

### Step

Step between generated frames.

### Thickness

The thickness of the grease pencil stroke.

### Threshold Angle

Threshold to determine the end of the strokes.

### Stroke Offset

Stroke offset from fill.

### Only Seam Edges

Convert only seam edges.

### Export Faces

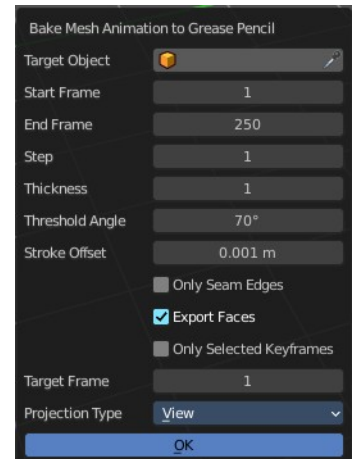

Export faces as filled strokes.

### Only Selected Keyframes

Convert only selected keyframes.

### Target Frame

The destination frame.

## Projection Type

How to project the grease pencil stroke.

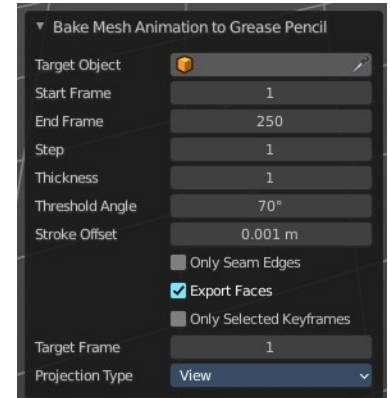

### OK

Accept the settings.

## Last Operator Bake Mesh Animation to Grease Pencil

In the last operator you can again adjust the settings. It is the same settings than in the settings dialog. So we won't cover it again.

## Bake Object Transform to Grease Pencil

Bakes grease pencil object transforms into single grease pencil keyframes. You need to have a keyframe animation recorded already. The result can then be found in the dopesheet editor in grease pencil mode.

When you perform this tool then an option panel will open up.

## Bake Transform to Grease Pencil panel

### Start Frame

The start frame to calculate.

### End Frame

The end frame to calculate.

### Step

The steps between generated frames

### Only selected Keyframes

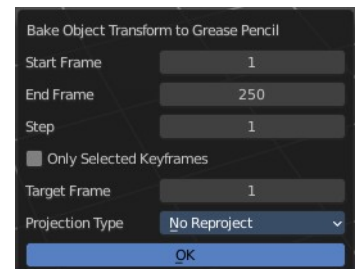

Convert only selected keyframes.

### Target Frame

The destination frame.

### Projection Type

If the grease pencil object should be reprojected, and with what method.

## Last Operator Bake Transform to Grease Pencil panel

The last operator contains the same settings than the settings panel.

## Rigid Body

Rigid Bodies belongs to physics. And can be added and modified in the physics tab in the Properties editor. This menu items here is just a quick way to add and modify the most basic things from within the 3D view.

The greyed out menu items becomes active when a rigid body is at the object.

### Add Active

Add Active adds a rigid body to the selected object. The type of this rigid body is active. This is useful for any actively moving object. Characters, bullets, etc.

### Add Passive

Add Active adds a rigid body to the selected object. The type of this rigid body is passive. This is useful for any static object, like ground for example.

### Last Operator Add Rigid bodies

The rigid body type is a drop-down box choose if the type of the rigid body is active or passive.

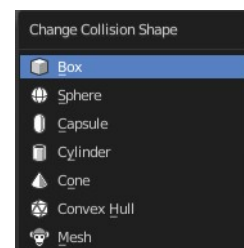

### Remove

Remove simply removes the rigid body from the current object.

### Change shape

Change Shape opens a pop-up menu change the shape of your rigid body.

## Last Operator Change Collision shape

Rigid Body Shape is a pop-up menu change the shape of your rigid body again.

## Calculate Mass

Calculate Mass does NOT calculate the mass. But gives you a long pop-up menu list choose between different predefined mass set-ups. The corresponding value will then be set in the physics settings in the Rigid Body settings.

## Last Operator Calculate Mass

### Material Preset

Material Preset is a pop-up menu choose the type of preset again.

### Density

Set a custom density for the material preset.

## Quick Effects

The quick effects menu contains some predefined basic Particle effects. They can be tweaked further in the Properties editor then.

You need to have a mesh object selected.

### Quick Fur

Adds a particle system with Fur settings.

### Quick Explode

Adds a particle system that lets the selected object explode into pieces.

Hit play to play the animation.

## Quick Smoke

Adds a particle system with a simple smoke.

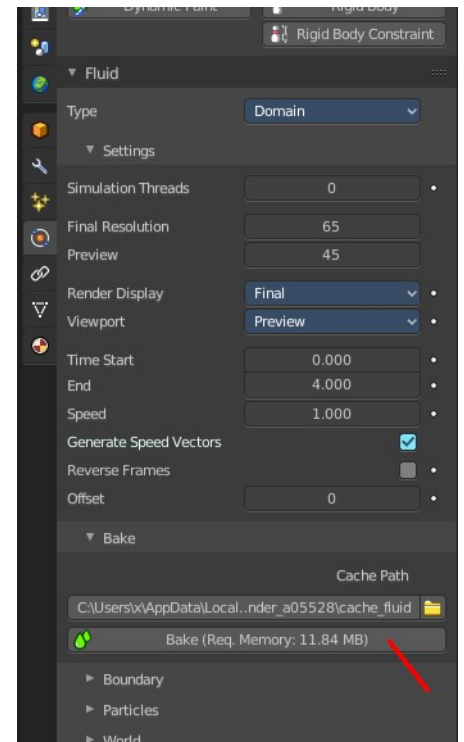

Hit play to play the animation.

## Quick Fluid

Adds a particle system with Fluid settings.

This feature does not completely work out of the box. You need to bake the animation first. This can be done in the Properties Editor, Particles Tab, Fluid Panel in the Bake sub panel.

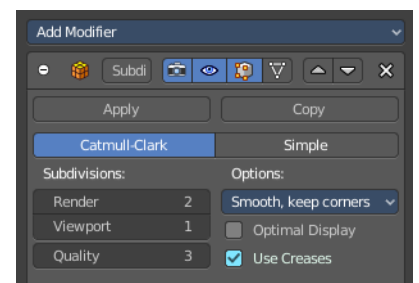

# Subdivide

Subdivide is a menu where you can quickly set the subdivision level of the selection. What it does is to add a SDS modifier in the Properties Editor if required. And set the SDS level to the needed value. Ctrl 0 sets SDS to level 0. Ctrl 1 sets SDS level to 1, and so on.

SDS happens at Object mode level. Even when you apply it in the Edit Mode! And it happens at the whole object.

## Last Operator Subdivision Set

### Level

Adjust the SDS level.

### Relative

Applies the Subsurf Level as an offset relative to the current level.

## Convert to

Convert to is a menu to convert object types to other object types. Not every object type can be converted to every object type though. A mesh cannot be converted to a grease pencil for example.

Note that different objects shows different content.

### General

#### Mesh

Converts a selected object to a Mesh Object.

#### Curve

Converts a selected object to a Curve Object.

#### Curves

Converts a selected curve to a Hair curves object.

#### Grease Pencil

Converts a selected curve to a grease pencil stroke.

#### Grease pencil object

Converts a selected curve to a grease pencil stroke.

#### Path

Converts a selected grease pencil object to a path.

#### Bezier Curve

Converts a selected grease pencil object to a bezier curve.

## Polygon Curve

Converts a selected grease pencil object to a polygon curve.

## Image object

### Convert to Mesh Plane

Converts a selected image object to a mesh plane.

### Trace Image to Grease Pencil

Extract Grease Pencil strokes from an image.

## Hair curve

## Particle System

Convert a curves hair object to a particle system.

## Last Operator Convert to

### Target

Target is a drop-down box that allows you to choose the convert method again.

### Target Point Cloud, Mesh, Curve

### Keep Original

With this option ticked the original object gets kept. And a new object gets created.

### Merge UV's

Merge UV coordinates that share a vertex to account for imprecision in some modifiers.

## Show/Hide

Sub-menu with shows or hide selection, unselected or hidden operators.

## Show Hidden

Makes all geometry in the scene visible again.

## Hide Selected

Hides the selected geometry.

## Last Operator Hide Selected

### *Unselected*

Hides the not selected geometry.

## Hide Unselected

Hides the not selected geometry. The selected geometry stays visible.

## Clean Up

Sub-Menu with clean up operators to help do some house keeping when it comes to vertex groups, weights and material slots.

## Clean Vertex Groups

Remove vertex assignments that are not required. This will delete any zero influence vertex groups.

## Limit Total Vertex Groups

Limit deform weights associated with a vertex to a specified number by removing lowest weights. This will set a total amount of vertex group influences per vertice.

## Remove Unused Material Slots

Removed unused material slots on the selected object.

## Edit Mode - Mesh Menu

The Mesh Menu in Edit Mode contains the tools to manipulate the mesh geometry in Edit mode. It just exists for Mesh Objects.

Lots of functionality that could also belong here can also be found in the Tool Shelf. The difference is that the tools in the tool shelf are easier to access. And so it contains the most used tools for the daily work. While the Mesh menu contains the not so often used tools. Or tools where you use the hotkey anyway. Delete for example.

## Legacy

The legacy sub menu contains tools that exist in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

## Bisect

Bisect cuts geometry along a plane. This description is a bit misleading though. You simply cut through the whole geometry by defining a line. And the cut goes through the geometry from the current view.

When you have set your cut and release the mouse then you reveal a widget with which you can move and rotate the cut. Clicking at the arrow and drag moves the cut. Clicking at the circle and drag rotates the cut.

## Last Operator Bisect

### **Plane Point X , Y , Z**

Defines the start point of the Bisect cut.

### **Plane Normal X , Y , Z**

The direction in which the bisect points.

### **Fill**

Fills the cut.

### **Clear Inner**

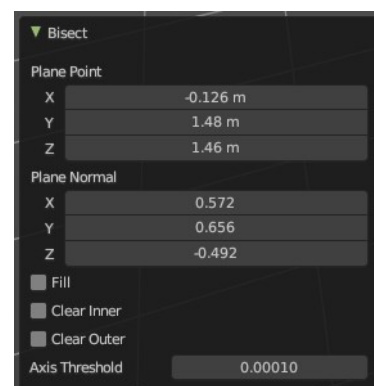

Removes the inner part of the face to cut.

### **Clear Outer**

Removes the outer part of the face to cut.

### **Axis threshold**

Axis threshold.

## Knife tool

The Knife tool cuts the geometry, and adds edges. When it crosses existing geometry then it adds a vertice at the crossing point.

Usage: activate the tool, left click to define the starting point. This can also be a point in the middle of a face. But ideally you choose an existing vertice or an edge as the start and endpoints. The knife tool tries to snap to them when you get close with the mouse cursor.

When done press Enter or Spacebar to confirm. Right click abandons the operation.

When you create a vertice in the middle of a face, then the knife tool will try to connect this vertice by an existing vertice of this face when you confirm with spacebar.

### **Hotkey functionality in the footer text**

Have a look at the footer when you work with this tool. Here you will find further instructions and hotkeys.

Enter, Pad Enter, Spacebar - confirm

Esc key, RMB - cancel the operation

LMB start the cut

Double LMB - close the cut

E - create new cut

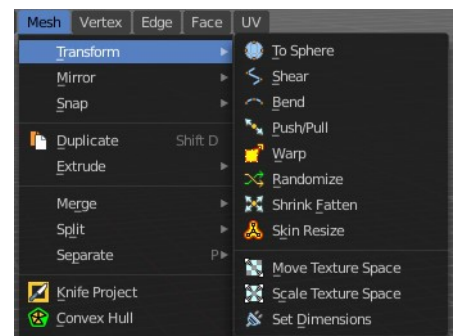

Ctrl or Shift while dragging - Snap to the middle of an edge

Z - cut through the whole geometry, also the backfaces.

MMB - pan the view.

Alt MMB - rotate the view.

# Transform

## To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

## Last Operator To Sphere Panel

### Factor

The factor to transform the selection into a shape form.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further

settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

# Shear

Shear shears the selection.

## Last Operator Shear

### Offset

Adjust an offset.

### Shear Axis

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

### Orientation

Choose the orientation for the shear action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further

settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Bend

Bends the selection.

---

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

## Last Operator Push/Pull

### Factor

Adjust the strength of influence of the tool.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Warp

Warp a mesh selection between two defined points.

### Last operator Warp

#### *Warp Angle*

The strength of the warp effect

#### *Offset Angle*

An offset angle to bend side wards.

#### *Min*

The start point.

#### *Max*

The end point.

## Randomize Transform

This tool allows randomizes the positions of the selected vertices.

### Last Operator Randomize Transform

#### *Amount*

Adjust the amount.

#### *Uniform*

The uniform offset distance.

#### *Normal*

Align the offset direction to the normals.

#### *Random Seed*

The seed value for randomization.

---

## Shrink/Fatten

Shrink/Fatten scales the selected geometry along its normals. Transform orientation and Pivot point gets ignored.

A positive value pushes the vertices outwards. A negative value pushes the vertices inwards.

### Last Operator Shrink/Fatten

The Last Operator Shrink/Fatten panel gives you tools to adjust the Shrink/Fatten operation. Here you have numeric input for the strength and a few more options.

#### Offset

Offset is the strength of the offset for Shrink/Fatten.

#### Offset Even

Offset Even scales the selection to give more thickness in even areas.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

#### Proportional Size

See and adjust the falloff radius.

#### Connected

The proportional falloff gets calculated for connected parts only.

#### Projected(2D)

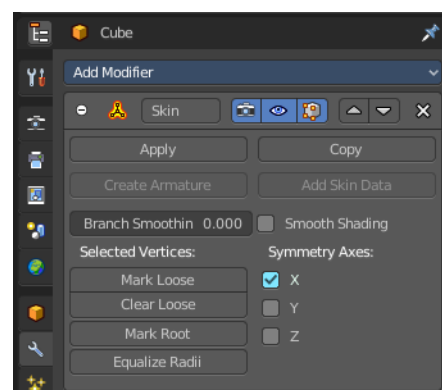

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Skin Resize

This tool requires to have a skin modifier at the mesh. It scales the thickness of the skin.

While the operation you will see in the header the strength value for the skin.

Scale X: -0.3484 Y: -0.3484 Z: -0.3484

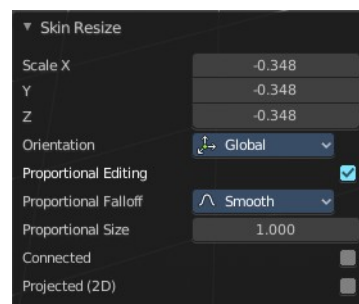

## Last Operator Skin Resize

### Vector

Adjust the position values for the three values.

### Scale X, Y, Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Move Texture Space

This tool relies at the move tool. With the difference that it moves the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Dx: -0.1501 m Dy: 0.05851 m Dz: 0.2117 m (0.2661 m)

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Translate

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Texture Space

This tool relies at the scale tool. With the difference that it scales the texture space instead of the object. It has also a very special use case, and just works with a material with a Texture Coordinate / Generated node. And requires to have the shading at Material or Rendered to see a result in the viewport.

In the viewport you will see the UV cage in black color. In the header you will see the values for the current position of the UV cage.

Note that once done and applied, there is no way to reset the UV cage back to zero. When you repeat the operation, then the values will start at 0 again. Even when the UV cage is already offset.

## Last Operator Resize Texture

### Move X, Y Z

Limit the position relative to the source object.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Set Dimensions

Edit Mode Only!

Normally all scale operations in Bforartists are relative to the current selection and dimensions. And you always start with a relative value of 1.

Set dimensions allows to scale mesh selections in absolute world values. No matter how the initial values are. The new values gets set in the Last Operator.

Set dimensions is an add-on. You can turn it off in the add-ons section of the user preferences when you want.

## Last Operator Set Dimensions

### New Dimensions

When you activate the tool then you will see the world coordinates of the selection. Change the values to other world coordinates.

# Mirror

Mirror mirrors the selected geometry along the defined axis.

## Interactive Mirror

Mirror by hotkeys. You activate the tool, type in x for x global for example, or x x for x local. And the selection gets mirrored

## X Global, Y Global etc.

Mirrors the selection around the chosen axis.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

## Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

## **Constraint Axis**

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Mirror Vertex Group**

This tool requires to have a vertex group assigned. It mirrors the selected vertex group.

This tool works only with a perfectly symmetrical mesh along the local X axis. Vertices that have no corresponding vertex on the other side will not be affected.

## **Last Operator Mirror Vertex Group**

### **Mirror Weights**

Mirrors the Weight Painting informations from the symmetrical counterpart.

When both are selected it will become a group and weight information exchange. If only one is selected, then the information from the unselected vertice will go to the selected vertice.

### **Flip Group Names**

Flip selected group names. This works with vertex groups with symmetrical name conventions. Like .L , .R, right, left.

### **All Groups**

Pass information to all groups instead of the active one.

## Topology Mirror

Use topology based mirroring.

# Snap

Choose several methods to snap one element to another. The menu items should be self explaining.

## Last Operator Snap

Some snap operations shows a last operation panel, some not.

## Offset

If the selection should snap as a whole, or if each individual element of the selection should snap.

# Single Operators

## Duplicate

Duplicates the current selection.

When you duplicate a selection, then it sticks to the mouse until you left click. And moves around. A right click repositions the duplicated geometry at its original location.

## Last Operator Duplicate

### Mode

Not to find out. No tool tip, no entry in the Blender manual. Good Job Blender Developers.

### Move X, Y, Z

Adjust the position.

### Orientation

Orientation is a drop-down box choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you again the possibility to define the mirror axis. You can choose more than one axis here.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Extrude

Extrude is a sub menu with several extrude methods. The content is dependent of the mesh select mode.

Note that the tool shelf also contains extrude functionality. And a few methods here are a double. These are marked with a (Legacy) in the tool name.

## Extrude Faces (Legacy)

Extrude the selected faces along their normals. This functionality is part of the Extrude Region tool in the tool shelf.

## Last Operator Extrude Region and Move

### Flip Normals

Flips the normals of the extruded faces.

## Dissolve Orthogonal Edges

Dissolves orthogonal edges at extrusion.

## Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

## Orientation

The extrusion can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Extrude Faces along Normals (Legacy)

In the toolshelf it's the Extrude Along Normals tool. Extrudes the selection along local normals. You won't see a widget here. Simply drag.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

## Last Operator Extrude Region and Shrink/Fatten

### Flip Normals

Flips the normals of the extruded faces.

## Dissolve Orthogonal Edges

Dissolves orthogonal edges at extrusion.

### Offset

The current extrude amount.

### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Extrude Individual Faces ( Legacy)

In the tool shelf the tool is called Extrude Individual. Extrudes the selection along local normals of each individual face. You won't see a widget here. Simply drag.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

### Last Operator Extrude Individual Faces and Move

#### Offset

The current extrude amount.

#### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extrude Manifold (Legacy)**

The same tool exists in the tool shelf. Extrude, dissolve Edges whose faces form a flat surface, and intersect new edges.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

### **Last Operator Extrude Manifold**

#### **Flip Normals**

Flips the normals of the extruded faces.

#### **Dissolve Orthogonal Edges**

Dissolve edges that are at the same straight surface.

#### **Move X, Y Z**

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

#### **Orientation**

The widget can have different orientations. The menu items should be self explaining.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extrude Edges**

Extrudes out the selected edges by moving the mouse.

### ***Last Operator Extrude Only Edges and Move***

### ***Flip Normals***

Flip the normals at the involved faces.

### ***Move X Y Z***

The coordinates for the extruded geometry.

### ***Orientation***

Choose the type of orientation, in which coordinate system the action should happen.

### ***Constraint Axis***

## ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Extrude Vertices

Extrudes out the selected vertices by moving the mouse.

### ***Last Operator Extrude Only Vertices and Move***

#### **Move X Y Z**

The coordinates for the extruded geometry.

#### **Orientation**

Choose the type of orientation, in which coordinate system the action should happen.

#### **Constraint Axis**

#### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

#### ***Proportional Falloff***

Adjust the falloff methods.

#### ***Proportional Size***

See and adjust the falloff radius.

#### ***Connected***

The proportional falloff gets calculated for connected parts only.

#### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Dupli Extrude / Dupli Extrude Rotate

Dupli Extrude is a two trick tool. With faces selected it creates a rotated copy of the geometry. With edges or vertices selected it extrudes to the mouse position. That's why it is a good idea to use this tool with a hotkey. But note that we have currently no hotkey assigned to this legacy functionality.

Dupli Extrude Rotate behaves the same than Dupli Extrude, but rotates the source geometry too.

### ***Dupli Extrude - with selected Faces***

Dupli Extrude with selected faces creates a copy of the selection and rotates it slightly.

### ***Dupli Extrude - with selected Vertices***

Dupli Extrude with selected vertices extrudes the vertice to the mouse position.

## **Extrude Repeat**

All modes. Extrudes into the Z depth of the viewport, and repeats the extrusion by the adjusted amount. You have to adjust the extrusion afterwards.

### ***Last Operator Extrude Repeat***

#### **Steps**

How much repetitions.

#### **Offset X / Y / Z**

The offset in the x y and z direction.

#### **Scale Offset**

The scale factor of the extruded element.

#### **Spin**

All modes. Extrudes in a curve form.

## Last Operator Spin

### Steps

How much segments.

### Use Duplicates

Creates not connected geometry. In Vertex mode single vertices for example. Auto Merge and Flip Normals will not be available with duplicates.

### Angle

The angle to extrude.

### Auto Merge

Merge first and last element when the extrude is a full circle.

### Flip Normals

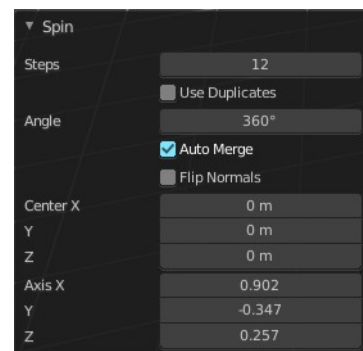

Flip the normals of the extruded geometry.

### Center X / Y / Z

The center point of the spin circle.

### Axis

Axis in global View space. The values goes from -1 to 1.

## Merge

Merges the geometry.

### At Center, At Cursor, Collapse, At First, At Last

Merges the geometry with the given methods.

The methods At First and At Last just shows when you have vertices selected, and there is at least one first vertice and one last vertice to merge at. So minimum two. But you can have more than one vertices selected.

### Last Operator Merge

#### Type

Choose the merge method again.

#### UV's

Move the UV's according to the merge.

## By Distance

Merge the vertices by their distance to each other. This tool is meant to remove double vertices at the same location.

### Last Operator Merge by Distance

#### *Merge Distance*

Adjust the distance below which the vertices gets merged.

Merge selected vertices to unselected vertices.

## Split

### Selection

Split splits the edges between the selected vertices. It creates two edges out of one. And splits the edge by that.

The mode doesn't matter. There will always the edges be splitted.

### Faces by Edges / Faces by Edges by Vertices

Splits selected edges so that each neighbor face gets its own copy. You have two methods here.

### Last Operator Edge Split

#### *Type*

Choose the method again.

## Separate

Separate separates the selected geometry, and creates a new object. The geometry becomes uneditable, since it is now a new object. You will have to leave the Edit mode, select the new object, and re-enter Edit mode when you want to edit it.

### Selection

Selection separates the current selection.

### By Material

By Material separates all geometry that has the same material than the current selection.

## By Loose Parts

By Loose parts separates all geometry that is connected by edges to the current selection.

---

## Knife Project

Knife Project uses an object as a knife to cut edges into a mesh.

Usage: Create a cube. Create a circle. Move the circle in front of the cube so that the geometry does not overlap the cube geometry. Enter Edit Mode with the cube. In the outliner hold down SHIFT, and select the circle. Note that you can select the circle in the 3d view with holding down CTRL.

Now that both objects are selected, go into front view, or whatever view you want. Just make sure that in the view the circle covers a part of the cube. Projection of the cut happens from the current view. Click the Knife Project tool.

## Last Operator Knife Project

### Cut through

The cut goes through the whole object when the Cut through checkbox is ticked.

## Convex Hull

Creates a convex hull around the outside of selected vertices. The old faces and inlaying vertices gets removed.

## Last Operator Convex Hull

### **Delete Unused**

Removes vertices that are not part of the convex geometry.

### **Use existing Faces**

Use existing input faces that lies on the hull where possible. This option allows to have N-Gons in the convex hull.

### **Make Holes**

Deletes edges and faces in the hull that were part of the input. This allows to delete faces between the existing mesh and the convex hull.

### **Join Triangles**

Joins adjacent triangles into quads.

### **Max Face Angle**

Max Face Angle belongs to the Join Triangles setting. Set the maximum face angle.

### **Max Shape Angle**

Max Face Angle belongs to the Join Triangles setting. Set the maximum shape angle.

### **Compare UV's**

Takes existing UV patches for the calculation into account.

### **Compare Vcols**

Takes existing Vertex colors for the calculation into account.

### **Compare Seam**

Takes existing seams for the calculation into account.

### **Compare Sharp**

Takes existing sharp edges for the calculation into account.

### **Compare Materials**

Takes existing materials for the calculation into account.

---

## Symmetrize

The Symmetrize tool mirrors the selected geometry symmetrical along a world axis.

## Last Operator Symmetrize

### Direction

Direction is a drop down box define the mirroring direction.

### Threshold

Adjust a distance after which the mirroring should happen, relative to the mirror axis. 0 means it mirrors the geometry directly at the axis.

## Snap to Symmetry

Tries to snap the selected vertices symmetrical along the chosen world orientation.

### Last Operator Snap to Symmetry

#### Direction

The calculation direction.

#### Threshold

The threshold defines the radius in which matching vertices gets located. When you get a warning that snapping failed try increasing the threshold value.

#### Factor

The snapping factor. Blend mirrored locations from one side to the other. 0.5 is blending both sides equal.

#### Center

Snap vertices in the center axis to zero.

## Smart Delete

Smart delete deletes what is selected in an intelligent way. When you for example delete an edge then the edge gets deleted. But it also deletes the vertices connected to this edge. It performs a Dissolve operation under the hood.

There is also a Delete and Dissolve menu in the Mesh menu, choose different methods for deleting if required.

Smart delete is an add-on. And can be deactivated if desired.

# Normals

This menu contains functionality about dealing with normals. Normals influences the shading and the direction of a face. They can point inwards or outwards. And edges can be split. So that two adjacent faces have a sharp edge.

You can activate the display of normals in the Overlays panel in Edit mode.

## Recalculate Outside

Recalculates the normals of the selected geometry so that everything points outwards.

### Last Operator Recalc Outside

#### Inside

Inside recalculates the normals of the selected geometry so that everything points inwards.

## Recalculate Inside

Recalculates the normals of the selected geometry so that everything points inwards.

## Flip

Flips the direction of the normals of the selected geometry.

## Set from Faces

Sets the vertex normals from the selected faces. This tool requires to have Auto smooth activated!

## Rotate

Rotate the normals of the selected vertices manually.

### Last Operator Rotate Normals

#### Angle

The angle of the selected normal(s).

## Axis

The axis to rotate around.

## Orientation

Choose the type of orientation, in which coordinate system the action should happen.

## Constraint Axis

Constraint specific axis.

## Point Normals to Target

All vertex normals will point to a specific target. This target can be chosen from hotkeys. They show in the header.

Pressing R for Reset will reset the normals to where they were before the operation.

## Last Operator Point Normals to Target

### Invert

The normal directions are reversed from what is specified.

### Align

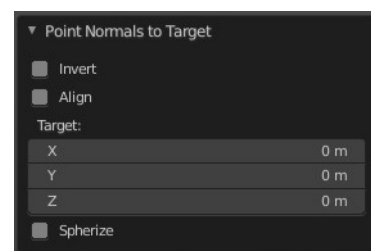

All normals will point in the same direction.

### Target

The target position.

### Spherize

Each normal will be interpolated between its original value and the direction to the target.

## Merge

Merge all of the normals at selected vertices, making one average normal for all of the faces.

## Split

Split the normals at all selected vertices so that there are separate normals for each face, pointing in the same direction as those faces.

## Average

Average all of the normals in each fan of faces between sharp edges at a vertex.

## Custom Normal

Take the average of vertices normals.

## Face Area

Set all vertices normals by face area.

## Corner Angle

Set all vertices by corner angle.

## Last Operator Average Normals

Type

Choose the average type again.

## Weigh

Just for custom normals method. Weight applied by face.

## Threshold

Just for custom normals method. Threshold value for different weights to be considered as equal.

## Copy Vectors

Copies the normals of a single selected vertice.

## Paste Vectors

Pastes the normals from a formerly copied selected vertice to the currently selected vertice.

## Last Operator Normals Vector Tools

### *Absolute Coordinates*

When you paste normals then they get pasted relative to the current orientation of the selected vertice. With absolute coordinates the normals gets pasted in world coordinates.

## Smoothen Vectors

Smooth custom normals towards the adjacent vertex normals.

## Last Operator Smooth Normals Vectors

### Factor

Adjust how strong the smoothen should be.

## Reset Vectors

Resets the normal of the selected element(s).

## Select by Face Strength

Face strength gets used by the Weighted Normals modifier. See Face Influence checkbox.

Select faces with either weak or medium or strong face strength.

## Set Face Strength

Face strength gets used by the Weighted Normals modifier. See Face Influence checkbox.

Set selected faces to either a weak, a medium or a strong face strength.

## Shading

Sets the shading of the selected elements to either smooth or flat.

Shading is under the hood a normals operation.

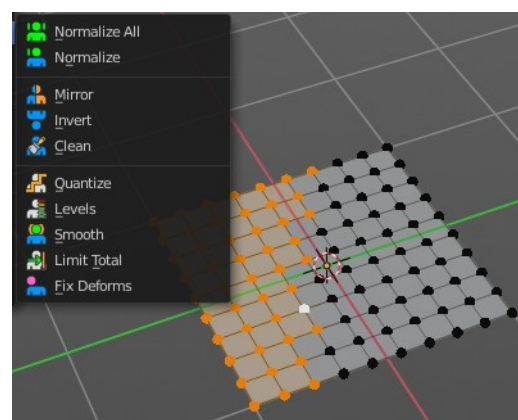

## Weights

The Weights menu contains Weight tools. Those tools are meant to modify the weight mapping. At characters for example. The Weight Tools requires Vertex Groups to work with. Such Vertex groups gets created when you do weight painting at a character for example. Here is defined what bone is connected to what vertice.

In Edit Mode the weight mapping doesn't show. Here you work with the Vertex Groups.

In Weight paint mode the weight painting shows with colors. Here you usually paint the weighting.

This menu items also exists in Weight Paint mode.

## Normalize All

While weight painting it can happen that a vertice gets several weightings assigned. Normalize all normalizes the weight of all Vertex groups so that the values for the single vertices in the sum is 1.

### *Last Operator Normalize all*

#### Subset

Subset is a drop-down menu choose the Subset method.

#### Lock Active

Keep the values of the active group while normalizing others.

## Normalize

Normalize normalizes the weight of the current selected Vertex group so that the values for the single vertices in the sum is 1. Means when there is influence from other groups, then those values are kept, but the one for the current group gets lowered so that the sum is 1.

The Last Operator Normalize panel has no adjustable settings.

## Mirror

Mirror Vertex Group mirrors Vertex Groups and flips weights and/or names. It only edits selected Vertices. It flips when both sides are selected. Otherwise it copies from Unselected.

### *Last Operator Mirror Vertex Group*

#### Mirror Weights

With Mirror Weights ticked it mirrors the weights.

#### Flip Group Names

With Flip Group Names ticked it flips the Group names.

## All Groups

Mirrors all Vertex Groups

## Topology Mirror

Uses topology based mirroring. This requires matching mirrored topology.

---

## Invert

Invert inverts the weight painting for the selected vertex group.

### *Last Operator Invert Vertex Group*

#### Subset

Subset is a drop-down menu choose the Subset method.

#### Add Weights

Add Vertices from Groups that have zero Weighting before inverting.

#### Remove Weights

Remove Vertices from Groups that have zero weight after inverting.

---

## Clean

Removes Vertex group assignments that are not required from the active vertex group.

### *Last Operator Clean Vertex Group*

#### Subset

Subset is a drop-down menu choose the Subset method.

#### Limit

Remove weights that are below or equal to the limit value.

#### Keep Single

Keep Vertices assigned to at least one vertex group when cleaning.

---

## Quantize

Quantize quantizes the weight paint values. It starts with 4 steps. With a step of 1 you have a single vertex color, no matter how you have painted it before.

### *Last Operator Quantize*

#### Subset

Subset is a drop-down menu choose the Subset method.

#### Steps

Here you adjust in how many steps the weight paint colors should be divided.

---

## Levels

Adds some offset to the Weight paint, and multiplies it with some gain.

### **Last Operator Vertex Group Levels**

#### **Subset**

Subset is a drop-down menu choose the Subset method.

#### **Offset**

Here you adjust the offset.

#### **Gain**

Here you adjust the gain.

---

## Smooth

Smooths the weight for selected vertices.

### **Last Operator Smooth Vertex Weights**

#### **Subset**

Subset is a drop-down menu choose the Subset method.

#### **Factor**

Here you adjust the factor.

#### **Iterations**

Here you adjust how many iterations you use.

#### **Expand/Contract**

Expand or contract the weights.

---

## Limit Total

Limit number of Weights per vertex. The lowest weights gets removed.

This is of interest when you have for example five bones associated with a vertice. But your game engine just allows four ...

### **Last Operator Limit Number of Weights per Vertex**

#### **Subset**

Subset is a drop-down menu choose the Subset method.

#### **Limit**

Here you adjust how many weights are allowed.

---

## Fix Deforms

Modify the position of selected vertices by changing only their respective group weights.

This tool may operate slow at too many vertices.

### Last Operator Fix Deforms

#### Distance

Adjust the distance.

#### Strength

Adjust the strength.

#### Change Sensitivity

Adjust the sensitivity.

## Set Attribute

Set values of the active attribute for the selected element.

The operator calls a popup where you can for now adjust UV mapping values.

## Sort Elements

Sort Elements is a menu with different sorting methods. It allows you to reorder the mesh indices of the selected mesh elements by various methods.

The indices can be turned on in the Overlays menu in the Developer section.

### View Z Axis

Sorts along the active view's Z axis, from farthest to nearest. You can use Reverse if you want it the other way.

### View Y Axis

Sorts along the active view's Y axis, from farthest to nearest. You can use Reverse if you want it the other way.

### Cursor Distance

Sorts from nearest to farthest away from the 3D cursor position.

### Material

Faces only! Sorts faces by their lowest material index up to highest material index. Order of faces inside each of those material groups remains unchanged.

Note that the Reverse option only reverses the order of the materials. And the order of the faces inside them.

## Selected

Moves all selected elements to the beginning without affecting their relative orders. Attention, this option will also affect unselected element indices!

## Randomize

Randomizes the indices of selected elements. This option does not affect the unselected elements.

## Reverse

Reverses the order of the selected elements.

## Last Operator Sort Mesh Elements

Sort Elements always brings up the same last operator. But with a small difference for Randomize and Reverse. Reverse has no checkbox. And Randomize has a Seed checkbox.

### Type

This is a drop-down box choose the sort method again.

### Vertices, Edges or Faces

Adjust if the sort will affect the vertices, edges or faces.

### Reverse Checkbox

Reverses the sorting.

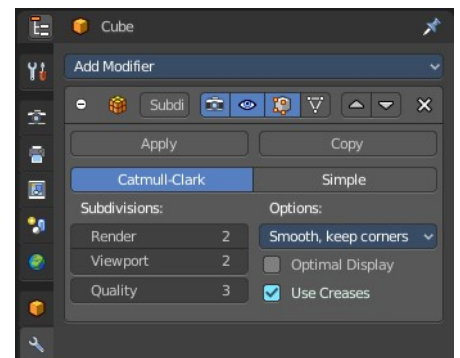

### Seed Edit box (Randomize only)

The seed option allows you to get another randomization – the same seed over the same mesh/set of selected elements will always give the same result!

## Subdivide

Subdivide is a menu where you can quickly add and change a subdivision surface modifier with a predefined resolution in a quick way. Especially when you use the hotkey for it. The subdivision surface modifier panel can then as usual be found in the Properties editor in the Modifier tab.

## Last Operator Subdivision Set

### Level

Set the level of subdivisions

### Relative

Applies the sub surf level as an offset to the already existing sub surf level.

## Show / Hide

The Show/Hide menu is available for all object types and in all modes. It is usually in the object related menu to find. In Object mode it's the Object menu, for a curve object in edit mode it is the Curve menu. It always contains three menu items. Show Hidden, Hide Selected and Hide Unselected.

## Show Hidden

Makes all hidden elements in the scene visible again.

## Hide Selected

Hides the selected elements.

## Hide Unselected

Hides the not selected elements. The selected elements stays visible.

## Last Operator Reveal Hidden / Hide Selected

### Select

Define if the selected or the unselected elements gets hidden or revealed.

## Cleanup

In the Cleanup menu you will find tools to clean up the current geometry.

## Delete Loose

Delete loose deletes not connected geometry. Vertices, Edges, and Faces. The tool starts with deleting Vertices and Edges. But you can tick Faces in the Last Operator too, and then it also removes not connected Faces.

### Last Operator Delete Loose

#### Vertices

Delete Vertices.

#### Edges

Delete Edges.

#### Faces

Delete Faces.

## Decimate Geometry

Decimate Geometry decimates the currently selected geometry. It starts with a Ratio of 1. Which means no decimation. The lower the ratio the more decimation you will get. The Decimate Modifier works with Tris!

### Last Operator Decimate Geometry

#### Ratio

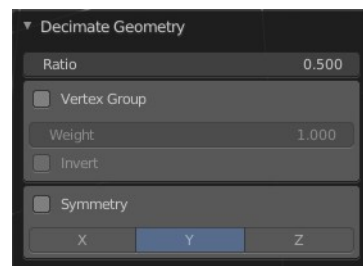

Adjust the strength of decimation.

#### Vertex Group

Use active Vertex Group as an influence. You need to have a Vertex Group.

#### Weight

Adjust the Vertex Group Strength.

## ***Invert***

Invert Vertex Group Influence.

## ***Symmetry***

Make the decimation geometry symmetric along a chosen world axis.

---

## **Degenerate Dissolve**

Removes zero size Faces and Edges.

---

## **Make Planar Faces**

Make Planar Faces tries to make the selected faces planar. Quads or N-Gons for example can have vertices that are not planar.

### **Last Operator Make Planar Faces**

#### ***Factor***

Here you adjust how strong the influence should be.

#### ***Iterations***

Here you adjust how often it should repeat in the try to find a solution.

---

## **Split Non-Planar Faces**

Split Non Planar Faces splits up non planar Quads and N-Gons to end in planar faces.

### **Last Operator Split Non-Planar Faces**

#### ***Max Angle***

Limit the action to a maximum angle.

---

## **Split Concave Faces**

Splits concave faces to make the geometry more stable. This tool is thought for N-Gons.

## Merge by Distance

Merges vertices that are very close to each other. The merge happens at the center. When you need more control then you should use the Merge Vertices tool.

### Last Operator *Merge by Distance*

#### *Merge Distance*

Adjust the distance in which the vertices gets merged.

#### *Unselected*

Merge selected vertices also with other unselected vertices.

## Fill Holes

Fill holes closes holes in the mesh geometry.

Fill holes can just calculate one face size at one time. So when you have several holes in the mesh, let's say one is a tri, and one is a quad, then you need to calculate twice.

### Last Operator Fill Holes

#### *Sides*

Define what face size will be filled.

## Delete

The smart delete add-on. usually does the delete job already fine. It deletes the selected element(s).

There are sometimes some situations where you need more control over what you want to delete. The tools for this can be found in the Delete menu.

### Vertices

Deletes the selected vertices, and all with it connected edges and faces.

## Edges

Deletes the selected edges and the connected faces.

## Faces

This one works similar to the smart delete. It deletes the selected faces.

## Only Edges and Faces

This mode is of interest when you have more than one selection mode activated. It deletes then just the selected edges and faces. And not single vertices.

## Only Faces

This mode is of interest when you have more than one selection mode activated. Just selected faces gets deleted. Not single edges or vertices.

## Edge Loops

This method works similar to the smart delete tool. It deletes the edge loop. But it selects the faces of the edge ring. And the Last operator offers you the option to split off face corners.

### *Last Operator Delete Edge Loop*

### Face Split

Split off face corners to maintain surrounding geometry.

# Dissolve

Dissolve operations removes for examples selected vertices, edges and faces. But they are not delete operations. They are union tools.

When you for example choose Delete vertices from the mesh menu, then the involved faces can get deleted too. When you choose Dissolve vertices, then the vertices gets removed, and the faces stays intact. The edges gets unioned.

Dissolve is a union operation.

## Dissolve Vertices

Dissolve Vertices dissolves the selected Vertices.

Note that pressing DEL in Vertice select mode calls Dissolve Vertices already. It's the same operator. But you

don't get the Last operator that way.

## Last Operator Dissolve Vertices

### *Face Split*

Split off Face corners to maintain surrounding geometry

### *Tear Boundary*

Split off Face corners instead of merging faces.

---

## Dissolve Edges

Dissolve Edges dissolves the selected Edges.

Note that pressing DEL in Edge select mode calls Dissolve Edges already. It's the same operator. But you don't get the Last operator that way.

## Last Operator Dissolve Edges

### *Dissolve Verts*

When the dissolve operation leaves vertices behind, then this vertices will be dissolved too.

### *Face Split*

Split off Face corners to maintain surrounding geometry.

---

## Dissolve Faces

Dissolve Faces removes the inlaying edges of the selected faces. This faces becomes one big N-Gon.

## Last Operator Dissolve Faces

### *Dissolve Verts*

When the dissolve operation leaves vertices behind, then this vertices will be dissolved too.

---

## Dissolve Selection

Dissolves the selected geometry.

## Last Operator Dissolve Selection

### *Dissolve Verts*

When the dissolve operation leaves vertices behind, then this vertices will be

dissolved too.

### ***Face Split***

Split off Face corners to maintain surrounding geometry.

### ***Tear Boundary***

Split off face corners instead of merging faces.

## **Limited Dissolve**

Limited Dissolve dissolves the selected Edges and Vertices, limited by the surrounding geometry.

### **Last Operator Limited Dissolve**

#### ***Max Angle***

The limiting angle.

#### ***All Boundaries***

All Boundaries dissolves in-between face boundaries.

#### ***Delimit***

You can also delimit by other methods than normals.

## **Edge Collapse**

Edge Collapse collapses the selected edges to a vertice at the center of the selection.

## **Mesh Select Mode**

Mesh Select mode is a sub menu Set the current mesh select mode. Its functionality is equal to the mesh select mode buttons in the header. Just that you can't select more than one mode directly here.

This menu just exists to show and to edit the hotkeys. Not to work with it.

## 7.1 Editors - 3D Viewport - Header

### Table of content

Introduction.....	1
Header.....	2
Header right click menus.....	2
Editortype Menu.....	2

## Introduction

The 3D View editor is the editor where you edit your 3D data. Here you can display and modify all the scene data like meshes, curves, metalballs, etc.

It has by default a grid in the middle. And you can navigate around in this view.

The 3D View has several areas. In this chapter we will cover the header area. Pink color.

## Header

The Header contains various menus, navigation elements and tools for the 3d view. This content vary, dependent of mode and object type. The Mesh menu just exists with a mesh object in Edit mode. The Object menu exists just in Object mode and so on.

The header is divided into three areas. Left is the mode drop down box. At the right of it is the text menus. And at the right side you will find some scene related settings.

When the Tool Settings are hidden, the area above the header, then you will also see some object related settings from there.

The header not only provides tools and menus. It is also the place where you will see specific informations when you perform an operation. When you move an object for example, then the menus hides, and you will see the actual transformation values in the header in real time.

Dx: -0.1421m Dy: 0.3069m Dz: 0.5101m (0.612m)

The text menus will be explained one by one and mode by mode in their own chapters.

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

## Editortype Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

# 7.2.10 Editors - 3D Viewport - Tool Shelf - Metaball - Edit Mode

## Table of content

- Tool Shelf - Metaball - Edit Mode..... 1
  - Tweak, Select, 3D Cursor, Transform, Measure and Annotate tools..... 1
  - Shear..... 1
    - Tool Settings..... 1
      - Orientation..... 2
      - Drag..... 2
        - Active Tool..... 2
        - Tweak, Select Box, Circle and Lasso..... 2
  - Last Operator Shear..... 2

  - Proportional editing..... 2
    - Proportional Falloff..... 2
    - Proportional Size..... 2
    - Connected..... 3
    - Projected(2D)..... 3

## Tool Shelf - Metaball - Edit Mode

### Tweak, Select, 3D Cursor, Transform, Measure and Annotate tools

The Tweak, Select, 3D Cursor, Transform, Measure and Annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Shear

The shear tool allows you to shear the selected geometry. When you activate the tool, then a widget appears that allows you to pull in the desired direction.

The shear happens between the meta elements. This means you need more than one. And you need to select the meta elements first!

### Tool Settings

## Orientation

Choose the orientation for the shear action.

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Shear

### Offset

Adjust an offset.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

### Orientation

Choose the orientation for the shear action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## 7.2.11 Editors - 3D Viewport - Tool Shelf - Text - Edit Mode

### Table of content

Tool Shelf - Text - Edit Mode.....	1
3D Cursor, Measure and Annotate tools.....	1

### Tool Shelf - Text - Edit Mode

The tool shelf does not have any tools in the tool shelf yet for the Metaball object.

Note that the Tweak tool does nothing here. But it is a good default to avoid placing accidentally the 3D cursor around.

### 3D Cursor, Measure and Annotate tools

The 3D Cursor, Measure and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

## Tool Shelf - Grease Pencil - Edit Mode

Here you can find tools to edit the curve geometry of the grease pencil strokes.

### Tweak, Select, Transform, 3D Cursor Measure and Annotate tools

The tweak, select, transform, 3d cursor, measure and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Extrude

Extrude out selected curve points.

### Snapping

Holding down Ctrl activates temporary global snapping.

### Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

### Header Values

When you move the mouse then you will see some values in the header, which defines the current position of the object.

D: 0.04303 m (0.04303 m) global

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

### Move without Widget

You don't have to use the widget to move the object. You can also click aside of it, and drag the object around. The mouse turns into a move cursor. The standard behavior then is to move in screen space. When you want to move into a specific axis, then press X or Y or Z to limit the movement to this axis.

## Limit Axis

When you want to move along a specific axis, then press X or Y or Z to limit the movement to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

D: 0.1529 m (0.1529 m) along global Z

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

## Tool Settings

### Axis Type

You can choose between the regular axis type. That's the yellow widget with just one handler. It always points in the direction of the middled normals of the selection.

Or you can use the XYZ axis type. That's a handler with three axis. This widget can be aligned with the transform orientation methods.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Extrude Stroke Points

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Radius

Increases the thickness of the stroke for the selected curve points.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move the mouse then you will see some values in the header, which shows the current scale factor. This value is relative to the starting value, which always starts with 1.

## Last Operator Transform

### Transform X, Y Z

The scale factor. Actually just the Value X does really matter. The other values have no effect.

## Axis

Define an axis to scale. But this setting has no effect.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Bend

Bends the selection.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move the mouse then you will see some values in the header, which shows the current scale factor. This value is relative to the starting value, which always starts with 1.

## Shear / To Sphere Tools group

### Shear

#### *Snapping*

Holding down Ctrl activates temporary global snapping.

#### *Precision movement*

When you hold down shift, then you will have a much slower but also much preciser movement.

#### *Header Values*

When you move the mouse then you will see some values in the header, which shows the current scale factor. This value is relative to the starting value, which always starts with 1.

#### *Hotkeys*

As shown in the header, you can press X or Y to set the shear axis.

#### *Last Operator Shear*

#### **Offset**

The shear offset. This value always starts at zero.

#### **Axis**

Define the first axis for the shear transformation.

#### **Axis Ortho**

Define the second axis for the shear transformation

#### **Orientation**

The widget can have different orientations. The menu items should be self explaining.

#### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

#### *Proportional Falloff*

Adjust the falloff methods.

#### *Proportional Size*

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **To Sphere**

Transforms the selection into a sphere shape.

### **Snapping**

Holding down Ctrl activates temporary global snapping.

### **Precision movement**

When you hold down shift, then you will have a much slower but also much preciser movement.

### **Header Values**

When you move the mouse then you will see some values in the header, which shows the current to sphere factor. This value is relative to the starting value, which always starts with 0.

### **Last Operator To Sphere**

#### **Offset**

The to sphere factor. This value is relative to the starting value, which always starts with 0.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

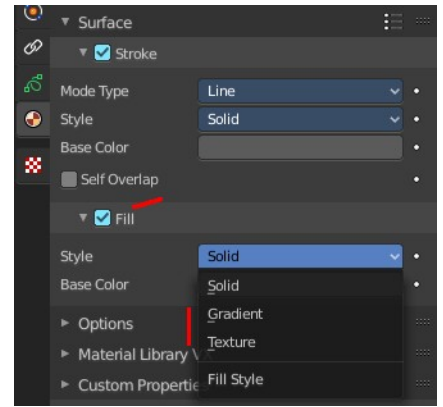

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Transform Fill

Change the Translation, Rotation and scale of strokes fill.

This tool is connected with the material settings. And works with Fill style Gradient and Texture.

## Tool Settings

Adjust the translation mode to Translate, Rotate or Scale.

## Last Operator Transform Stroke Fill

### Mode

Adjust the translation mode to Translate, Rotate or Scale.

## 7.2.13 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Sculpt Mode

### Table of content

Tool Shelf - Grease Pencil - Sculpt Mode.....	1
Annotate tools.....	1
Stabilize Stroke.....	1
Radius.....	1
Factor.....	2

Randomize.....	2
Grab.....	2
Push.....	2
Twist.....	2
Pinch.....	3
Clone.....	3

## Tool Shelf - Grease Pencil - Sculpt Mode

In Sculpt Mode you will mainly find brushes in the tool shelf.

The brushes settings are covered in the chapter 25.1.8 Editors - Properties Editor - Tools Tab - Grease Pencil Object.

### Annotate tools

The annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

However, the active tool setting in Sculpt mode has an extra setting.

### Stabilize Stroke

Helper to draw smooth and clean lines. Press Shift for an invert effect (even if this option is not active)

Radius and factor becomes visible when stabilize stroke is activated.

#### **Radius**

Stabilizer stroke radius. Minimum distance from last point before the stroke continues

#### **Factor**

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Select Tools

When you activate one of the mask modes then the select tool group appears. It is explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

## Footer

When you use a brush then you will see some further informations to the brush. Scroll Wheel changes for example the brush radius.

GPencil Sculpt: Smooth Stroke | LMB to paint | RMB/Escape to Exit | Ctrl to Invert Action | Wheel Up/Down for Size | Shift-Wheel Up/Down for Strength

## Smooth brush

Smoothens the stroke under the brush.

## Thickness

Changes the thickness of the stroke under the brush.

## Strength

Adjust the transparency of the stroke under the brush. Note that the effect is pretty weak with even a strength of 1. You need several strokes until you get a visible effect.

## Randomize

Randomizes the curve points.

## Grab

Grab the stroke and pull it around.

## Push

Push the stroke under the brush around.

## Twist

Twist the stroke under the mouse. Clockwise or counter clockwise.

## Pinch

Pinches or inflates the stroke under the mouse.

## Clone

Clones strokes. You first need to copy a stroke before you can clone it.

Currently you need to be in one of the mask selection modes for that. Then select a stroke. With circle select for example. Copy it with ctrl c. And then you should be able to clone the current stroke around with a mouse click.

Note that it clones the whole stroke, and not just the selected stroke geometry. The clone brush is more of a copy and paste stroke tool.

## Tool Shelf - Grease Pencil - Draw Mode

In Sculpt Mode you will mainly find draw tools in the tool shelf.

The brushes settings are covered in the chapter 7.3.12 Editors - 3D View - Sidebar - Tool Tab - Grease Pencil - Draw Mode

For the Annotate tools group see chapter 7.2.1 Editors - 3D View - Tool Shelf - Object Mode

### 3D Cursor Tool

The 3D cursor tool is explained in the chapter 7.2.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tool again here.

### Footer

Some of the brushes and tools shows some further information in the footer.

LMB: Stroke - Shift: Fill - Shift+Ctrl: Stroke + Fill

### Hotkeys

Some tools have some additional hotkey functionality. We will cover it one by one.

### Draw

The Draw tool allows you to draw free-hand strokes. You paint with the left mouse.

Holding down Shift while drawing reveals a stabilizer widget which gives you more fine control over painting the stroke.

Holding down ALT while drawing will allow you to draw straight horizontal or vertical lines.

Holding down CTRL while drawing will turn the brush into an eraser brush.

Pressing B will allow you to box select stroke parts and delete them.

### Draw Color

The Draw color is in real a material. To change the color you need to change the material. Or create one with the color that you need. The Grease Pencil Stroke object comes already with a few predefined colors. You can choose between them in the header tools area.

New materials can be created in the Properties editor in the Materials tab. You can also change the color of an existing material. But note that all previously drawn strokes will also change their color then. It is one material for one color.

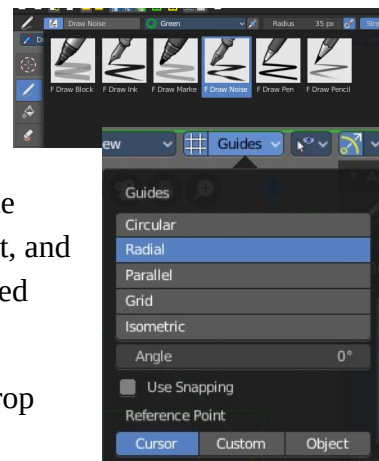

## Brushes

In the Brush browser you will find some more brush types for the Draw tool.

## Guides

When you activate the Draw tool, then the Guides panel shows in the header. The Guides tools are directly connected with the Draw brush, it is a tools subset for it, and allows you to draw some guide shapes. Some perform around a center point called Reference Point.

You need to activate the Guides by clicking at the button at the left side of the drop down box.

### Guides Hotkeys

There are some special hotkeys just for the Guides tools. They don't have a regular menu entry. Better said, they are connected to the Guides panel.

- J/K** adjust guide angle by 15°, with holding alt key by 45°
- C** turn on Circular guide then toggle between Circular and Radial
- V** turn off guides
- L** turn on Parallel Line guide
- Alt L** Use angle of last freehand stroke for Parallel mode
- M** toggle between Circular & Radial mode or 90° in Parallel mode
- O** sets the reference point (only in Cursor or Custom mode)

### **Circular**

Draws a circle around the reference point.

### **Radial**

Draws a line from the starting point through the reference point.

### **Parallel**

Draws parallel horizontal lines. You can draw rotated lines with changing the angle slider.

### **Grid**

Draws parallel horizontal and vertical lines.

### **Isometric**

Draws parallel horizontal and vertical lines. You can draw rotated lines with changing the angle slider. Vertical lines can still be drawn.

## Angle

Radial, Angle, Isometric. The angle.

## Use Snapping

Enable snapping to guides angle or spacing options.

## Reference Point

Circular, Radial. What reference point to use.

---

## Fill

This tool does not fill, but extend strokes of closed strokes areas by click drag, coming from the border. For example, when you create a Bezier circle. When you then click in the inner area, drag the mouse and release it, then the outer line of this Bezier circle gets extended into the inner direction by the in the brush panel adjusted amount.

When you use this tool outside of closed geometry, then it draws a frame around the current view.

## Erase

Erase stroke curve points under the mouse.

## Tint

With the tint tool you can pant onto strokes points and mix the material base color with a selected vertex color.

You first have to set up the colors in the color panel in the sidebar. The colors can be seen in viewport shading Material Preview and Rendered.

## Cutter

Lasso select delete tool. Erases stroke curve points in the selection.

## Tool settings

### Flat Caps

Define if after cutting the stroke the cap of the cut side will be set as flat.

## Eye Dropper

Pick a grease pencil material and make it the draw color.

## Line

Draw straight lines by click drag. The yellow points are handlers that can be dragged around. Right mouse abandons the action. Pressing enter or middle mouse button confirms and makes the stroke real.

Hotkey E allows you to extrude the line.

## Poly line

Draw straight lines by click drag. Clicking creates a new line in the polygon. Right mouse abandons the action. Pressing enter or middle mouse button confirms and makes the stroke real.

The polygon cannot be closed.

## Arc

Draw simple arcs by click drag. The yellow points are handlers that can be dragged around. Right mouse abandons the action. Pressing enter or middle mouse button confirms and makes the stroke real.

## Curve

Draw complex Bezier style curves by click drag. First you create a straight line. The handlers allows you to deform the curve to your needs. Right mouse abandons the action. Pressing enter or middle mouse button confirms and makes the stroke real.

## Box

Draw rectangular shapes by click drag. Hold Shift to create square shapes. The handlers allows you to adjust the rectangle to your needs. Right mouse abandons the action. Pressing enter or middle mouse button confirms and makes the stroke real.

## Circle

Draw oval shapes by click drag. Hold Shift to create square shapes. The handlers allows you to adjust the rectangle to your needs. Right mouse abandons the action. Pressing enter or middle mouse button confirms and makes the stroke real.

## Interpolate

Interpolate grease pencil strokes between frames. You need to have two frames to interpolate between.

## Tool settings

## ***Layer***

What layers to include in the interpolation.

## ***Flip Mode***

How to invert destination stroke to match start and end with source stroke.

## ***Smooth***

Amount of smoothing to apply to interpolated strokes, to reduce jitter or noise.

## ***Iterations***

How often to smooth newly created strokes.

## 7.2.15 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Vertex Paint Mode

### Table of content

Tool Shelf - Grease Pencil - Vertex Paint Mode.....	1
Annotate tools.....	1

Blur.....	1
Average.....	2
Smear.....	2
Replace.....	2

## Tool Shelf - Grease Pencil - Vertex Paint Mode

In Sculpt Mode you will mainly find brushes in the tool shelf.

### Annotate tools

The annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Select Tools

When you activate one of the mask modes then the select tool group appears. It is explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Footer

When you use a brush then you will see some further informations to the brush.

GPencil Vertex Paint: LMB to paint | RMB/Escape to Exit | Ctrl to Invert Action

### Draw

Paint vertices.

### Blur

Blur the color.

## **Average**

Blends the color under the brush.

## **Smear**

Smear the colors.

## **Replace**

Replaces the vertex color under the mouse with the current color.

## 7.2.16 Editors - 3D Viewport - Tool Shelf - Grease Pencil - Weight Paint Mode

### Table of content

Tool Shelf - Grease Pencil - Weight Paint Mode.....	1
Footer.....	1
Weight.....	1
Blur.....	2
Average.....	2
Smear.....	2

### Tool Shelf - Grease Pencil - Weight Paint Mode

You can rig grease pencil strokes. And so you need a weight paint mode.

The brush settings are covered in the chapter Editors - Properties Editor - Tools Tab - Grease Pencil Object.

#### Footer

When you paint then you will see some further information in the footer.

```
GPencil Sculpt: <?> Stroke | LMB to paint | RMB/Esc to Exit | Ctrl to Invert Action | Wheel Up/Down for Size | Shift-Wheel Up/Down for Strength
```

#### Weight

Draws a weight on a stroke. This draws to the active vertex group of the grease pencil. If there is no vertex group, it will automatically create one when drawing.

Allows you to weight paint the current stroke with the settings defined in the brush panel.

## **Blur**

Smooths out the weights of adjacent vertices of a grease pencil stroke. The strength defines how much the weights are blurred.

---

## **Average**

Smooths weights by painting the average resulting value from all values under the brush.

---

## **Smear**

Smudges weight by grabbing the values under the brush and “dragging” them over.

---

## **Annotate Tools Group**

For more information, refer to chapter Editors – 3D Viewport – Tool Shelf – Object Mode

## Tool Shelf - Armature - Edit Mode

Here you find some tools to edit and extend the armature.

### Tweak, Select, 3D Cursor, Transform, Annotate and Measure

The tweak, select, 3D cursor and transform tools and the annotation and measure tool is already described in the chapter Object Mode. So we won't cover it here again.

### Roll

Adjust the bone roll of the selected bone(s).

### Snapping

Rotate and holding down Ctrl activates temporary global snapping. The rotation snaps every 5 degrees. With holding shift too it snaps every 1 degree.

### Precision movement

When you hold down shift, then you will have a much slower but also much preciser rotation.

### Header Values

When you move the mouse then you will see some values in the header, which shows the current rotation factor. This value is relative to the starting value, which always starts with 0.

### Tool Settings

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Values X, Y Z

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

The only relevant setting here is Value X. All other values and settings does not have any effect.

### Axis

The axis to use. Axis has no effect, the bone axis X is always used.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

Orientation has no effect, the bone axis X is always used.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

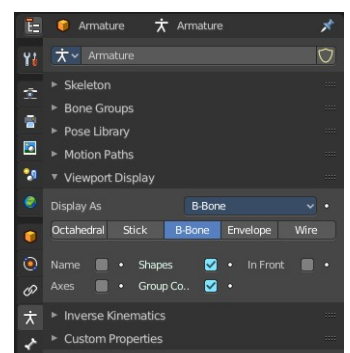

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Bone Size / Envelope Tools group

### Bone Size

This tool just works with bone display type Bbone. With other bone display types nothing happens. Here you can scale the bbones.

The bone display can be changed in the properties editor in the Object Data tab in the Viewport Display panel.

## Snapping

Move and holding down Ctrl activates temporary global snapping. The rotation snaps every 5 degrees. With holding shift too it snaps every 1 degree.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser rotation.

## Header Values

When you move the mouse then you will see some values in the header, which shows the current rotation factor. This value is relative to the starting value, which always starts with 0.

## Tool Settings

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Values X, Y Z

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

The only relevant setting here is Value X. All other values and settings does not have any effect.

### Axis

The axis to use. Axis has no effect, the bone axis X is always used.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

Orientation has no effect, the bone axis X is always used.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

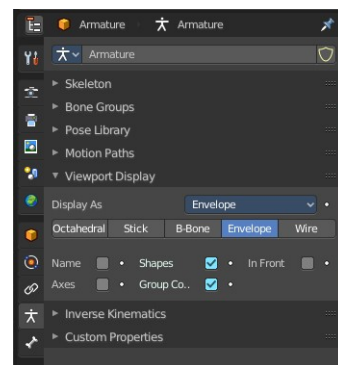

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Bone Envelope

This tool just works with bone display type Bbone. With other bone display types nothing happens. Here you can scale the envelope of the bones.

The bone display can be changed in the properties editor in the Object Data tab in the Viewport Display panel.

## Snapping

Move and holding down Ctrl activates temporary global snapping. The rotation snaps every 5 degrees. With holding shift too it snaps every 1 degree.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser rotation.

## Header Values

When you move the mouse then you will see some values in the header, which shows the current rotation factor. This value is relative to the starting value, which always starts with 0.

## Tool Settings

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Values X, Y Z

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

The only relevant setting here is Value X. All other values and settings does not have any effect.

### Axis

The axis to use. Axis has no effect, the bone axis X is always used.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

Orientation has no effect, the bone axis X is always used.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Extrude Tools group

This group contains some extrude tools.

There are some general settings, since they all have some move settings We will cover them all here for all of the tools.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

D: 0.2411 m (0.2411 m) custom matrix

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

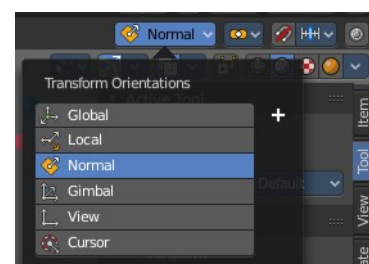

## Move without Widget

You don't have to use the widget to move the object. You can also click aside of it, and drag the object around. The mouse turns into a move cursor. The standard behavior then is to move in screen space. When you want to move into a specific axis, then press X or Y or Z to limit the movement to this axis.

## Limit Axis

When you want to move along a specific axis, then press X or Y or Z to limit the movement to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

D: 0.1529 m (0.1529 m) along global Z

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

## Extrude

The Extrude tool extrudes out bones from selected joints.

When you activate the tool, then you will by default see a yellow widget at the selection. Drag it to extrude the selection.

## Tool Settings

### Axis Type

You can choose between the regular axis type. That's the yellow widget with just one handler. It always points in the direction of the middled normals of the selection.

Or you can use the XYZ axis type. That's a handler with three axis. This widget can be aligned with the transform orientation methods.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Extrude

### Forked

You need to tick X Axis Mirror. When you tick Forked, then the bone that you extrude to the one side will now be extruded to the other side too. The extrude gets mirrored along the x axis. This allows you to create a symmetrical armature.

### Move X , Y, Z

The transform values for the new created joint(s)

### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### Proportional editing

Proportional editing is dysfunctional. You cannot activate it.

## Extrude to cursor

Extrudes the selection towards the mouse cursor by clicking and dragging. The extruded geometry will rotate towards the mouse pointer.

## Shear

Shear shears the selection. When you activate the tool then you will reveal a widget. This widget allows you to shear the selection in all possible axis.

## Tool Settings

### Orientation

Choose the orientation for the shear action.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Last Operator Shear

#### Offset

Adjust an offset.

#### Axis

Defines one axis of the imaginary shear axis plane.

#### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

#### Orientation

Choose the orientation for the shear action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

#### Proportional Size

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Tool Shelf - Armature - Pose Mode

The Pose mode provides some pose tools.

### Tweak, Select, 3D Cursor, Transform, Annotate and Measure

The tweak, select, 3d cursor and transform tools and the annotation and measure tool is already described in the chapter Object Mode. So we won't cover it here again.

### Breakdowner Push Relax tools group

#### Breakdowner

Creates a suitable breakdowner pose on the current frame. Requires to have a keyframe before and after the current position.

#### Header values

When you activate one of the tools, then you will see a percentage slider in the header. This slider is not interactive. It just displays the percentage of the exaggeration.

#### Footer hotkey display

In the footer you will see some hotkeys for further options. These hotkeys are hard coded, and cannot be changed in the input manager.

Breakdown: W/E/R/B/C - Limit to Transform/Property Set | S - Enable overshoot | Shift - Hold for precision | Ctrl - Hold for 10% increments | [H] - Toggle bone visibility

The hotkeys W, E and R stands for the usual transform modes move, rotate or scale. Hotkey B stands for Bendy Bones. And C is for a custom property.

Overshoot allows you to go over the 0 -100 per cent range. The header values shows a bigger range then.

The rest of the hotkeys should be self explaining.

## Last Operator Pose Breakdowner

### Percentage

The percentage of exaggeration. Interestingly the value in the Last operator differs from the value in the header.

### Previous Keyframe

The keyframe position before the current frame.

### Next Keyframe

The keyframe position after the current frame.

### Channels

Which channels to affect.

### Axis Lock

Lock the action to specific axis.

## Push

Push exaggerates the current pose.

### Header Values

When you move the mouse then you will see some values in the header, which shows the current factor. This value is relative to the starting value, which always starts with 0.

It also shows some more available transform hotkeys. The hotkeys W E and R allows you just to move, rotate or scale. Hotkey B stands for Bendy Bones. And C is for a custom property. This hotkeys are hard coded, and cannot be changed in the input manager.

### Last Operator Push Pose from Breakdown.

### Previous Keyframe

The keyframe position before the current frame.

### Next Keyframe

The keyframe position after the current frame.

### Percentage

The percentage of exaggeration. Interestingly the value in the Last operator differs from the value in the header.

### Channels

Which channels to affect.

## Axis Lock

Lock the action to specific axis.

---

## Relax

Relax relaxes the current pose.

### Header Values

Push Pose: 38 % | W/E/R/B/C - Limit to Transform/Property Set

When you move the mouse then you will see some values in the header, which shows the current factor. This value is relative to the starting value, which always starts with 0. It also shows some more available transform hotkeys.

It also shows some more available transform hotkeys. The hotkeys W E and R allows you just to move, rotate or scale. Hotkey B stands for Bendy Bones. And C is for a custom property. This hotkeys are hard coded, and cannot be changed in the input manager.

### Last Operator Relax Pose to Breakdown

#### Previous Keyframe

The keyframe position before the current frame.

#### Next Keyframe

The keyframe position after the current frame.

#### Percentage

The percentage of exaggeration. Interestingly the value in the Last operator differs from the value in the header.

#### Channels

Here you can again choose if you just want to limit a specific channel.

#### Axis Lock

Allows you to lock a specific axis.

## Tool Shelf - Lattice - Edit Mode

### Select, 3D Cursor, Transform, Measure and Annotate tools

The Select, 3D Cursor, Transform, Measure and Annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Shear

Shear shears the selection. When you activate the tool then you will reveal a widget. This widget allows you to shear the selection in all possible axis.

### Tool Settings

## Orientation

Choose the orientation for the shear action.

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Shear

### Offset

Adjust an offset.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

### Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Tool Shelf - Object Mode

In Object mode you will see mainly the general select and transform tools.

Those tools will also appear in other modes like Edit mode. We will not cover it again there.

## Select Tools Group

Tools with a triangle down right are a group of tools. Click and hold to reveal the content. Then choose the tool that you need.

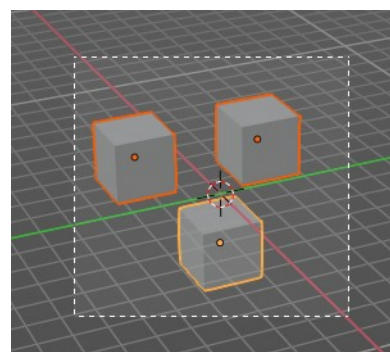

### Tweak

Allows you to select or tweak single elements by clicking at it.

Note that Tweak is a transform tool, and therefore contains the same modal hotkeys with further functionality like the regular transform tools.

### Select Box

Draws a box to select several elements at once. Click at the start point, then drag.

### Tool Settings

#### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

#### *Set a new selection*

#### *Extend existing selection*

#### *Subtract existing selection*

#### *Inverts existing selection*

#### *Intersect existing selection*

## Select Circle

Draws a box to select several elements at once. Click at the start point, then drag.

### Tool Settings

#### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

***Set a new selection***

***Extend existing selection***

***Subtract existing selection***

#### Radius

The brush radius.

## Select Lasso

Draws a box to select several elements at once. Click at the start point, then drag.

### Tool Settings

#### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

***Set a new selection***

***Extend existing selection***

***Subtract existing selection***

***Inverts existing selection***

***Intersect existing selection***

## Cursor

The cursor tool allows you to move the 3d cursor around.

## Tool Settings

### Surface Project

Project the 3D cursor onto the surface.

### Orientation

The 3d cursor can have different orientations. The menu items should be self explaining.

## Move Rotate Scale Transform

The transformation tools.

### Move

Activates the move tool. Activating the move tool also reveals a move widget at the object. This widget allows you to move the object around, by using the corresponding axis.

When you click at one of the square buttons at the icon, then you can move the object along the plane of the two adjacent axis. The rectangle buttons between the arrows allows you to move in direction of the blue and green arrows. This can also be done by clicking at the tip of the arrow and holding down shift. Then you can move the cube along the two other axis.

### Snapping

Holding down Ctrl activates temporary global snapping.

### Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

### Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

D: 0.1529 m (0.1529 m) along global Z

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you move the object, and hold down the mouse and type in a value, like 20, then the movement will be performed by the value that you have typed in. In this case by 20 units in direction of the selected axis.

## Move without widget

You don't have to use the widget to move the object. You can also click aside of it, and drag the object around. The mouse turns into a move cursor. The standard behavior then is to move in screen space. When you want to move into a specific axis, then press X or Y or Z to limit the movement to this axis.

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and global.

This can be combined with the numerical input. Type in X, type in X again to use the local space, type in 20 to move by 20 units in local orientation. Release the mouse to confirm.

## Tool Settings

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Last Operator Move

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Rotate

Activates the Rotate tool. Activating the move tool also reveals a rotate widget at the object. This widget allows you to rotate the object, by using the corresponding axis.

## Snapping

Holding down Ctrl activates temporary global snapping. It snaps then by 5 degrees steps.

When you use the white circle to rotate, then the widget also shows a division circle around the widget. This divisions shows even finer when you do precision rotation.

## Precision rotation

When you hold down shift, then you will have a much slower but also much preciser rotation.

## Header Values

When you rotate your object then you will see some values in the header, which defines the current rotation of the object. The rotation is shown in degrees.

Rot: -3.57 global

## Numerical Input

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in. In this case by 20 degree around the selected axis.

## Rotate without widget

You don't have to use the widget to rotate the object. You can also click asides and drag the object around. A black arrow will appear. The standard behavior then is to rotate in viewport orientation.

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

Rot: -0.08 along normal X

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

This can be combined with the numerical input. Type in X, type in X again to use the local space, type in 20 to rotate by 20 degree. Release the mouse to confirm.

## Tool Settings

## Orientation

The 3d cursor can have different orientations. The menu items should be self explaining.

## Last Operator Rotate

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Tools Group

You can use two scale tools with different widget styles.

### Scale

Activates the Scale tool. Activating the scale tool also reveals a traditional scale widget at the object. This widget allows you to scale the object, by using the corresponding axis. When you click at the outer white circle and drag, then you can scale the object uniformly.

The rectangle buttons between the arrows allows you to scale in direction of the adjacent arrows. This can also be done by clicking at the tip of the arrow and holding down shift. Then you can scale the cube along the two other axis.

### Snapping

Holding down Ctrl activates temporary global snapping.

### Precision Scale

When you hold down shift, then you will have a much slower but also much preciser scale.

### Header Values

When you scale your object then you will see some values in the header, which defines the current scale of the object.

Scale: 1.1996 global

These values are always relative to the starting point. You always start with 1, regardless of the real world scale.

### Numerical Input

When you scale the object, and hold down the mouse and type in a value, like 20, then the scale will be performed by the value that you have typed in. In this case by factor 20 along the selected axis.

### Scale without widget

You don't have to use the widget to scale the object. You can also click asides and drag the object around. A black arrow will appear. The standard behavior then is to scale uniformly. When you want to scale into a specific axis, then press X or Y or Z to limit the scale to this axis.

## Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the scale to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

Rot: -0.08 along normal X

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

This can be combined with the numerical input. Hold down mouse, type in X, type in X again to use the local space, type in 20 to scale by 20 units. Release the mouse to confirm.

## Tool Settings

## Orientation

The 3d cursor can have different orientations. The menu items should be self explaining.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Cage

Activates the Scale tool. Activating the scale tool also reveals a scale widget in cage style at the object. This widget allows you to scale the object by clicking at the white handler points and drag them in the desired direction.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Header Values

When you scale your object then you will see some values in the header, which defines the current scale of the object.

These values are always relative to the starting point. You always start with 1, regardless of the real world scale.

## Scale without widget

You don't have to use the widget to scale the object. You can also click asides and drag the object around. A black arrow will appear. The standard behavior then is to scale uniformly. When you want to scale into a specific axis, then press X or Y or Z to limit the scale to this axis.

### Limit Axis

When you want to rotate a specific axis, then press X or Y or Z to limit the rotation to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

Scale: 1.1996 global

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

### Tool Settings

### Orientation

The 3d cursor can have different orientations. The menu items should be self explaining.

### Last Operator Resize

#### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

#### Axis

Which axis to rotate.

#### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## ***Proportional Falloff***

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Transform**

Transform reveals a multi transform widget with all three transform methods available at once. Move, Rotate and Scale.

The rules are the same than for the single tools, and also the last operators. Dependent of which widget part you pull here. So i won't go into detail again here.

## **Tool Settings**

### ***Drag Action***

Define what kind of transform should happen when you click not at the widget but besides, and drag the mouse.

### ***Orientation***

The 3d cursor can have different orientations. The menu items should be self explaining.

## **Modal Operators for the Transform tools**

Every transform tool has a sub set of modal operators that extends the functionality. These modal operators are shown at the bottom in the info bar. Usually they are self explaining. But the transform tools contains a few tools that needs further explanation.

Note that these hotkeys are hardcoded, and cannot be changed in the keymap manager.

To use these tools you must start the transform operation by moving and holding the mouse. Then press one of the hotkeys to perform this operator.

## General transform modal tools

### **Confirm**

Left Mouse button confirms the tool.

### **Cancel**

Right mouse button cancels the operation

### **X Axis**

Constraint the transformation to the X axis.

### **Y Axis**

Constraint the transformation to the Y axis.

### **Z Axis**

Constraint the transformation to the Z axis.

### **X Plane**

Constraint the transformation to the X plane. You can transform in Y Z direction.

### **Y Plane**

Constraint the transformation to the Y plane. You can transform in X Z direction.

### **Z Plane**

Constraint the transformation to the Z plane. You can transform in Y Z direction.

### **Sert Snap Base**

Usually the snap base is the center of the object. This tool allows you to move the snap base to another point. The corner of another mesh for example.

Hold down B and move the mouse to the location that you want to be the snap base. The new snap base will be displayed as an orange circle.

Pressing b again while in transformation will now snap the object to this new snap base.

Note that you cannot place this tool freely, it needs geometry to snap to.

### **Snap Invert**

Snap in incremental steps.

## ***Snap Toggle***

Ctrl + Tab toggles to snap in incremental steps.

## ***Automatic Constraints***

Displays all the three axis and allows you to snap to one of it to constraint the operation to this axis then.

## ***Automatic Constraints Plane***

Same as with Automatic Constraints, but this time you can snap to a plane to constraint the operation to this plane then.

## ***Precision Mode***

Activates the precision mode to allow much more accurate transform operations.

---

## **Move tool in Object mode**

### ***Rotate***

Rotate around the chosen axis instead of moving the selection. When you didn't use one of the widget arrows then it rotates towards the mouse.

### ***Resize***

Resize along the chosen axis instead of moving the selection. When you didn't use one of the widget arrows then it scales towards the mouse.

## **Move Tool in Edit mode**

### **Vert/Edge Slide**

Edit Mode with the move tool. Slide the selected edges or vertices along their corner or face.

### ***Rotate***

Rotate the selection around the chosen axis instead of moving the selection. When you didn't use one of the widget arrows then it rotates towards the mouse.

### ***Resize***

Resize the selection along the chosen axis instead of moving the selection. When you didn't use one of the widget arrows then it scales towards the mouse.

## **Rotate Tool in Object mode**

### ***Move***

Move around the chosen axis instead of rotating the selection. When you didn't use one of the widget arrows then it moves towards the mouse.

### ***Trackball***

Use trackball rotation.

### ***Resize***

Resize along the chosen axis instead of moving the selection. When you didn't use one of the widget arrows then it scales towards the mouse.

## **Rotate Tool in Edit mode**

### ***Move***

Move the selection around the chosen axis instead of rotating the selection. When you didn't use one of the widget arrows then it moves towards the mouse.

### ***Trackball***

Use trackball rotation.

### ***Resize***

Resize the selection along the chosen axis instead of moving the selection. When you didn't use one of the widget arrows then it scales towards the mouse.

### ***Rotate Normals***

Rotates the normals instead of the selection. Note that it might be a good idea to turn on display normals in the overlays.

## **Scale Tool in Object mode and Edit Mode**

### ***Move***

Move around the chosen axis instead of scaling the selection. When you didn't use one of the widget arrows then it moves towards the mouse.

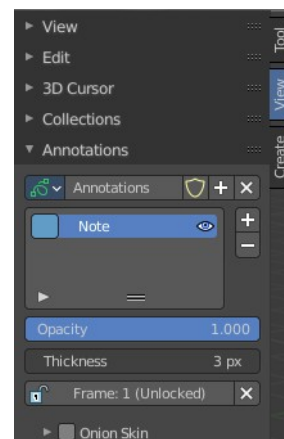

### ***Rotate***

Rotate around the chosen axis instead of scaling the selection. When you didn't use one of the widget arrows then it rotates towards the mouse.

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar. Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate tool

Draw free-hand strokes in the main window.

## Tool Settings

The tool settings for the Annotate tool.

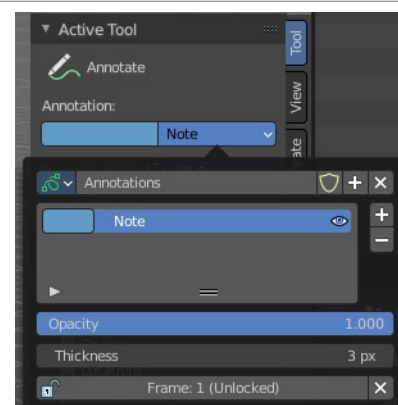

## Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

## Note

Clicking at the Note drop down box reveals a panel with further settings. It's the same content than in the annotations in the View tab.

## Annotations list

Add, remove and rename new annotations.

### Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

### Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### Add Annotation

Add a new annotation.

### Remove Annotation

Delete the annotation.

### Active Layer Index

The list of annotation layers.

### Add Annotation Layer

Add a new annotation layer.

### Remove Annotation Layer

Remove the selected annotation layer.

### Opacity

The opacity of the stroke.

### Thickness

The thickness of the annotation stroke.

### Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

### Delete Active Frame

Deletes the active frame from the active grease pencil layer.

---

## Placement

Define how annotation strokes are aligned in the 3d space.

## Stabilize Stroke

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### Radius

The radius for the stroke stabilization.

### Factor

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Drag

Define what kind of transform should happen when you click not at the widget but besides, and drag the mouse.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Placement

Define how annotation strokes are aligned in the 3d space.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

### End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for AnnotatePolygon.

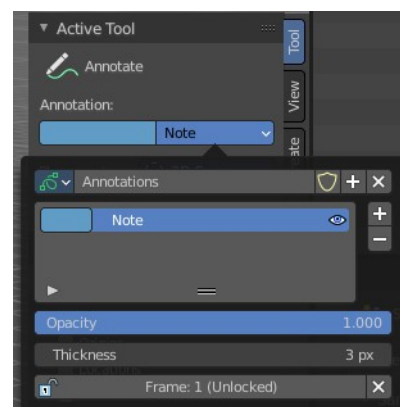

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Note

Clicking at the Note drop down box reveals a panel with further settings. It's the same content than in the annotations in the View tab.

### Annotations list

Add, remove and rename new annotations.

### Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

### Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### Add Annotation

Add a new annotation.

## Remove Annotation

Delete the annotation.

## Active Layer Index

The list of annotation layers.

## Add Annotation Layer

Add a new annotation layer.

## Remove Annotation Layer

Remove the selected annotation layer.

## Opacity

The opacity of the stroke.

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

## Delete Active Frame

Deletes the active frame from the active grease pencil layer.

---

## Placement

Define how annotation strokes are aligned in the 3d space.

---

## Annotate Eraser

Click and drag to remove annotate lines.

## Tool Settings

### Radius

The radius of the eraser pencil.

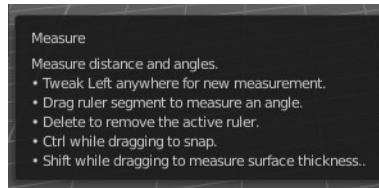

## Measure

Measure allows you to draw measure lines into the view.

The measure tool has a few options, which are described in the tool tip.

New measure lines gets created by left clicking and dragging.

When you change the tool then the measure lines becomes visible. But they are not removed. When you activate the measure tool then they reappear.

### Restrict to global axis

You can constraint the measure tool to a single global axis by pressing the corresponding X Y or Z key once while holding down the mouse.

To escape this constraint, press the axis key twice again.

### Measuring angles

When you want to measure an angle, first create a straight measure line. Then grab it in the middle to drag out a new point at the line. Then align everything proper.

### Snapping

Holding down Ctrl activates temporary global snapping.

### Delete measure lines

Select them and press delete. When you have selected an angle point then first this angle point gets deleted. You need to have to select an endpoint to make the whole stroke active.

## Primitives Add tools group

This tools appears in object and edit mode with the correct object types. The tools allows you to create primitives by dragging with the mouse. First you create a ground plane by dragging a rectangle. Then you release the mouse and drag the mouse upwards to create the third dimension of it. And a left click makes the object real then.

You can choose between five primitive types. Cube, Cone, Cylinder, UV Sphere and Icosphere.

By default the ground plane starts to scale from one of the edges.

Holding down ALT key while dragging scales from the center instead of the default corner.

Holding down Shift key while dragging allows you to scale uniformly.

Holding down CTRL while dragging snaps to other objects.

## Add Cube

Adds a cube primitive.

## Tool Settings

### Depth

### Position

How to position the primitive.

### Surface

Start placing on the surface. The 3d cursor acts as a fallback.

### 3D Cursor Plane

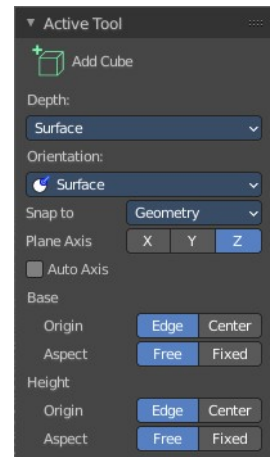

Start placement using a point that is projected at the selected axis at the 3d cursor position

### 3D Cursor View

Start placement using the mouse cursor projected onto the view plane.

### Orientation

In which orientation the new object to create.

**Snap To**

The target for snapping. Geometry snaps to existing mesh geometry. Default snaps to the ground.

**Plane Axis**

What plane axis to use.

**Auto Axis**

Select the closest axis when placing objects. Surface overrides.

**Base**

**Origin**

From where to scale the primitive. From one of its corners or from the center.

**Aspect**

Scale uniformly or in drag direction.

**Height**

**Origin**

From where to scale the primitive. From one of its corners or from the center.

**Aspect**

Scale uniformly or in drag direction.

**Last Operator Add Cube Panel**

Size is in real the size of the Cube.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

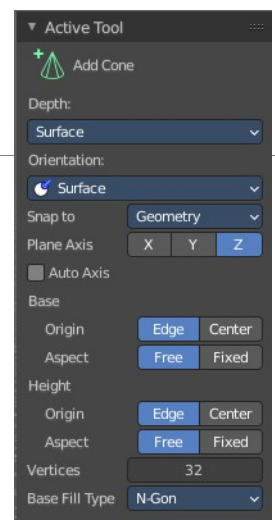

**Location** defines the location of the Cube.

**Rotation** defines the rotation of the Cube.

**Add Cone**

Adds a cone primitive.

## Tool Settings

### Depth

#### Position

How to position the primitive.

#### Surface

Start placing on the surface. The 3d cursor acts as a fallback.

#### 3D Cursor Plane

Start placement using a point that is projected at the selected axis at the 3d cursor position

#### 3D Cursor View

Start placement using the mouse cursor projected onto the view plane.

### Orientation

In which orientation the new object to create.

### Snap To

The target for snapping. Geometry snaps to existing mesh geometry. Default snaps to the ground.

### Plane Axis

What plane axis to use.

### Auto Axis

Select the closest axis when placing objects. Surface overrides.

### Base

#### Origin

From where to scale the primitive. From one of its corners or from the center.

#### Aspect

Scale uniformly or in drag direction.

### Height

#### Origin

From where to scale the primitive. From one of its corners or from the center.

## Aspect

Scale uniformly or in drag direction.

## Vertices

The number of vertices for the cone ground plane.

## Base Fill Type

Defines how the Base face is filled.

Nothing means you have no base face.

N-Gon means that the base face is an N-Gon face.

Triangle Fan means that the base face is triangulated.

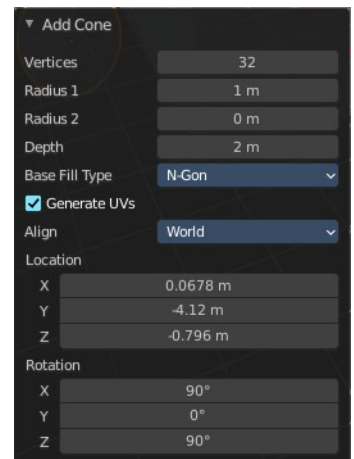

## Last Operator Add Cone Panel

**Vertices** defines of how much vertices the circle is made.

**Radius 1** defines the base radius of the Cone.

**Radius 2** defines the top radius of the Cone.

**Depth** defines the length of the Cone.

**Base Fill Type** defines how the Base face is filled.

- Nothing means you have no base face.
- N-Gon means that the base face is an N-Gon face.
- Triangle Fan means that the base face is triangulated.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

**Location** defines the location of the Cone.

**Rotation** defines the rotation of the Cone.

---

## Add Cylinder

Adds a cylinder primitive.

## Tool Settings

### Depth

#### Position

How to position the primitive.

#### Surface

Start placing on the surface. The 3d cursor acts as a fallback.

#### 3D Cursor Plane

Start placement using a point that is projected at the selected axis at the 3d cursor position

#### 3D Cursor View

Start placement using the mouse cursor projected onto the view plane.

### Orientation

In which orientation the new object to create.

### Snap To

The target for snapping. Geometry snaps to existing mesh geometry. Default snaps to the ground.

### Plane Axis

What plane axis to use.

### Auto Axis

Select the closest axis when placing objects. Surface overrides.

### Base

#### Origin

From where to scale the primitive. From one of its corners or from the center.

#### Aspect

Scale uniformly or in drag direction.

### Height

#### Origin

From where to scale the primitive. From one of its corners or from the center.

## Aspect

Scale uniformly or in drag direction.

## Vertices

The number of vertices.

**Cap Fill Type** defines how the cap face is filled.

- Nothing means you have no face at the top and the bottom of the Cylinder.
- N-Gon means that the cap face is an N-Gon face.
- Triangle Fan means that the cap face is triangulated.

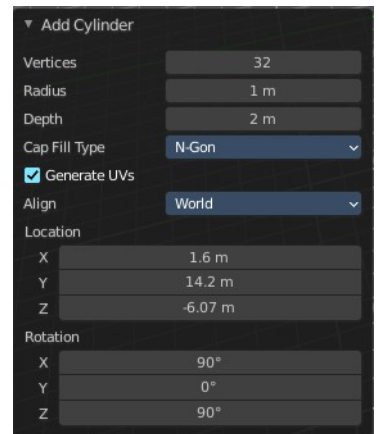

## Last Operator Add Circle Panel

**Vertices** defines of how much vertices the circle is made.

**Radius** defines the radius of the Cylinder.

**Depth** defines the length of the Cylinder.

**Cap Fill Type** defines how the cap face is filled.

- Nothing means you have no face at the top and the bottom of the Cylinder.
- N-Gon means that the cap face is an N-Gon face.
- Triangle Fan means that the cap face is triangulated.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

**Location** defines the location of the Cylinder.

**Rotation** defines the rotation of the Cylinder.

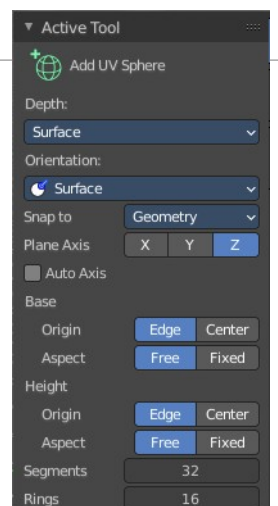

---

## Add UV Sphere

Adds a UV sphere primitive.

## Tool Settings

## Depth

### **Position**

How to position the primitive.

### **Surface**

Start placing on the surface. The 3d cursor acts as a fallback.

### **3D Cursor Plane**

Start placement using a point that is projected at the selected axis at the 3d cursor position

### **3D Cursor View**

Start placement using the mouse cursor projected onto the view plane.

### **Orientation**

In which orientation the new object to create.

### **Snap To**

The target for snapping. Geometry snaps to existing mesh geometry. Default snaps to the ground.

### **Plane Axis**

What plane axis to use.

### **Auto Axis**

Select the closest axis when placing objects. Surface overrides.

### **Base**

#### **Origin**

From where to scale the primitive. From one of its corners or from the center.

### **Aspect**

Scale uniformly or in drag direction.

## Height

### Origin

From where to scale the primitive. From one of its corners or from the center.

### Aspect

Scale uniformly or in drag direction.

### Segments

Defines of how much segments the sphere has vertically.

### Rings

Defines how much rings the sphere has horizontally.

## Last Operator Add UV Sphere Panel

**Segments** defines of how much segments the sphere has vertically.

**Rings** defines how much rings the sphere has horizontally.

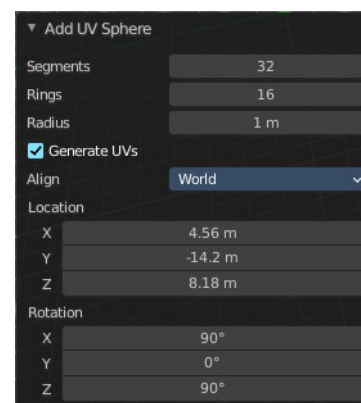

**Size** defines the radius of the UV Sphere.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

**Location** defines the location of the Sphere.

**Rotation** defines the rotation of the Sphere.

## Add Icosphere

Adds an icosphere primitive.

### Tool Settings

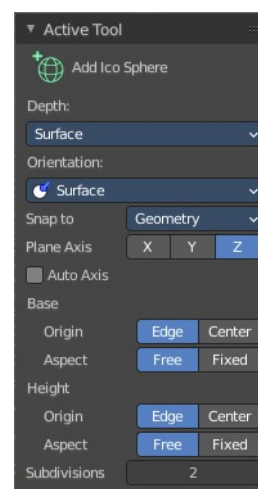

#### Depth

#### Position

How to position the primitive.

#### Surface

Start placing on the surface. The 3d cursor acts as a fallback.

### 3D Cursor Plane

Start placement using a point that is projected at the selected axis at the 3d cursor position

### 3D Cursor View

Start placement using the mouse cursor projected onto the view plane.

### Orientation

In which orientation the new object to create.

### Snap To

The target for snapping. Geometry snaps to existing mesh geometry. Default snaps to the ground.

### Plane Axis

What plane axis to use.

### Auto Axis

Select the closest axis when placing objects. Surface overrides.

### Base

#### Origin

From where to scale the primitive. From one of its corners or from the center.

#### Aspect

Scale uniformly or in drag direction.

### Height

#### Origin

From where to scale the primitive. From one of its corners or from the center.

#### Aspect

Scale uniformly or in drag direction.

### Subdivisions

The subdivision level of the Ico Sphere.

### Last Operator Add Ico Sphere Panel

**Subdivisions** defines the subdivision level of the Ico Sphere.

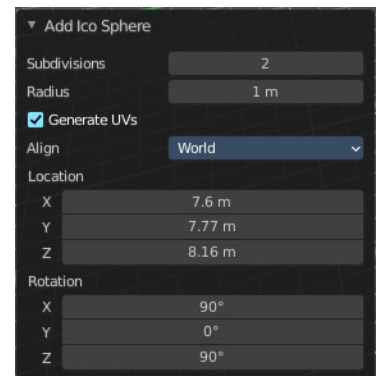

**Size** defines the radius of the Ico Sphere.

**Generate UV's** creates UV's for this primitive.

**Align to view** aligns the geometry to the chosen view. World, View or 3D cursor.

**Location** defines the location of the Sphere.

**Rotation** defines the rotation of the Sphere.

## Tool Shelf - Hair Curve - Edit Mode

With a hair curve object in edit mode you will find some tools to edit the curve geometry in the tool shelf.

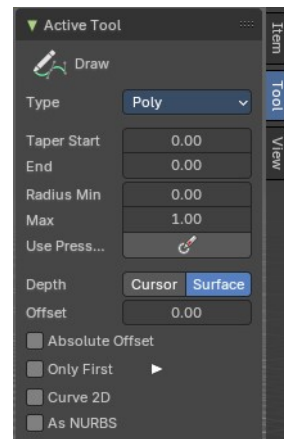

### Tweak, Select, Transform, 3D Cursor Measure and Annotate tools

The tweak, select, transform, 3d cursor, measure and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

## Draw

Allows you to draw a curve into the viewport.

## Tool Settings

### Type

Set the draw method for the curve. Poly draws a simple polygon shape. Bezier creates a Bezier curve type with handlers.

With type Bezier you will get more options.

## Method

The curve fitting method for a Bezier curve.

## Refit

Incrementally refit the curve.

## Split

Split the curve until it fits.

## Tolerance

Allow deviation for a smoother but less precise line.

## Detect Corners

Detect corners and use non aligned angles.

## Taper Start / End

Taper factor for the radius of each curve point.

## Radius Min/Max

Minimum or maximum radius when the pressure is applied.

## Use Pressure

Use tablet pressure to draw the curve.

## Depth

The method of projecting depth. Cursor or surface.

## Cursor

Cursor has no further settings.

## Surface

### Absolute Offset

Apply a fixed offset, and don't scale by the radius.

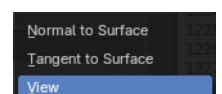

### Only First

Use the start of the stroke for the depth.

### Plane

The plane for the projected strokes.

### Normal to Surface

Draw in a plane perpendicular to the surface.

## Tangent to Surface

Draw in the surface plane.

## View

Draw in a plane that is aligned to the viewport.

## Curve 2D

Paint in 2d at the groundplane.

## As Nurbs

Draw nurbs instead of bezier curves.

---

## Last Operator Draw Curves

### Error

Adjust the error distance threshold in object units

### Fit Method

The curve fitting method. Choose between Refit and Split.

### Corner Angle

Corners above this angle are considered as corners.

### Cyclic

With curve type Bezier the curve gets closed. Has no effect at curve type Poly.

---

## Radius

Bezier curves have a radius. This is displayed by the black lines that points away from the curve. The radius tool allows you to resize this radius.

## Header Value

When you resize the curve radius then you will see a value in the header. It tells you the current scale factor. This factor always starts with 1.

## Tool Settings

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Values X Y Z W

The axis to increase the radius. Just X has an effect with the curve radius.

### Axis

The axis to use. This has no effect with a curve object.

### Orientation

Adjust the orientation of the extrusion. It usually starts with Normal.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

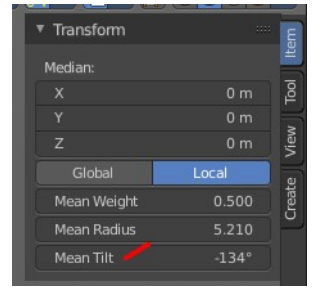

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Tilt

With this tool you can tilt the curve. It is the mean tilt value in the Transform panel of the Sidebar.

## Header Value

When you rotate the curve with the tilt tool, then you will see a value in the header. It tells you the current rotation relative to the starting rotation. This value always starts with 0.

## Tool Settings

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Angle

This value tells you the current rotation relative to the starting rotation. This value always starts with 0.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

### Tool Shelf - Hair Curve - Sculpt mode

In Sculpt mode with a hair curve object selected, you will find mainly brushes in the tool shelf. This mode is used for styling hair curves with various tools, including adding, combing and more.

Hair Curve Sculpting is a process to deform hair strands by using brushes.

#### Annotate tools

The annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

## Brush cursor

When you activate one of the brushes then the mouse cursor turns into a brush cursor. This cursor represents the size of the current brush.

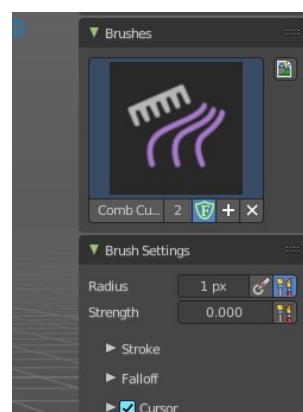

## Brush settings

The different brushes settings can be found in the sidebar in the tools tab. Or in the properties editor in the Active Tool and Workspace settings tab. Or above the header area.

The different brushes settings in the Active Tool and Workspace settings are explained in the chapter **7.3.16 Editors - 3D Viewport - Sidebar - Tool Tab - Hair Curve - Sculpt Mode**.

We won't cover this chapters again, but just explain what the different brushes do in this mode.

## Hotkeys

Pressing **X** allows you to change the brush size onscreen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing **C** allows you to change the strength of the brush. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

## Symmetry

Note that the sculpting mode starts with Symmetry off. You can turn this on per the desired axis from in the tool header.

## Tool Shelf - Hair Curve - Sculpt mode - Brushes

### Selection Paint

This brush draws a selection mask to aid in isolating strands. Isolated control points are lighter grey, and locked control points are dark grey.

### Comb

The comb brush acts like a true hair comb to pull strands at an angle. Click and hold it to pull strands with the comb.

### Add

This brush adds hair strands at a set density onto the mesh. Useful for painting new hair. When you add an “Empty Hair” curve object, there will be no hair till you add strands.

### Delete

This brush completely removes any hair curves from the surface.

### Snake Hook

This brush grows hair and extends it with the brush stroke, creating a flow of hair curves. This is useful for quickly styling general hair shapes.

## Grow/Shrink

This brush grows existing hair or inversely shrinks it. Useful for extending hair without reshaping it.

## Pinch

This brush pulls hair curves together towards the center of the brush. Useful for hair clumping.

#

## Smooth

This brush smooths out the hair curves and removes kinks and crinkles. Useful to straighten and relax hair strands.

## Puff

This brush pushes out the hair strand from the root by pushing a force on the tips. This is useful to add volume to hair.

## Density

Adds more hair strands and increases the density.

## Slide

This is similar to the grab brush in Mesh Sculpt Mode, this pulls the root and control points of the hair curves over the surface to a new location.

## Tool Shelf - Mesh - Edit Mode

In Edit mode with a mesh object you will find some polygon tools in the tool shelf.

### Tweak, Select, 3D Cursor, Transform, Annotate and Measure

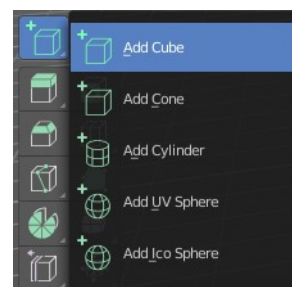

The weak, select and transform tools and the annotation and measure tool is already described in the chapter Object Mode. So we won't cover it here again. And start directly with the polygon tools.

### Primitives Add Tools Group

This chapter is already explained in the Editors - 3D View - Tool Shelf - Object Mode chapter. Please have a look in this chapter.

The only difference is that the created primitive will be part of the mesh that you are in edit mode with. And not an independent object.

### Extrude tools group

This group contains some extrude tools. A few more exotic ones can be found in the mesh menu.

There are some general settings, since they all have some move settings We will cover them all here for all of the tools.

### Snapping

Holding down Ctrl activates temporary global snapping.

### Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

### Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

D: 0.2411 m (0.2411 m) custom matrix

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Move without Widget

You don't have to use the widget to move the object. You can also click aside of it, and drag the object around. The mouse turns into a move cursor. The standard behavior then is to move in screen space. When you want to move into a specific axis, then press X or Y or Z to limit the movement to this axis.

## Limit Axis

When you want to move along a specific axis, then press X or Y or Z to limit the movement to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

D: 0.1529 m (0.1529 m) along global Z

## Extrude Region

The Extrude Region tool extrudes by default along the vertex normals of the current selection. When it's more than one vertex, edge or face, then the middle will be used.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

When you activate the tool, then you will by default see a yellow widget at the selection. Drag it to extrude the selection.

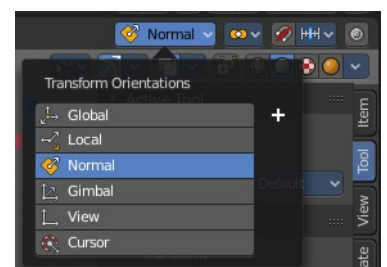

## Tool Settings

### Axis Type

You can choose between the regular axis type. That's the yellow widget with just one handler. It always points in the direction of the muddled normals of the selection.

Or you can use the XYZ axis type. That's a handler with three axis. This widget can be aligned with the transform orientation methods.

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Extrude Region and Move

### Flip Normals

Flips the normals of the extruded faces.

### Dissolve Orthogonal Edges

Dissolves orthogonal edges at extrusion.

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extrude Manifold**

Extrude, dissolve Edges whose faces form a flat surface, and intersect new edges.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

### ***Header Value***

The extrude amount.

D: 0 m (0.551 m) normal

### ***Tool Settings***

### **Drag**

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### ***Active Tool***

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

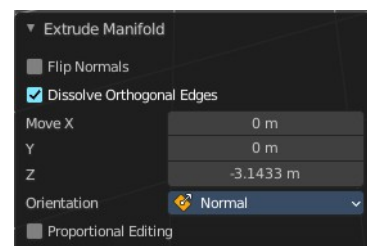

### ***Tweak, Select Box, Circle and Lasso***

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## ***Last Operator Extrude Manifold***

### **Flip Normals**

Flips the normals of the extruded faces.

### **Dissolve Orthogonal Edges**

Dissolve edges that are at the same straight surface.

## Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Extrude Along Normals

Extrudes the selection along local normals. You won't see a widget here. Simply drag.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

### *Header Value*

This tool works like a shrink fatten extrude. And so you will see a corresponding set of values in the header.

## Tool Settings

### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Extrude Region and Shrink/Fatten

### Flip Normals

Flips the normals of the extruded faces.

### Dissolve Orthogonal Edges

Dissolves orthogonal edges at extrusion.

### Offset

The current extrude amount.

### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Extrude Individual

Extrudes the selection along local normals of each individual face. You won't see a widget here. Simply drag.

The method works the same in all Mesh select modes. Vertice, Edge and Face Mode.

## Header Value

This tool works like a shrink fatten extrude. And so you will see a corresponding set of values in the header.

## Tool Settings

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Extrude Individual Faces and Move

### Offset

The current extrude amount.

### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extrude to cursor**

Extrudes the selection towards the mouse cursor by clicking and dragging. The extruded geometry will rotate towards the mouse pointer.

### **Tool Settings**

#### **Rotate Source**

In theory this setting should rotate the source geometry too to achieve a better result. In practice this setting does nothing.

## **Last Operator Move**

#### **Move X Y Z**

The current extrude amount.

#### **Orientation**

The widget can have different orientations. The menu items should be self-explaining.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Inset Faces**

Inset insets edges into the selected faces. Think of it as an extrude inwards the face.

Activate the tool, drag the mouse. But carefully. The control is not the best. You better adjust the amount in the last operator.

## **Tool Settings**

### ***Outset***

With outset ticked the Inset will not extrude inwards but outwards.

### ***Interpolate***

Blend Face Data across the inset.

### ***Offset Even***

Scales the offset to give more even thickness.

### ***Offset Relative***

Scales the offset by surrounding geometry.

### ***Drag***

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## **Active Tool**

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## **Tweak, Select Box, Circle and Lasso**

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Inset Faces

### **Boundary**

With Boundary ticked you will get the connect edges in the corners. Without the edges ends straight.

### **Offset Even**

Scales the offset to give more even thickness.

### **Offset Relative**

Scales the offset by surrounding geometry.

### **Edge Rail**

Inset the region along existing edges.

### **Thickness**

Thickness adjusts the thickness of the inset geometry.

### **Depth**

With depth you can bevel the inset geometry. It is then not longer co planar to the initial face.

### **Outset**

With outset ticked the Inset will not extrude inwards but outwards.

### **Select Outer**

With Select Outer the outer ring will be selected after the Inset.

### **Individual**

Inset every face individually.

### **Interpolate**

Blend Face Data across the inset.

## Bevel

The Bevel Tool adds a bevel to the selected geometry.

Usage: first select the geometry that you want to bevel. Then activate the tool. Don't wonder that the mouse movement does nothing until you move the mouse really really far away. That's by design. Best is to adjust the amount in the Last Operator Bevel panel.

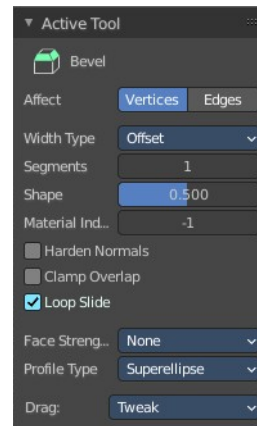

## Tool Settings

### Affect

What geometry to bevel. Vertices or Edges.

Note that with Vertices some options are not available.

### Width type

Which measure type to choose for the bevel action. Offset, Width, Depth or Percent.

### Segments

How many segments gets created.

### Shape

Controls the profile shape strength. A value close to 0 bends the roundness to inside. A value towards 1 bends the curve to outside. A value of 0.5 defines a radius around the center point of the bevel.

### Material Index

The material for bevel faces. -1 means to use the material from the adjacent faces.

### Harden Normals

Match normals of new faces to adjacent faces.

## ***Clamp Overlap***

Do not allow beveled edges / vertices to overlap each other.

## ***Loop Slide***

Prefer sliding along edges to even widths.

## ***Mark***

### **Seam**

Mark seam along beveled edges.

### **Sharp**

Mark beveled edges as sharp.

## ***Miter outer***

How the outer miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Patch**

This replaces the outside vertex of a miter with 3 vertices. And uses a patch pattern there.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## ***Miter Inner***

How the inner miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## Spread

Belongs to inner miter method Arc. Adjust how strong the inner radius is bent.

## Intersections

The method to use to create meshes at intersections. Bevel can create self intersecting geometry.

## Face Strength Mode

Set Face Strength on the faces involved in the bevel, according to the specified mode. This can be used in conjunction with a Weight Normals Modifier (with the Face Influence option checked).

### None

Do not set face strength.

### New

Set the face strength of new faces along edges to Medium, and the face strength of new faces at vertices to Weak.

### Affected

In addition to those set for the New case, also set the faces adjacent to new faces to have strength Strong.

### All

In addition to those set for the Affected option, also set all the rest of the faces of the model to have strength Strong.

## Profile Type

Which profile type to use. Super ellipse or Custom.

## Custom Profile

Choose and adjust a custom bevel profile. This feature needs more than one segment to work.

### Preset

Choose some profile presets.

### Zoom in

Zooms into the curve view.

## Zoom out

Zooms out of the curve view.

## Tools

### **Reset View**

Resets the zoom factor of the curve view.

### **Reset Curve**

Resets the curve to the defaults. This means when you choose a curve preset to reset it to the values of the latest chosen preset.

### **Reverse Path**

The path gets reversed. The first point becomes the last and vice versa.

### **Toggle Profile Clipping**

Toggles the profile clipping.

### **Curve view**

Adjust the profile curve.

Left click where no point is adds a new point. Left click at a point allows you to move it.

Holding down Shift while moving a node point activates precision movement.

Holding down ctrl while moving activates temporary snapping.

When a point is selected then the curve view reveals a sub menu at the bottom.

### **Handle Type *Auto Handle***

Sets the handle type of this curve point to smooth.

### **Handle Type *Vector Handle***

Sets the handle type of this curve point to sharp.

### **Handle Type *Free Handle***

Sets the handle type of this curve to Free handles. The curve point has now two handles with which you can adjust the curve before and after the point each.

### **Handle Type *Aligned Free Handle***

Sets the handle type of this curve to Free handles. The curve point has now a handle with which you can adjust the curve.

### **X Y Values**

The position of the currently selected curve point

### **Delete**

Delete the selected curve point.

### **Sample Straight Edges**

Sample edges with vector handles.

## Sample Even Lengths

Sample edges with even lengths.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Bevel

### Affect

What geometry to bevel. Vertices or Edges.

### Width type

Which measure type to choose for the bevel action. Offset, Width, Depth or Percent.

### Segments

How many segments gets created.

### Shape

Controls the profile shape strength. A value close to 0 bends the roundness to inside. A value towards 1 bends the curve to outside. A value of 0.5 defines a radius around the center point of the bevel.

### Material Index

The material for bevel faces. -1 means to use the material from the adjacent faces.

### Harden Normals

Match normals of new faces to adjacent faces.

### Clamp Overlap

Do not allow beveled geometry to overlap each other.

## ***Loop Slide***

Prefer slide along edge to even widths.

## ***Mark Seams***

Mark the edges of the new created geometry as seams.

## ***Mark Sharp***

Mark the edges of the new created geometry sharp.

## ***Outer Miter***

How the outer miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Patch**

This replaces the outside vertex of a miter with 3 vertices. And uses a patch pattern there.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

## ***Inner Miter***

How the inner miter is set. Miter is how the bevel rounding at a corner is done.

### **Sharp**

Creates a sharp miter.

### **Arc**

This replaces the vertex of a miter with 2 vertices, joined by an arc. A separate Spread parameter says how far to move the vertices away from their original position.

### **Spread**

Belongs to inner miter method Arc. Adjust how strong the inner radius is bent.

## Intersections

The method to use to create meshes at intersections. Bevel can create self intersecting geometry.

### Face Strength Mode

Set Face Strength on the faces involved in the bevel, according to the specified mode. This can be used in conjunction with a Weight Normals Modifier (with the Face Influence option checked).

#### None

Do not set face strength.

#### New

Set the face strength of new faces along edges to Medium, and the face strength of new faces at vertices to Weak.

#### Affected

In addition to those set for the New case, also set the faces adjacent to new faces to have strength Strong.

#### All

In addition to those set for the Affected option, also set all the rest of the faces of the model to have strength Strong.

## Profile Type

Which profile type to use. Super ellipse or Custom.

### Profile Type Custom

Choose and adjust a custom bevel profile. This feature needs more than one segment to work.

#### Preset

Choose some profile presets.

#### Zoom in

Zooms into the curve view.

#### Zoom out

Zooms out of the curve view.

## Tools

### Reset View

Resets the zoom factor of the curve view.

### **Reset Curve**

Resets the curve to the defaults. This means when you choose a curve preset to reset it to the values of the latest chosen preset.

### **Reverse Path**

The path gets reversed. The first point becomes the last and vice versa.

### **Toggle Profile Clipping**

Toggles the profile clipping.

### **Curve view**

Adjust the profile curve.

Left click where no point is adds a new point. Left click at a point allows you to move it.

Holding down Shift while moving a node point activates precision movement.

Holding down ctrl while moving activates temporary snapping.

When a point is selected then the curve view reveals a sub menu at the bottom.

### **Handle Type *Auto Handle***

Sets the handle type of this curve point to smooth.

### **Handle Type *Vector Handle***

Sets the handle type of this curve point to sharp.

### **Handle Type *Free Handle***

Sets the handle type of this curve to Free handles. The curve point has now two handles with which you can adjust the curve before and after the point each.

### **Handle Type *Aligned Free Handle***

Sets the handle type of this curve to Free handles. The curve point has now a handle with which you can adjust the curve.

### **X Y Values**

The position of the currently selected curve point

### **Delete**

Delete the selected curve point.

### **Sample Straight Edges**

Sample edges with vector handles.

### **Sample Even Lengths**

Sample edges with even lengths.

## Loop Cut tools group

### Loop Cut

Loop Cut adds edge loops. When you hover with the mouse over the geometry then you will see a yellow line in the exact middle of the face(s). This is what will be the new cutted edge.

When you click once, then this edge gets created. When you click and hold, then you can move this edge to a new location.

Loop cut ignores selections. It will try to divide the face under the mouse, and continue the loop until it is closed, or until it cannot continue. At poles for example.

### Tool Settings

#### Number of Cuts

You can with one cut add more than one edge. Adjust the amount.

Note that here you need to adjust this setting before adding the loop. Note also that the yellow preview line will not show all added loops. But just the yellow line.

The settings remains its values as long as you don't close Bforartists and restart it.

#### Correct UV's

Correct the UV's when transforming the new added loop.

### Last Operator Loop Cut and Slide

Note that all settings here just changes the latest added loop. Not all added loops in the current session.

#### Number of Cuts

The number of cuts that gets added. It can be more than one loop at once.

#### Smoothness

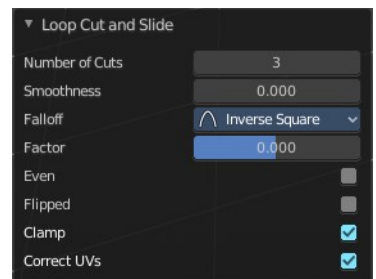

This value defines how smooth the loop cut gets added. From flat to bent.

#### Falloff

Adjust the Falloff type for smoothness.

#### Factor

Change the center of the added loop.

### Even

Make the edge loop match the shape of the adjacent edge loop

### Flipped

When Even mode is active, flips between the two adjacent edge loops.

### Clamp

Clamp within the edge extend.

### Correct UV's

Corrects the UV's when modifying the geometry.

## Offset Edge Loop Cut

Slides the selected edge(s)

Usage: select the edges that you want to slide. Click to confirm.

You can adjust the sliding amount in the Last Operator Offset Edge Slide.

### *Last Operator Offset Edge Slide*

### Cap Endpoint

Cap Endpoint caps the loose edges.

### Edge Slide Factor

Adjust the slide amount.

### Even

Make the edge loop match the shape of the adjacent edge loop

### Flipped

When Even mode is active, flips between the two adjacent edge loops.

### Clamp

Clamp within the edge extend.

### Correct UV's

Corrects the UV's when modifying the geometry.

## Knife Tool Group

### Knife tool

The Knife tool cuts the geometry, and adds edges. When it crosses existing geometry then it adds a vertice at the crossing point.

Usage: activate the tool, left click to define the starting point. This can also be a point in the middle of a face. But ideally you choose an existing vertice or an edge as the start and endpoints. The knife tool tries to snap to them when you get close with the mouse cursor.

When done press Enter or Spacebar to confirm. Right click abandons the operation.

When you create a vertice in the middle of a face, then the knife tool will try to connect this vertice by an existing vertice of this face when you confirm with spacebar.

The Knife tool can now cut through multiple objects in edit mode. You need to enter edit mode with these objects. Hold down shift to select the other objects ...

### **Hotkey functionality in the footer text**

Have a look at the footer when you work with this tool. Here you will find further instructions and hotkeys.

Enter, Pad Enter, Spacebar - confirm

Esc key, RMB - cancel the operation

LMB start the cut

Double LMB - close the cut

E - create new cut

Ctrl or Shift while dragging - Snap to the middle of an edge

Z - cut through the whole geometry, also the backfaces.

MMB - pan the view.

Alt MMB - rotate the view.

S - activate the measure tools. Holding down S will cycle through the three measure modes. Only Distance, Only Angles and both distance and angle measurement.

A - activate the angle constraint.

## Tool Settings

### Occlude Geometry

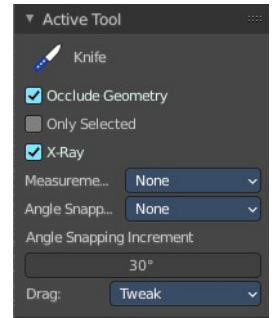

Just cut the visible geometry that points towards you. Not the backfaces.

### Only Selected

Just cut through selected geometry. Not through not selected.

### X-Ray

Show cuts through the geometry.

### Measurements

The measurements modes. The names should be self explaining.

### Angle Snapping

Activate snap to angles. When active then the knife cut snaps to an angle either aligned to the screen or relative to the object.

### Angle Snapping Increment

The snapping angle in case the angle snapping tool is active.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Bisect

Bisect cuts geometry along a plane. This description is a bit misleading though. You simply cut through the whole geometry by defining a line. And the cut goes through the geometry from the current view.

#

When you have set your cut and release the mouse then you reveal a widget with which you can move and rotate the cut. Clicking at the arrow and drag moves the cut. Clicking at the circle and drag rotates the cut.

## Tool Settings

### Fill

Fills the cut.

### Clear Inner

Removes the inner part of the face to cut.

### Clear Outer

Removes the outer part of the face to cut.

### Axis threshold

Axis threshold.

## Last Operator Bisect

### Plane Point X , Y , Z

Defines the start point of the Bisect cut.

### Plane Normal X , Y , Z

The direction in which the bisect points.

### Fill

Fills the cut.

### Clear Inner

Removes the inner part of the face to cut.

### Clear Outer

Removes the outer part of the face to cut.

### Axis threshold

Axis threshold.

## Poly Build

This tool extrudes out edges and faces from the border of existing open geometry.

The tool will not work at a cube, since here it cannot extrude out an existing polygon from a border. There is no border since the geometry is closed.

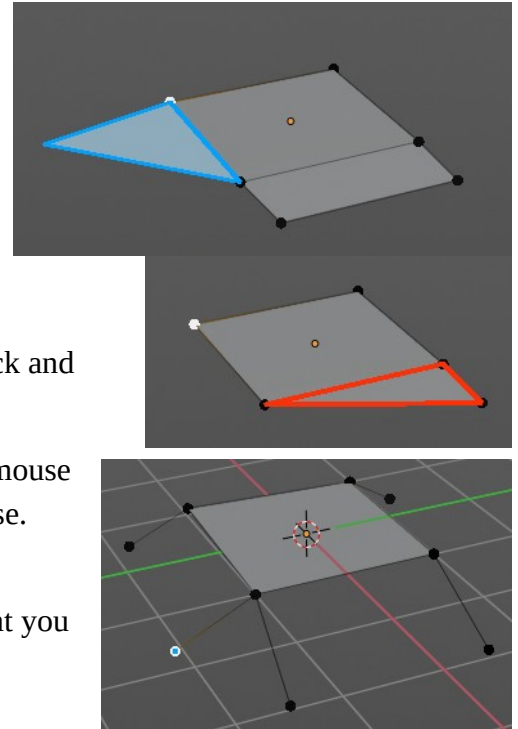

### Usage:

Move the mouse over an edge until it turns blue. Then you can left click and drag to extrude it out.

Holding ctrl and clicking will extrude the last selected element to the mouse cursor. To extrude out an edge from a vertex don't click with left mouse. This would create a polygon. But with right mouse button.

Holding down shift allows you to mark vertices, edges or polygons that you want to remove. By clicking the selected geometry will be deleted.

You can just work at one edge at a time.

## Tool Settings

### Create Quads

Create quad or tri geometry.

## Last Operator

We have two last operators here, dependent of which method we use. Dragging out edges will reveal the Extrude At Cursor Move panel. Holding down CTRL will reveal the Face at Cursor Move panel.

### Extrude At Cursor Move panel

#### Flip Normals

Flips the normals of the extruded faces.

#### Move X, Y Z

The position of the new created element. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

#### Orientation

The widget can have different orientations. The menu items should be self explaining.

## Face at Cursor Move panel

### Move X, Y Z

The position of the new created element. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Spin

The Spin tool extrudes the selection and spins it by a defined amount and segments. This amount and number of segments can be adjusted.

When you activate the tool then you reveal some widgets with various handlers.

You can spin vertices, edges and faces. And even whole closed objects.

## Usage

Select the geometry that you want to spin out. In our case we choose a face at a cube.

The first thing that you need to is to activate the correct Axis widget, which can be done in the Tool Settings. The ones with the big + buttons at the end defines in which direction the extrusion happens. And when you touch them then you start the spin extrusion. The rest of the widget functionality should be self explaining. You have handlers to pull and to rotate.

Hint, you activate all three axis widgets by holding down shift, and clicking at the axis buttons in the tool settings.

The second step is then to move the center of the spin to the desired location to get the rotation that you want. This can be done by the move handler. Or you click into the middle of the widget, at the white circle there, and drag it around.

For an accurate rotation around a single axis you should work in one of the orthographic views.

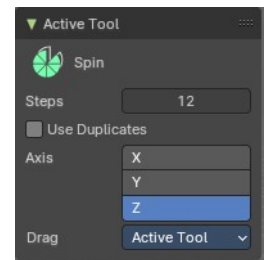

## Tool Settings

### Steps

The number of divisions.

### Use Duplicates

With duplicate checked the geometry gets duplicated instead of extruded.

### Axis

Activates the axis handler to perform the spin operation.

Hint, you activate all three axis widgets by holding down shift, and clicking at the axis buttons in the tool settings.

## Last Operator Spin

### Steps

Steps is the number of segments.

### Duplicate

With duplicate checked the geometry gets duplicated instead of extruded.

### Angle

Angle defines the angle of the spin.

### Center X Y Z

The Center edit boxes defines the center of the radius for the spin operation. In our example the X value is set to 2, and the Z value is set to 1.

## Axis X Y Z

Axis defines the extrude direction. With X and Z values you can twist the result.

---

## Smooth / Randomize Tools group

### Smooth

Smoothens the selected vertices.

#### Usage

Activate the tool, move the mouse.

#### Tool Settings

##### Repeat

How often the smoothing should be applied.

##### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

##### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

##### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Last Operator Smooth Vertices

#### Smoothing

The smoothing factor.

#### Repeat

How often the smoothing should be applied.

#### X Axis, Y Axis, Z Axis

Which axis to affect

---

### Randomize

Randomizes the selected vertices.

## Usage

Activate the tool, move the mouse.

## Tool Settings

### Uniform

Uniform offset. The higher the value the more uniform the offset becomes.

### Normal

Align the random offset to the normals. This is a factor. 0 means no offset but completely random vertices positions. 1 means completely aligned with the normal axis, and just along this normal axis.

### Random Seed

The seed for the randomization.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Smooth Vertices

### Amount

The randomization amount.

### Uniform

Uniform offset. The higher the value the more uniform the offset for all vertices becomes.

### Normal

Align the random offset to the normals. This is a factor. 0 means no offset but completely random vertices positions. 1 means completely aligned with the normal axis, and just along this normal axis.

### Random Seed

The seed for the randomization.

## Edge and Vertex Slide Tools Group

### Edge Slide

Edge Slide slides the selected edge along the face that it is part of. This is for the edge at a cube into two possible directions.

This tool requires to have at least one edge selected.

#### Header Values

The header values shows you the current transformation. But also hints towards a hotkey.

Holding down ALT will allow you to slide the edges behind the limits of the guide edge. Yellow infinite guide lines appears.

### Tool Settings

#### Correct UV's

Correct UV's corrects the UV's while editing the geometry.

#### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

#### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

#### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Last Operator Edge Slide

#### Factor

Factor is a sliding box Adjust the slide strength numerically. The width of the face is the 0-1 range.

#### Even

Make the Edge loop match the shape of the adjacent edge loop.

#### Flipped

When Even Mode is active, flips between the two adjacent edge loops.

## Clamp

Clamp within the edge extend.

## Correct UV's

Correct UV's corrects the UV's while editing the geometry.

## Vertex Slide

Vertex Slide slides the selected vertex along the edge that it is part of. This is for the corner vertex at a cube into three possible directions.

## Header Values

The header values show you the current transformation. But also hints towards a hotkey.

Holding down ALT will allow you to slide the edges behind the limits of the guide edge. Yellow infinite guide lines appear.

## Tool Settings

### Correct UV's

Correct UV's corrects the UV's while editing the geometry.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose these options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Last Operator Vertex Slide

## Factor

Factor is a sliding box Adjust the slide strength numerically. The width of the face is the 0-1 range.

## Even

Make the Edge loop match the shape of the adjacent edge loop.

## Flipped

When Even Mode is active, flips between the two adjacent edge loops.

## Clamp

Clamp within the edge extend.

## Correct UV's

Correct UV's corrects the UV's while editing the geometry.

---

## Shrink/Fatten / Push/Pull Tools Group

### Shrink / Fatten

Shrink / Fatten shrinks or fattens the selection. The faces moves along the normals of the faces.

#### *Header Values*

The header values shows you the current transformation. But also hints towards a hotkey. Holding down ALT will turn off Even Thickness.

Shrink/Fatten: -0.5251, (R or Alt) Even Thickness OFF

#### *Tool Settings*

##### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

##### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

##### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

##### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

#### *Last Operator Shrink/Fatten*

## Offset

The offset amount

## Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Push/Pull

It pushes or pulls the selection relative to the center of the selection.

## Header Values

The header values shows you the current transformation.

## Tool Settings

### Offset Even

Scales the offset to give more even thickness. Without this checked the farer away faces will have a bigger extrude amount.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Push/Pull

### Distance

The push pull amount

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Shear and To Sphere Tools Group

### Shear

Shear shears the selection. When you activate the tool then you will reveal a widget. This widget allows you to shear the selection in all possible axis.

### Tool Settings

## Orientation

Choose the orientation for the shear action.

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Shear

### Offset

Adjust an offset.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

## Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

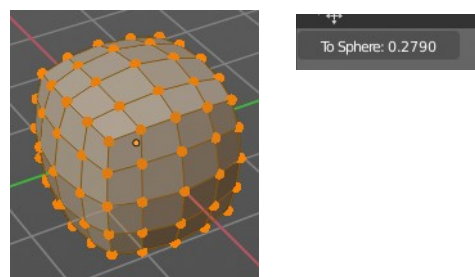

## To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

## Usage

Select the vertices, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

## Last Operator To Sphere Panel

### Factor

The factor to transform the selection into a shape form.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Rip Tools Group

### Rip Vertices

Rip splits the edges between the selected vertices. It creates two edges out of one.

This tool works similar to the Edge Split tool. It also selects the outer edges so that you immediately move them. Right click will snap them back to the initial space.

### Tool Settings

#### Fill

Fills the gap between the new edges when you move the geometry.

#### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

#### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

#### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Last Operator Rip

#### Move X , Y , Z

Adjust the position.

#### Constraint Axis

Limit the position relative to the source object.

#### Orientation

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Rip Edge

Rip Edge extrudes out the selected vertices. When you do this operation at an edge then you will create N-Gons that way.

## Tool Settings

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## ***Last Operator Extend Vertices***

### **Move X , Y , Z**

Adjust the position.

### **Constraint Axis**

Limit the position relative to the source object.

### **Orientation**

Orientation is a drop-down box. Choose the type of orientation for the mirroring action.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Tool Shelf - Mesh - Sculpt Mode

In Sculpt mode with a mesh object you will find mainly brushes in the tool shelf.

### Transform and Annotate tools

The transform and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Brush cursor

When you activate one of the brushes then the mouse cursor turns into a brush cursor. This cursor represents the size of the current brush. It aligns to the surface under the mouse. When you start to draw then the brush cursor will disappear except for one little yellow dot in the center.

### Brushes settings

The different brushes settings can be found in the sidebar in the tools tab. Or in the properties editor in the Active Tool and Workspace settings tab. Or above the header area.

The different brushes settings in the Active Tool and Workspace settings are explained in the chapter 25.1 Editors - Properties Editor - Tools Tab.

We won't cover this chapters again, but just explain what the different brushes does.

## Hotkeys

Pressing **X** allows you to change the brush size onscreen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing **C** allows you to change the strength of the brush. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

## Symmetry

Note that the sculpting mode starts with Symmetry in X axis on. You can turn this off up right in the header.

## Draw

Draws a stroke.

## Draw Sharp

Draws a negative stroke. In the Brush panel you will see that the direction is set to subtract instead of add. But you can also set it to add. This brush is a bit sharper than the Draw brush.

## Clay

Draws a stroke. The pencil reacts different than with draw. It's more like sculpting, not so much like drawing, and deforms the surface also more in a sculpting style. The brush has a pretty weak effect in its default settings.

## Clay Strips

Draws little strips on top of each other.

## Clay Thumb

Draws like you would use the thumb.

## Layer

Adds a layer stroke with a predefined height. This height can be adjusted with the height slider in the Brushes panel.

## Inflate

Inflates or deflates existing strokes. See Inflate/Deflate setting in the Brush panel.

## Blob

Reacts pretty similar to Draw. It draws a stroke.

## Crease

Draws a negative stroke.

## Smooth

Smoothens the surface.

## Flatten

Flattens the surface.

## Fill

Tries to fill the valley between two hill strokes. Hard to see in the shot. And the default values have a very weak influence.

## Scrape

As the name says. With this brush you can scrape.

## Multipane Scrape

As the name says. With this brush you can scrape. But this brush takes different surface angles into account.

## Pinch

Pinches existing strokes. Hard to see in the shot. What happens is that the stroke at the top becomes much sharper.

## Grab

Allows you to grab a portion of the sculpt mesh and drag it around.

## Elastic Deform

Allows you to grab a portion of the sculpt mesh and drag it around. This brush tries to preserve the volume of closed meshes. So it's best used at a closed geometry.

## Snake Hook

Allows you to grab a portion of the sculpt mesh and drag it around. The tool reacts a bit different than the Grab tool.

## Thumb

Allows you to pull geometry around than you would press your thumb into the clay.

## Pose

Allows you to pose the geometry under the brush by rotating it freely.

## Nudge

Nudges the geometry. Drag it sideways.

## Rotate

Rotates the geometry under the brush, aligned with the brush alignment.

## Slide Relax

Allows you to relax the surface in drag direction by dragging with the mouse over it.

## Boundary

Allows to deform the boundary geometry in various modes.

## Cloth

The cloth brush allows you to crumple the surface like it would be a piece of cloth.

## Simplify

Has no effect on quad geometry. This tool is of interest for Dyntopo sculpting. It simplifies the geometry, using the less dense areas as reference.

## Mask

Allows you to mask out specific parts of the mesh by painting it black. Black means no sculpt stroke possible in this area.

In the Brush panel you can negate the effect. And remove the mask by repainting over it with Direction set to Subtract.

The mask menu in the header provides you with further functionality like clear and invert the mask.

## Draw Face Sets

Allows you to draw so called faces set areas. It is some kind of a permanent mask. Every drawn face set gets a random color assigned. This face sets can then be manipulated with the Mesh Filter tool. Or you can use them to hide the parts away that you don't want to sculpt at the moment.

Holding Shift will relax or smooth the edges of the Face Sets.

Holding Ctrl will continue drawing the same Face Set as the one under the cursor.

Once you have painted Face Sets, the Face Set beneath your mouse pointer can be hidden by pressing the H hotkey.

Hotkey Shift H hides all Face Sets but the one under your mouse pointer. See also the Face Sets menu.

To reset all face sets choose Face Sets from Visible in the Face Sets menu, followed by Randomize Color. This should clear all colors.

## Multires Displacement Eraser

Deletes the displacement information of the Multires Modifier. And resets the mesh to the subdivision limit surface.

Use case is to delete parts of the sculpt or to fix reprojection artifacts after applying a Shrinkwrap Modifier.

## Multires Displacement Smear

Moves Multires displacement over the surface. This works like smearing a displacement texture. The brush can be used continually without creating topology artifacts.

## Paint

Paint over vertex colors. Note that this feature is not supported when you work in Dynatopo.

## Smear

Smears painted vertex colors. Note that this feature is not supported when you work in Dynatopo.

---

## Mask selection tools group

### Box Mask, Lasso Mask and Line Mask

Allows you to mask out specific parts of the mesh by selecting mesh parts, and mask them with black. Black means no sculpt stroke possible in this area.

This tools is, different from the mask brush not brushes, but select tools. Box mask and Lasso mask behaves like the general box and lasso select methods. To subtract hold down ctrl. Line mask selects along a line.

The mask menu in the header provides you with further functionality like clear and invert the mask.

### Active Tool setting

#### *Front Faces only*

Affect only the faces that points to the front.

#### *Limit to Segment*

Line mask only. Affect only the current segment.

---

## Box Hide

This tool allows you to box select parts of the mesh that gets hidden then. To reveal hidden mesh parts left click anywhere.

## Box / Lasso Faceset tools group

Allows to select faces and apply a face set to it.

### Box Face Sets

Box select an area of the mesh to apply a face set.

### Tool Settings

#### Front faces only

Only affect the front faces.

### Lasso Face Sets

Lasso select an area of the mesh to apply a face set.

### Tool Settings

#### Front faces only

Only affect the front faces.

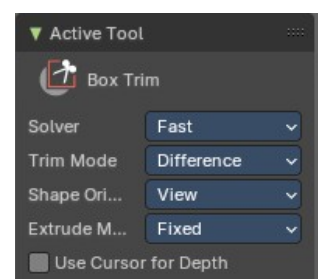

## Box Trim / Lasso Trim tools group

Trim the geometry with a rectangle or lasso.

### Box Trim

### Tool Settings

## Solver

Use the Exact or Fast solver for the booleans that the tool uses. Exact is best used with non-manifold booleans, and fast is best used with manifold booleans.

## Trim Mode

What trim method to choose. Trim uses a boolean method. You have the choice between difference, union and join.

## Shape Orientation

Use the orientation of the boolean aligned to the viewport or the surface.

## Extrude Mode

How to deal with extrude.

## Use Cursor Depth

Use cursor location and radius for the dimensions and position of the trimming shape.

## Lasso Trim

### Tool Settings

## Solver

Use the Exact or Fast solver for the booleans that the tool uses. Exact is best used with non-manifold booleans, and fast is best used with manifold booleans.

## Trim Mode

What trim method to choose. Trim uses a boolean method. You have the choice between difference, union and join.

## Shape Orientation

Use the orientation of the boolean aligned to the viewport or the surface.

## Extrude Mode

How to deal with extrude.

## Use Cursor Depth

Use cursor location and radius for the dimensions and position of the trimming shape.

## Line Project

Cuts away part of the mesh along a line.

## Tool Settings

Apply the action only to the current segment.

## Mesh Filter

Apply a Mesh Filter Type. Mesh filters are something like deform modifiers.

## Usage

Choose the filter type that you want to apply in the Tool Settings panel. Then drag with the mouse to adjust the amount.

To work with Face Sets first tick Use Face Sets in the Active Tool panel. Then hover the mouse over the Face Set that you want to manipulate. Then drag with the mouse to adjust the amount.

You have to adjust everything beforehand. This tool has no last operator.

## Adjust Last Operator Filter Mesh

### Strength

Filter Strength.

### Repeat

How many times to repeat the filter

### Orientation

Orientation of the axis to limit the filter displacement.

### Deform Axis

Which axis to affect by the deformation.

## Tool Settings

### **Filter Type**

#### **Smooth**

Smoothens the surface.

#### **Scale**

Scales the surface.

#### **Inflate**

Inflates the surface.

#### **Sphere**

Forms the surface to a sphere.

#### **Random**

Randomizes the vertices positions.

#### **Relax**

Relaxes the mesh.

#### **Relax Face Sets**

Smooth the edges of all face sets.

#### **Surface Smooth**

Smooth the surface of the mesh, preserving the volume.

#### **Shape preservation**

How much of the original mesh is preserved when smoothing.

#### **Per Vertex Displacement**

How much the position of each individual vertex influences the final result.

#### **Sharpen**

Sharpen the cavities of the mesh.

#### **Smooth Ratio**

How much smoothing is applied to polished surface.

#### **Intensity Details**

How much creases and valleys are intensified.

### **Curvature Smooth Iterations**

How smooth the resulting shape is. This feature ignores high frequency details.

### **Strength**

The strength of the effect.

### **Deform Axis**

Limit the effect to single world axis.

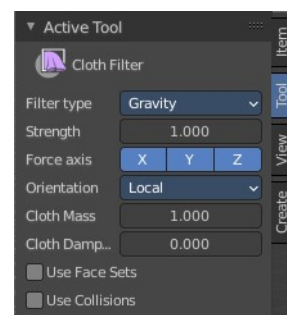

## **Cloth Filter**

Applies a cloth filter type.

Choose the filter type that you want to apply in the Tool Settings panel. Then drag with the mouse to adjust the amount.

You have to adjust everything beforehand. This tool has no last operator.

## **Tool Settings**

### **Filter Type**

The cloth filter type.

### **Strength**

The filter strength.

### **Force Axis**

Apply the force in the selected axis.

### **Orientation**

Orientation of the axis to limit the filter force. Local, World or View.

### **Cloth Mass**

Mass of each simulation particle

## ***Cloth Damping***

How much the applied forces are propagated through the cloth.

## ***Use Face Sets***

Use an existing face set under the mouse for the cloth filter brush.

## ***Use Collisions***

Collide with other collider objects in the scene.

---

## **Color Filter**

Applies a filter to modify the current sculpt vertex colors.

### **Tool Settings**

### ***Filter Type***

What kind of filter to apply to the vertex colors.

### ***Strength***

The strength of the filter.

## **Edit Face Sets**

Allows you to grow or shrink the face set under the mouse.

### **Tool Settings**

### ***Mode***

Grow or shrink.

### ***Modify Hidden***

Affect hidden face sets too.

## Mask by Color

Creates a mask from the sculpt vertex colors under the mouse.

### Tool Settings

#### ***Threshold***

How much changes in color affect the mask generation. Or in other words, the threshold after which the color gets count as an equal color to the current vertex color under the mouse to mask this color out.

#### ***Contiguous***

Only mask out color parts that are connected.

#### ***Invert***

Invert the generated mask.

#### ***Preserve Previous Mask***

Add to or subtract from the current color mask.

## 7.2.4 Editors - 3D Viewport - Tool Shelf - Mesh - Vertex Paint Mode

### Table of content

Tool Shelf - Mesh - Vertex Paint Mode.....	1
Annotate tools.....	1
Brush cursor.....	1
Brushes settings.....	2
Symmetry.....	2

Multiply.....	3
Subtract.....	3
Blur.....	3
Average.....	3
Smear.....	3

### Tool Shelf - Mesh - Vertex Paint Mode

In Vertex Paint mode with a mesh object you will find mainly brushes in the tool shelf. Vertex painting allows you to paint the vertices of a mesh object with a specific color. This can then be used in various ways. As direct painting without any UV mapping. Or for some special calculations. There is a shader node that reads the vertex color values.

### Annotate tools

The annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover these tools again here.

### Brush cursor

When you activate one of the brushes then the mouse cursor turns into a brush cursor. This cursor represents the size of the current brush. It does not align with the surface under the mouse. But always faces towards you.

## Brushes settings

The different brushes settings can be found in the sidebar in the tools tab. Or in the properties editor in the Active Tool and Workspace settings tab. Or above the header area.

The different brushes settings in the Active Tool and Workspace settings are explained in the chapter 25.1.4 Editors - Properties Editor - Tools Tab - Vertex Paint Mode

We won't cover this chapters again, but just explain what the different brushes does.

## Symmetry

You can enable Symmetry painting up right in the header.

## Hotkeys

Pressing F allows you to change the brush size on-screen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing Shift F allows you to change the strength of the brush. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

## Draw

Draws a stroke. The Draw tool has several sub brushes in the Brush panel. The names of the brushes are pretty self explaining.

## Add

The specified weight value is added to the vertex weights. The strength determines which fraction of the weight gets added per stroke. But the brush will not paint weight values above 1.0.

## Darken

Darkens the current colour at the vertices down to the specified target value. Only weights above the target weight are affected. Weights below the target weight remain unchanged.

## Draw

Draws a stroke.

## Lighten

Lightens the current colour at the vertices up to the specified target value. Only weights below the target weight are affected. Weights above the target weight remain unchanged.

## Mix

Mix the colour that you draw with the background colour.

## Multiply

Multiplies the colour that you draw with the background colour.

## Subtract

Removes the colour from the vertex with drawing.

## Blur

Smooths out the colours of adjacent vertices. In this mode the Colour Value is ignored. The strength defines how much the colours are blurred.

## Average

Smooths colour by painting the average resulting colour from all colours under the brush.

## Smear

Smudges colours by grabbing the colours under the brush and “dragging” them.

## Tool Shelf - Mesh - Weight Paint Mode

In Vertex Paint mode with a mesh object you will find mainly brushes in the tool shelf. Vertex painting allows you to paint the vertices of a mesh object with a specific color. This can then be used in various ways. As direct painting without any UV mapping. Or for some special calculations. There is a shader node that reads the vertex color values.

## Transform and Annotate tools

The transform and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

The transform tools group shows when you activate Paint Mask or Vertex selection sub modes.

## Brush cursor

When you activate one of the brushes then the mouse cursor turns into a brush cursor. This cursor represents the size of the current brush. It does not align with the surface under the mouse. But always faces towards you.

## Brushes settings

The different brushes settings can be found in the sidebar in the tools tab. Or in the properties editor in the Active Tool and Workspace settings tab. Or above the header area.

The different brushes settings in the Active Tool and Workspace settings are explained in the chapter 25.1.4 Editors - Properties Editor - Tools Tab - Vertex Paint Mode

We won't cover this chapters again, but just explain what the different brushes does.

## Symmetry

You can enable Symmetry painting up right in the header.

## Hotkeys

Pressing F allows you to change the brush size onscreen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing Shift F allows you to change the strength of the brush. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing Ctrl F allows you to change the weight size onscreen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

---

## Draw

Draws a stroke. The Draw tool has several sub brushes in the Brush panel. The names of the brushes are pretty self explaining.

## Add

The specified weight value is added to the vertex weights. The strength determines which fraction of the weight gets added per stroke. But the brush will not paint weight values above 1.0.

## Darken

Darkens the current color at the vertices down to the specified target value. Only weights above the target weight are affected. Weights below the target weight remain unchanged.

## Draw

Draws a stroke.

## Lighten

Lightens the current color at the vertices up to the specified target value. Only weights below the target weight are affected. Weights above the target weight remain unchanged.

## Mix

Mix the color that you draw with the background color.

## Multiply

Multiplies the color that you draw with the background color.

## Subtract

Removes the color from the vertex with drawing.

---

## Blur

Smooths out the colors of adjacent vertices. In this mode the Color Value is ignored. The strength defines how much the colors are blurred.

## Average

Smooths color by painting the average resulting color from all colors under the brush.

## Smear

Smudges colors by grabbing the colors under the brush and “dragging” them.

---

## Gradient

Allows you to draw a gradient between two defined points. The gradient gets drawn with the starting color at the start point, and the color for zero weight at the end point.

## Tool Settings

### **Weight**

The starting weight.

### **Strength**

The strength with which it mixes with the existing weighting.

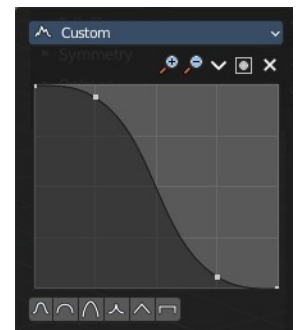

### **Type**

Choose the gradient type. Linear or Radial.

### **Falloff**

Allows you to adjust the falloff by a curve.

### **Curve Presets**

Curve presets to choose from.

### **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

## Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

### **Reset Curve**

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke. The blue button at the top turns clipping on or off.

## Delete Points

Deletes the selected curve point.

## Curve Presets

Predefined curve presets.

## Last Operator Weight Gradient

### Type

Choose the gradient type. Linear or Radial.

## Sample tools group

### Sample Weight

Sets the actual weight value to the color under the mouse.

The mouse turns into a picker. When clicking at the mesh with that picker, the header shows the weight value of the weighting of the corresponding vertice under the mouse

### Sample Vertex Group

Opens a popup menu where you can select one of the vertex groups that are under the mouse.

## 7.2.6 Editors - 3D Viewport - Tool Shelf - Mesh - Texture Paint Mode

### Table of content

## Tool Shelf - Mesh - Texture Paint Mode

In Texture Paint mode with a mesh object you will find mainly brushes in the tool shelf. Texture painting allows you to paint directly onto the texture of the mesh.

Texture painting requires to have a proper UV mapping and a texture at the mesh. When there is no texture at the mesh then the mesh shows pink. And you will get a No Textures message in the tools settings in the Texture Slots panel. You can add a texture paint slot under the tiny little button at the right.

### Transform and Annotate tools

The transform and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

The transform tools group shows when you activate Paint Mask sub mode.

### Brush cursor

When you activate one of the brushes then the mouse cursor turns into a brush cursor. This cursor represents the size of the current brush. It does not align with the surface under the mouse. But always faces towards you.

## Brushes settings

The different brushes settings can be found in the sidebar in the tools tab. Or in the properties editor in the Active Tool and Workspace settings tab. Or above the header area.

The different brushes settings in the Active Tool and Workspace settings are explained in the chapter Tools Tab - Texture Paint Mode

We won't cover this chapters again, but just explain what the different brushes does.

## Symmetry

You can enable Symmetry painting up right in the header.

## Hotkeys

Pressing F allows you to change the brush size onscreen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing Shift F allows you to change the strength of the brush. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

## Draw

Draws a stroke. The color and quite a few other settings can be defined in the Tools settings.

## Soften

Softens the texture region under the brush cursor.

## Smear

Smears the color under the brush cursor

## Clone

Clone a texture area and paint with it.

## Usage

Hold down CTRL and click at the source area that you want to draw with. Then draw with left mouse strokes

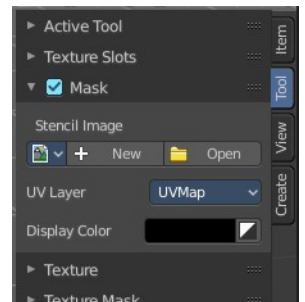

## Fill

Fills the whole selection with the chosen color.

## Mask

Mask out mesh parts by painting these areas with the mask color, which is by default black. Masked texture parts won't be painted when you paint over it. Turn off the mask to see the effect.

This tool requires to have a stencil texture. This stencil texture can be created or loaded in the tools tab in the Mask panel.

## Tool Shelf - Mesh - Particle Edit Mode

You can attach a particle system to a mesh object. And then you can switch to a Particle Edit Mode.

This mode allows you to edit the particles. In the tool shelf you will find several brushes. These brushes are of use for particles of type hair. They can be combed, cut etc. .

### Select and 3D Cursor tools

Select tools group and 3D Cursor are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

### Hotkeys

Pressing F allows you to change the brush size onscreen. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

Pressing Shift F allows you to change the strength of the brush. Drag the mouse to increase or decrease the size. Left click applies the new size, right click cancels the resizing.

### Comb

Allows you to comb the strands of the particle system.

### Tool Settings

#### Radius

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

#### Strength

The brush strength. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

#### Deflect Emitter

Prevent paths to intersect the emitter mesh geometry.

## ***Distance***

The distance to keep particles away from the emitter mesh geometry.

---

## **Smooth**

Allows you to smooth the strands of the particle system.

## **Tool Settings**

### ***Radius***

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### ***Strength***

The brush strength. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

---

## **Add**

Allows you to add strands to the particle system.

## **Tool Settings**

### ***Radius***

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### ***Count***

The amount of strands.

### ***Interpolate***

Interpolate new particles from the existing ones.

### ***Steps***

Brush steps. Steps is connected with Interpolate.

### ***Keys***

How many keys to make new particles with.

---

## **Length**

Manipulate the length of the strands.

## Tool Settings

### **Radius**

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### **Strength**

The brush strength. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### **Length Mode**

Grow or shrink the particles.

---

## Puff

Manipulate the volume of the strands.

## Tool Settings

### **Radius**

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### **Strength**

The brush strength. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### **Add / Sub**

Add or subtract to the current volume.

### **Puff Volume**

Apply Puff to unselected end points.

---

## Cut

Cut away particles.

## Tool Settings

### **Radius**

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

## ***Strength***

The brush strength. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

---

## **Weight**

Manipulate the weight of the strands.

## **Tool Settings**

### ***Radius***

The brush radius. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

### ***Strength***

The brush strength. The button behind the edit box allows you to set the radius by mouse move. This is a hotkey tool, and should be performed in the viewport.

## Tool Shelf - Curve - Edit Mode

With a curve object in edit mode you will find some tools to edit the curve geometry in the tool shelf.

### Tweak, Select, Transform, 3D Cursor Measure and Annotate tools

The tweak, select, transform, 3d cursor, measure and annotate tools at the end of the list are explained in the chapter 7.1.1 Editors - 3D View - Tool Shelf - Object Mode. We won't cover this tools again here.

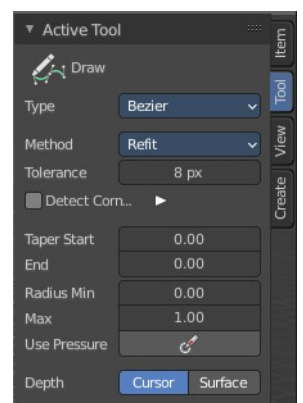

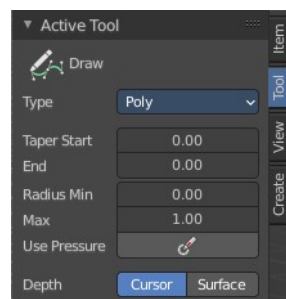

### Curve Stroke Panel

The curve stroke panel is covered in the chapter 25.1.1 Editors - Properties Editor - Tools Tab - Edit Mode. We won't cover this tools again here.

### Draw

Allows you to draw a curve into the viewport.

## Tool Settings

### Type

Set the draw method for the curve. Poly draws a simple polygon shape. Bezier creates a Bezier curve type with handlers.

With type Bezier you will get more options.

### Method

The curve fitting method for a Bezier curve.

### Refit

Incrementally refit the curve.

### Split

Split the curve until it fits.

### Tolerance

Allow deviation for a smoother but less precise line.

### Detect Corners

Detect corners and use non aligned angles.

### Corner Angle

Corners above this angle are considered as corners.

### Taper Start / End

Taper factor for the radius of each curve point.

### Radius Min/Max

Minimum or maximum radius when the pressure is applied.

### Use Pressure

Use tablet pressure to draw the curve.

### Depth

The method of projecting depth. Cursor or surface.

## ***Cursor***

Cursor has no further settings.

## ***Surface***

### **Absolute Offset**

Apply a fixed offset, and don't scale by the radius.

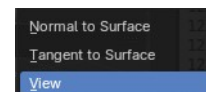

### **Only First**

Use the start of the stroke for the depth.

### **Plane**

The plane for the projected strokes.

### **Normal to Surface**

Draw in a plane perpendicular to the surface.

### **Tangent to Surface**

Draw in the surface plane.

### **View**

Draw in a plane that is aligned to the viewport.

## **Last Operator Draw Curve**

### ***Error***

Adjust the error distance threshold in object units

### ***Fit Method***

The curve fitting method. Choose between Refit and Split.

### ***Corner Angle***

Corners above this angle are considered as corners.

### ***Cyclic***

With curve type Bezier the curve gets closed. Has no effect at curve type Poly.

## **Extrude Tools Group**

This tools allows you to extrude out a new curve segment from the current selection

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your selection then you will see some values in the header, which defines the current position of the extrude point.

D: 0.2411 m (0.2411 m) custom matrix

## Move without Widget

You don't have to use the widget to move the object. You can also click aside of it, and drag the object around. The mouse turns into a move cursor. The standard behavior then is to move in screen space. When you want to move into a specific axis, then press X or Y or Z to limit the movement to this axis.

## Limit Axis

When you want to move along a specific axis, then press X or Y or Z to limit the movement to this axis. You usually start in global orientation. But you can change this in the Orientation settings.

D: 0.1529 m (0.1529 m) along global Z

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

## Extrude

The Extrude tool extrudes the current selection in the direction of the widget.

When you activate the tool, then you will by default see a yellow widget at the selection. Drag it to extrude the selection.

D: 0.4618 m (0.4618 m) custom matrix

## Header Value

When you extrude curve points then you will see a value in the header. It tells you the current target position relative to the initial starting point(s) . This factor always starts with 0.

## Tool Settings

## Axis Type

You can choose between the regular axis type. That's the yellow widget with just one handler. It always points in the direction of the middle normals of the selection.

Or you can use the XYZ axis type. That's a handler with three axis. This widget can be aligned with the transform orientation methods.

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last operator Extrude Curve and Move

### Mode

A drop-down box. Choose between different extrude modes.

Default is Translation. Most other methods has no effect.

### Move X , Y , Z

The position of the extruded point(s).

### Orientation

Adjust the orientation of the extrusion. It usually starts with Normal.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Extrude Cursor

Extrudes the control points to where you click.

### *Last Operator Add Vertex*

#### Location X Y Z

The location of the new created control point(s).

## Radius

Bezier curves have a radius. This is displayed by the black lines that points away from the curve. The radius tool allows you to resize this radius.

## Header Value

When you resize the curve radius then you will see a value in the header. It tells you the current scale factor. This factor always starts with 1.

## Tool Settings

## Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Values X Y Z W

The axis to increase the radius. Just X has an effect with the curve radius.

### Axis

The axis to use. This has no effect with a curve object.

### Orientation

Adjust the orientation of the extrusion. It usually starts with Normal.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Tilt

With this tool you can tilt the curve. It is the mean tilt value in the Transform panel of the Sidebar.

## Header Value

When you rotate the curve with the tilt tool, then you will see a value in the header. It tells you the current rotation relative to the starting rotation. This value always starts with 0.

## Tool Settings

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## Last Operator Transform

### Angle

This value tells you the current rotation relative to the starting rotation. This value always starts with 0.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Shear

The shear tool allows you to shear the selected geometry. When you activate the tool, then a widget appears that allows you to pull in the desired direction.

### Tool Settings

#### Orientation

Choose the orientation for the shear action.

#### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

#### Active Tool

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

#### Tweak, Select Box, Circle and Lasso

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

### Last Operator Shear

#### Offset

Adjust an offset.

#### Axis

Defines one axis of the imaginary shear axis plane.

#### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

#### Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Randomize

Randomize the position of the selected polygon or control points.

### Header Value

When you randomize the points, then you will see a value in the header. It tells you the current randomization amount. This value always starts with 0.

0.1167

## Tool Settings

### Uniform

With a value of 0 the randomization happens uniformly. The higher the value the more uniform the randomization affects the selected points.

### Normal

Align the offset direction to normals. This value has no effect.

### Random Seed

A random seed value.

### Drag

When you click at the widget of the active tool, then you perform the tool action. Adjust what should happen when you click outside of the widget, in the empty area.

## **Active Tool**

When you click off the widget then the click still does the same than clicking at the widget. It performs the active tool.

## **Tweak, Select Box, Circle and Lasso**

When you choose this options then you will set the off click to the different select methods. Whereas tweak works more than a move tool then. Tweak is the default.

## **Last Operator Transform**

### ***Amount***

The randomization amount.

### ***Uniform***

With a value of 0 the randomization happens uniformly. The higher the value the more uniform the randomization affects the selected points.

### ***Normal***

Align the offset direction to normals. This value has no effect.

### ***Random Seed***

A random seed value.

Tool Shelf Tabs.....	4

# Tool Shelf

Some editors have a tool shelf at the left. Here you can find and use various tools.

## Active Tool

In the tool shelf there can just be one active tool in the tool shelf. An activated tool stays active as long as you don't change it. To deactivate the current tool you have to choose another tool. One of the select tools for example.

## Tool Settings

When you activate a tool in the tool shelf then you will also reveal its tool settings. There are two locations where you can find the tool settings. In the header, and in the sidebar in the Tool tab. It's your choice with which panel you want to work.

## Mode dependent content

The content of the tool shelf is changing depend and of the mode that you are in, and dependent of the object type. A mesh object in edit mode has another set of tools than a metaball. But there are some tools that are available in all modes. 3D Cursor, Select tools and Transform tools.

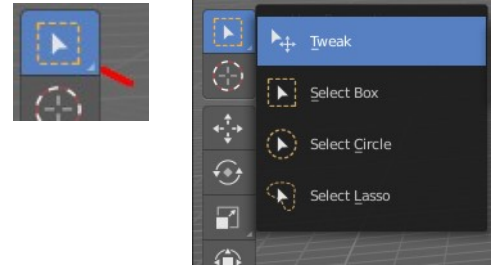

## Tool tips

The new tool system works here and there different from the old tool system. It is one gigantic hack on top of the old tool system. Already the tool tips are different. It misses the Python strings. And some tools misses a proper description. The tool tips are separated from the operators.

## Tool groups

Some icons have a white small triangle down right. This indicates that this icon is part of a tool group. This group can be revealed by holding down the mouse until the popup reveals the hidden tools. You can then choose the needed tool in this group. And it will become the one that gets displayed.

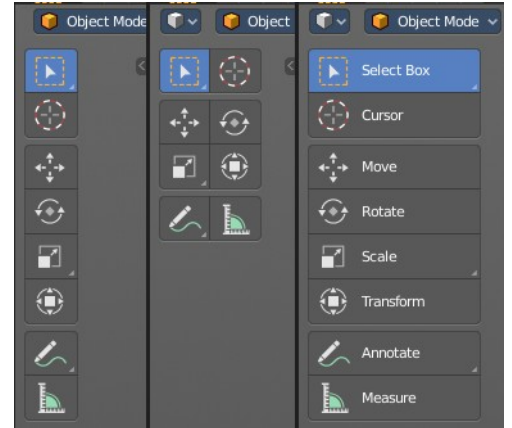

## Resizing the tool shelf

The tool shelf can be resized by dragging the border of it in and out.

You have the choice between one, two and three icon rows. And text and icon buttons.

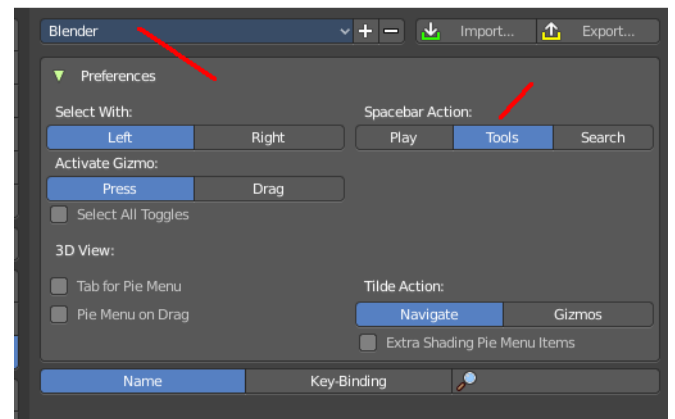

Currently the default starts with two rows.

## Switching Tools

The Blender key map provides a way to call the tools from the tool shelf under the mouse in a popup menu. And with hotkeys. Even when they don't have a hotkey assigned in the toolbar yet.

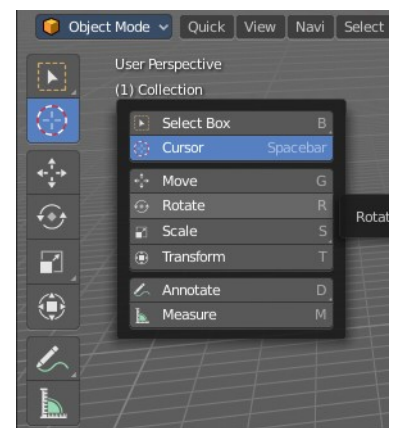

Keyboard tool switching is not enabled by default. You need to set the key-map preference Space bar Action to Tools. And when you press space bar, then you will see the tool shelf content under the mouse. But with an hotkey assigned. And then you can use this hotkey in combination with the space bar to activate the tool

Spacebar-T for Transform, Spacebar-D for Annotate, Spacebar-M for measure, and so on.

The accelerator keys are displayed in the tool tips of the tools in the tool shelf. The hotkeys are hard coded. And are NOT the hotkeys for the tools in the tool shelf. But just the hotkeys in conjunction with the space bar menu!

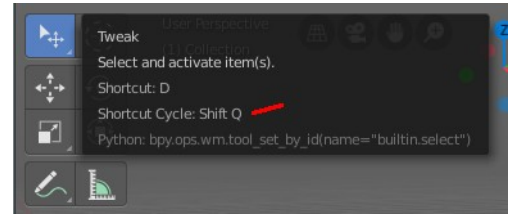

**Attention, this is not implemented in the Bforartists key map. This feature is just available in the Blender key map!**

## Cycling through Tools in groups

You can assign a hotkey to a group of tools, and then activate Cycle in the key map manager. This allows you to cycle through the tools in this group with the hotkey.

This is for example done with the Select tool group. The hotkey to cycle through the tools in the group shows in the tool tip.

## Tool Shelf Tabs

The tool shelf contains not only the new tool system tools. But contains also the old tools from the text menus in the header in tabs. They are a double menu entry by design. This tabs are faster to access. They resize like the tool shelf tabs, and allows icon rows of one, two and three width, and also the display as text buttons.

You can also pin panels. This allows for example to display the snap tools below the regular tool shelf tools. So that you don't need to dig in the text menus all the time. When they are pinned, then they are in reach with one click.

We won't explain the tools here, since they are already covered in the corresponding text menus.

You can turn the tabs off in the View menu if you don't want to work with this tool set.

Note that you need to adjust the width of the tool shelf manually afterwards since it does not automatically update the width of the tool shelf area.

Note that you need to save the startup.blend to save the state of this checkbox. So be careful with modifications.

## 7.3.10 Editors - 3D Viewport - Sidebar - Tool Tab - Particle Edit Mode

### Table of content

Tools Tab in Particle Edit Mode.....	2

Fade Time.....	4
Frames.....	4

## Tools Tab in Particle Edit Mode

The Particle Edit mode enables to edit particle settings. For example, Hair Particles can be manipulated with some brushes. They can be combed, cut etc.

The Tools tab contains the settings for the hair editing brushes.

Different from the other paint modes, there is no brush panel. The brushes are here part of the tool settings of the single brushes. The brush settings will be covered in the 3D view in the chapter for Particle Edit Mode.

## Particle Edit Mode - Options panel

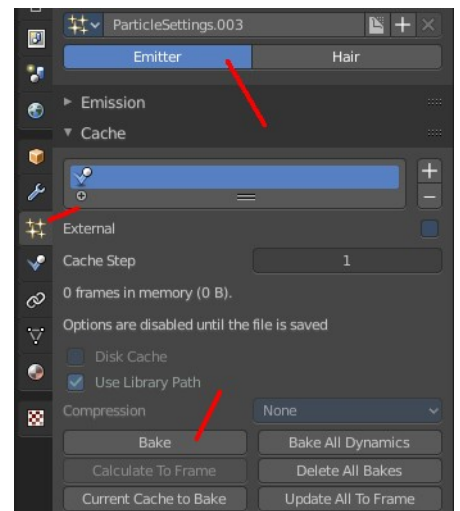

This panel contains some further options for the particles.

Note that you need to bake some particle types to be able to modify them. Emitter for example. You will get a warning then, and the Options panel content is greyed out.

The particles can be baked in the Particles tab in the Cache panel.

## Particle Edit Type

The Particle Edit Type. This edit box just shows you what particle type you currently have. It does not allow you to change the particle type.

## X Mirror

Mirrors the selected particles.

If you want a symmetrical haircut, first select all particles, then mirror the particles, then tick X Mirror.

## Preserve Strand Lengths

Keep the path lengths constant.

## Preserve Root Positions

Keep root keys unmodified.

## Auto-Velocity

Calculate Point Velocity automatically.

---

## Cut particles to Shape

Define an object to cut the hair particles into the shape of the object.

---

## Viewport Display

### With Hair

#### *Path Steps*

How many steps to display the path with. Meant is the resolution for the hair strains.

#### *Children*

Display all particles, including children. For performance reasons child particles are usually not displayed in the viewport.

### With Emitter

#### *Path Steps*

How many steps to display the emitter path with.

### ***Particles***

Display the actual particles.

### ***Fade Time***

Fade paths and keys further away from the current frame

### ***Frames***

How many frames to fade.

## Sculpt Mode

In Sculpt mode you can sculpt the grease pencil strokes.

## Sculpt Mode - Brushes Panel

### Brush browser

Pick a pencil, and see what pencil is active.

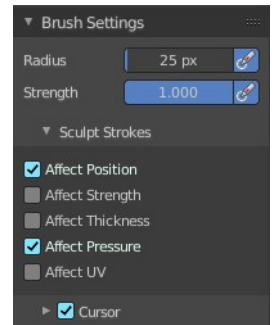

## Sculpt Mode - Brush Settings Panel - Smooth Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Sculpt Strokes sub panel

#### Affect Position

The brush affects the position of the point.

#### Affect Strength

The brush affects the color strength of the point.

#### Affect Thickness

The brush affects the thickness of the point.

#### Affect Pressure

The brush affects the pressure values as well when smoothing strokes.

#### Affect UV

The brush affects the UV rotation of the point.

## Sculpt Mode - Brush Settings Panel - Thickness Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Add / Subtract

Thickness and Strength brush. If this brush should add or subtract to the

sculpt surface.

## Sculpt Mode - Brush Settings Panel - Strength Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Add / Subtract

Thickness and Strength brush. If this brush should add or subtract to the sculpt surface.

## Sculpt Mode - Brush Settings Panel - Randomize Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Sculpt Strokes sub panel

#### Affect Position

The brush affects the position of the point.

#### Affect Strength

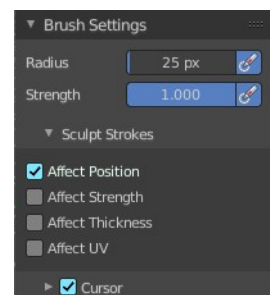

The brush affects the color strength of the point.

#### Affect Thickness

The brush affects the thickness of the point.

#### Affect UV

The brush affects the UV rotation of the point.

## Sculpt Mode - Brush Settings Panel - Grab Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Sculpt Mode - Brush Settings Panel - Push Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Sculpt Mode - Brush Settings Panel - Twist Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Clockwise/Counter Clockwise

If the twist goes clockwise or counter clockwise.

### Pinch / Inflate

Pinch brush. If the brush should pinch or inflate.

## Sculpt Mode - Brush Settings Panel - Pinch Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Pinch / Inflate

Pinch brush. If the brush should pinch or inflate.

## Sculpt Mode - Brush Settings Panel - Clone Brush

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Sculpt Mode - Brush Settings Panel - Cursor Sub panel

This subpanel shows with all brushes in the Brush settings panel.

### Show Brush

Show the brush icon when painting.

### Cursor Color

The brush icon color with adding.

### Inverse Color

The brush icon color with subtracting.

Inverse color does not show with all brushes. Just with Pinch for example.

## Grease Pencil - Weight Paint Mode

In Weight Paint Mode you can weight paint your strokes.

## Weight Paint Mode - Brushes Panel

### Brush browser

Pick a pencil, and see what pencil is active. There is just one pencil available for weight painting.

## Weight Paint Mode - Brush Settings Panel

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Weight

The target weight. Everything below gets added towards this value. Everything above gets subtracted from this value. Usually you work with the maximum value of 1.

### Use Falloff

Use Falloff for the brush.

## Weight Paint Mode - Brush Settings Panel - Cursor Sub panel

### Show Brush

Show the brush icon when painting.

### Color

The brush icon color.

## Sculpt Mode - Options panel

### Auto Normalize

Ensure that all bone deforming vertex groups adds up to 1.0 while weight painting.

## Draw Mode

Just the grease Pencil object has a Draw mode.

The Grease Pencil Object allows you to draw in 2D in the workspace.

It starts as an object type. By switching into paint mode it becomes a paint feature. And editing turns it into a curve or a mesh object then.

In the Tools tab you will find all the options and settings for drawing and manipulating the grease pencil object, means your drawing.

The type **Blank** allows you to draw strokes.

The type **Stroke** allows you to draw filled forms.

The type **Monkey** is just an example object.

## Brushes Panel

### Brush Browser

Choose between the different draw, fill and erase brushes. It's the same than in the tool shelf.

### Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

### Brush Name Edit Box

The edit box below the Image shows you the name of the current active brush.

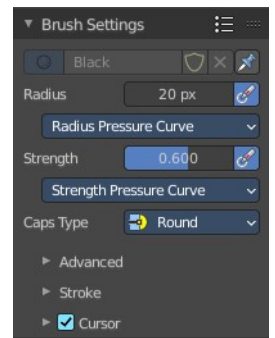

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**Fake User** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Brush settings Panel

### Header - Add Brush Preset

In the header is a brush preset menu where you can store and load custom brush presets. The dialog should be self explaining. In the edit box you type in the name of your new preset. And with clicking at the + button the new preset gets stored. Existing presets can be removed by clicking at the - button at the right side of the preset.

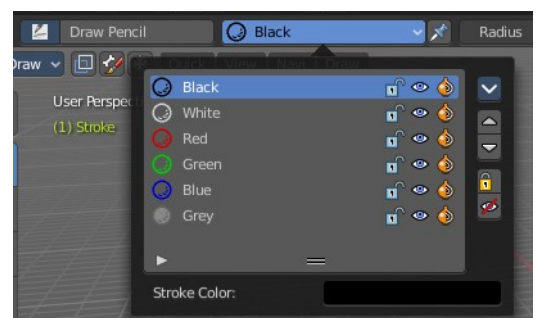

### Material Browser

This browser is just active when the Keep material assigned to Brush Pin is activated.

The colors for the grease pencil are materials each. For the grease pencil type Blank you will just have one color available. For this type you have to create new materials in the material tab first when you need more colors. But the other two types, strokes and monkey, comes with a few base materials already. Which can be found in the Materials tab.

The tool settings above the header shows this panel too. And here you can quickly change the color of a material. It is explained in the chapter Materials Tab.

## Drop down box

Choose another material to draw with.

## Edit Box

Read and modify the material name.

For set the material to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The X button** deletes the material as the active one. It does NOT delete it from the materials list.

**Keep material assigned to Brush Pin** pins the brush to this material.

## With Draw Tools

### Radius

The Radius edit box allows you to adjust the radius of the brush.

### Use Pressure

The button behind the edit box enables tablet pressure sensitivity for radius.

### Radius Pressure Curve

The pressure curve allows you to adjust the falloff curve for the tablet pressure. It shows when Use Pressure is activated. The curve panel shows when clicking at the button.

### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

### Zoom in

Zooms in.

### Zoom out

Zooms out.

## Tools

Tools is a menu where you can find some curve related tools.

### Reset View

Resets the curve windows zoom.

### Vector Handle

Set handle type to Vector.

### Auto Handle

Set handle type to Auto.

### Auto Clamped Handle

Set handle type to Auto Clamped.

### Reset Curve

Resets the curve to the initial shape.

## Clipping options

Set up clipping for the stroke.

## Delete Points

Deletes the selected curve point.

## Strength

The Strength edit box allows you to adjust the strength of the brush.

## Use Pressure

The button behind the edit box enables tablet pressure sensitivity for strength.

## Strength Pressure Curve

The pressure curve allows you to adjust the falloff curve for the tablet pressure. It

shows when Use Pressure is activated. The curve panel shows when clicking at the button.

### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### Navigation elements

#### Zoom in

Zooms in.

#### Zoom out

Zooms out.

### Tools

Tools is a menu where you can find some curve related tools.

#### Reset View

Resets the curve windows zoom.

#### Vector Handle

Set handle type to Vector.

#### Auto Handle

Set handle type to Auto.

#### Auto Clamped Handle

Set handle type to Auto Clamped.

#### Reset Curve

Resets the curve to the initial shape.

### Clipping options

Set up clipping for the stroke.

## Delete Points

Deletes the selected curve point.

---

## Caps Type

What caps type to use at the end of the grease pencil stroke. Flat or round

## With Fill Tool

Note that the Fill tool does not fill an existing stroke like you would expect. It extends existing strokes with closed areas, or the border.

## Direction

The fill direction. Fill internal or inverted.

## Precision

Factor for fill boundary accuracy. Higher values are more accurate but slower.

## Leak Size

Size in pixels to consider the leak closed.

## Thickness

The thickness of the new created stroke drawn with the fill tool around existing strokes or the border.

---

## With Eraser Tools

### Radius

The radius of the eraser brush.

### Use Pressure

The button behind the edit box enables tablet pressure sensitivity for strength.

### Occlude Eraser

Erase only visible and not occluded strokes.

### Default Eraser

Use this brush when you enable the eraser with fast switch key.

Note! Whatever this means. There is no fast switch key. This functionality is not documented in the Blender manual, and it is not to find out what is meant.

## **Mode**

### **Dissolve**

Erase strokes, fading their points strength and thickness.

### **Point**

Erase stroke points.

### **Stroke**

Erase entire strokes.

---

## **Display Cursor**

Show the eraser cursor.

## **Brush settings Panel - Advanced Sub panel**

## **With Draw Tool**

### **Mode**

What draw mode to use.

### **Active**

Use the current active draw mode.

### **Material**

Draw with material colors.

### **Vertex Color**

Draw with Vertex colors.

### **Input Samples**

Generate intermediate Points for very fast mouse movements. A value of 0 means this feature is disabled.

### **Active Smooth**

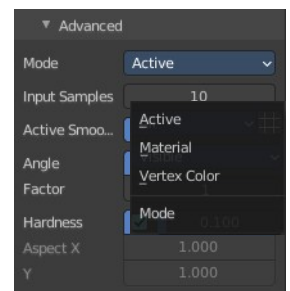

The amount of smoothing the strokes while drawing.

### **Angle**

Direction of the stroke at which it gives the biggest thickness.

### **Factor**

Reduce the brush thickness by this amount when the stroke is perpendicular to "Angle" direction.

## Border Opacity Factor

Amount of transparency (alpha) to apply from the border of the point to the center. Works only when the brush is using stroke materials of Dot or Box style.

## Aspect Ratio X / Y

The width and height of the alpha gradient.

It is unfortunately not to find out where this ominous Dot or Box Style material is to find or to create. So please ignore this settings for now. They are greyed out anyways. Maybe this will solve itself at a later development state.

## With Fill Tool

## Boundary

The mode to draw the boundary lines.

## Layers

What layers to use as boundaries.

## Stroke Extension

Stroke End Extension for closing gaps. Zero disables the stroke extension.

## Show Extend Lines

Show help lines for filling to see boundaries.

## Simplify

Number of simplify steps. Large values reduces Fill accuracy.

## Show Fill

Show transparent lines to use as boundary for filling.

## ***Threshold***

The threshold to consider the color to be transparent for filling.

## **Limit to Viewport**

Threshold to consider a color as transparent for filling.

# Brush settings Panel - Stroke Sub panel

Here you will find some further stroke related settings. It has three sub sections. Post Processing, Randomize and Stabilize Stroke.

## **Post Processing**

Here you find some post processing settings for new strokes.

### **Smooth**

The smooth amount to reduce jittering.

### ***Iterations***

Number of iterations to smooth new created strokes.

### **Smooth Thickness**

Amount of thickness smoothing to reduce jittering.

### ***Iterations***

Number of iterations to smooth new created strokes.

### **Subdivision Steps**

Number of subdivisions of new created strokes

### **Randomness**

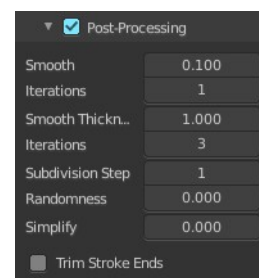

Randomness factor for new created strokes after subdivision.

### **Simplify**

Simplify new created strokes.

### **Trim Stroke Ends**

Trim intersecting stroke ends.

## Randomize

Add some randomization to the stroke.

### Pressure

Randomize the pressure.

### Strength

Randomize the strength.

### UV

Randomize the auto generated UV rotation.

### Jitter

Add Jitter

### Use Pressure

The button behind the edit box enables tablet pressure sensitivity.

---

## Stabilize Stroke

Draw lines with a delay to allow smooth strokes.

### Radius

The minimum distance from last point before the stroke continues.

### Factor

Smooth stroke factor. Higher values gives smoother stroke.

## Brush settings Panel - Curves Sub panel

See and manipulate the curves for drawing Sensitivity, Strength and Jitter.

The navigation elements are the same for all three curve types.

## Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

### Tools

Tools is a menu where you can find some curve related tools.

#### **Reset View**

Resets the curve windows zoom.

#### **Vector Handle**

Set handle type to Vector.

#### **Auto Handle**

Set handle type to Auto.

#### **Auto Clamped Handle**

Set handle type to Auto Clamped.

#### **Reset Curve**

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve points.

## Brush settings Panel - Cursor Sub panel

Show the brush cursor under the mouse.

## Show Fill Color while drawing

Show the fill color of the grease pencil while drawing.

## Color Panel

The default grease pencil color is based at materials. And then this panel is greyed out and dysfunctional. But you can also choose to work with vertex colors instead. And then all the color panel features becomes activated.

### Material / Vertex Color

Choose if you want to work with material based colors or with vertex colors. Turn it to vertex colors to activate the features.

This can also be done in the tool settings in the header.

### Color picker

Define the color for your brush.

#### Active color

The active color is the left one. When you click the button with the two arrows down right then you can swap the color with the secondary color. Then this secondary color becomes the primary color, and is active.

A click at one of the color fields will open a more detailed color dialog, to Set up the color by using rgb, hsv and hex colors and with value sliders.

### Brush colors flip

Flips the primary color with the secondary color.

### Mode

How the vertex color is applied.

### Mix Factor

Factor used to mix the vertex color to get final color.

## Color Panel - Palette sub panel

Here you will find a predefined color palette, and here you can create a color palette for later reuse.

The color palette cannot be saved externally. It is part of the current blend file. You can however append color palettes from other blend files.

The currently active color is the one with the triangle at it.

The elements are explained from left to right and from top to bottom.

## Palette browser

The button at the left opens a drop down list to choose between your palettes.

## Edit Box

Read the name of the currently active palette. You can also rename the palette here. A click into the edit box makes the name editable.

## Number of users

See how many users the palette currently has.

## Fake User

Fake User sets the element to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

## Add palette

Add a new palette.

## Remove Palette

Clicking at this button removes the palette. Note that you need to save, close Bforartists and reload the blend file to remove the palette completely.

## New Palette color

Adjust a color in the color picker. Then click at the add button to add this color to the palette.

## Delete Palette color

Select the color in the palette, then click at the minus button to remove it.

## Move Palette Color up and down

With these two buttons you can move the active color up or down in the palette.

## Sort By

Sort the palette by different methods.

## Palette Colors

The actual list of the current palette colors. Click at one to make it the active one that gets used for painting.

## Grease Pencil - Vertex Paint Mode

In draw mode you can paint whole strokes with vertex color. In Vertex Paint mode you can paint the single vertices of a stroke with vertex color.

## Brushes Panel

### Brush Browser

Choose between the different draw, fill and erase brushes. It's the same than in the tool shelf.

### Brush Specials

#### Reset

Reverts the brush to the factory settings.

#### Reset all Brushes

Reverts all brushes to the factory settings.

#### Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

#### Brush Name Edit Box

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**Fake User** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the

## Brush Settings Panel

### Radius

The radius of the brush.

## Grease Pencil - Weight Paint Mode

The Tools tab in Weight Paint Mode provides you the tools to do weight painting at a mesh. Skinned characters for example. Also grease pencil strokes can be skinned to a skeleton. In Weight Paint Mode you can weight paint your strokes.

## Brushes Panel

### Brush browser

Pick a pencil, and see what pencil is active. There is just one pencil available for weight painting.

## Brush Settings Panel

### Weight

The target weight. Everything below gets added towards this value. Everything above gets subtracted from this value. Usually you work with the maximum value of 1.

### Direction

Add or subtract the weight.

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Cursor Sub panel

### Show Brush

Show the brush icon when painting.

### Color

The brush icon color.

## Falloff Sub panel

Adjust the falloff of the brush.

### Curve Presets

A dropdown menu where you can choose predefined falloff curves.

## Options Panel

### Auto Normalize

Ensure that all bone deforming vertex groups adds up to 1.0 while weight painting.

## 7.3.15 Editors - 3D Viewport - Sidebar - Tool Tab - Grease Pencil - Layer Panel

### Table of content

Layer Panel.....	1

## Layer Panel

The content of the Tool tab in the sidebar and the tool settings above the 3D view is usually equal. The Layer panel is a special panel in this regards. It just exists in the tool settings above the 3Dview. And it exists in all grease pencil modes but the object mode.

Grease Pencil objects each have a list of 2D layers for grouping and arranging strokes in a List view. Any stroke can only belong to a single 2D layer. There is always only one active layer in the list (the selected one). When you draw, the new strokes are added to the active layer. By default the view order of the layers in the viewport is top to bottom.

Every layer correspond to a channel in the Dope Sheet editor (in Grease Pencil mode). Layers can also be used together with Modifiers to only affects part of your drawing.

## Layer list

### Layer name

The name of the layer.

### Mask Layer

Toggle the Masks visibility in the layer.

### Onion Skinning

Toggle the use the layer for Onion Skinning.

### Viewport/Render Visibility

Toggle layer visibility in the viewport and in render.

### Lock

Toggle layer from being editable.

### Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

### Add new layer

Adds a new layer.

### Remove layer

Removes the selected layer.

## Layer Specials

### Duplicate Layer

Makes an exact copy of the selected layer appending a number to differentiate its name.

### Show All

Turns on the visibility of every layer in the list.

### Hide Others

Turns off the visibility of every layer in the list except the active one.

### Lock All

Locks edition of all the layers in the list

## Unlock All

Unlocks edition of all the layers in the list.

## Autolock inactive layer

Locks automatically the edition of every layer in the list except the active one. This way you avoid to make unwanted changes in other layers without the need to lock them every time.

## Merge Down

Merge the selected layer with the layer below, the new layer keeps the name of the lower layer.

## Copy Layer to Object

Makes a copy of the layer and move it to the selected Grease Pencil object.

## Isolate Layer

Hide and lock the layer.

## Isolate Layer

Lock the layer.

## Blend

The layer blending operation to perform. See Color Blend Modes.

## Opacity

Used to set the opacity of the layer.

## Mask Layer

Toggle the Masks visibility in the layer.

## Use Lights

When enabled, the layer is affected by lights.

## Sculpt Mode

In Sculpt mode you can sculpt the hair curves.

## Sculpt Mode - Brushes Panel

### Brushes browser

You can create and manage brush settings from the brush browser and see what brush is active.

### Select Mode

Change the mode used for selection masking in curves sculpt mode.

This toggles two methods of how the brushes interact with the hair curves. They can either be selected and manipulated by control points or the complete hair curve.

### Control Point

Use the masked selection of the Selection Paint brush. Whatever is opaqued by dark grey is locked. Brush will only affect unlocked areas of the selection. You can modify the selection from the Select menu mentioned in chapter **7.1.42 Editors - 3D Viewport - Header - Hair Curve - Sculpt mode - Curves menu**

### Curves

Uses the complete hair curve with the evaluation of the brush. You can modify the selection from the Select menu mentioned in chapter **7.1.42 Editors - 3D Viewport - Header - Hair Curve - Sculpt mode - Curves**

menu

## Symmetry

Enable symmetry sculpting for single axis. This is also a panel in the tool tab.

## Use Sculpt Collision

Enable the collision of the hair curve particles with the surface.

# Selection Paint

## Radius

The radius of the brush.

## Strength

The strength of the brush.

## Direction

The direction of the brush selection, if it is additive or subtractive by adding or subtracting to the selected curves or control points.

# Add

## Radius

The radius of the brush.

## Strength

The strength of the brush.

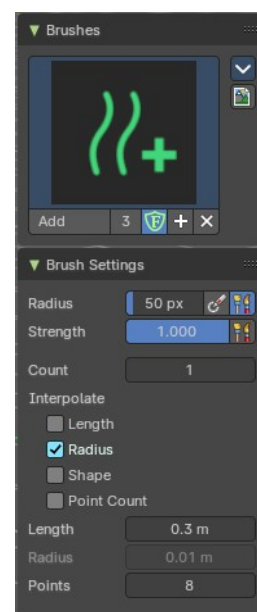

## Count

Number of curves added by the add brush.

## Interpolate

## Length

Use length of the curve in close proximity.

## Radius

Use radius of the curve in close proximity.

## Shape

Use shape of the curve in close proximity.

## Point Cloud

Use the number of points from the curve in close proximity.

## (Curve) Length

Length of the newly added curves when it is not interpolated from other curves.

## (Curve) Radius

Radius of the newly added curves when it is not interpolated from other curves.

## Points (per Curve)

Number of control points in a newly added curve.

## Delete

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Density

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Comb

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Snake Hook

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Grow/Shrink

### Radius

The radius of the brush.

### Strength

The strength of the brush.

### Direction

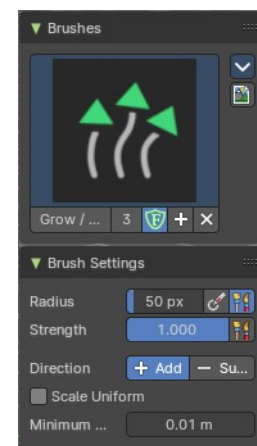

Add or subtract the effect of the brush. Add grows hair curves, Subtract shorten the hair curves.

### Scale Uniform

Grow or shrink curves by changing their size uniformly instead of using trimming or extrapolation. This is useful for preserving control point count.

### Minimum Length

Avoids shrinking curves shorter than this length.

## Pinch

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Puff

### Radius

The radius of the brush.

### Strength

The strength of the brush.

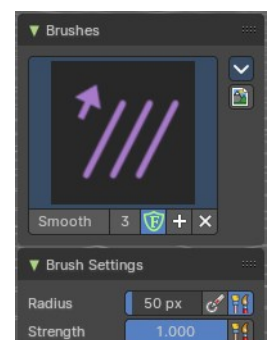

## Smooth

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Slide

### Radius

The radius of the brush.

### Strength

The strength of the brush.

## Stroke Sub panel

This subpanel shows with all brushes in the Brush settings panel.

### Stroke Method

Show the brush icon when painting.

### Dots

Apply paint on each mouse move step.

### Jitter

The position of the brush while painting. Pressure sensitivity can be activated here.

### Jitter Unit

Jitter in view in screen space or relative to brush size. Buttons are View and Brush Relatively..

### Input Samples

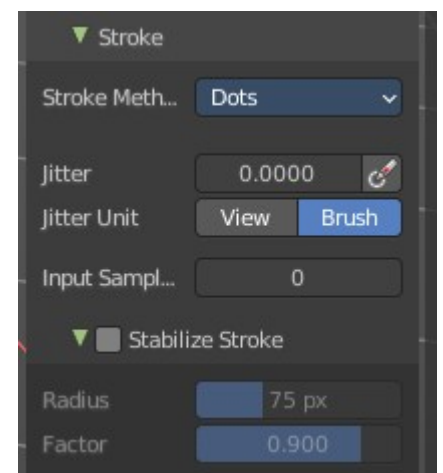

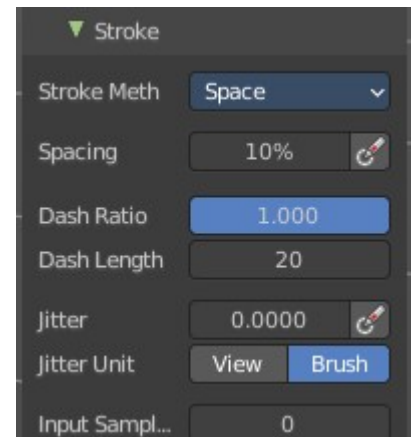

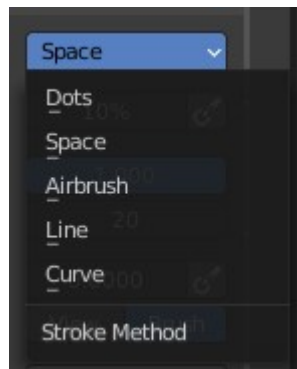

Average multiple input samples together to smooth the brush stroke.

### Stabilize Stroke subpanel

Brush lags behind the mouse and follows a smoother path when activated.

### Radius

Smooth stroke radius: minimum distance from the last point before stroke continues.

## Factor

Smooth stroke factor: higher values give a smoother stroke.

## Space

Limit brush applications to the distance specified by spacing.

## Spacing

Spacing between brush daubs as a percentage of a brush diameter. Pressure sensitivity activated here.

## Dash Ratio

Ratio of samples in a cycle that the brush is enabled.

## Dash Length

Length of a dash cycle measured in stroke samples.

## Jitter

The position of the brush while painting. Pressure sensitivity can be activated here.

## Jitter Unit

Jitter in view in screen space or relative to brush size. Buttons are View and Brush respectively.

## Input Samples

Average multiple input samples together to smooth the brush stroke.

## Stabilize Stroke

Brush lags behind the mouse and follows a smoother path when activated.

## Radius

Smooth stroke radius: minimum distance from the last point before stroke continues.

## Factor

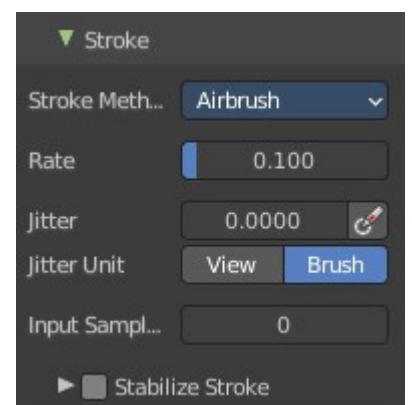

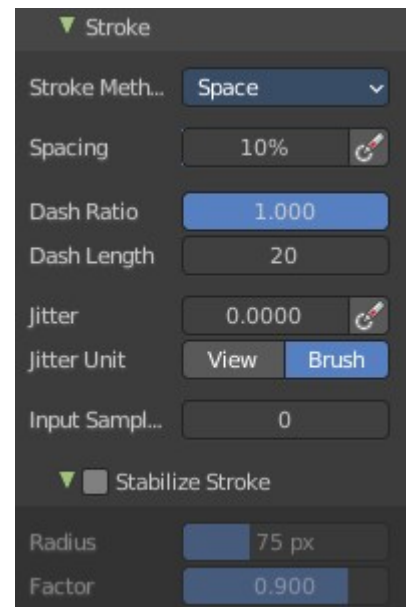

Smooth stroke factor: higher values give a smoother stroke.

## Airbrush

Keep applying paint effect while hiding mouse (spray).

## Rate

Intervals between paints for airbrush.

## ***Jitter***

The position of the brush while painting. Pressure sensitivity can be activated here.

## ***Jitter Unit***

Jitter in view in screen space or relative to brush size. Buttons are View and Brush respectively.

## ***Input Samples***

Average multiple input samples together to smooth the brush stroke.

## ***Stabilize Stroke***

Brush lags behind the mouse and follows a smoother path when activated.

## **Radius**

Smooth stroke radius: minimum distance from the last point before stroke continues.

## **Factor**

Smooth stroke factor: higher values give a smoother stroke

## **Line**

Drag a line with dabs separated according to spacing.

## ***Spacing***

Spacing between brush daubs as a percentage of a brush diameter.

## ***Dash Ratio***

Ratio of samples in a cycle that the brush is enabled.

## ***Dash Length***

Length of a dash cycle measured in stroke samples.

## ***Jitter***

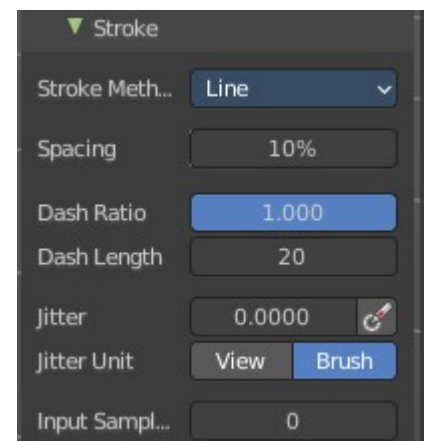

The position of the brush while painting. Pressure sensitivity can be activated here.

## ***Jitter Unit***

Jitter in view in screen space or relative to brush size. Buttons are View and Brush respectively.

## ***Input Samples***

Average multiple input samples together to smooth the brush stroke.

## Curve

Define the stroke curve with a bezier curve. Dabs are separated according to spacing.

## Spacing

Spacing between brush daubs as a percentage of a brush diameter.

## Paint Curve Data

Make new or select existing paint curve data profiles.

## Dash Ratio

Ratio of samples in a cycle that the brush is enabled.

## Dash Length

Length of a dash cycle measured in stroke samples.

## Jitter

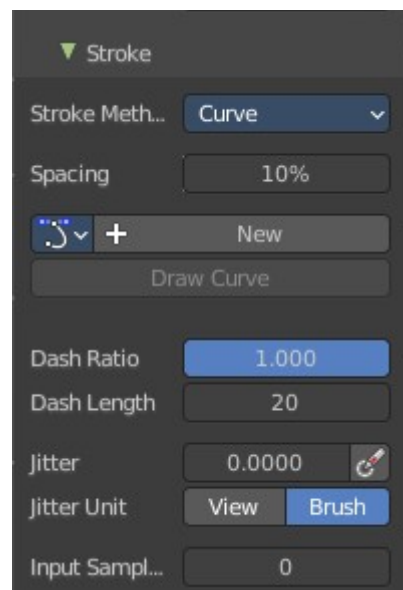

The position of the brush while painting. Pressure sensitivity can be activated here.

## Jitter Unit

Jitter in view in screen space or relative to brush size. Buttons are View and Brush respectively.

## Input Samples

Average multiple input samples together to smooth the brush stroke.

## Falloff Sub panel

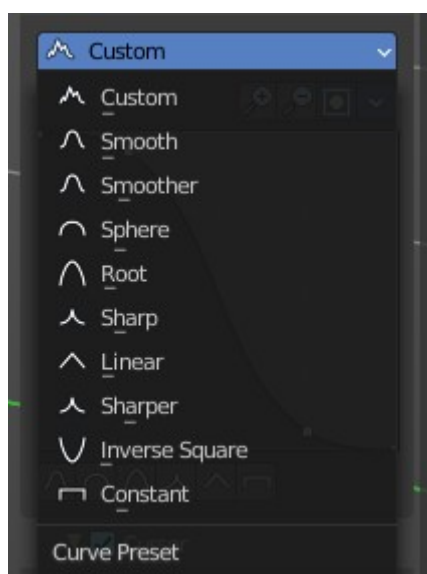

This subpanel shows with all brushes in the Brush settings panel. This customizes the fall off of the brush, where the left is the center and right is the outer circle of the brush. Higher values is stronger falloff.

## Curve Preset

Select a falloff curve preset.

## Zoom In

Zoom the graph in.

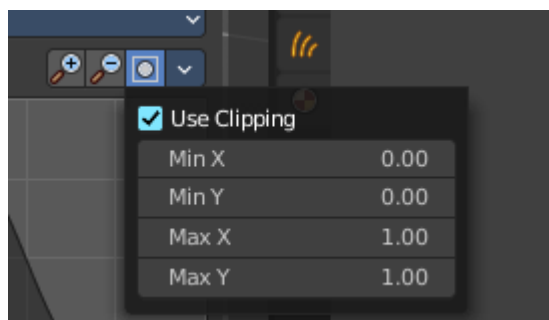

## Zoom Out

Zoom the graph out.

## Clipping Options

Control the minimum X and Y values and maximum X and Y values.

## Reset View

Restore the default zoom value and center view.

## Reset Curve

Reset to preset curve values.

## Presets

Quickly draw some default curve profiles.

## Cursor Sub panel

This subpanel shows with all brushes in the Brush settings panel.

### Show Brush

Show the brush icon when painting.

### Cursor Color

The brush icon color with adding.

### Falloff Opacity

The brush icon falloff opacity. This is an overlay drawn by a percentage.

### Override Overlay

When activated it won't show the overlay when drawing.

### Use Cursor Overlay

When activated, this will hide the overlay in the viewport completely.

## Symmetry panel

Enable symmetry sculpting for single axis.

## 7.3.18 Editors - 3D Viewport - Sidebar - View Tab

## View tab

The View tab contains viewport related settings.

The content is in all modes and for all object types the same.

## View tab - View Panel

The View panel contains some camera settings for the world camera and the render camera.

### Focal Length

Set up the focal length for the world camera. You need to be in perspective view. In Orthographic view the lens values doesn't have an effect.

### Clip Near / Clip Far

Set up the clipping values for the world camera. Geometry behind the end value and before the start value will not be drawn.

### Use Local Camera

Normally when you render an image it gets rendered from the currently active camera.

Define a custom camera that is always used for rendering. Regardless which camera is the active one.

### Passepartout

Toggles and shows all camera passepartout overlays.

## Use Render Region

When you have defined a render region rectangle, then you can toggle it on and off with this switch. See View menu in the 3d view header, the render region menu item.

## Camera Lock

Camera Lock is a sub tab with camera related settings.

### Lock to Object

Locks the view of the world camera to an object. Choose an object for it.

### Lock to 3D Cursor

Locks the view of the world camera to the 3D cursor. You can either lock to an object or to the 3d cursor. When you choose an object then the checkbox for the 3d cursor vanishes.

### Lock Camera to view

This menu item allows you to navigate in camera view like you would be in world view. When it is unticked then you can navigate the passepertout, you can zoom and move it. And when you rotate the view, then you will leave the camera mode.

Note that this functionality also exists in the header when you are in camera view. This double menu entry exists by design.

### Lock View Rotation

Locks the camera rotation, you cannot rotate the camera anymore. A use case is the 2D Animation workspace, where you can easily accidentally rotate the orthographic view out of position.

## View tab - Edit Panel

### Lock Object Modes

Restrict selection to content that is in the same mode than the current element.

## View Tab - 3D Cursor Panel

### Location

The position of the 3D cursor in world coordinates.

### Rotation

The rotation of the 3D cursor in world coordinates.

### Right Click menu

When you right click at the edit boxes then a menu with further functionality appears.

#### ***Reset All to Default Value***

Resets the X Y and Z values to the default value.

#### ***Reset Single to Default Value***

Resets the value for the single edit box under the mouse to the default value.

#### ***Unset***

Unset is usually a RMB menu entry when you right click at an edit box. It is somehow similar to Reset to Default Value. But it clears the property instead of resetting it to the default value. Which can end in another value.

#### ***Copy All to Selected***

Allows to copy the current rotation of all axis to another object.

Workflow. Select target object, hold down shift, select source object, and use Copy All to Selected.

#### ***Copy Single to Selected***

Allows to copy the current rotation of the single selected axis to another object.

Workflow. Select target object, hold down shift, select source object, and use Copy All to Selected.

#### ***Copy Data Path***

Copy Data Path copies the RNA data path for this property.

## Copy as new Driver

Copies the current value as a new driver.

## Online Python Reference

Developer feature. Open the Blender Python Reference.

## Edit Source

Developer feature. When you have a text editor open in the current layout then you can call the UI script that contains this menu item.

## View tab - Collections Panel

### Local Collections

Allows the list of visible collections to be controlled per viewport rather than globally.

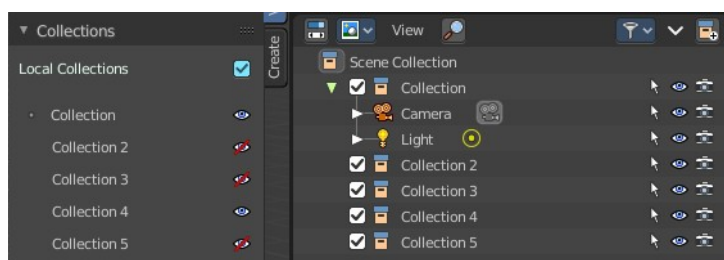

### List of Collections

The Collections panel shows a list of collections.

They can be hidden in the viewport by clicking on the eye icon.

If a collection contains objects, there is a circle to the left of the collection name. If a collection is empty, there is no circle to the left of the collection name.

By clicking directly on the collection names, it “isolates” the collection by hiding all other collections, and showing the direct parents and all the children of the selected collection.

## View tab - Annotations Panel

Manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

### Annotations prop

Add, remove and rename new annotations.

### Drop down box

A list of the available annotation layers.

## Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

## Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

---

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

## In Front

Toggle if the stroke is displayed in front of geometry or behind.

## Eye icon

The eye icon allows you to make it invisible And it has a search field.

---

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

## Move up / Down

Move the selected annotation up or down in the list

---

## Opacity

The opacity of the stroke.

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

## Onion Skin

Enable Onion Skinning.

Onion Skinning allows to show ghosts of the keyframes before and after the current frame. In this sub panel you can adjust the color of the onion skin frames.

With the numbers below the colors you can define how many frames before or after are displayed that way.

## View tab - Stereoscopy Panel

This panel shows when you have Stereoscopy enabled in the Output Properties of the Properties editor. Some content depends of the Stereoscopy settings.

## Left / Right / 3D

With Stereoscopy setting Stereo 3D.

Show the image in the 3d view from the left or right camera, or from both.

## Views / 3D

With Stereoscopy setting Multi-View.

Show the image in the 3d view from the single cameras, or from both.

## Cameras

With Stereoscopy setting Stereo 3D. Show the left and right cameras.

## Plane

Show the convergence plane.

## Alpha

The transparency of the convergence plane.

## Volume

Show the stereoscopy volume.

## Alpha

The transparency of the stereoscopy volume.

## Set Stereo 3D

Calls a panel where you can adjust the stereoscopy display in the 3D view to preview the result.

This settings does not affect the output, just how the result gets displayed in the viewport!

## Display Mode

How to display the stereoscopic image when viewing through the camera. This is the preview mode. You need a special monitor for some of the methods. There are five methods available.

## Display Mode Type Anaglyph

Render Views for left and right eyes as two differently filtered colors in a single image. You need anaglyph glasses to see the 3d effect.

## Anaglyph Type

The color model to display the graphics.

## Display Mode Type Interlace

Render Views from left and right eyes interlaced into a single image. You need a 3D Ready monitor to see the stereo effect.

### ***Interlace Type***

The interlace type that you can choose.

### ***Swap Left/Right***

Swaps left and right camera view.

### **Display Mode Type Time Sequential**

Render alternate eyes. Also known as page flip. Needs a graphics card that supports quad buffer.

### **Display Mode Type Side by Side**

Displays images of the two cameras side by side. You need to go into Window Full screen to see the effect.

Don't use the full screen. feature in the View menu of the 3D view, but the Window toggle full screen. in the Window menu!

Attention! the menus becomes nearly unreadable then. The whole UI gets distorted by splitting the main window of Bforartists into two views. You might want to assign a shortcut here before trying.

### ***Cross Eyed***

Swaps left and right camera view.

### **Display Mode Type Top Bottom**

Displays images of the two cameras top and bottom. You need to go into Window Full screen to see the effect.

Don't use the full screen. feature in the View menu of the 3D view, but the Window toggle full screen. in the Window menu!

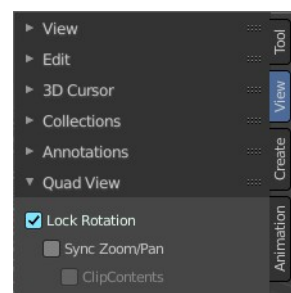

Attention! the menus becomes nearly unreadable then. The whole UI gets distorted by splitting the main window of Bforartists into two views. You might

want to assign a shortcut here before trying.

## View tab - Quad View panel

This panel just shows when you are in quad view. Toggle Quad View can be found in the View menu.

### Lock rotation

Quad view has four windows. Three of them can be locked to the orthographic views.

Turning off Lock Rotation reveals the quick navigation buttons Switch to Camera View and Switch between Perspectivic and Orthographic display.

### Sync Zoom Pan

In the three orthographic views you can either zoom and pan individually. Or you zoom and pan them in sync.

### Clip Contents

Clip objects based on what is visible in the other orthographic side views. The perspetivic view is not affected.

## View tab - Important Hotkeys

This panel is an addon called Important Hotkeys, and can be turned off in the Preferences.

It displays the most important hotkeys in the viewport.

### Show Text

Show or hide the text in the viewport.

### Color

Define what color the text should have. Default is white.

## Font Size

The size of the font.

## View tab – Sequencer Sync

## 7.3.16 Editors - 3D Viewport - Sidebar - Animation Tab

### Table of content

Animation tab - Pose Library Panel.....	2
Create Pose Asset.....	2
Copy Pose as Asset.....	2
Active Asset Library.....	2
List of Asset Poses.....	2
Search Field.....	2
Invert.....	2
Sort by Name.....	2

## Animation tab - Pose Library Panel

The Animation tab contains currently the pose library settings.

### Create Pose Asset

This button becomes active with a armature in pose mode. It allows you to insert the current pose into the Asset browser, to reuse it at a later point.

### Copy Pose as Asset

Copy the current pose as an asset, which can then be pasted into an asset library.

### Active Asset Library

Which asset library to use. A custom one, or the built in asset lib. Default is the built-in called Current File.

### List of Asset Poses

The list of available asset poses.

### Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

### Invert

Exclude the search term instead of searching for it.

### Sort by Name

Sort the List by name.

## Pose Assets context menu

When you right click on a pose asset in the Pose Library, you get extra options to help apply the pose. To use them, make sure you have a compatible armature selected, are in Pose Mode and have the bones you'd like to pose selected.

### Apply Pose

Apply the given pose action to the active rig. When you select this, this will apply the pose to selected bones.

### Apply Pose Flipped

Apply the given pose action to the active rig with a flipped axis. When you select this, this will apply the flipped pose to selected bones. Flipping happens usually from bones labeled .L and .R

### Blend Pose

Blend the given pose action to the active rig. This is useful to interpolate from the original pose to the new pose. When using, you will see a slider in the asset browser header giving you a degree of blend.

### Select Pose Bones

Select those bones used in this pose action. This will select all the necessary bones you need to apply the pose effectively. If you have no bones selected, the pose will not apply. Poses only apply to bones that are selected.

### Deselect Pose Bones

Deselect those bones used in this pose action. This will ultimately clear the selection based on the pose action bones defined in the marked action clip.

### Open Blend File

Opens the path for the blend file that contains the active asset. Useful to help edit poses.

## Item tab - Transform Panel

When you add an object to the scene then the Item tab with the Transform panel becomes visible. The content changes, dependent of the object type. And it changes with the mode.

In general you will most of the time see the same content though. Location, Rotation, Scale and Dimension.

### Animate Property

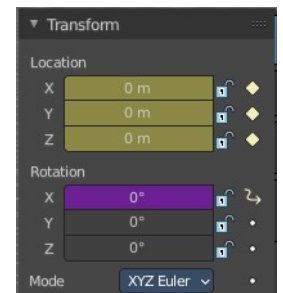

The properties with a dot button behind can be animated.

Note that you can, different from Blender, animate multiple objects at once this way.

### Keyframe and Driver coloring

When a keyframe exists at the current position, then the corresponding edit box turns yellow. When a driver exists at the current position, then the corresponding edit box turns purple.

Note that you can have either a driver or a keyframe. Both is not possible.

### Location

The current location of the object in its X, X and Z axis. The lock button behind the edit boxes allows you to lock the values.

### Rotation

The current rotation of the object in its X, X and Z axis in world coordinates. The lock button behind the edit boxes allows you to lock the values.

### Rotation Mode

Adjust what method gets used for the rotation. Euler rotation can run into a so called Gimbal lock, which can be avoided with quaternion rotation mode. But for most cases the default XYZ Euler method should work.

### Quaternion

With euler angles you will have three values available. But with a quaternion you will have four values available. And quaternions reveals a 4L button. This button shows or hides a lock behind the W value. Normally a quaternion has just three locks, one for each of the single axis. The W value is a mathematical construct from the three object axis. And you usually neither want to edit it nor to lock it therefore.

Locking the W axis will lock all axis.

## Scale

The current scale of the object in its X, X and Z axis in world coordinates. The lock button behind the edit boxes allows you to lock the values.

Scale is not dimensions. Your object can have a scale of 1 in world coordinates. But a dimension of 4.5. Note that for some operations it is required to have a scale of 1 to get some operations to work. This can be achieved with applying scale in the Object menu.

---

## Dimensions

The current dimension of the object in its X, X and Z axis in world coordinates. The lock button behind the edit boxes allows you to lock the values.

The Dimensions edit boxes are just available for primitives objects. Objects like Empties or a Camera doesn't have a dimension, but a scale factor.

## Right Click menu

Location, Rotation and Scale edit boxes and the locks have a right click menu with further functionality.

When there is already a keyframe available then the right click menu looks a bit different. Same counts for adding a driver first.

## Insert Keyframe

Inserts a keyframe at the current position. The keyframe type depends of where you right click. Insert Keyframe adds a keyframe for all axis.

## Insert Single Keyframe

Inserts a keyframe at the current position. The keyframe type depends of where you right click. Insert Single

Keyframe adds a keyframe for just the current axis.

---

## Add Driver

In Bforartists lots of things can be animated. Also buttons. Add Driver does exactly what it tells. It adds a driver for animation needs to the element. Drivers allows to control animation by properties like expressions, scripts or movements of other objects. Drivers are explained in the chapter 18 Editors - Drivers.

When you click the button the Driven Property panel will appear where you can change the properties for this driver. You don't need to confirm the driver creation. It is just further settings.

### Driver Settings

#### Type

The Driver type. There are two categories of drivers. Built-in and Custom

#### Built-in functions (Average, Sum, Min and Max)

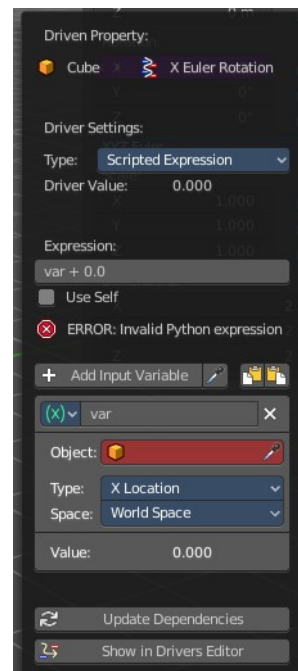

The driven property will have the value of the average, sum, lowest or highest (respectively) of the values of the referenced Driver Variables. If there is only one driver variable, these functions will yield the same result.

#### Custom (Scripted Expression)

An arbitrary Python expression that can refer to the Driver Variables by name.

#### Driver Value

The current result of the driver setup.

---

## Expression

### Expression edit box

Add a custom expression. An Expression to use for scripted expression.

The expression has access to a set of standard constants and math functions provided in the Driver Name space. For an example of adding a custom function to the name space.

When the expression is invalid then you get an error message. This error message appears also with the default values. Just ignore.

### Use Self

The variable self can be used for drivers to reference their own data. This is useful for objects and bones to avoid having creating a Driver Variable pointing to itself.

Example: self.location.x applied to the Y rotation property of the same object will make the object tumble when

moving.

Note that dependencies for properties accessed via self may not be fully tracked.

## Driver Variables

Driver Variables are references to properties, transformation channels, or the result of a comparison between transformations of two objects. It is displayed by a panel with all necessary settings, which gets filled in automatically when you create the driver.

### Add Input variable

Add manually a new driver variable.

Picker should allow you to pick a target object. But this is dysfunctional here since the panel closes immediately when you move the mouse out of it. Please use the picker in the Driver Editor.

Copy and Paste buttons allows you to copy and paste Driver variable panels.

## Driver Variable panel

### Variable type

The content of the Driver variable panel changes, dependent of the variable type that you choose here. We came from the transform panel, so our default type here is transform channel. That's what we will explain here.

### Object

Our object type.

### Type

The type of the driver.

### Space

The transform space in which the transform should happen.

### Value

The resulting value of the driver.

### Update Dependencies

Update all dependencies.

### Show in Drivers Editor

Opens the Drivers editor in a floating window. The drivers editor is explained in the chapter 18 Editors - Drivers.

## ***Open Drivers Editor***

Opens the Drivers editor in a floating window. The drivers editor is explained in the chapter 18 Editors - Drivers.

## **Add All to Keying Set**

Add All to Keying Set adds the information of the element to the current keyframe.

## **Add single to Keying Set**

Add to Keying Set adds the information of the element to the current keyframe.

## **Remove from Keying Set**

Remove from Keying Set removes the information of the element from the current keyframe.

## ***Reset All to Default Value***

Resets the X Y and Z values to the default value.

## ***Reset Single to Default Value***

Resets the value for the single edit box under the mouse to the default value.

## **Unset**

Unset is usually a RMB menu entry when you right click at an edit box. It is somehow similar to Reset to Default Value. But it clears the property instead of resetting it to the default value. Which can end in another value.

## **Copy All to Selected**

Allows to copy the current rotation of all axis to another object.

Workflow. Select target object, hold down shift, select source object, and use Copy All to Selected.

## **Copy Single to Selected**

Allows to copy the current rotation of the single selected axis to another object.

Workflow. Select target object, hold down shift, select source object, and use Copy All to Selected.

## **Copy Data Path**

Copy Data Path copies the RNA data path for this property.

## **Copy as new Driver**

Copies the current value as a new driver.

## **Assign Shortcut**

This is just for the locks. Here you could assign a shortcut.

## **Online Python Reference**

Developer feature. Open the Blender Python Reference.

## **Edit Source**

Developer feature. When you have a text editor open in the current layout then you can call the UI script that contains this menu item.

---

## **Replace Keyframes**

Replaces the keyframes in all axis at the current position.

## **Replace single Keyframe**

Replaces the keyframe in the currently selected axis at the current position.

## **Delete Keyframes**

Deletes the keyframes in all axis at the current position.

## **Delete Single Keyframe**

Deletes the keyframe in the currently selected axis at the current position.

## **Clear Keyframes**

Deletes all keyframes for all axis.

## **Clear single Keyframe**

Deletes all keyframes for the currently selected axis.

---

## **Delete Drivers**

Deletes the drivers for all axis.

## **Delete Single Driver**

Deletes the drivers for just the current axis.

## Copy Driver

Copies the driver.

## Edit Driver

Opens the Driven Property panel where you can change the settings for this driver.

# Item tab - Transform Panel in Edit Mode

Just primitive objects like mesh and curve does have an edit mode. Non primitive objects like a camera or an empty doesn't have an edit mode. With two exceptions. Text and Force Field type Curve Guide. Both are curve types.

## Mesh Objects

### Median

Median is the position of the selected mesh part.

### Global / Local

Define if the orientation of the selection is local to the selected object, or global to the world coordinates.

### Vertices Data

#### *Mean Bevel Weight*

Adjust the bevel weight for the selected vertices when you have a bevel modifier at the mesh.

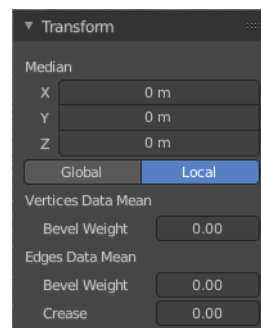

### Edges Data

#### *Mean Bevel Weight*

Adjust the bevel weight for the selected edges when you have a bevel modifier at the mesh.

#### *Mean Crease*

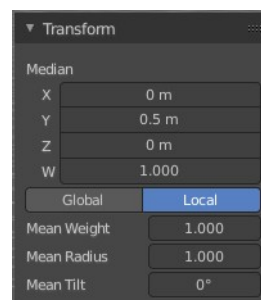

Adjust the weight of the selected vertices when you have a subdivision surface modifier at the mesh.

## Curve Objects / Surface Objects

### Median

Median is the position of the selected mesh part

## Global / Local

Define if the orientation of the selection is local to the selected object, or global to the world coordinates.

## Mean Weight

Adjust the weight used by softbody. Needs softbody.

## Mean Radius

Adjust the radius of the curve control points

## Mean Tilt

Adjust the tilt of the curve control points.

---

## Metaball Objects

### *Median*

Median is the position of the selected mesh part

### *Global / Local*

Define if the orientation of the selection is local to the selected object, or global to the world coordinates.

### *Radius*

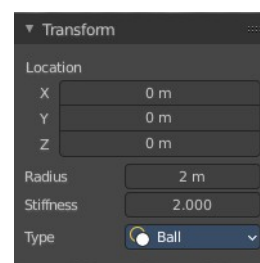

Adjust the radius of the selected meta element.

### *Stiffness*

Adjust the stiffness of the selected meta element.

### *Type*

Type is a drop down box. Adjust the meta element type.

---

## Text Objects

Text objects do have an edit mode, but they don't show content in the Transform panel.

## Armature objects Edit Mode

Bones do have a head and a tail. You cannot position the whole bone by numeric values, but the head and tail joints.

### Head

Adjust the world position of the head joint.

### Radius

This is just useful when you use Envelopes type bones. Adjust the Envelope radius of the head joint.

### Tail

Adjust the world position of the tail joint.

### Radius

This is just useful when you use Envelopes type bones. Adjust the Envelope radius of the tail joint.

### Roll

Adjust the bone roll.

### Length

Adjust the length of the bone.

### Envelope

This is just useful when you use Envelopes type bones. Adjust the overall Envelope size.

---

## Lattice Objects

You need to have some vertices of the Lattice object selected to see the content.

### Vertex

See and set the vertex positions of the lattice objects.

### Global / Local

Define if the orientation of the selection is local to the selected object, or global to the world coordinates.

### Mean Weight

Lattice object is a deform cage. Adjust the mean weight of the selected vertice(s).

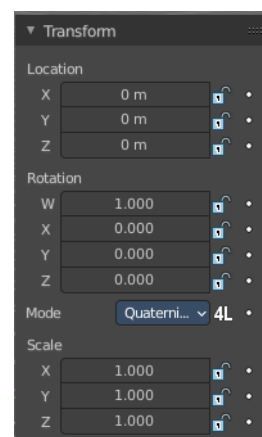

## Item tab - Transform Panel in Pose Mode

### Armature Objects in Pose Mode

The content in Pose mode is the same than in Object mode. We have Location, Rotation and Scale Edit Boxes. And the corresponding lock and animate buttons.

With one small difference. The rotation mode starts with Quaternions by default. And not with Euler Angles.

## Item tab - Vertex Weights Panel

The Vertex Weights panel shows in Edit and Weight Paint mode, when you have vertices selected, and the selected vertice(s) has a weight assigned.

It allows you to modify the weight of this selected vertice(s).

In Weight paint mode you need to be in vertex selection mode and have a vertice selected. It will not show with face select mode. To select a vertice in weight paint mode hold down ctrl and click.

In Edit Mode you can select more than one vertices. In Weight Paint Mode just one vertice at a time.

### Filter Vertex Groups

The first row is a setting. You can filter by all, only vertex groups that are assigned to deform bones. Or vertex groups that are assigned to non deform bones.

### Group

Set as active Vertex Group.

### Weight

The weight of the selected vertice(s). The range goes from 0 to 1.

### Paste Weight to Selected

Copy this group's weight to other selected vertices.

### Delete Weight

Deletes the weight for this selected vertice(s).

## **Normalize**

Normalizes the weight of the selected vertice(s).

## **Copy**

Copy active vertex to other selected vertices.

## 7.3.2 Editors - 3D Viewport - Sidebar - Tool Tab

### Table of content

Tool Tab.....	1
Tool Tab and Top Bar.....	1
Workspace Panel.....	1
Pin Scene.....	2
Mode.....	2
Filter Addons.....	2
Custom Properties.....	2
Top bar tools arrangement.....	2

### Tool Tab

In the tool tab you will find the tool related settings for the tools in the tool shelf. In Weightpaint mode you have for example all brush related panels.

The tool specific entries are explained in the tool shelf chapter. The brushes panels are explained in the tool tab chapters.

### Tool Tab and Top Bar

The content in the Tool Tab is besides one panel the same than in the Topbar. The panel called Workspace just exists in the sidebar.

The content of the Options panel changes, dependent of the object type and the mode. And will be described in other tool tab chapters.

### Workspace Panel

Workspaces can be configured to start in specific modes, and with a specific sets of active addons. This is the place where you configure this settings.

You have to save the startup file to make these changes permanent.

## Pin Scene

Remember the last used scene for the workspace. And switch to it whenever the workspace is activated again.

## Mode

The mode in which the 3D view should start when you switch to this workspace layout.

## Filter Addons

Filter, means activate or deactivate specific addons. Here you can turn on or off specific addons.

## Custom Properties

Custom properties allows you to store your own metadata. This metadata can then be used for rigging and Python scripts.

The following data supports custom properties:

- All data-blocks types.
- Bones and Pose-Bones.
- Sequence strips.

## Top bar tools arrangement

The tools in the top bar are arranged in a special way. Left you have the tools area. At the right you will find further options in case there are any. This is a general UI design paradigm. Left tools and menus, right settings.

## 7.3.3 Editors - 3D View - Sidebar - Tool Tab - Object Mode

### Table of content

Object Mode - Options Panel.....	1
Transform.....	1
Affect Only.....	1
Origins.....	1
Location.....	1
Parents.....	1

## Object Mode - Options Panel

### Transform

#### Affect Only

Restrict the elements that moves when you move rotate or scale the object.

#### Origins

Move or rotate the origin instead of the object geometry. Scale has no effect. And it will not work on geometry like lamps.

#### Location

This is for having more than one object selected. Scales or rotates the selection instead of scaling or rotating the single objects. The single objects keeps their scale and their rotation.

#### Parents

Don't transform the child objects. Just the parent objects.

## Tools Tab in Edit Mode

Many object types can be edited in edit mode. Mesh objects, armature, text object and so on. In this chapter we will go through all the object types in edit mode. But just a few object types have really relevant settings in the tools tab in edit mode. Mesh Objects. All kind of curve objects. And the Armature.

For the rest of the editable object types the tools tab stays blank.

## Mesh Object - Options Panel

This panel contains some mesh specific settings. It can also be found in the header.

### Transform sub panel

#### Correct Face Attributes

Correct data such as UV's and vertex colors when transforming.

#### **Keep Connected**

During the face attributes correction merge attributes connected to the same vertex.

#### **Mirror**

Mirror Editing.

The same mirror buttons can also be found in the tool settings bar as icon buttons. This allows quicker access and better visual control which mirror axis is currently active.

### ***Topology Mirror***

Use Topology based mirroring. This checkbox shows when you have selected a mirror axis.

### **Auto Merge**

Automatically merge vertices that are close to each other.

The same checkbox can also be found in the tool settings bar as an icon button. This allows quicker access and better visual control which mirror axis is currently active.

### ***Split Edges and Faces***

When mirror editing then split edges and faces automatically.

### ***Threshold***

Limit for removing duplicates and 'Auto Merge'.

## **UV subpanel**

### **Live Unwrap Edge Path**

Changing an edges seam in the 3d view recalculates the UV unwrap.

## **Armature - Armature Options panel**

### **X Axis Mirror**

X Axis Mirror is made to sync the right side of a symmetrical armature with the left side of a symmetrical armature. Means you can create just one half of a skeleton. And then simply mirror it over to the other half. And any further changes that you do at the one side will also apply to the other side of the armature. This includes the whole FK IK setup. And can save you lots of work therefore.

The same checkbox can also be found in the tool settings bar as an icon button. This allows quicker access and better visual control which mirror axis is currently active.

### **Workflow**

To get X Axis mirror to work requires a bit preparation work.

Create an armature, with some bones at the one side. Like this. The 3D cursor needs to be

at 0/0/0. The left bone is in the middle. Think of it as the backbone. The right bone has an offset, and shall represent our right side of the armature.

Change the Pivot Point in the Header to 3D Cursor. Important step. We want to mirror around the 3D Cursor.

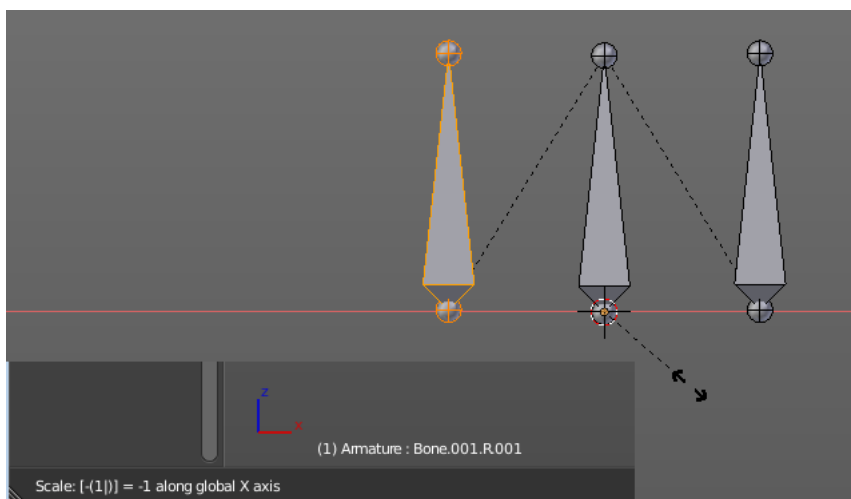

Now select the right side of the armature. Border select is one fast way. But NOT the bone in the middle, which is our backbone. We don't want to mirror this one too.

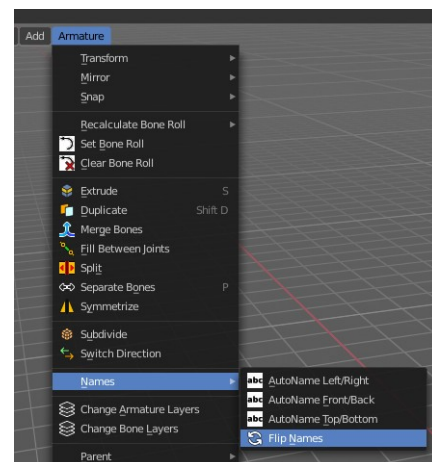

Duplicate what we have selected. And click immediately to leave the duplicate mode. Or you will pull the duplicated part around. Which is not what we want.

Next we will scale our new created armature part by -1 to mirror it over to the other side. Activate Scale, don't move the mouse, but type immediately in X for the axis and -1 for the scale factor.

This will create our mirrored armature part.

Next important step is to Flip Names. This renames the mirrored bones. Bone.001.R becomes without this step Bone.001.R.001. With rename we get Bone.001.L

And now we are finally arrived at X Axis Mirror. Tick it.

Now you should be able to modify the one side of the armature, and the other side will be modified too. This includes as told above also FK IK set-ups that you do in Pose mode.

X Axis Mirror.....	1
Relative Mirror.....	1
Affect Only Locations.....	1

## Tools Tab in Pose Mode

There are two object types that has a pose mode. The armature, and the grease pencil object. We will cover the armature here. The grease pencil object has its own chapter as a whole.

The number of available tools in the tools panel is rather small. There is just one panel.

## Pose Mode - Armature

### Pose Options Panel

#### Auto IK

Add temporary IK constraints while grabbing bones in Pose mode.

#### X Axis Mirror

X Axis Mirror in pose mode synchronizes the right side of a symmetrical armature with the left side of a symmetrical armature.

The same checkbox can also be found in the tool settings bar as an icon button. This allows quicker access and better visual control which mirror axis is currently active.

#### Relative Mirror

This is a setting for X Axis Mirror, and just shows when X Axis Mirror is ticked. Here you can define if the mirroring happens relative to the armature or to the world.

### Affect Only Locations

This is for having more than one armature part selected. Scales or rotates the selection instead of scaling or rotating the single armature parts. The single bones keeps their scale and their rotation.

## Tools Tab in Sculpt Mode

Sculpting is a process to deform the geometry by using a brush. Mesh objects, Grease Pencil objects and Hair Curve objects can be sculpted. In this chapter we handle the mesh tools. Grease Pencil and Curve Objects have their own chapter.

In Sculpt Mode you will mainly find settings for the different brushes, General settings, and brush specific settings. This settings can be found in different panels. The different brushes have different options and settings, dependent of which brush is selected. This brush specific options and settings are explained in the tool shelf chapter. Here we just cover the general panels with options and settings that exists for (nearly) all brushes.

The Sculpt Mode just exists for Mesh, Grease Pencil and Hair Curve objects.

## Brushes Panel

The Brush Panel contains an image browser to display the different Sculpt Brushes. Usually you have just one icon when you choose a brush from the tool shelf. But you can create your own brushes, based at the current chosen brush type. They save with the blend file when fake user is ticked.

### Browse Brush

The big image at the top is a drop down box where you can see the currently active brush. The file browser just shows the current active brush. Which gets chosen in the 3d view in the tool shelf. You can duplicate this brush, and modify it to your needs.

When you have added a few more brushes then the drop down box may be more than full. You will see some little white arrows then. Either in the top left or in the bottom right corner. They indicate that some brushes are hidden before or after the current display.

To scroll to this hidden content use the mouse wheel, or the arrow up and down buttons at the keyboard.

### Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

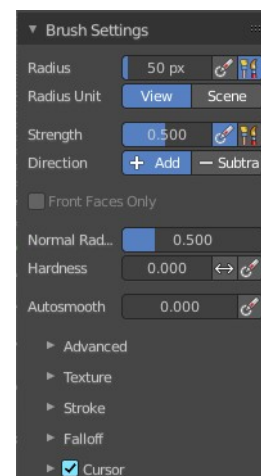

**F** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Brush Settings Panel

The Brush Settings Panel contains the Brush settings. The content differs, dependent of which brush you have chosen.

## Brush Settings Panel - Common Settings

These settings can be found in all brushes.

### Radius

The Radius edit box allows you to adjust the radius of the brush.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

### Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## Radius Unit

Display the radius value in view units or in scene units. View units are by default in pixels, scene units in meters.

## Strength

The Strength edit box allows you to adjust the strength of the brush.

## Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

## Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## Front Faces Only

Front Faces only means that the stroke just affects the vertices that are pointing forwards to the camera.

You need to have the falloff method set to Projected to activate the Front Faces Only checkbox.

## Normal Radius

The ratio between the brush radius and the radius that is going to be used to sample the normal.

## Hardness

How close the brush falloff starts from the edge of the brush.

## Invert Pressure for Hardness

Invert the modulation of pressure in hardness.

## Use pressure for hardness

Tablet feature. Use pressure to modulate hardness.

## Autosmooth

The autosmooth edit box allows you to adjust the amount of smoothing that gets automatically applied to each stroke.

## Use pressure for hardness

Tablet feature. Use pressure to modulate hardness.

## Brush Settings Panel - Draw brush

### Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Brush Settings Panel - Draw Sharp brush

### Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Brush Settings Panel - Clay brush

## Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Plane Offset

Adjust the plane on which the brush acts towards or away from the objects surface.

Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Plane Trim

Various brushes like Clay, Clay Thumb, Fill and Scrape brush. Enable Plane Trim.

Sculpting with these brushes happens in a plane defined by the view you are in and the

first vertices hit by the brush. The trim distance defines a limit above which vertices are not affected by the brush.

## Brush Settings Panel - Clay Strip brush

## Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Plane Offset

Adjust the plane on which the brush acts towards or away from the objects surface.

Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Plane Trim

Various brushes like Clay, Clay Thumb, Fill and Scrape brush. Enable Plane Trim. Sculpting with these brushes happens in a plane defined by the view you are in and the first vertices hit by the brush. The trim distance defines a limit above which vertices are not affected by the brush.

## Distance

Adjust the plane trim distance.

## Tip roundness

Roundness of the brush tip.

# Brush Settings Panel - Clay Thumb brush

## Plane Offset

Adjust the plane on which the brush acts towards or away from the objects surface.

Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Plane Trim

Various brushes like Clay, Clay Thumb, Fill and Scrape brush. Enable Plane Trim. Sculpting with these brushes happens in a plane defined by the view you are in and the first vertices hit by the brush. The trim distance defines a limit above which vertices are not affected by the brush.

## Distance

Adjust the plane trim distance.

# Brush Settings Panel - Layer brush

## Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Height

Layer brush setting. The height that can be affected by the layer brush.

## Persistent

Layer brush setting. Sculpt on a persistent layer of the mesh.

## Set Persistent Base

This button resets the base so that you can add another layer.

# Brush Settings Panel - Inflate brush

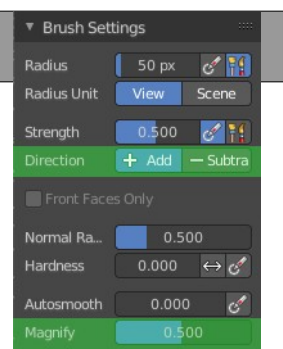

## Direction Inflate / Deflate

Add or subtract effect of the brush.

# Brush Settings Panel - Blob brush

## Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

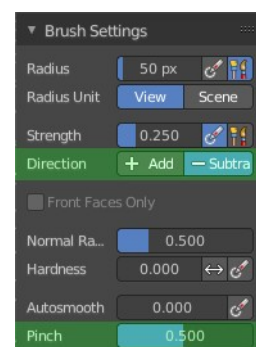

## Magnify

The Crease Brush Pinch Factor.

## Brush Settings Panel - Crease brush

## Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Pinch

The Crease Brush Pinch Factor.

## Brush Settings Panel - Smooth brush

## Direction Smooth / Enhance

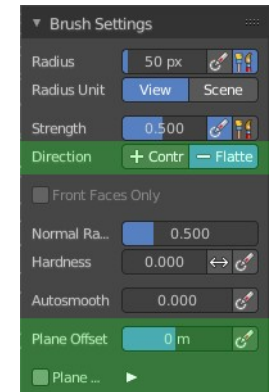

Smooth or enhance the surface detail.

## Brush Settings Panel - Flatten brush

## Direction Contrast / Flatten

Give more contrast or smooth the surface.

## Plane Offset

Adjust the plane on which the brush acts towards or away from the objects surface.

Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Plane Trim

Enable Plane Trim. Sculpting with these brushes happens in a plane defined by the view you are in and the first vertices hit by the brush. The trim distance defines a limit above which vertices are not affected by the brush.

## Brush Settings Panel - Fill brush

## Direction Fill / Deepen

Add or subtract effect of the brush

## Plane Offset

Adjust the plane on which the brush acts towards or away from the objects surface.

Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Plane Trim

Enable Plane Trim. Sculpting with these brushes happens in a plane defined by the view you are in and the first vertices hit by the brush. The trim distance defines a limit above which vertices are not affected by the brush.

## Area Radius

The ratio between the brush radius and the radius that is going to be used to sample the area center.

## Size Pressure

Enables tablet pressure sensitivity for radius.

## Invert to Scrape

Invert the stroke to a scrape stroke. Does not invert the displacement direction.

## Brush Settings Panel - Scrape brush

## Direction Fill / Deepen

Add or subtract effect of the brush.

## Plane Offset

Adjust the plane on which the brush acts towards or away from the objects surface.

Sculpting with the Clay brush happens in a plane defined by the view you are in and the first vertices hit by the brush.

## Plane Trim

Enable Plane Trim. Sculpting with these brushes happens in a plane defined by the view you are in and the first vertices hit by the brush. The trim distance defines a limit above which vertices are not affected by the brush.

## Area Radius

The ratio between the brush radius and the radius that is going to be used to sample the area center.

## Size Pressure

Enables tablet pressure sensitivity for radius.

## Invert to Fill

Use scrape or fill tool when inverting this brush instead of inverting its displacement direction.

# Brush Settings Panel - Multi-plane Scrape brush

## Plane Angle

Multiplane Scrape brush. The angles between the planes of the crease.

## Dynamic Mode

Multiplane Scrape brush. Fit the angles during the stroke to fit the angles under the cursor.

## Show Cursor Preview

Multiplane Scrape brush. Preview the plane scrapes in the cursor during the stroke.

# Brush Settings Panel - Pinch brush

## Direction Magnify / Pinch

Add or subtract effect of the brush.

## Autosmooth

The autosmooth edit box allows you to adjust the amount of smoothing that gets automatically applied to each stroke. The button behind the edit box enables tablet pressure sensitivity for autosmooth.

# Brush Settings Panel - Grab brush

## Normal Weight

How much grab will pull vertexes out of surface during grab.

## Grab active Vertex

Apply the maximum grab strength to the active vertex instead of the cursor position.

## Grab Silhouette

Grab trying to automask the silhouette of the object.

# Brush Settings Panel - Elastic Deform brush

## Normal Weight

How much grab will pull vertexes out of surface during grab.

## Deformation

The deformation type to use.

## Volume Preservation

Poisson ratio for elastic deform. The higher the value is the more the volume is kept. But leads to more bulging.

# Brush Settings Panel - Snake Hook brush

## Normal Weight

How much grab will pull vertexes out of surface during grab.

## Magnify

The Crease Brush Pinch Factor.

## Rake

How much grab will follow cursor rotation.

## Deformation

The deformation type.

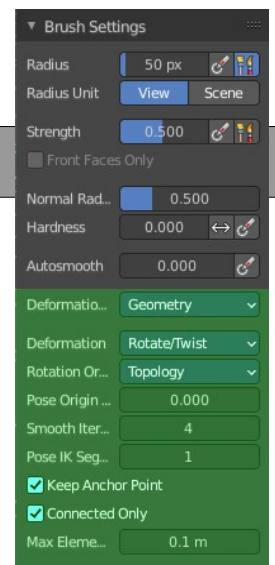

# Brush Settings Panel - Thumb brush

Just standard settings.

# Brush Settings Panel - Pose brush

## Deformation Target

Pose Brush setting. How the deformation of the brush will affect the object.

## Deformation

Pose Brush setting. Deformation type that is used in the brush.

## Lock Rotation when scaling

With Scale/Translate mode. Do not rotate the segment when using the scale deform mode.

## Rotation Origins

Pose Brush setting. Define the rotation origins.

## Pose Origin Offset

Pose Brush setting. Offset of the pose origin in relation to the brush radius.

## Smooth Iterations

Pose Brush setting. Smooth iterations applied after calculating the pose factor of each vertex.

## Pose IK Segments

Pose Brush setting. Number of segments of the IK chain that will deform the mesh.

## Keep Anchor Point

Pose Brush setting. Keep the position of the last segment in the IK chain fixed.

## Connected only

Affect only topology connected elements.

## Max Element Distance

Maximum distance to search for disconnected loose parts in the mesh.

### Brush Settings Panel - Nudge brush

Just standard settings.

### Brush Settings Panel - Rotate brush

Just standard settings.

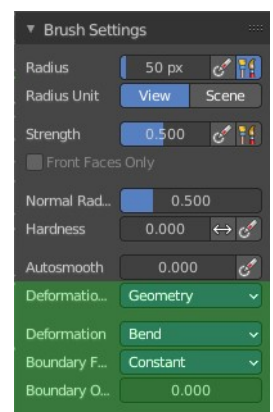

### Brush Settings Panel - Slide Relax brush

## Deformation

The deformation type to use.

### Brush Settings Panel - Boundary brush

## Deformation Target

The deformation type to use.

## Deformation

The deformation type to use.

## Boundary Falloff

Boundary brush option. The falloff type.

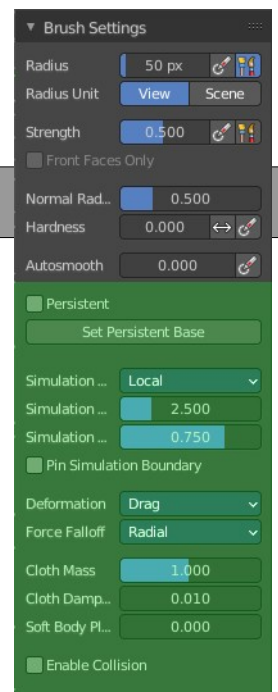

## Boundary Origin Offset

Boundary brush option. Offset of the boundary origin in relation to the brush radius.

## Brush Settings Panel - Cloth brush

## Persistent

Layer brush setting. Sculpt on a persistent layer of the mesh.

## Set Persistent Base

This button resets the base so that you can add another layer.

## Simulation Area

Cloth brush. Simulates either only a specific area around the brush or the entire mesh.

## Simulation Limit

Cloth brush with local area. Factor added relative to the size of the radius. To limit the cloth simulation effect.

## Simulation Falloff

Cloth brush with local area. The area to apply deformation falloff to the effects of the simulation.

## Pin Simulation Boundary

Lock the position of the vertices in the simulation falloff area.

---

## Deformation

Cloth brush. The type of cloth deformation that you want to perform.

## Force Falloff

Cloth brush. The shape that is used in the brush to apply force to the cloth.

## Cloth Mass

Cloth brush. The mass of each simulation particle.

## Cloth Damping

Cloth brush. How much the applied forces are propagated through the cloth.

## Soft Body Influence

Cloth brush. How much the simulation preserves the original shape, acting as a soft body.

## Enable Collision

Cloth brush. Collide with objects during the simulation.

## Brush Settings Panel - Simplify brush

Just standard settings.

## Brush Settings Panel - Mask brush

## Direction Add / Subtract

Add means the stroke adds to the geometry. Subtract means the stroke subtracts from the geometry.

## Mask Tool

Draw or smooth the current mask.

## Brush Settings Panel - Draw Face Sets brush

Just standard settings.

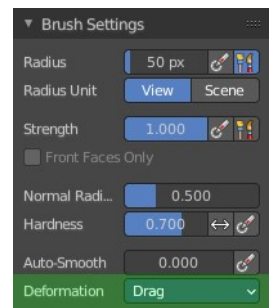

## Brush Settings Panel - Multires Displacement Eraser brush

Just standard settings.

## Brush Settings Panel - Multires Displacement Smear brush

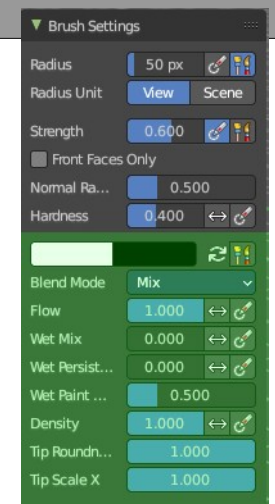

### Deformation

The deformation method for the smear.

## Brush Settings Panel - Paint

Paint allows you to vertex paint at the sculpt mesh.

## Primary / Secondary color

Set the primary and secondary color for painting.

## Swap colors

Swap the primary with the secondary color.

## Use Unified Color

Use the same color over all editors and modes.

## Blend Mode

The blending mode for the color.

## Flow

Amount of paint applied per stroke sample.

## Invert Pressure

Invert pressure.

## Use Pressure

Use Pressure. This requires a tablet.

## Wet Mix

Mix the existing color into the paint color.

## Invert Pressure

Invert pressure.

## Use Pressure

Use Pressure. This requires a tablet.

## Wet Persistence

Amount of wet paint that stays at the stroke after applying paint to the surface.

## Invert Pressure

Invert pressure.

## Use Pressure

Use Pressure. This requires a tablet.

## Wet Paint Radius

Ratio between the brush radius and the radius that gets used for wet paint.

## Density

Amount of random elements that are going to be affected by the brush.

## Invert Pressure

Invert pressure.

## Use Pressure

Use Pressure. This requires a tablet.

## Tip Roundness

Roundness of the brush tip.

## Tip Scale X

Scale of the brush tip in X axis.

## Brush Settings Panel - Smear

Smear vertex colors.

## Deformation

How to deform the smearing.

## Brush Settings Panel - Color Picker Sub panel

This sub panel is for the vertex painting paint tool. Define the primary and secondary color for the paint by a color picker and gradient dialog.

### Mode

#### Color / Gradient

Choose the color mode.

#### Color picker mode

##### Colorpicker

The color wheel of the color picker.

#### *Primary / Secondary color*

Set the primary and secondary color for painting.

#### *Swap colors*

Swap the primary with the secondary color.

#### *Use Unified Color*

Use the same color over all editors and modes.

### Gradient mode

Allows you to paint gradients.

#### *Color Ramp*

Color Ramps enables the user to specify a range of colors based on color stops. The color between the color stops gets interpolated.

### Controls

+

Add a stop to your color ramp. The stop will be added after the selected one, in the middle to the next one.

-

Deletes the selected color stop from the list.

## Tools menu

### **Flip Color Ramp**

Flips the gradient, inverting the values of the color ramp.

### **Distribute Stops from Left**

Rearrange the stops so that every step has the same space to the right.

### **Distribute Stops Evenly**

Space between all neighboring stops becomes equal.

### **Eyedropper (pipette icon) E**

An Eyedropper to sample a color or gradient from the interface to be used in the color ramp.

### **Reset Color Ramp**

Resets the color ramp to its default state.

## Color Mode

### **RGB**

Blends color by mixing each color channel and combining.

### **HSV/HSL**

Blends colors by first converting to HSV or HSL, mixing, then combining again. This has the advantage of maintaining saturation between different hues, where RGB would de-saturate, this allows for a richer gradient.

## Interpolation

### **Ease**

Uses an Ease Interpolation for the color stops.

### **Cardinal**

Uses a Cardinal Interpolation for the color stops.

### **Linear**

Uses a Linear Interpolation for the color stops.

### **B-Spline**

Uses a B-Spline Interpolation for the color stops.

### **Constant**

Uses a Constant Interpolation for the color stops.

## Color Ramp

The color band. A click at one of the color stops makes it the active one. You can move the color stops by clicking at them and dragging them around.

## Active Color Stop elements

Adjust the active color stop.

### **Choose active color stop**

Choose the color stop by index.

#### **Pos**

The position of the active color stop. The range goes from 0.000 to 1.000

#### **Color**

The color of the active color stop. Click at it to change the color.

### **Background Color**

The background color.

### **Gradient Mapping**

How to paint the gradient.

#### **Pressure**

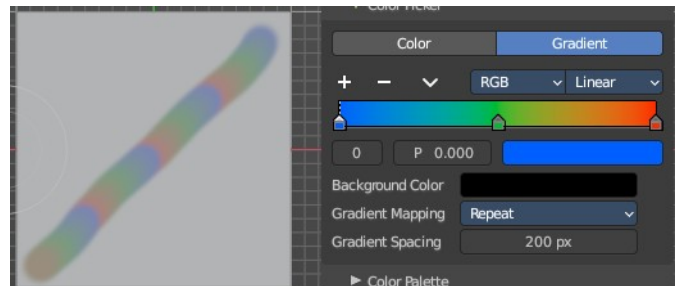

Paint the gradient by tablet pressure. Obviously you need a tablet for this.

#### **Repeat**

Paint the gradient by repeating the colors.

#### **Gradient Spacing**

The spacing between the colors in screen pixels. You need to have a gradient spacing higher than 0.

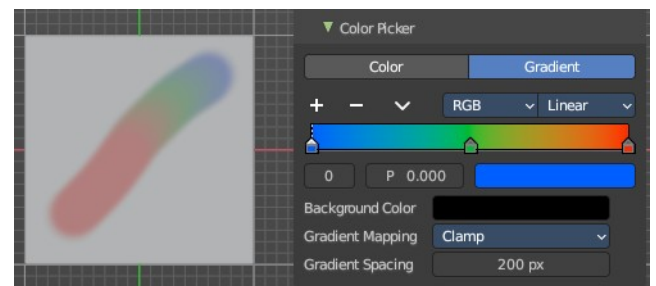

#### **Clamp**

Paint the gradient from first color to last color, and then sticks with the last color. You need to have a gradient spacing higher than 0.

#### **Gradient Spacing**

The spacing between the colors in screen pixels.

## **Brush Settings Panel - Color Palette Sub panel**

This sub panel just shows with the paint tool. Define a color palette to use for vertex painting.

Create a color palette for later reuse.

First create a new palette by clicking at New. Then adjust the color in the

color picker. And then click at the add button to add this color to the palette.

To set the color picker to a palette color simply click at this palette color.

To remove a color from the palette, choose it, then click at the remove button. The active palette color that gets removed is the one with the triangle at it.

The color palette cannot be saved externally. It is part of the current blend file. You can however append color palettes from other blend files.

The currently active color is the one with the triangle at it.

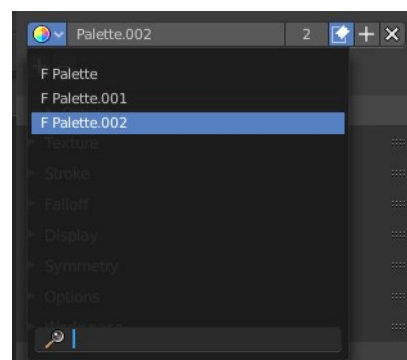

The elements are explained from left to right.

## Palette browser

The button at the left opens a dropdown list. Choose between your palettes.

## Edit Box

The name of the currently active palette. You can also rename the palette here. A click into the edit box makes the name editable.

## Number of users

See how many users the palette currently has.

## Fake User

Fake User sets the element to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

## Add palette

Add a new palette.

## Remove Palette

Clicking at this button removes the palette. Note that you need to save, close Bforartists and reload the blend file to remove the palette completely.

## Add color

Adjust a color in the color picker. Then click at the add button to add this color to the palette.

## Remove color

Select the color in the palette, then click at the minus button to remove it.

## Sort By

Sort the palette by the chosen method.

## Brush Settings Panel - Advanced Sub panel

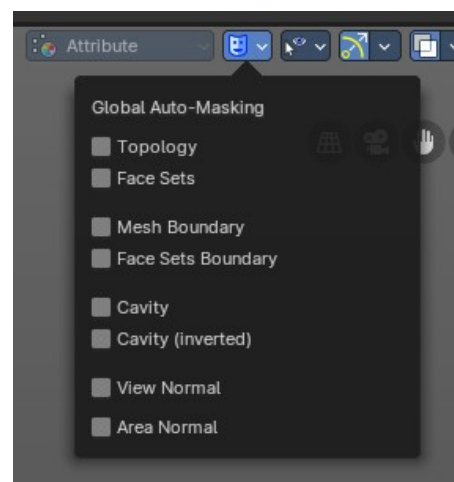

In this sub panel you can find the not so often used settings. They differ from brush to brush. Have a look at the tool tips.

## Global Automasking (Header)

In this sub panel in the header you can define Auto-Masking for scene brush settings.

**Note:** *These override any brush Auto-Masking settings.*

## Automasking

In this group of properties toggles you can define Auto-Masking settings per brush. These are

### Topology

Affect only vertices that are connected to the current active vertex under the brush.

## Face Sets

Affect only vertices that share face sets with the active vertex.

## Mesh Boundary

Do not affect non manifold boundary edges.

The setting that appears on activation and is valid for both, Mesh Boundary and Face Sets Boundary.

## Face Sets Boundary

Do not affect vertices that belong to a face set boundary.

The setting that appears on activation and is valid for both, Mesh Boundary and Face Sets Boundary.

## Cavity

Do not affect vertices on peaks. This feature is based on the surface curvature.

The setting that appears on activation and is valid for both, Cavity, and Cavity (Inverted).

## Cavity (Inverted)

Do not affect vertices in valleys. This feature is based on the surface curvature.

The setting that appears on activation and is valid for both, Cavity, and Cavity (Inverted).

## Create Mask

Creates a mask based on the curvature of the surface.

## Factor

The contrast of the cavity mask.

## Blur

The number of times the cavity mask is blurred

## Custom Curve

Use a custom falloff curve for the cavity mask.

## Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

### Clipping Options

Set up clipping for the stroke.

#### *Use Clipping*

Turns clipping on or off.

#### **Min and Max X Y**

The values for the clipping area.

### Tools

Tools is a menu where you can find some curve related tools.

#### *Reset View*

Resets the curve windows zoom.

#### *Extend horizontal*

Extends the curve before the first curve point and after the last curve point horizontally.

#### *Extend extrapolated*

Extends the curve before the first curve point and after the last curve point extrapolated.

#### *Reset Curve*

Resets the curve to the initial shape.

### Handle Types

Sets the handle type for the current selected curve point.

### X Y Position

The position of the current active curve point.

## Delete Points

Deletes the current active curve point.

---

## View Normal

Affect only vertices with a normal that faces the viewer.

## Occlusion

Only affect vertices that are not occluded by other faces. With Occlusion on the Limit and Falloff options are not available.

## Limit

View normal limit. The range of angles that will be affected.

## Falloff

Extend the angular range with a falloff gradient.

## Area Normal

Affect only vertices with a similar normal to where the stroke starts.

## Limit

Area normal limit. The range of angles that will be affected.

## Falloff

Extend the angular range with a falloff gradient.

---

## Sculpt Plane

The sculpt plane defines how the sculpting is aligned. It is a dropdown box. Choose different methods. By default the Area Plane gets used.

## Use Original

### Normal

When ticked keep using normal of the surface where the stroke was initiated.

### Plane

When ticked keep using plane origin of the surface where the stroke was initiated.

## Accumulate

Accumulate stroke daubts on top of each other.

## Front Faces Only

The brush only affects the vertices that faces the viewer. Projected Falloff Only.

# Brush Settings Panel - Texture Subpanel

The Texture panel allows you to sculpt with textures. This allows you for example to grab a foto from some fish scales, and simply sculpt them into the surface of your object by using this image as a pencil. Or as a blueprint where you calk through ( Stencil method ).

Note that the following shots are made with Symmetry off and without Brush falloff. Since they disturbed.

Symmetry can be turned off a few panels deeper in the Symmetry panel.

## Browse Texture to be linked

The image at the top of the panel is a image browser. Choose a texture that you can choose for sculpting then. You can also have more than one image loaded at once.

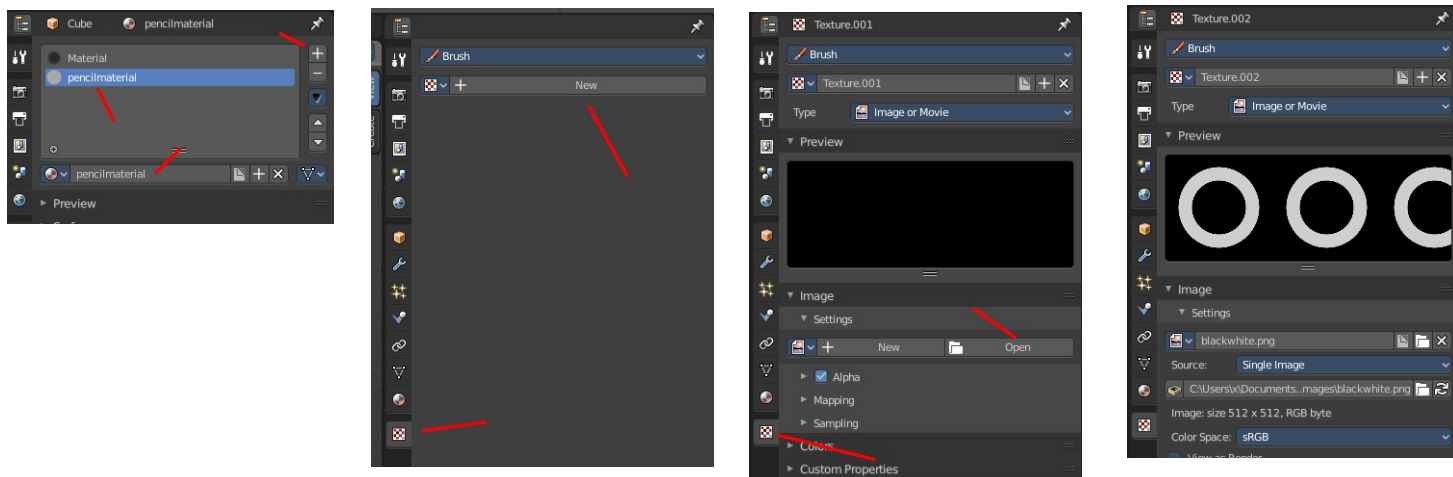

## Adding a texture

The way to add the texture here is a bit more complicated. And not done with clicking at the New button.

First click at the New button below the image. This will create a new texture slot. This slot is still empty, it displays black.

We need to load the texture in this slot. This must be done in the Properties editor in the Textures tab.

And when you switch back to the Tools tab, then the texture finally shows in the Texture panel in the Tool Shelf. And we can use it.

## Texture Edit box

The Texture edit box is the edit box below the Image browser. When there's no image loaded then it displays the New button. When there's a image (or more) loaded, then you will see the name of the current texture.

The Fake User button turns this texture into a data block with a fake user. Means it will exists even when there is no data connected to it anymore.

The + Button adds another texture slot. Note that you will have to load a texture too, as explained above.

The X button deletes the texture slot.

## Brush Mapping

Our texture can be mapped in different methods. The Brush mapping is a drop down box. Choose this different brush mapping methods.

The settings vary. So we will go through them by the different brush mapping methods.

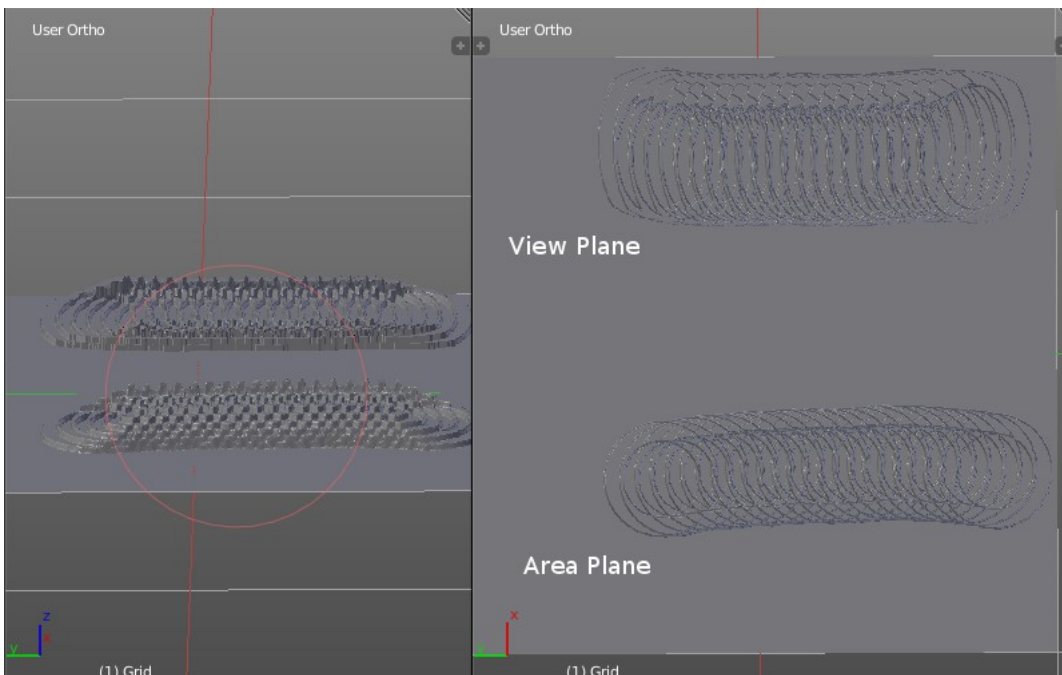

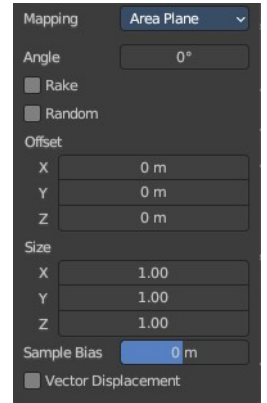

## Brush Mapping with mapping method View Plane and Area Plane

The brush mapping method View Plane maps the brush onto the surface of the object, calculating the mapping from the current view. The result may be distorted when the view does not align with the surface of the object.

The brush mapping method Area Plane maps the brush onto the surface of the object, calculating the mapping from the current view. The result is not distorted.

### **Angle edit box**

Adjust the angle of the brush.

### **Rake**

The angle follows the direction of the brush stroke.

### **Random**

The brush angle gets set random.

### **Random edit box**

Becomes visible when you tick Random. Adjust the maximum value of the random angle.

### **Offset**

Fine tune the offset of the texture in the brush.

## **Size**

Fine tune the size of the texture in the brush.

## **Sample Bias**

Add to or subtract from the amount that gets added by the brush texture.

## **Vector Displacement**

Just Area Plane. Handles each pixel color as an individual vector for displacement.

## **Brush Mapping with mapping method Tiled**

The brush mapping method View Plane maps the brush onto the surface of the object, and tiles the pencil onto the surface. The mapping happens from the View plane. Means you get distortions when you sculpt from an angle.

## **Angle edit box**

Adjust the angle of the brush.

## **Offset**

Fine tune the offset of the texture in the brush.

## **Size**

Fine tune the size of the texture in the brush.

## **Sample Bias**

Add to or subtract from the amount that gets added by the brush texture.

## Brush Mapping with mapping method 3D

The brush mapping method View Plane and Area Plane sculpts where the pencil is. The method 3D sculpts at the initial position of the pencil, as long as you don't release the mouse. The mapping happens from the View plane. Means you get distortions when you sculpt from an angle.

### **Offset**

Fine tune the offset of the texture in the brush.

### **Size**

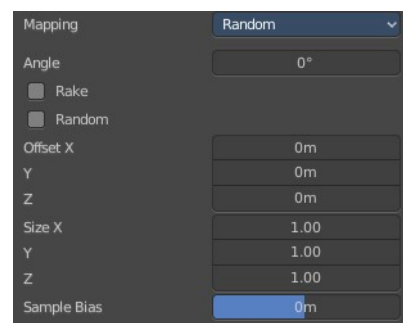

Fine tune the size of the texture in the brush.

### **Sample Bias**

Add to or subtract from the amount that gets added by the brush texture.

## Brush Mapping with mapping method Random

The brush mapping method Random randomizes the texture position of the pencil texture. And so it sculpts random fragments of the pencil.

## **Angle edit box**

Adjust the angle of the brush.

## **Rake**

The angle follows the direction of the brush stroke.

## **Random**

The brush angle gets set random.

## **Random edit box**

Becomes visible when you tick Random. Adjust the maximum value of the random angle.

## **Offset**

Fine tune the offset of the texture in the brush.

## **Size**

Fine tune the size of the texture in the brush.

## **Sample Bias**

Add to or subtract from the amount that gets added by the brush texture.

---

## **Brush Mapping with mapping method Stencil**

The former methods uses the textures for the brush. The method Stencil works different. You have your texture displayed in the workspace above the object, and you paint this texture onto your object with your pencil strokes.

Note that the texture in the 3d space is just visible when you are with the mouse over the viewport.

## Image Aspect

Adjust the stencil size to fit to the image aspect ratio.

## Angle edit box

Adjust the angle of the brush. The button at the end allows you to set the radius by dragging the mouse. This should be done in the viewport and with the hotkey. This button is just a visible reminder.

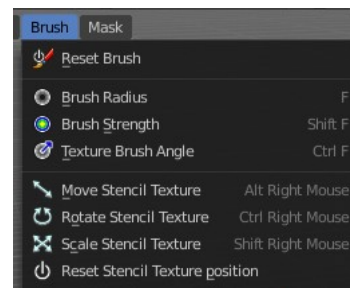

## Offset

Fine tune the offset of the texture in the brush.

## Stencil Texture Controls

You can find the controls to modify the position, rotation and scale of the stencil texture in the Brush menu in the 3D view. This happens by Hotkeys.

# Brush Settings Panel - Stroke Sub panel

The Stroke panel contains settings to influence the behavior of the brush stroke. There are various stroke methods available. We will go through them one by one.

## Stroke Panel with Stroke method Space

This is the default Stroke method. The sculpt stroke gets added continuously with given settings.

## Spacing Edit Box

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

### Spacing Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Spacing Distance

If the spacing happens in View or in Scene distance.

## Adjust Strength for Spacing

Automatically adjust the strength to give consistent results for different spacing.

## Dash Ratio

Ratio of samples in a cycle that the brush is enabled.

## Dash Length

Length of a dash cycle measured in stroke samples.

## Jitter Edit Box

Add Jitter to the brush while painting.

### Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Jitter Unit

If the jitter happens in screen space in pixels, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

### Stabilize Stroke

When activated then the brush lags behind the mouse position, and produces a much smoother stroke by that. It is a sub panel with two settings.

## Smooth Stroke Radius Edit Box

Adjust the radius of the smoothing.

## Smooth Stroke Factor Edit Box

Adjust the factor of the smoothing.

---

## Stroke Panel with Stroke method Curve

The Stroke method curve doesn't simply influence the way how the stroke is painted.

It is a special method. First you draw a curve object by holding down ctrl and clicking with left mouse button. Then you tweak the curve. You can click at the curve point, and drag out handlers to make the curve points smooth.

Then you hit the Draw Curve button. And the curve gets sculpted.

## Spacing Edit Box

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Spacing Distance

If the spacing happens in View or in Scene distance.

### Adjust Strength for Spacing

Automatically adjust the strength to give consistent results for different spacing.

## Paint Curve edit box

Here you set the active curve.

**The first element** is a drop down box where you will find your curves objects. You can have more than one.

**The second element** is the edit box that displays the active curve.

**Fake User** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Draw Curve Button

A click at it to turns the curve into a sculpt stroke.

## Jitter Edit Box

Add Jitter to the brush while painting.

### Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Jitter Unit

If the jitter happens in screen space in pixels, or relative to the brush size.

## ***Input Samples Edit Box***

Average multiple input samples together to smooth the brush stroke.

## **Stroke Panel with Stroke method Line**

With Stroke method line you draw a line between a starting point and an endpoint. And when you release the mouse then the line gets sculpted.

## **Spacing Edit Box**

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### ***Spacing Distance***

If the spacing happens in View or in Scene distance.

### ***Adjust Strength for Spacing***

Automatically adjust the strength to give consistent results for different spacing.

## **Jitter Edit Box**

Add Jitter to the brush while painting.

## ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

If the jitter happens in screen space in pixels, or relative to the brush size.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## **Stroke Panel with Stroke method Airbrush**

The sculpt stroke acts like an airbrush pencil. The dots gets placed randomly.

## **Rate Edit Box**

Define the rate of the drawing.

## ***Spacing Distance***

If the spacing happens in View or in Scene distance.

## **Jitter Edit Box**

Add Jitter to the brush while painting.

## ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Unit

If the jitter happens in screen space in pixels, or relative to the brush size.

---

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

---

## Stabilize Stroke

When activated then the brush lags behind the mouse position, and produces a much smoother stroke by that. Smooth stroke has two settings.

## Smooth Stroke Radius Edit Box

Adjust the radius of the smoothing.

## Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

## Stroke Panel with Stroke method Anchored

Click and drag to place a dot and to scale it.

## Edge to Edge

Without Edge to Edge the scaling happens from the center of the brush. With edge to edge the scaling happens from the edge of the brush.

## ***Spacing Distance***

If the spacing happens in View or in Scene distance.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## **Stroke Panel with Stroke method Drag dot**

Click and drag to place a dot.

## **Spacing Distance**

If the spacing happens in View or in Scene distance.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## Stroke Panel with Stroke method dot

### Spacing Distance

If the spacing happens in View or in Scene distance.

### Jitter Edit Box

Add Jitter to the brush while painting.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Jitter Unit

Jitter in screen space or relative to the brush size.

### Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

### Stabilize Stroke

When activated then the brush lags behind the mouse position, and produces a much smoother stroke by that. Smooth stroke has two settings.

### Smooth Stroke Radius Edit Box

Adjust the radius of the smoothing.

### Smooth Stroke Factor Edit Box

Adjust the factor of the smoothing.

## Brush Settings Panel - Falloff Sub panel

The Falloff panel allows you to define different falloffs methods for the border of the brush.

### Presets

The different available falloff presets. The method custom allows you to define your own falloff. And reveals a curve panel.

### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

### **Reset Curve**

Resets the curve to the initial shape.

## Use Clipping

Clipping options. Set up clipping for the stroke. The blue button at the top turns clipping on or off.

## Delete Points

Deletes the selected curve point.

## Curve Presets

Predefined curve presets as a starting point.

## Falloff Shape

Use projected or spherical falloff.

# Brush Settings Panel - Cursor Sub panel

Change the appearance of the brush cursor.

## Cursor checkbox in header

Show or hide the brush cursor.

## Cursor Color

The cursor color with add operations.

## Inverse Color

The cursor color with subtract operations.

## Falloff Opacity

You can turn on the cursor overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Cursor Overlay when painting.

## Use Cursor Overlay

Turn on Cursor Overlay.

## Texture Opacity

This is for the case when you paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

# Dyntopo Panel

Dyntopo stands for Dynamic Topology Sculpting.

Without Dyntopo you just deform the existing geometry. With Dyntopo geometry gets subdivided when needed. This makes it possible to sculpt complex shapes out of a block.

Left without Dyntopo, right with Dyntopo.

**Note:** Some brushes are incompatible with Dyntopo.

*Brushes that are incompatible are the Grab brush, Rotate brush, Thumb brush, Layer brush, Smooth brush (including alt-key smoothing with a different brush) and Mask brush.*

*The topology will also not update if the stroke mode is Anchored or Drag Dot.*

---

## Detailing

Define the Detail Type method.

### **Relative Detail**

Mesh Detail is relative to brush size and detail size

### **Brush Detail**

Mesh Detail is relative to brush radius.

### **Constant Detail**

Mesh detail is constant in object space according to detail size.

### **Manual Detail**

Mesh detail does not change on each stroke. But just on flood fill

---

## Refine method

Define the Detail refine method.

### **Subdivide Collapse**

Both methods in one. Subdivide long edges to add mesh detail where needed. And collapse short edges to remove mesh detail where possible.

### **Collapse Edges**

Collapse short edges to remove mesh detail where possible.

### **Subdivide Edges**

Subdivide long edges to add mesh detail where needed.

---

## Resolution

The Resolution defines how fine the subdivision will be.

The edit box below does the same. But with a slider, and without visible feedback in form of a widget.

## Sample detail size picker

This pipette allows you to pick the current resolution from a mesh.

To activate the tool, hover with the mouse over the mesh and left click to apply.

**Note:** This work in the Constant and Manual methods exclusively.

## Remesh Panel

You may create a sculpt mesh that has ways too many polygons. Or too many polygons at one area, and not enough polygons at another area. Remeshing recreates the mesh geometry, with a more uniform topology.

Remesh does not work with Dyntopo enabled. You need to turn it off for remeshing.

## Mode

The Remesher in Sculpt mode uses the Voxel remesher by default. When you want to remesh with the QuadriFlow method, then switch to Quad remesher. Quad remesher has no further options.

## Voxel Size

Adjust the density of the new created geometry

## Sample Detail Size

With this picker you can pick the density from an area of your mesh.

## Adaptivity

Reduces the final face count by simplifying geometry where detail is not needed. This method uses tris. A value greater than 0 disables the Fix Poles feature.

## Fix Poles

Produce less poles and a better topology flow.

## Smooth Normals

Smooths the normals of the result.

## Preserve

### Volume

Tries to preserves the volume of the original mesh.

## Attributes

Keep existing paint masks, face sets, vertex color and other generic mesh attributes on the new mesh.

## Voxel Remesh / Quadriflow Remesh

Starts the remesh operation.

# Symmetry Panel

The Symmetry Lock panel contains tools around symmetry and lock features. Here you can turn on or off mirroring along axis, etc.

## Mirror

Mirror sculpt along activated axis. By default the mirroring is activated around X axis.

The same buttons plus the whole Symmetry Lock Panel as a drop down menu can also be found in the tool settings bar as icon buttons. This allows quicker access and better visual control which mirror axis is currently active.

## Lock

Disallow vertices movement in locked axis direction.

## Tiling

Produces a mesh that is tilable in the activated directions.

## Feather

Reduce the strength of the brush where it overlaps symmetrical daubs.

## Radial

Adjust the repeating across some axis. For example, when you change Z to 32, then you can draw 32 segments simultaneously around the Z axis instead of just one, distributed around the Z axis.

## Tile Offset

Adjust the offset of the tiling.

## Symmetrize

### Direction

The direction in which the mirroring happens.

### Merge Distance

The distance to merge vertices with symmetrizing.

### Symmetrize

Symmetrize the topology modifications.

## Sculpt Mode - Options Panel

### Display

#### Fast Navigate

For Multires, show Low Res mesh when navigating.

#### Delay Viewport Updates

Update the geometry when it enters the view. This enables a faster viewport navigation.

## Use Deform only

Use only deformation modifiers ( The other constructive modifiers except multi-resolution gets temporary disabled)

## Display

### *Topology*

Affect only vertices connected to the active vertex under the brush.

### Face Sets

Affect only vertices that share face sets with the active vertex.

### Mesh Boundary

Do not affect non manifold boundary edges.

### Face Sets Boundary

Do not affect vertices that belongs to a face set boundary.

### Cavity

Do not affect vertices at the peaks. Based on the surface curvature.

### Cavity ( Inverted)

Do not affect vertices in the valleys. Based on the surface curvature.

### Area Normal

Affect only vertices with a similar normal to where the stroke starts.

### View Normal

Affect only vertices with a normal that faces to the view.

### Propagation Steps

Distance where boundary edge automasking is going to protect vertices from the fully masked edge.

## Gravity sub panel

A panel with the gravity settings. Add gravity after each stroke.

### Factor

The factor slider defines the amount.

### Orientation

Here you define an object that gets used to determine the gravity from. The Z axis of this object gets used.

## Tools tab in Vertex Paint Mode

The Vertex paint allows you to color the vertices of a mesh.

In Vertex Paint Mode you will mainly find settings for the different brushes. General settings. And brush specific settings. This settings can be found in different panels. The brush specific options and settings are explained in the tool shelf chapter. Here we just cover the general panels.

The Vertex paint Mode just exists for Mesh objects.

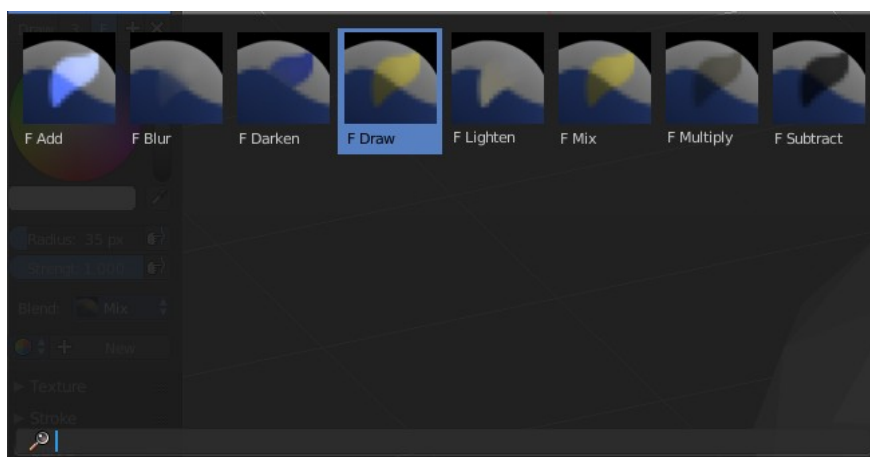

## Brushes Panel

The Brush Panel contains the different Brushes and some Brush settings. Choose and adjust your current active brush.

## Browse Brush

The big image at the top is a dropdown box. Choose a brush. Click at it, and you will see the different brushes. A click at one of the images will choose this brush then.

When you have added a few more brushes then the dropdown box may be more than full. You will see some little white arrows then. Either in the top left or in the bottom right corner. They indicate that some brushes are hidden before or after the current display.

To scroll to this hidden content use the mouse wheel, or the arrow up and down buttons at the keyboard.

## Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**F** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

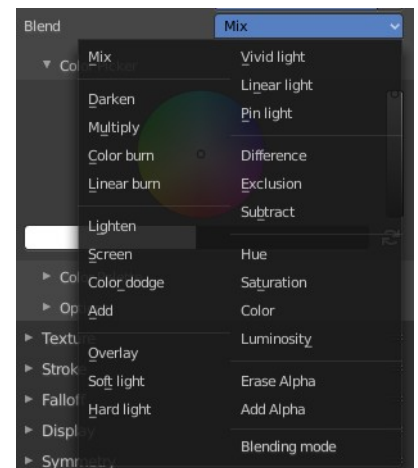

## Brush Settings Panel

The Brush Settings Panel contains the Brush settings. The content differs, dependant of which brush you have chosen.

### Blend

Define how the stroke will blend. You can choose between various blend modes.

### Radius

The Radius edit box allows you to adjust the radius of the brush. The button behind the edit box enables tablet pressure sensitivity for radius.

## ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

## ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

---

## **Strength**

The Strength edit box allows you to adjust the strength of the brush. The button behind the edit box enables tablet pressure sensitivity for strength.

## ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

## ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

# Brush Settings Panel - Color Picker Subpanel

Define the color for your brush.

The active color is the left one. When you click the button with the two arrows down right then you can swap the color with the secondary color. Then this secondary color becomes the primary color, and is active.

A click at one of the the color fields will open a more detailed color dialog, wSet up the color by using rgb, hsv and hex colors and with value sliders.

## **Brush colors flip**

Flips the primary color with the secondary color.

## **Use unified Color**

Choose if you want to use global colors or local color just for vertex painting.

## Brush Settings Panel - Color Palette Subpanel

Create a color palette for later reuse.

First create a new palette by clicking at New. Then adjust the color in the color picker. And then click at the add button to add this color to the palette.

To set the color picker to a palette color simply click at this palette color.

To remove a color from the palette, choose it, then click at the remove button. The active palette color that gets removed is the one with the triangle at it.

The color palette cannot be saved externally. It is part of the current blend file. You can however append color palettes from other blend files.

The currently active color is the one with the triangle at it.

The elements are explained from left to right.

### Palette browser

The button at the left opens a dropdown list. Choose between your palettes.

### Edit Box

The name of the currently active palette. You can also rename the palette here. A click into the edit box makes the name editable.

### Number of users

See how many users the palette currently has.

### Fake User

Fake User sets the element to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

### Add palette

Add a new palette.

### Remove Palette

Clicking at this button removes the palette. Note that you need to save, close Bforartists and reload the blend file to remove the palette completely.

### Add color

Adjust a color in the color picker. Then click at the add button to add this color to the palette.

## Remove color

Select the color in the palette, then click at the minus button to remove it.

## Sort By

Sort the palette by the chosen method.

## Brush Settings Panel - Advanced Subpanel

Brush specific settings.

### Affect Alpha

When disabled then the alpha is locked while painting.

### Accumulate

Accumulate stroke daubts on top of each other.

### Front Faces Only

Paint just at faces that points forwards. Backwards pointing faces are not painted.

## Vertex Paint Mode - Texture Panel

The Texture panel allows you to paint with textures. This allows you for example to grab a foto from some fish scales, and simply paint them onto the vertices by using this image as a pencil. Or as a blueprint where you calk through ( Stencil method ).

## Browse Texture to be linked

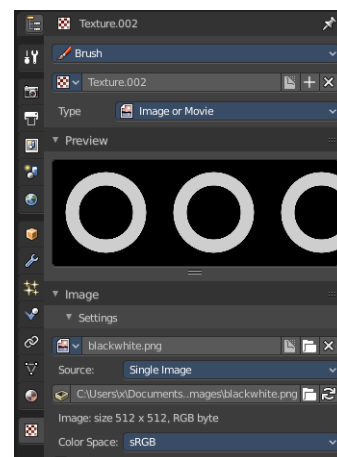

The image at the top of the panel is a image browser. Choose a texture that you can choose for vertex painting then. You can also have more than one image loaded at once.

In this shot there is already a texture added. The way to add the texture here is a bit more complicated. And not done with clicking at the New button.

First click at the New button below the image. This will create a new texture slot. This slot is still empty, it displays black.

We need to load the texture in this slot. This must be done in the Properties editor in the Textures tab. And then the texture finally shows in the Texture panel in the Tool Shelf.

And when we switch back to the tools tab, then the texture is loaded. And we can work with this texture.

## Texture Edit box

The Texture edit box is the edit box below the Image browser. When there's no image loaded then it displays the New button. When there's a image (or more) loaded, then you will see the name of the current texture.

**The F button** turns this texture into a data block with a fake user. Means it will exists even when there is no data connected to it anymore.

When you activate Fake User, then you may get a value in front of it, which displays how much users this data block (our texture slot) currently has.

**The + Button** adds another texture slot. Note that you will have to load a texture too, as explained above.

**The X button** deletes the texture slot.

## Brush Mapping

Our texture can be mapped in different methods. The Brush mapping is a drop down box. Choose this different brush mapping methods.

The settings vary. So we will go through them by the different brush mapping methods.

### Brush Mapping with mapping method Tiled

The brush mapping method Tiled tiles the brush stroke at the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

#### Angle

The angle of the brush.

#### Offset

The offset of the texture in the brush.

#### Size

The size of the texture in the brush.

### Brush Mapping with mapping method View Plane

The brush mapping method View Plane simply paints onto the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Angle

The angle of the brush.

## Rake

The angle follows the direction of the brush stroke.

## Random

The brush angle gets set random.

## Offset

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method 3D

The brush mapping method 3D paints the texture at the surface, by tiling it 1/1 at the object surface.

## Offset

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method Random

The brush mapping method Random paints onto the surface, and randomizes the texture position in the brush while that. The mapping happens from the current

view. The result may be distorted when the view does not align with the surface of the object.

### **Angle**

The angle of the brush.

### **Rake**

The angle follows the direction of the brush stroke.

### **Random**

The brush angle gets set random.

### **Offset**

The offset of the texture in the brush.

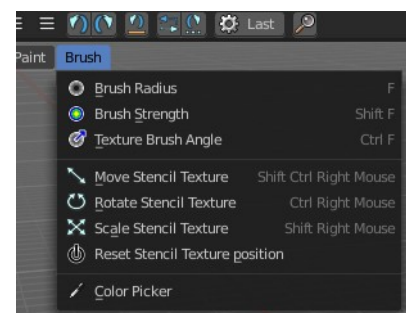

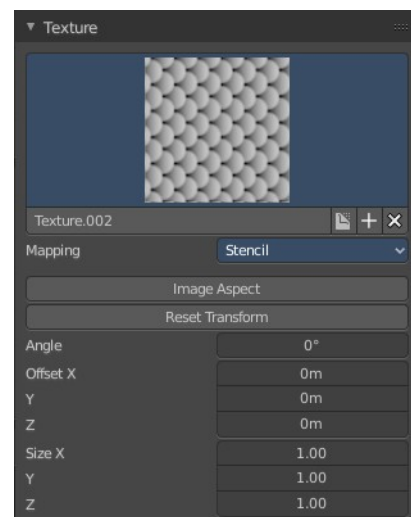

### **Size**

The size of the texture in the brush.

## **Brush Mapping with mapping method Stencil**

The former methods uses the textures for the brush. The method Stencil works different. You have your texture displayed in the workspace above the object, and you paint this texture onto your object with your pencil strokes.

Note that the texture in the 3d space is just visible when you are with the mouse over the viewport. It gets by default displayed down left. You have to position it where you need it. See Brush menu, Stencil Texture controls.

## **Image Aspect**

Adjust the stencil size to fit to the image aspect ratio.

## **Reset Transform**

Resets all transforms.

## **Angle edit box**

Adjust the angle of the brush. The button at the end allows you to set the radius by dragging the mouse. This should be done in the viewport and with the hotkey. This button is just a visible reminder.

## **Offset**

Fine tune the offset of the texture in the brush.

## **Size**

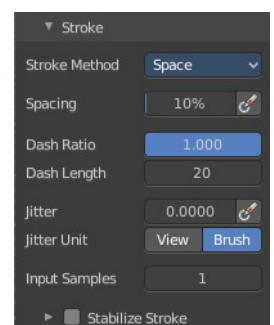

Fine tune the size of the texture in the brush.

# Brush Settings Panel - Stroke Sub panel

The Stroke panel contains settings to influence the behavior of the brush stroke. There are various stroke methods available. We will go through them one by one.

## **Stroke Panel with Stroke method Space**

This is the default Stroke method. The sculpt stroke gets added continuously with given settings.

## Spacing Edit Box

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Dash Ratio

Ratio of samples in a cycle that the brush is covering.

## Dash Length

Length of a dash cycle measured in stroke samples.

## Jitter Edit Box

Add Jitter to the brush while painting.

## Spacing Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Unit

Jitter in screen space, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

---

## Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that. The Smooth Stroke related settings are hidden as long as Smooth Stroke is not activated.

## Smooth Stroke Radius Edit Box

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

## Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

## Stroke Panel with Stroke method Curve

The Stroke method curve doesn't simply influence the way how the stroke is painted. It is a special method. First you draw a curve object by holding down ctrl and clicking with left mouse button. Then you tweak the curve. You can click at the curve point, and drag out handlers to make the curve points smooth.

Then you hit the Draw Curve button. And the curve gets drawn onto the surface.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for

tablets.

---

## Paint Curve edit box

Here you set the active curve.

**The first element** is a drop down box where you will find your curves objects. You can have more than one.

**The second element** is the edit box that displays the active curve.

**The shield icon** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

---

## Draw Curve Button

A click at it to turns the curve into a sculpt stroke.

---

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

Jitter in screen space, or relative to the brush size.

---

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

---

## Stroke Panel with Stroke method Line

With Stroke method line you draw a line between a starting point and an endpoint. And when you release the mouse then the line gets sculpted.

## Spacing Edit Box

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

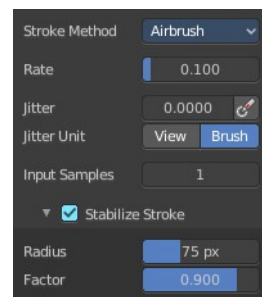

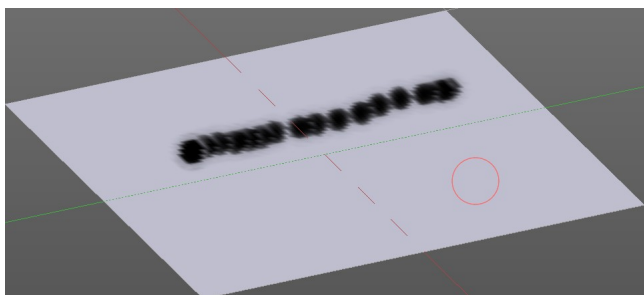

Jitter in screen space, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stroke Panel with Stroke method Airbrush

The stroke acts like an airbrush pencil. The dots gets placed randomly.

## Rate Edit Box

Define the rate of the drawing.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

Jitter in screen space, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

---

## Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### *Smooth Stroke Radius Edit Box*

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

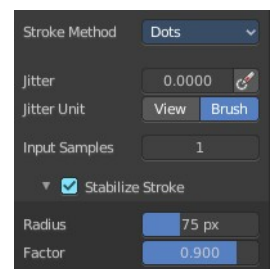

### *Smooth Stroke Factor Edit Box*

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

## Stroke Panel with Stroke method Dots

The stroke method Dots draws dots of the pencil onto the surface. The mapping happens from the current view. Means you will get distortions when your view is not aligned with the surface of the object.

## Jitter Edit Box

Add Jitter to the brush while painting.

## ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## **Smooth Stroke**

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## ***Smooth Stroke Radius Edit Box***

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

## ***Smooth Stroke Factor Edit Box***

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

# Brush Settings Panel - Falloff Sub panel

The curve panel allows you to define different falloffs methods for the border of the brush.

## **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y

coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***Reset Curve***

Resets the curve to the initial shape.

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve points.

---

## Curve window

Tweak and adjust the falloff curve by clicking at a curve point and dragging it around.

Double click adds a new point.

Holding down ctrl activates temporary snapping.

Holding down shift enables slower movement, which allows more accurate setting.

---

## Curve Presets

Predefined curve presets.

## Falloff Shape

Use projected or spherical falloff.

## Front Face Falloff

Blend Brush influence, dependent by how much they face the front.

## Angle

Adjust the angle.

# Brush Settings Panel - Cursor Sub panel

Adjust the color and appearance of the brush cursor to custom values.

## Cursor Checkbox

Activate the custom settings.

## Cursor Color

Choose another color for the brush cursor. Double clicking at the color field will open a color picker.

## Falloff Opacity

You can turn on the cursor overlay with the eye button at the end. The

falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Cursor Overlay when painting.

## Use Cursor Overlay

Turn on Cursor Overlay.

## Texture Opacity

This is for the case when you paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

# Symmetry Panel

## Mirror

Mirror along given axis.

The same buttons plus the whole Symmetry Lock Panel as a drop down menu can also be found in the tool settings bar as icon buttons. This allows quicker access and better

## Radial

Tiling. The number of times to repeat the strokes across the surface.

## Tools Tab in Texture Paint Mode

The Texture Paint Mode provides you the tools to paint directly at the texture of your mesh in the viewport. To fix visible seams for example.

The Texture Paint mode is just available for mesh objects.

## Requirements

Texture Painting requires to have a working UV mapping and a texture applied. When there is no UV mapping and no assigned texture, then you will get a warning about No Texture. You have to create a texture slot first.

Open the Texture Paint Slot drop down menu, and choose Base Color. This will call a menu. Create a new blank texture.

## Save Texture

The result of texture painting can be found and be saved in the UV Image Editor. You can also paint in the UV editor.

The modified texture does NOT save with the scene. You have to save out the image when you want to save the changes at the texture. There is no warning. So **DON'T FORGET TO SAVE THE TEXTURE.**

## Brushes Panel

The Brush Panel contains the different Brushes and some Brush settings. Choose and adjust your current active brush.

### Browse Brush

The big image at the top is a drop down box where you can see the current active brush. You can add duplicates of this active brush, and customize it to your needs. But the active brush gets chosen in the Tool Shelf at the left of the 3D View.

When you have added a few more brushes then the drop down box may be more than full. You will see some little white arrows then. Either in the top left or in the bottom right corner. They indicate that some

brushes are hidden before or after the current display.

To scroll to this hidden content use the mouse wheel, or the arrow up and down buttons at the keyboard.

### Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**The shield icon** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Brush settings Panel

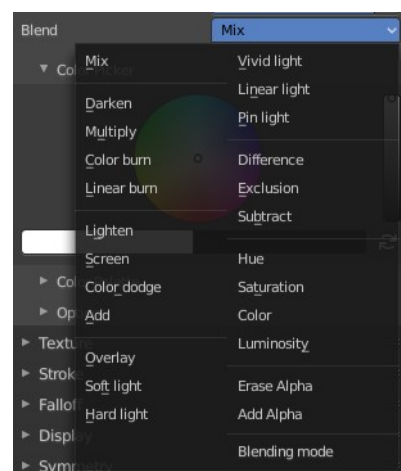

### Brush Panel

The Brush Panel contains the different paint brushes, a color dialog, and some brush settings.

### Blend

Define how the stroke will blend. You can choose between various blend modes.

### Radius

The Radius edit box allows you to adjust the radius of the brush. The button behind the edit box enables tablet pressure sensitivity for radius.

#### ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

#### ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

### Strength

The Strength edit box allows you to adjust the strength of the brush. The button behind the edit box enables tablet pressure sensitivity for strength.

## Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

## Use Unified Radius

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

# Brush Settings Panel - Color Picker Sub panel

Define the color for your brush.

The active color is the left one. When you click the button with the two arrows down right then you can swap the color with the secondary color. Then this secondary color becomes the primary color, and is active.

A click at one of the color fields will open a more detailed color dialog, where you can set up the color by using rgb, hsv and hex colors and with value sliders.

## Brush colors flip

Flips the primary color with the secondary color.

## Use unified Color

Choose if you want to use global colors or local color just for vertex painting.

# Brush Settings Panel - Color Palette Sub panel

Create a color palette for later reuse.

First create a new palette by clicking at New. Then adjust the color in the color picker. And then click at the add button to add this color to the palette.

To set the color picker to a palette color simply click at this palette color.

To remove a color from the palette, choose it, then click at the remove button. The active palette color that gets removed is the one with the triangle at it.

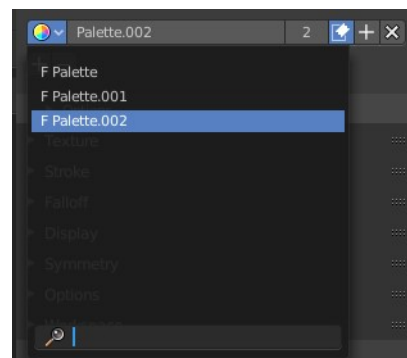

The color palette cannot be saved externally. It is part of the current blend file. You can however append color palettes from other blend files.

The elements are explained from left to right.

## Palette browser

The button at the left opens a dropdown list where you can choose between your palettes.

## Edit Box

The name of the currently active palette. You can also rename the palette here. A click into the edit box makes the name editable.

## Number of users

See how many users the palette currently has.

## Fake User

Fake User sets the element to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

## Add palette

Add a new palette.

## Remove Palette

Clicking at this button removes the palette. Note that you need to save, close Bforartists and reload the blend file to remove the palette completely.

## Sort By

Sort the palette by the chosen method.

# Brush Settings Panel - Advanced Subpanel

Brush specific settings.

## Accumulate

Accumulate stroke daubts on top of each other.

## Affect Alpha

When disabled then the alpha is locked while painting.

## Sharpen / Soften (Soften Brush)

### Sharp Threshold

The threshold below which no sharpening is performed.

### Blur Mode (Soften Brush)

Choose the blur method. Gaussian or Box.

### Mask Value (Mask brush)

The vertex weight when brush is applied.

## Brush Settings Panel - Texture Subpanel

The Texture panel allows you to paint with textures. This allows you for example to grab a foto from some fish scales, and simply paint them onto the vertices by using this image as a pencil. Or as a blueprint where you calk through ( Stencil method ).

## Browse Texture to be linked

The image at the top of the panel is a image browser. Choose a texture that you can choose for vertex painting then. You can also have more than one image loaded at once.

In this shot there is already a texture added. The way to add the texture here is a bit more complicated. And not done with clicking at the New button.

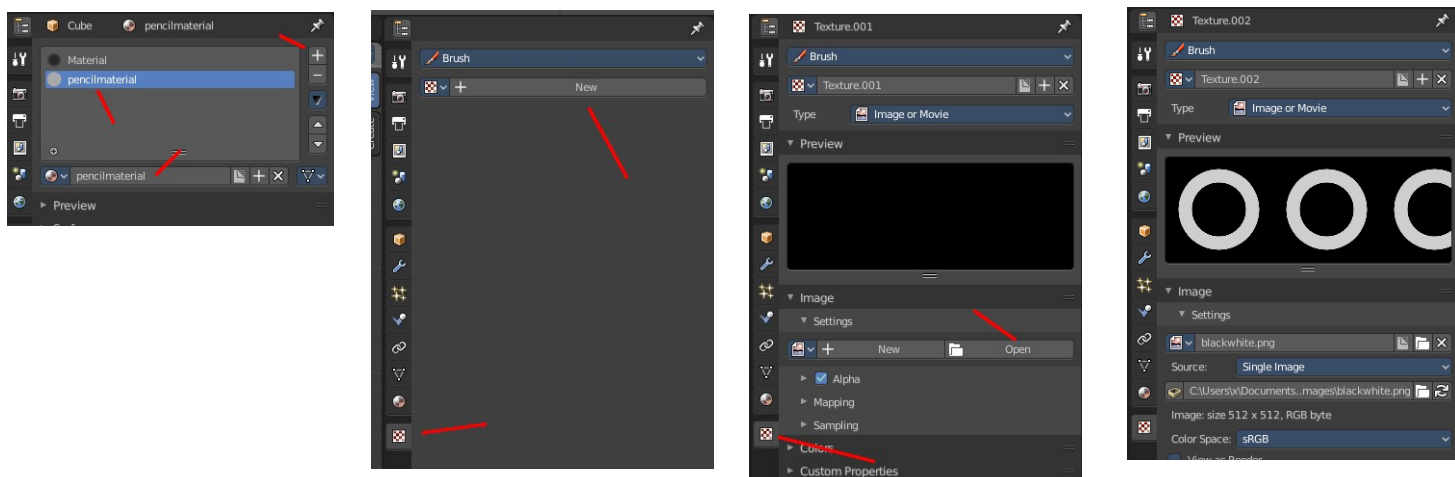

First click at the New button below the image. This will create a new texture slot. This slot is still empty, it displays black.

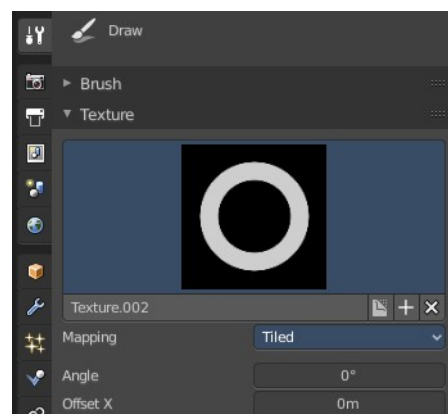

We need to load the texture in this slot. This must be done in the Properties editor in the Textures tab. And then the texture finally shows in the Texture panel in the Tool Shelf.

The problem is, we have an object with a material and a texture already selected. And when we change this texture, then we don't get the pencil texture loaded. But we change the texture at our mesh.

What we need to do is to create a material first. And in this material we load our pencil texture then. And then this texture becomes available in the image browser of the Texture panel.

And when we switch back to the tools tab, then the texture is loaded. And we can work with this texture.

## Texture Edit box

The Texture edit box is the edit box below the Image browser. When there's no image loaded then it displays the New button. When there's a image (or more) loaded, then you will see the name of the current texture.

**The F button** turns this texture into a data block with a fake user. Means it will exists even when there is no data connected to it anymore.

When you activate Fake User, then you may get a value in front of it, which displays how much users this data block (our texture slot) currently has.

**The + Button** adds another texture slot. Note that you will have to load a texture too, as explained above.

**The X button** deletes the texture slot.

## Brush Mapping

Our texture can be mapped in different methods. The Brush mapping is a dropdown box where you can choose this different brush mapping methods.

The settings vary. So we will go through them by the different brush mapping methods.

### Brush Mapping with mapping method Tiled

The brush mapping method Tiled tiles the brush stroke at the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

#### Angle

The angle of the brush.

#### Offset

The offset of the texture in the brush.

#### Size

The size of the texture in the brush.

### Brush Mapping with mapping method View Plane

The brush mapping method View Plane simply paints onto the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

#### Angle

The angle of the brush.

#### Rake

The angle follows the direction of the brush stroke.

#### Random

The brush angle gets set random.

## Offset

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

---

## Brush Mapping with mapping method 3D

The brush mapping method 3D paints the texture at the surface, by tiling it 1/1 at the object surface.

## Offset

The offset of the texture in the brush.

## Size

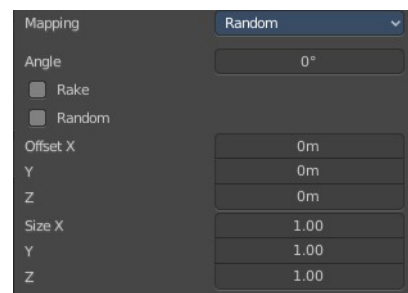

The size of the texture in the brush.

---

## Brush Mapping with mapping method Random

The brush mapping method Random paints onto the surface, and randomizes the texture position in the brush while that. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Angle

The angle of the brush.

## Rake

The angle follows the direction of the brush stroke.

## Random

The brush angle gets set random.

## Brush Mapping with mapping method Stencil

The former methods uses the textures for the brush. The method Stencil works different. You have your texture displayed in the workspace above the object, and you paint this texture onto your object with your pencil strokes.

Note that the texture in the 3d space is just visible when you are with the mouse over the viewport.

It gets by default displayed down left. You have to position it where you need it. See Brush menu, Stencil Texture controls.

### Image Aspect

Adjust the stencil size to fit to the image aspect ratio.

### Reset Transform

Resets the stencil image to be down right in the 3D view.

### Angle edit box

Adjust the angle of the brush. The button at the end allows you to set the radius by dragging the mouse. This should be done in the viewport and with the hotkey. This button is just a visible reminder.

### Offset

Fine tune the offset of the texture in the brush.

### Size

Fine tune the size of the texture in the brush.

## Brush Settings Panel - Texture Mask Subanel

The texture mask subpanel allows you to use a texture as a mask to define the strength of painting. In the shot example we use a tiled fishscale Texture as a pencil,

and a stencil map as our texture mask. And it paints just where the mask texture is bright. You can of course use gradients here to define the paint strength.

## Browse Texture to be linked

The image at the top of the panel is a image browser. Choose a texture that you can choose for painting then. You can also have more than one image loaded at once.

In this shot there is already two textures added. The way to add the texture here is a bit more complicated. And not done with clicking at the New button.

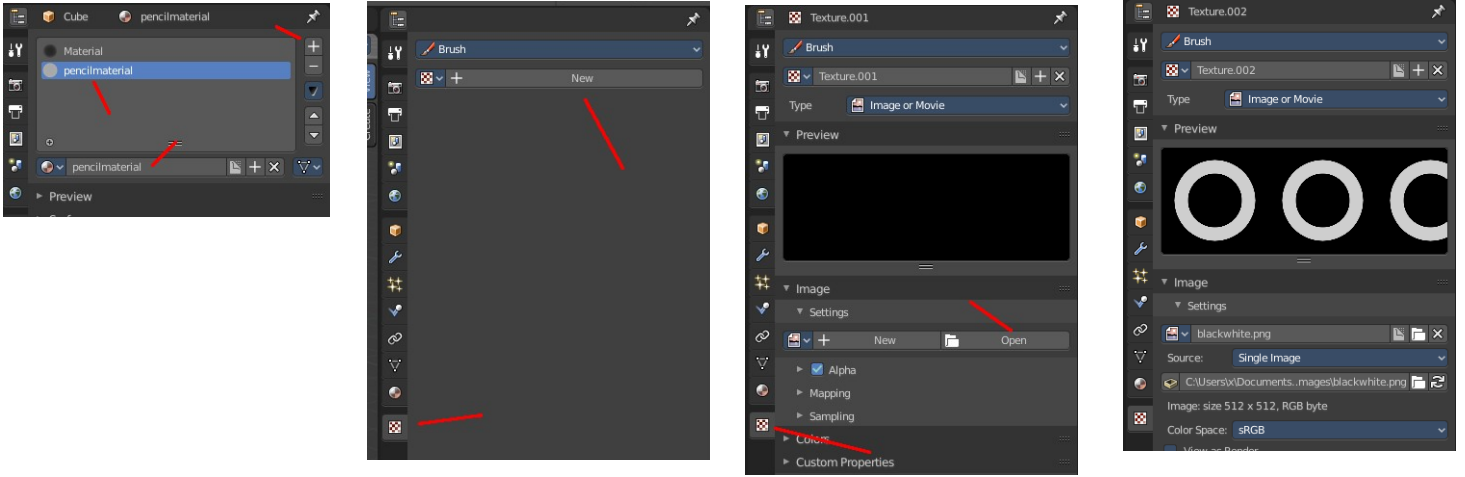

First click at the New button below the image. This will create a new texture slot. This slot is still empty, it displays black.

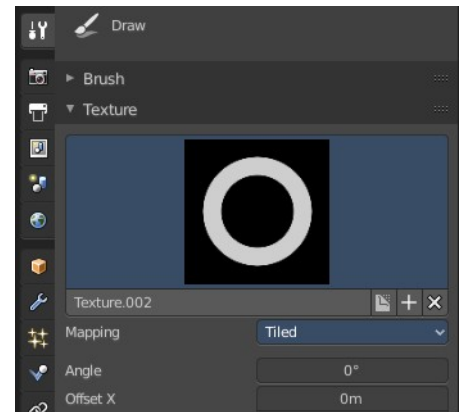

We need to load a texture in this slot. This must be done in the Properties editor in the Textures tab.

The problem is, we have an object with a material and a texture already selected. And when we change this texture , then we don't get the pencil texture loaded. But we change the texture at our mesh.

What we need to do is to create a material first. And in this material we load our pencil texture then. And then we can choose this texture in the image browser of the texture.

And when we switch back to the tools tab, then the texture is loaded. And we can work with this texture.

## Brush Mapping with mapping method Tiled

The brush mapping method Tiled tiles the brush stroke at the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Mask Pressure Mode

A dropdown box to choose the mask pressure mode for tablets.

## Angle

The angle of the brush.

## Offset

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method View Plane

The brush mapping method View Plane simply paints onto the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Mask Pressure Modem

A dropdown box to choose the mask pressure mode for tablets.

## Angle

The angle of the brush.

## Rake

The angle follows the direction of the brush stroke.

## Random

The brush angle gets set random.

## Offset

The offset of the texture in the brush.

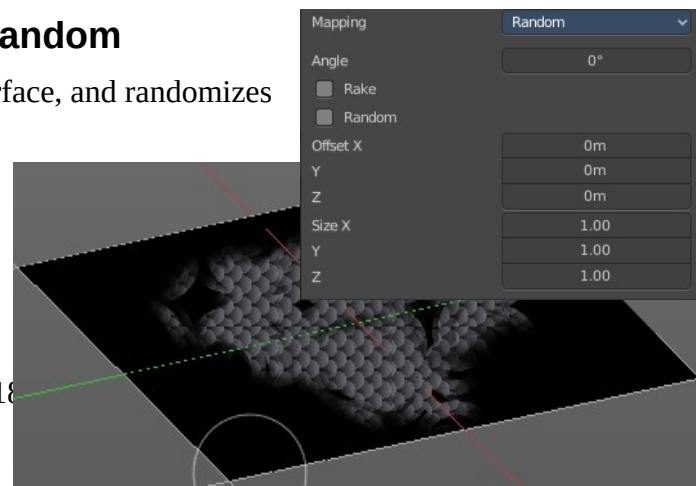

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method Random

The brush mapping method Random paints onto the surface, and randomizes the texture position in the brush while that. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Mask Pressure Mode

A dropdown box to choose the mask pressure mode for tablets.

## Angle

The angle of the brush.

## Rake

The angle follows the direction of the brush stroke.

## Random

The brush angle gets set random.

## Offset

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

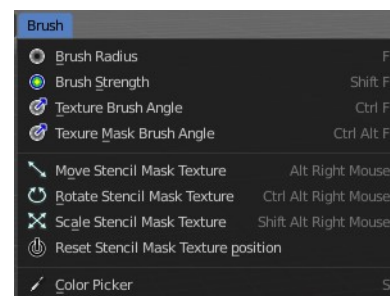

---

## Brush Mapping with mapping method Stencil

The former methods uses the textures for the brush. The method Stencil works different. You have your texture displayed in the workspace above the object, and you paint this texture onto your object with your pencil strokes.

Note that the texture in the 3d space is just visible when you are with the mouse over the viewport. Note that the texture in the 3d space is just visible when you are with the mouse over the viewport. It gets by default displayed down left. You have to position it where you need it. See Brush menu, Stencil Texture controls.

## Mask Pressure Mode

A drop down box to choose the mask pressure mode for tablets.

### **Angle edit box**

Adjust the angle of the brush. The button at the end allows you to set the radius by dragging the mouse. This should be done in the viewport and with the hotkey. This button is just a visible reminder.

### **Offset**

Fine tune the offset of the texture in the brush.

### **Size**

Fine tune the size of the texture in the brush.

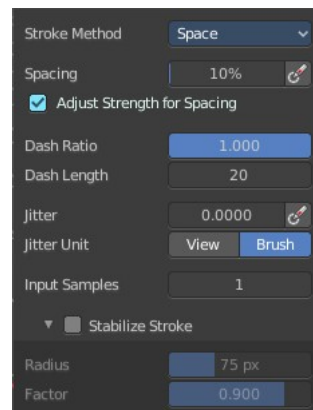

## Brush Settings Panel - Stroke Sub panel

The Stroke panel contains settings to influence the behavior of the brush stroke. There are various stroke methods available. We will go through them one by one.

## Stroke Panel with Stroke method Space

This is the default Stroke method. The sculpt stroke gets added continuously with given settings.

### Spacing Edit Box

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

### Spacing Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Adjust Strength for Spacing

Automatically adjust strength to give consistent results for different spacing.

### Dash Ratio

Ratio of samples in a cycle that the brush is covering.

### Dash Length

Length of a dash cycle measured in stroke samples.

### Jitter Edit Box

Add Jitter to the brush while painting.

### Spacing Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Jitter Unit

Jitter in screen space, or relative to the brush size.

### Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### **Smooth Stroke Radius Edit Box**

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### **Smooth Stroke Factor Edit Box**

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

## Stroke Panel with Stroke method Curve

The Stroke method curve doesn't simply influence the way how the stroke is painted. It is a special method. First you draw a curve object by holding down ctrl and clicking with left mouse button. Then you tweak the curve. You can click at the curve point, and drag out handlers to make the curve points smooth.

Then you hit the Draw Curve button. And the curve gets drawn onto the surface.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity

for tablets.

## Adjust Strength for Spacing

Automatically adjust strength to give consistent results for different spacing.

## Paint Curve edit box

Here you set the active curve.

**The first element** is a drop down box where you will find your curves objects. You can have more than one.

**The second element** is the edit box that displays the active curve.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

Set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Draw Curve Button

A click at it turns the curve into a sculpt stroke.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

Jitter in screen space, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stroke Panel with Stroke method Line

With Stroke method line you draw a line between a starting point and an endpoint. And when you release the mouse then the line gets sculpted.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Adjust Strength for Spacing

Automatically adjust strength to give consistent results for different spacing.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

Jitter in screen space, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stroke Panel with Stroke method Anchored

Click and drag to place a dot and to scale it.

### Edge to edge

Drag Anchor Brush from edge to edge.

### Jitter Edit Box

Add Jitter to the brush while painting.

### Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Jitter Unit

Jitter in screen space, or relative to the brush size.

### Input Sample Edit Box

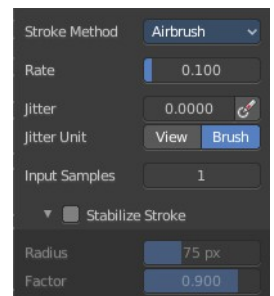

Average multiple input samples together to smooth the brush stroke.

---

## Stroke Panel with Stroke method Airbrush

The stroke acts like an airbrush pencil. The dots gets placed randomly.

### Rate Edit Box

Define the rate of the drawing.

### Jitter Edit Box

Add Jitter to the brush while painting.

### Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## **Stabilize Stroke**

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## ***Smooth Stroke Radius Edit Box***

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

## ***Smooth Stroke Factor Edit Box***

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

## **Stroke Panel with Stroke method Drag Dot**

Paint a dot and drag it around. The actual painting happens then at releasing the mouse

## **Jitter Edit Box**

Add Jitter to the brush while painting.

## ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

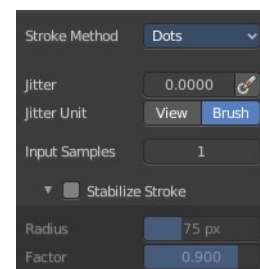

Jitter in screen space, or relative to the brush size.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## **Stroke Panel with Stroke method Dots**

The stroke method Dots draws dots of the pencil onto the surface. The mapping happens from the current view. Means you will get distortions when your view is not aligned with the surface of the object.

## **Jitter Edit Box**

Add Jitter to the brush while painting.

### **Jitter Pressure**

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### **Jitter Unit**

Jitter in screen space, or relative to the brush size.

### **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

### **Stabilize Stroke**

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### **Smooth Stroke Radius Edit Box**

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### **Smooth Stroke Factor Edit Box**

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

## **Brush Settings Panel - Falloff Sub panel**

The curve panel allows you to define different falloffs methods for the border of the brush.

### **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***Reset Curve***

Resets the curve to the initial shape.

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve points.

## Curve window

Tweak and adjust the falloff curve by clicking at a curve point and dragging it around.

Double click adds a new point.

Holding down ctrl activates temporary snapping.

Holding down shift enables slower movement, which allows more accurate setting.

## Curve Presets

Predefined curve presets.

## Falloff Shape

Use projected or spherical falloff.

## Normal Falloff

Blend Brush influence, dependent by how much they face the front.

## Angle

Adjust the angle.

# Brush Settings Panel - Cursor Sub panel

Adjust the color and appearance of the brush cursor to custom values.

## Cursor Checkbox

Activate the custom settings.

## Cursor Color

Choose another color for the brush cursor. Double clicking at the color field will open a color picker.

## Falloff Opacity

You can turn on the cursor overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Cursor Overlay when painting.

## Use Cursor Overlay

Turn on Cursor Overlay.

---

## Texture Opacity

This is for the case when you paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

---

## Mask Texture Opacity

This is for the case when you mask paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

## Brush Settings Panel - Clone from Paint Slot Sub panel

This panel is just for the clone tool in the tool shelf.

Activate to clone from the current texture. For the clone tool description see tool shelf. Here you just can activate, then see or choose the material to clone from. It is a list.

# Symmetry Panel

## Symmetry Panel

Turn on/off symmetry painting along X, Y and Z axis. The mirroring happens along the world axis.

The same buttons can also be found in the tool settings bar as icon buttons. This allows quicker access and better visual control which mirror axis is currently active.

# Options Panel

## Bleed

An edit box to adjust the amount of bleeding into the areas outside of the faces UV.

## Dither

An Edit box to adjust the amount of dither when painting on byte images

## Occlude

Only paint the faces directly under the mouse.

## Backface Culling

Ignore faces that are painting away from the viewport.

## External

The external sub panel allows you to do projection painting by using an external 2d image editor. The projection happens from the current view. So this can lead to distortions.

## Screen Grab Size

Set the resolution of the shot.

## Quick Edit

Opens a shot of the current view in your 2D Image Editor.

## Apply

Applies the changes that you made and saved in your 2D Image Editor.

## Apply Camera Image

Project an edited render from the active camera back onto the object.

This feature requires to have a background image loaded. Then this background image can be projected onto the object from the camera view.

## Workflow for external editing

### Preparations

You first have to link your software that you want to use here. When there is no image editor linked then you will get a warning.

Open the User Preferences, go to the File tab. Here choose the Image Editor section, and browse for your image editor. I have chosen Gimp here at Windows 7.

Don't forget to save the User Settings!

For further options have a look in the Project Paint panel.

### Usage

Click at the Quick Edit Button. And your image editor will open up with a shot from the current view. Modify your image.

When done simply overwrite the image. Sorry for the german shot ...

Back in Bforartists click at the Apply button. And the result gets mapped onto your object.

Attention, don't change the camera view while doing this. Mapping happens from the current camera view!

## Tools tab in Weight Paint Mode

The Tools tab in Weight Paint Mode provides you the tools to do weight painting at a mesh. Skinned characters for example.

The vertices becomes a "weighting" assigned in this process. Means a per centage influence of the bone to a vertice. And under the hood you create vertex groups with the vertices that are assigned to the bones.

The amount of influence is defined by the weight paint color. Pure red has an influence value of 1. Pure blue has an influence value of 0. And the gradients between red and blue defines the in between steps in the 0-1 range. This is needed since there can be more than one bone influence and deform a vertice. Usually at the transition areas between two bones. The green areas in this shot.

The Weight Paint mode is just available for mesh objects.

## Weight painting at characters

The main purpose for Weight painting is to weight the skin for characters. So that they deform proper when you pose your armature.

### Skinning

To do weight painting at a character you first have to assign the mesh to the armature. This process is called skinning. The mesh becomes the "skin" for the skeleton.

Let's do a quick run through skinning. You can skin in Object Mode. But also from Pose Mode. Lock Object Modes needs to be unticked to get it to work from Pose Mode, which it is by default. In case you have it on, untick it now.

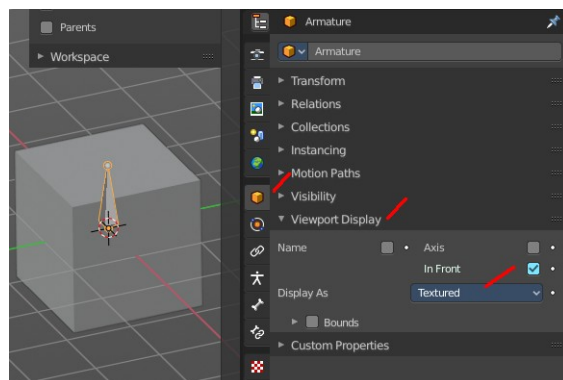

Create an object, create an armature

First we activate Display "in Front" for the armature. So that we can still see the armature inside of the mesh.

Position the mesh at its final location.

Now select the Mesh, hold down Shift key, and select the Armature. Both should be selected now.

Dive into the Object menu in the header of the 3D view, and search for Parent, with automatic weights. You can also press the hotkey Ctrl P. This calls the parenting menu under the mouse position.

Here we choose "With Automatic Weights". Automatic weighting means that the bones grabs the nearest vertices within a given radius, and assigns them to this bone.

When everything went well then the mesh, in our case the Cylinder, is now part of the hierarchy of the armature.

And when you select the armature, and switch to Pose mode now, then you can already deform the mesh by posing the armature.

Note that currently the outliner does not indicate the hierarchy anymore. In former versions the cylinder became part of the armature when you parented it together. In the current version the cylinder remains where it is.

You can however select the whole hierarchy in the right click menu. And put it into an own collection for example.

## Enter and leave Weight painting

Weight painting should happen in Pose mode so that you can pose your mesh to see the resulting deforming.

With the armature in Pose mode, select the mesh by clicking at it. Then enter Weight Paint mode. You can now do weight painting at the mesh.

To leave Weight painting, simply switch back to Object mode. Or select the armature in the outliner.

## Face Selection Mode

The face selection mode allows using selection operators to define a mask based on faces for weight painting. You can then use the weight paint brush tools and operators to assign new weight to the selection.

## Vertex Selection Mode

The face selection mode allows using selection operators to define a mask for based on vertex selection for weight painting. You can then use the weight paint brush tools and operators to assign new weight to the selection.

## Bone Selection Mode

The weighting that gets displayed in the Bone Selection mode when you enter Weight Paint mode and the armature is in Pose mode. The last active bone defines which vertex group you will weight paint. With this method to define the bone to define where you want to weight paint and assign weight accordingly. You can also switch bones while in weight painting mode on the active mesh object.

To switch bones while weight painting, hold down **Ctrl**, and **left click** at the bone that you want to set active. Then the weighting for this bone gets displayed.

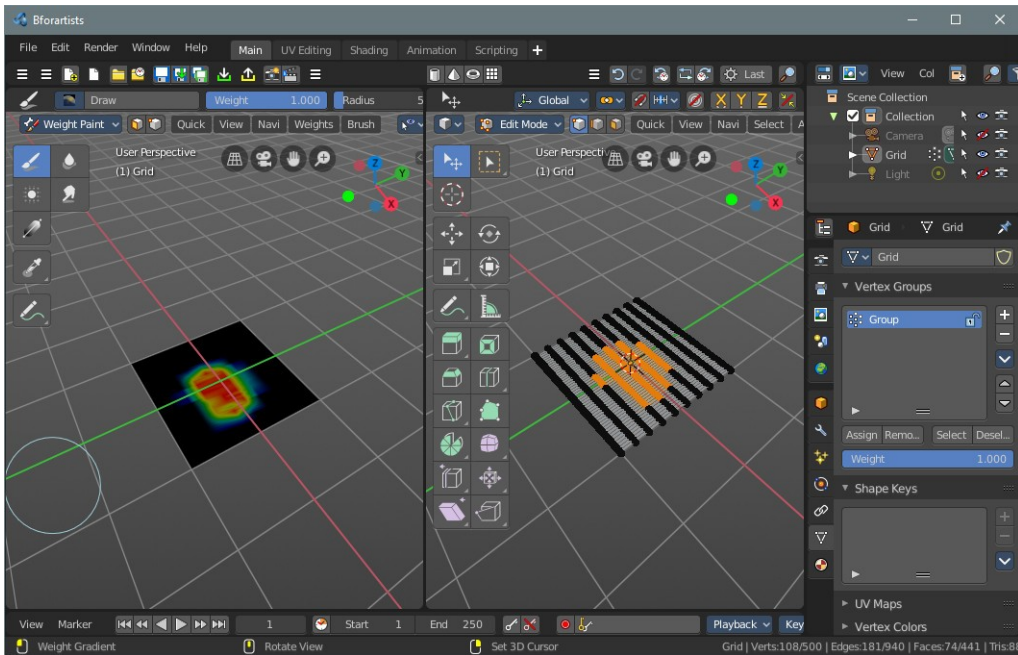

**Note:** *this mode works best when you have a selection of an armature in Pose Mode. When you have an armature in Object Mode, then you can't select another bone in this way. To facilitate selecting the mesh with an armature in pose mode, go to the side bar > view tab > edit panel and turn off “Lock Object Modes”.*

## Weight painting a plain mesh

You can also do weight painting without an armature. Just at the pure mesh. In this case you just create the vertex groups for the mesh. And those vertex groups can be accessed in edit mode then for further usage. As shown in the shots below.

## Weight painting in combination with particles

You can also combine weight painting with particles. To influence the density of hair for example. The weightmap can be assigned in the Vertex Groups panel in the Particles tab.

## Brushes Panel

The Brush Panel contains the different Brushes and some Brush settings. Choose and adjust your current active brush.

## Browse Brush

The big image at the top is a drop down box to choose a brush. Click at it, and you will see the different brushes. A click at one of the images will choose this brush then.

When you have added a few more brushes then the drop down box may be more than full. You will see some little white arrows then. Either in the top left or in the bottom right corner. They indicate that some brushes are hidden before or after the current display.

To scroll to this hidden content use the mouse wheel, or the arrow up and down buttons at the keyboard.

## Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the

parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**F** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

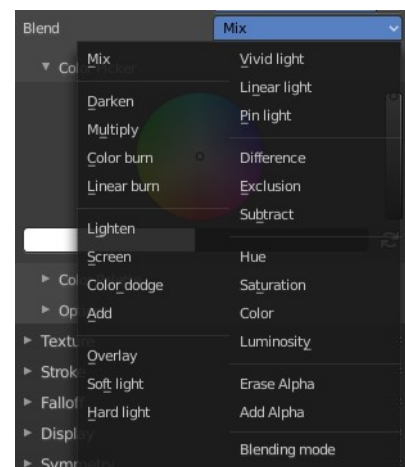

## Brush Settings Panel

The Brush Settings Panel contains the Brush settings. The content differs, dependent of which brush you have chosen.

### Blend

Define how the stroke will blend. You can choose between various blend modes.

### Weight

Adjust the strength of the weight painting.

### Size Pressure

The first button behind the edit box enables tablet pressure sensitivity for radius.

### Radius

The Radius edit box allows you to adjust the radius of the brush. The button behind the edit box enables tablet

pressure sensitivity for radius.

### ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

### ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## **Strength**

The Strength edit box allows you to adjust the strength of the brush. The button behind the edit box enables tablet pressure sensitivity for strength.

### ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

### ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## **Brush Settings Panel - Advanced Sub panel**

### ***Accumulate***

Accumulate stroke daubs on top of each other.

### ***Front Faces Only***

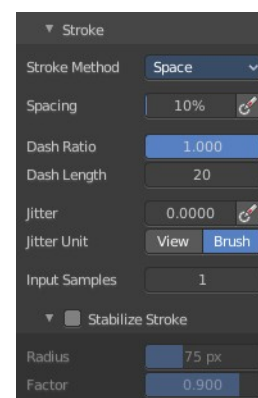

The Brush only paints at faces that faces to the view.

## **Brush Settings Panel - Stroke Sub panel**

The Stroke panel contains settings to influence the behavior of the brush stroke. There are various stroke methods available. We will go through them one by one.

### **Stroke Panel with Stroke method Space**

This is the default Stroke method. The sculpt stroke gets added continuously with given settings.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

## Spacing Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Dash Ratio

Ratio of samples in a cycle that the brush is enabled.

## Dash Length

Length of a dash cycle measured in stroke samples.

## Jitter Edit Box

Add Jitter to the brush while painting.

## Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Unit

If the jitter happens in screen space in pixels, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### Smooth Stroke Radius Edit Box

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

## Stroke Panel with Stroke method Curve

The Stroke method curve doesn't simply influence the way how the stroke is painted. It is a special method. First you draw a curve object by holding down ctrl and clicking with left mouse button. Then you tweak the curve. You can click at the curve point, and drag out handlers to make the curve points smooth.

Then you hit the Draw Curve button. And the curve gets drawn onto the surface.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### ***Paint Curve edit box***

Here you set the active curve.

**The first element** is a drop down box where you will find your curves objects. You can have more than one.

**The second element** is the edit box that displays the active curve.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

Set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

### ***Draw Curve Button***

A click at it to turns the curve into a sculpt stroke.

### **Jitter Edit Box**

Add Jitter to the brush while painting.

### ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### ***Jitter Unit***

If the jitter happens in screen space in pixels, or relative to the brush size.

### ***Input Samples Edit Box***

Average multiple input samples together to smooth the brush stroke.

### **Stroke Panel with Stroke method Line**

With Stroke method line you draw a line between a starting point and an endpoint. And when you release the mouse then the line gets sculpted.

## Spacing Edit Box

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

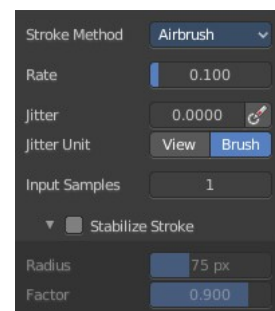

If the jitter happens in screen space in pixels, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stroke Panel with Stroke method Airbrush

The stroke acts like an airbrush pencil. The dots gets sprayed randomly.

## Rate Edit Box

Define the rate of the drawing.

---

## Jitter Edit Box

Add Jitter to the brush while painting.

## Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Unit

If the jitter happens in screen space in pixels, or relative to the brush size.

---

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Smooth Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## Smooth Stroke Radius Edit Box

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

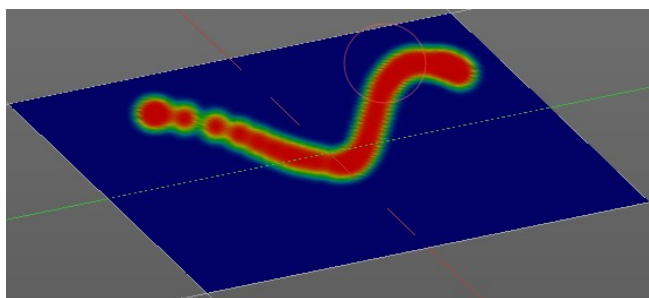

## Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

## Stroke Panel with Stroke method Dots

The stroke method Dots draws dots of the pencil onto the surface. The mapping happens from the current view. Means you will get distortions when your view is not aligned with the surface of the object.

## Jitter Edit Box

Add Jitter to the brush while painting.

## Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Unit

If the jitter happens in screen space in pixels, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## Smooth Stroke Radius Edit Box

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

## Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

# Brush Settings Panel - Falloff Sub panel

The Falloff panel allows you to define different falloffs methods for the border of the brush.

## Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

## Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

## Auto Clamped Handle

Set handle type to Auto Clamped.

## Reset Curve

Resets the curve to the initial shape.

## Use Clipping

Clipping options. Set up clipping for the stroke. The blue button at the top turns clipping on or off.

## Delete Points

Deletes the selected curve point.

## Curve Presets

Predefined curve presets.

## Falloff Shape

Use projected or spherical falloff.

## Front face Falloff

Blend brush influence by how much they face the front.

## Angle

Paint most on faces pointing towards the view according to this angle.

## Brush Settings Panel - Cursor Sub panel

Adjust the color and appearance of the brush cursor to custom values.

## Cursor Checkbox

Activate the custom settings.

## Cursor Color

Choose another color for the brush cursor. Double clicking at the color field will open a color picker.

## Falloff Opacity

You can turn on the cursor overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Cursor Overlay when painting.

## Use Cursor Overlay

Turn on Cursor Overlay.

## Texture Opacity

This is for the case when you paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

## Symmetry Panel

The same buttons plus the whole Symmetry Lock Panel as a drop down menu can also be found in the tool settings bar as icon buttons. This allows quicker access and better.

## Mirror Vertex Groups

Mirror the left/right vertex groups when painting.

## Topology Mirror

Not available with Mirror Vertex Groups deactivated. Use topology based mirroring. Both sides of the mesh needs matching geometry.

## Mirror

Mirror along given axis. With Mirror Vertex groups on you just can turn on or off the X axis.

## Radial

Tiling. The number of times to repeat the strokes across the surface. Not available with Mirror Vertex Groups

activated.

## Options Panel

### Auto Normalize

Ensure that all bone deforming vertex groups adds up to 1.0 while weight painting.

### Multi Paint

Paint across the weights of all selected bones, maintaining their relative influence.

### Restrict

Restrict painting to vertices in the group.

### X Mirror

X Axis Mirror Editing.

### Topology Mirror

Needs X Mirror ticked. Use topology based mirroring. For when both sides of the mesh have matching, unique topology.

## 7.3 Editors - 3D Viewport - Sidebar

### Table of content

Introduction..... 1

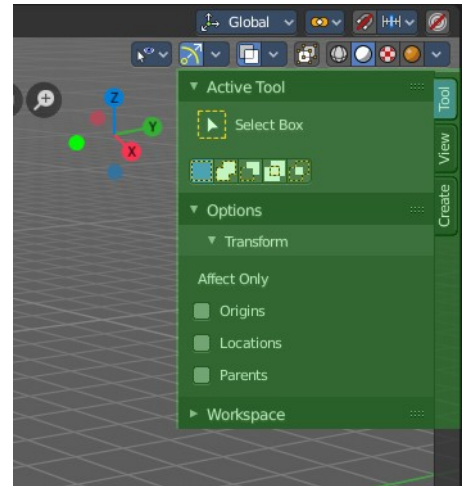

### Introduction

The 3D View is made of several areas. At the right side you will find the sidebar.

In the sidebar you will find tool settings and view related settings. And it is also the home of addons. The Create tab is already created by an add-on. The Mini Lightlib add-on., which is covered in chapter 7.3.13

The content differs, dependent of the chosen object and the current mode.

The Tools tab is also a special chapter. It contains the settings for the tools from the tool shelf.

## 7.4 Editors - 3D Viewport – Asset Shelf

### Introduction

The 3D View is made of several areas. At the bottom you will find the Asset Shelf.

This shelf lists assets from the Asset Browser for quick and easy access to drag and drop marked assets into the 3D View directly from the 3D view footer.

**Note:** *At the moment, the Asset Shelf exclusively shows Pose Assets with Armature objects in Pose mode.*

### Use

1. In the 3D View, select your Armature object and go into Pose Mode
2. Select the bones you want to store as a pose
3. In the Asset Browser Header Asset menu, use the operator Create Pose Asset
4. This will create a Pose Asset in the Unassigned (Catalogue) category in the Current File.
5. Click on the new Pose Asset in the Asset Shelf or Asset Browser to apply. Press and drag to apply with a slider strength.
6. You can alternatively right click on the Pose Asset for alternative methods of applying the pose.

## Pose Asset Context Menu

When you right click into the a pose asset then an Asset context menu opens. For more information, please refer to the **Editors – Asset Browser** chapter

### Apply Pose

Apply the Pose asset to the selected bones.

### Apply Pose Flipped

Apply the flipped Pose asset to the selected bones.

### Blend Pose

Blends the selected bones with the Pose asset.

### Blend Pose Flipped

Blends the selected bones with the flipped Pose asset.

### Select Pose Bones

Selects the pose bones stored in the Pose asset

### Deselect Pose Bones

Deselects the pose bones stored in the Pose asset

## Catalog selector

Here you can pick and choose which asset library you would like to see listed in the Asset Shelf.

## Asset Library

The available asset libraries.

## Refresh

Refresh the libraries.

## Tabs

Chosen catalogs will list here as tabs. Choose a tab for a quick filter of the assets in the Asset Shelf.

## Display Settings

To the right you can find the display settings.

### Size

Changes the size of the asset thumbnails.

### Names

Toggles the asset names.

## Display Filter

Filters the assets by name.

Edit Voxel Size.....	13

## 3D View editor

The 3D View editor is the editor where you edit your 3D data. Here you can display and modify all the scene data like meshes, curves, metalballs, etc.

It has a grid overlay in the middle per default, and you can navigate around in this view with your mouse.

Each part of this editor will be explained in their own individual chapter.

In this chapter you will find general GUI information that doesn't fit elsewhere.

The 3D View has several areas highlighted with colour overlays:

In the center is the actual 3D viewport. Here you see and modify your mesh data as an example.

## A. Header

The light blue area is the Header. This area contains menus, viewport settings, tools and settings.

## B. Tool Settings

The pink area at the top is the Tool Settings. Here you can find settings for the currently active tool and viewport options.

## C. Toolbar

The green area at the left is the Tool Shelf. This contains all the modal tools.

## D. Tabbed Toolbar

The orange area are additional optional tabs and panels with act-once tools also found in the header.

## E. Sidebar

The dark blue area to the right is the Sidebar. This contains settings and transform values. This is also the place where addons add their additional panels.

## F. Asset Shelf

The purple area to the bottom is the Asset Shelf. Here you can quickly access asset library assets from the 3D

Viewport.

## G. Adjust Last Operator Panel

The **red** area at the bottom left you is the Adjust Last Operation panel. This panel appears after you do an operation, like move the mesh to another location, and allows you to adjust the values for the operation afterwards.

## H. Navigation Widgets

The **yellow** area is the navigation widgets.

# Viewport Navigation

Navigation in the viewport happens mainly by mouse or hotkeys. Some of them does not have a menu entry. And needs to be explained here.

For the rest of the available navigation functionality have a look into the Navi menu in the header.

## Navigation Elements

From left to right.

## Perspective / Orthographic

Switch the view between perspective and orthographic view.

## Camera View

Enter and leave the camera view. You need to have an active camera in the scene.

## Move

Moves the view.

## Zoom

Zooms in and out.

## Mini Axis

A mini axis. It allows rotation of the view and snap to the nearest ortho view when it is in interactive navigation mode. See Viewport gizmos for more options. There you can turn it to a simple widget, or turn it even completely off.

## Lock camera to view

Available when you are in camera view. Either navigate the passepartout around the camera, or navigate in the camera view.

## Viewport navigation hotkeys

Right mouse button rotates the view.

Middle mouse button pans the view.

Holding ctrl + middle mouse button zooms the view.

Scroll Wheel zooms the view.

Holding down ALT and middle mouse button snaps the view to the next available orthographic view. Front, Left, etc. . When you continue dragging then you continue to the next orthographic view.

Numpad \* resets the 3D view.

Left clicking into an empty space deselects what is currently selected. Exception: when you are in one of the navigation modes and drag the mouse, then the navigation takes over.

## Object navigation

Hotkey W moves the selected object/s

Hotkey E rotates the selected object/s

Hotkey R scales the selected object/s

## Trackball Navigation

Pressing the hotkey for object rotation once (by default the E key in the Bforartists key map) will rotate the object around the screen axis. Pressing the hotkey for rotation twice will activate trackball rotation. Now you can rotate the object freely around all three axis.

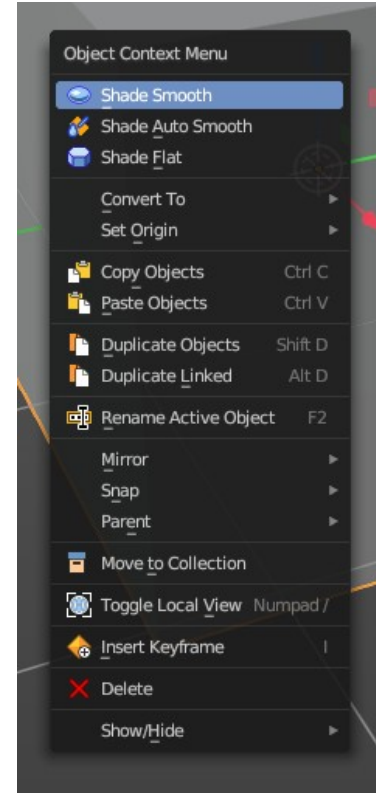

## Context Menus

Not every functionality has a menu entry. Some is hotkey only.

One of it is calling the so called context menu. You will find it in several places in the UI. Normally it's a simple right click in the viewport.

The content of this menu is to 100% double content to already existing menus. And it is, despite the name, not contextual. The different menu types comes from the object modes, not from a context.

The single context menus are described in their own chapters in the corresponding editors.

## Right click Menus

Not every functionality has a menu entry. Some is even a right click at an existing menu. Like clicking at an operator or a property in the UI to add it to the quick favourites menu or to add a shortcut.

Note that not all right click menu functionality might be documented.

## Add to selection with Shift

When you want to parent two objects together, then you need to select them. You can do this with border select for example. Or you select the first object, hold down shift, then the second object. The first object selected will be the child object then when you parent them together.

## Constraining the scaling axis (axis locking)

Scaling can be constrained to a particular axis or axes through the use of *Axis Locking*. To constrain scaling, the following shortcuts can be used:

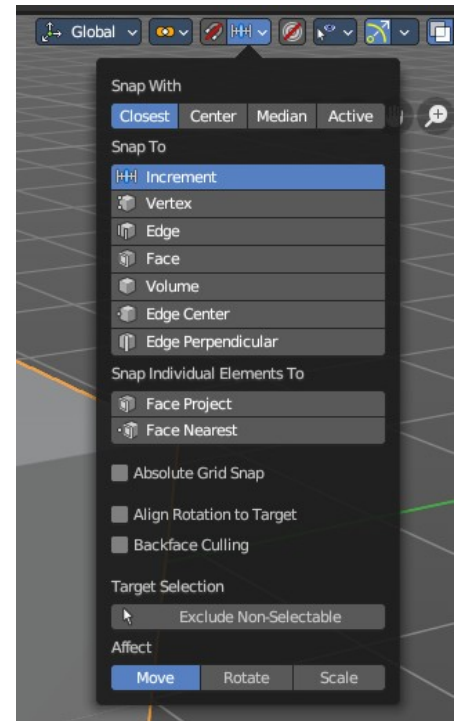

- **Scale Hotkey, X:** Scale only along the **X Axis**
- **Scale Hotkey, Y:** Scale only along the **Y Axis**
- **Scale Hotkey, Z:** Scale only along the **Z Axis**

Axis locking can also be enabled by pressing the **MMB** after enabling scaling and moving the mouse in the desired direction e.g.

- **Scale Hotkey,** move the mouse along the X axis, **MMB:** Scale only along the **X Axis**

## Object Snapping with Increment snap

Holding **Ctrl** during a transform operation (such as grab, rotate or scale) will temporary activate Transform Snapping. When the Snap Element is set to *Increment*, this allows the transformation to be performed in fixed steps.

## Slider snapping

Snapping also works at sliders for example. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

Note that this also works at brushes hotkeys for example. Hotkey F usually allows to change the radius. When you hold down ctrl too then it increases or decreases the size by incremental steps.

## Fine tuning Transform

Holding **Shift** during a transform operation will transform the object at 1/10th the speed, allowing much finer control over the snapping.

The magnitude of the transformation can be viewed in the 3D window header in the bottom left hand corner. Releasing **Ctrl** or **Shift** during the transformation will cause the movement to revert back to its normal mode of operation.

This fine tune transform operation works with both, the transform hotkeys and the 3D widget.

### Tip

#### Combining with other controls

All of the precision controls detailed on the page can be combined with the *Axis Locking* controls and used with the different *Pivot Points*.

## Rotation transformations

Holding **Ctrl** will cause rotations of 5 degrees.

Holding **Ctrl-Shift** will cause rotations of 1 degree.

## Scale transformations

Holding **Ctrl** will cause size changes in increments of 0.1 BU.

Hold **Shift** down while scaling to scale the selected element in very fine increments.

Hold **Shift-Ctrl** down while scaling to scale the selected element in 0.01 BU increments.

### Tip

#### Orientation dependent scaling

By default, all scaling happens around a Global Orientation. You can change the scaling orientation by pressing the axis key twice. For example, pressing **S, X, X** will by default set scaling to occur around the local orientation in X direction.

### Note

#### Snapping modes

Note that if you have a Snap Element option enabled, holding **Ctrl** will cause the selection to snap to the nearest element.

## Numeric input for Transform

Using the mouse for transformations is convenient. But if you require more precise control, then you can also enter numeric values. After pressing one of the navigation hotkeys, type a number to indicate the magnitude of the transformation.

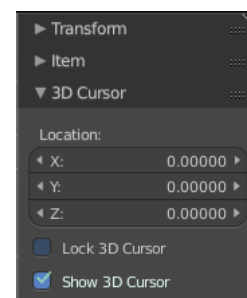

You can see the numbers you enter in the bottom left hand corner of the 3D window header. Negative numbers and decimals can be entered by pressing the minus (MINUS) and period (.) keys respectively.

The process is the same for translation, rotation and scale. Press the corresponding navigation hotkey, the header will show the values, then type in the values that you need. And finally left click or press enter to confirm. A right click abandons the operation.

For translation you have to define the axis in which you want to translate. So when you want to translate your object in X axis to 10, then press the translation hotkey, then type in X 10. And the object will arrive at X position 10. Keep in mind that pressing the navigation hotkey twice will work in local orientation.

## 3D Cursor

The 3D Cursor is simply a point in 3D space which can be used for a number of purposes. It is often in the way. You can hide it in the properties sidebar in the 3D Cursor panel at the right.

## Placement

There are various methods to place this 3D cursor, including some snapping methods.

The free placement method with a hotkey is with Alt + RMB with the default Bforartists key map.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map! And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

## File Menu - F4

Calls the file menu under the mouse.

## Set 3D Cursor - Alt Right Mouse

Sets the 3D cursor position to Mouse position.

## Frame All - Ctrl Home

View all objects in the scene in all regions. This hotkey is for quad view.

## Frame All - Shift C

View and center all objects in the scene.

## Pivot Point Pie menu - ` (german keyboard . )

Calls a pivot point pie menu. The content is the same than in the pivot menu in the header.

## Call the Snap Pie menu - Shift E

Calls the Snap Pie Menu.

## Interactive Light Track to Cursor - Shift T

Navigate a lamp of type sun or spot light to point at objects. The lamp follows the mouse cursor.

## Call pivot pie menu - .

Call pivot pie menu.

## Call orientation pie menu - ,

Call orientation pie menu.

## Cycle through select method - Shift Q

Cycle through the select method in the tool shelf.

## Toggle Viewport Gizmos - Tab

Toggles the display of the viewport gizmos.

## Loop Select - Alt Left Mouse

Selects an edge loop.

## Loop Select - Shift Alt Left Mouse

Selects an edge loop., adds to selection.

## Edge Ring Select - Ctrl Alt Left Mouse

Selects a ring loop.

Edge Ring Select - Shift Ctrl Alt Left Mouse

Selects a ring loop, adds to selection.

## Pick shortest path - Ctrl Left Mouse

Mesh Object in Edit mode.

Pick the shortest path by selecting the first element, holding down ctrl, then selecting the last element.

## Last Operator Pick shortest path

## Face Stepping

Traverse connected faces.

## Topology Distance

Find the minimum number of steps instead of the shortest distance.

## Fill Region

Select the region faces too.

## Deselected

Don't select the whole path, but just every nth element of it.

## Skip

This is connected to nth element. Number of elements to skip at once.

## Offset

This is connected to nth element. Start with an offset.

## Curve Object, Add Vertex - Ctrl Right mouse

Edit Mode. Adds a duplicate of the selected curve points under the mouse.

## Armature Object, Extrude Forked - Shift S

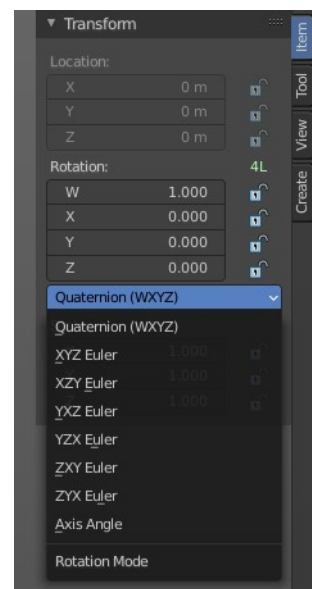

Edit Mode. Extrudes with option Forked enabled. Bones extrudes from the center of the selected joints.

## Armature Object, Click Extrude - Ctrl Right mouse

Edit Mode. Extrudes the bone to mouse position.

## Armature Object, Set Rotation Mode - Alt R

Pose Mode. Calls a menu under the mouse to set the rotation mode of the selected bone(s). The same menu is also in the Transform panel in the Item tab.

## Stencil Brush Control Hotkeys

This is for the paint modes where you have a stencil map available. Vertex Paint and Texture Paint. They move, rotate and scale the stencil image. There are two possible sets. A texture stencil map. And a mask stencil map.

### Texture set:

Alt Right Mouse

Shift Right Mouse

Ctrl Right Mouse

### Mask set:

Shift Ctrl Alt Right Mouse

Shift Alt Right Mouse

Ctrl Alt Right Mouse

## Radial Control

In Paint modes you can set the strength or radius of the brush not only by the sliders. But also by hotkeys.

Sets the brush radius - F

Sets the brush strength - Shift F

Sets the brush direction - Ctrl F

Sets the brush direction - Ctrl Alt F

## Face sets edit

Sculpt mode. Calls a pie menu to set the face sets.

## Mask Expand

Sculpt mode. Expands a Face mask.

## Edit Voxel Size

Sculpt mode. Shows a grid and allows you to adjust the voxel resolution for remeshing. The slider in the remesh panel does not show the grid.

## Image Editor - Header Tools

The header contains several tools, depends on what you do and what toolset is selected. The render result has some additional functionality.

### Image Prop

This property contains the list of loaded images. When no image is loaded then it displays the New and Open Buttons.

When an image exists then it displays the name of the currently selected image.

From left to right ...

### List of images in the scene

This is a list of the images in the scene. This list allows you to switch to other images.

### Image Edit Box

Read the name of the currently selected image. And you can rename the image here too.

## Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Search form

Search for specific images.

## New Image

Create a new image.

Creates a new image. You will get a dialog where you can define settings for the new image.

### Name

The name of the new image

### Width

The width of the new image.

### Height

The height of the new image.

### Color

Adjust the color of the new image. A click will call a color picker.

### Alpha

Check this checkbox if the new image should have an alpha channel.

### Generated Type

Here you can define what kind of texture you want to create.

Blank is one plain color.

UV Grid is a checker texture in black and white.

Color Grid is a colored checker texture.

### 32 Bit Float

Check this checkbox if the image should be in 32 Bit floating point bit depth per channel. Else it is in 8 bit per channel.

## ***Duplicate***

Not supported here.

## ***Unlink Datablock***

This deletes the selected image. Unfortunately not immediately. You need to save the scene and to reload it.

And you need to make sure that it is not linked to anything else. A mesh or a fake user for example. Have a look if there is a number besides the F button. When this is the case then the image has still a user, and so still loads with loading the scene.

## ***Fake User***

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## ***Open Image***

Opens the file browser to load an image.

## ***Unpack***

Unpack packed files to a directory.

## ***User***

The number of users that uses this data. Data with a user number of 0 will be removed with closing Bforartists.

---

## **Use Image Pin**

When you select another object. for UV mapping for example, then usually the connected images for this object gets displayed. Use image pin nails the currently selected image so that it stays displayed.

---

## **Display Channels**

Adjust what channels of the image gets displayed.

### **Color and Alpha**

Displays the whole image, including alpha channel.

### **Color**

Displays the whole image, but without alpha channel.

## Alpha

Displays the alpha channel of the image.

## Red

Displays the red channel of the image.

## Green

Displays the green channel of the image.

## Blue

Displays the blue channel of the image.

---

## Mask Prop

When you are in Mask mode then you can create a new mask, and work with this mask then.

Masks have many purposes. They can be used to mask out, or influence a particular object in the footage in Motion tracking. They can be used for manual rotoscoping to pull a particular object out of the footage. They can be used as a rough matte for green-screen keying.

Masks are independent from a particular image of movie clip, and so they can also be used for creating motion graphics or other effects in the compositor.

Masks can be driven over the time so that they follow some object from the footage. For example a running actor. This can be achieved with shape keys or parenting the mask to tracking markers.

## List of Masks

This is a list of the masks in the scene. Here you can switch to other masks.

## Mask Edit Box

Read the name of the currently selected mask. And you can rename the image mask too.

## Fake User

With this button you assign a fake user to this selected mask. Masks gets created with a fake user already. Means when you save the scene and reopen it, then this mask will still be there.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Search form

Search for specific images.

## Create Mask

Adds a new mask.

## Unlink Datablock

This deletes the selected mask. Unfortunately not immediately. You need to save the scene and to reload it.

And you need to make sure that it is not linked to anything else. A mesh or a fake user for example. Have a look if there is a number besides the F button. When this is the case then the image has still a user, and so still loads with loading the scene.

## Show Gizmos

Display the viewport gizmos.

### Navigate

Display the navigation gizmos in the Image Editor

## Show Overlays

Display the overlays in the viewport.

## Overlays settings

### Image

#### Show Metadata

Display existing metadata in the viewport.

## Mask Display

In Mask mode and with a Render result. Adjust the display of the mask.

### Smooth

Smoothens the outline of the mask curve.

### Overlay

When it's a closed curve then this closed area gets displayed as filled where it covers the image. When you tick Overlay then the drop down box becomes active where you can choose the overlay method.

## Edge Display Type

The mask curve can be displayed in different styles.

## Slot

Just with a render result. Here you can render a new image into a new slot, which allows you to compare the two images then.

You need to render into this slot. So you need to choose it beforehand. Slots without a render result does not show the Render and Pass drop down boxes.

## Layers

Here you can choose in which layer the render result is.

Renders can be separated into layers. This allows you to composite them back together afterwards.

For example blurring the background and foreground layers separately for depth of field, or rendering different lighting variations of the same scene.

Using View Layers can also save you from having to re-render your entire image each time you change something, allowing you to instead re-render only the layer(s) that you need.

You can create more View Layers in the Properties editor. In the View Layer Tab.

## Pass

Here you can set the pass mode. Combined or Depth.

## Combined

The final combination of render passes with everything included.

## Depth

Just the Depth render pass.

---

## Show Stereo

Just with stereoscopy enabled. Shows either the stereoscopic image. Or a single image from one of the cameras.

## View

Show the image from one of the cameras in the list.

## Options Panel

### In View and Mask mode

#### Update Automatically

Update other editor windows simultaneously with the changes in the Image Editor.

#### Show Metadata

Draw Metadata properties of the image.

---

### In Paint Mode

#### Update Automatically

Update other editor windows simultaneously with the changes in the Image Editor.

#### Show Metadata

Draw Metadata properties of the image.

#### Display Texture Paint UV's

Display the UV wire from the active mesh. It needs to be in edit mode.

#### Show same material

This is for the case that you work at a texture for the current mesh. Just show faces of the mesh where the material with this texture is assigned to.

## 8.1.2 Editors - Image Editor - Header - Quick Menu

### Table of content

Quick Menu.....	1
Adding an operator to the Quick menu.....	1
Adding a menu to the Quick menu.....	1
Order.....	2
Removing an operator from the Quick menu.....	2
Context and mode dependent content.....	2

### Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

Note also that the Quick menu for the Image editor shares the content with the Quick menu from the UV editor.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

# Image Editor - View Menu

The View menu contains all View related tools.

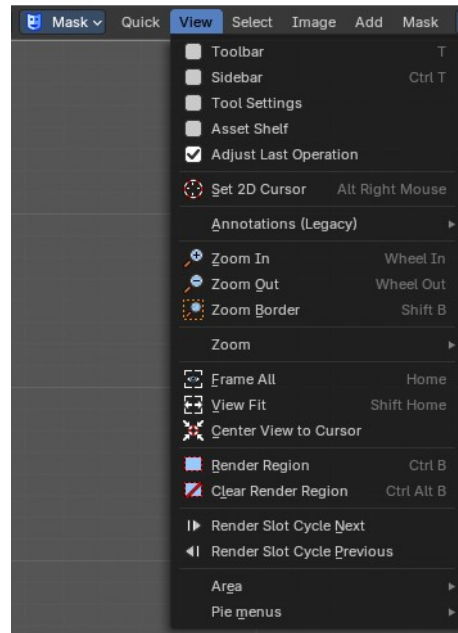

It is available in all sub modes. With a render result the view image shows a different content. And in mask mode it shows one more item. Set 2D cursor.

ts Render

ists Render

## Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Tool Settings

Shows or hides the tool settings above the header in the 3D view.

## Asset Shelf

Not yet. The asset shelf is planned but not implemented yet.

## Adjust Last Operation

Shows or hides the Adjust Last Operation panel down left.

Note that the Adjust Last Operation menu item in the Edit menu in the main header and the Last button in the toolbar are not related and not functional with this last operator panel. It is an independent element.

---

## Set 2D Cursor

Mask mode only. Set the 2D cursor position. Hotkey only tool! Please use the hotkey!

---

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet.

**Note:** *These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.*

### **Draw Annotation**

Starts the annotation free hand draw tool in the editor.

## ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

## ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

## ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

## ***Add Annotation Layer***

Starts a new annotation layer.

## ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

## **Zoom In**

Zooms into the viewport.

## **Zoom Out**

Zooms out of the viewport.

## **Zoom Border**

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## **Fractional Zoom**

A sub menu where you can choose between predefined zoom factors.

## **Frame All**

Zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## **View Fit**

Zooms out or in to fit the image to the viewport.

## Render Region

Render result only. Allows you to draw a rectangle. And when you re-render the image, just the content in this rectangle region gets rendered.

This tool does, different from the 3d view, not draw a permanent red rectangle to define the render region area. You will see what you have chosen when you render the image.

## Clear Render Region

Render result only. Removes any existing render region rectangle.

## Render Slot Cycle Next

Render result only. Cycle through the Render slots.

## Render Slot Cycle Previous

Render result only. Cycle through the Render slots.

## Center View to Cursor

Mask Mode only. Center the view to the 2D cursor.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI any more.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the area window.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Image Editor - Image Menu

The Image menu contains the load and save functionality.

It is available in all sub modes. But not all content shows in all combinations.

### New

Creates a new image. You will get a dialogue where you can define settings for the new image.

### Name

The name of the new image

### Width

The width of the new image.

### Height

The height of the new image.

### Colour

Adjust the colour of the new image. A click will call a colour picker.

### Alpha

Check this checkbox if the new image should have an alpha channel.

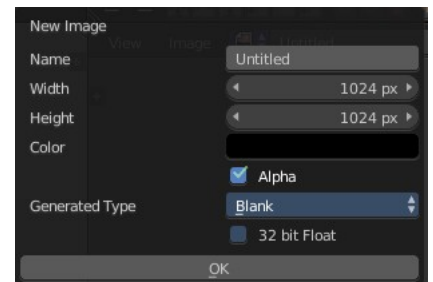

### Generated Type

Define what kind of texture you want to create.

Blank is one plain colour.

UV Grid is a checker texture in black and white.

Colour Grid is a coloured checker texture.

## 32 Bit Float

Check this checkbox if the image should be in 32 Bit floating point bit depth per channel. Else it is in 8 bit per channel.

---

## Open Image

Opens the file browser to load an image.

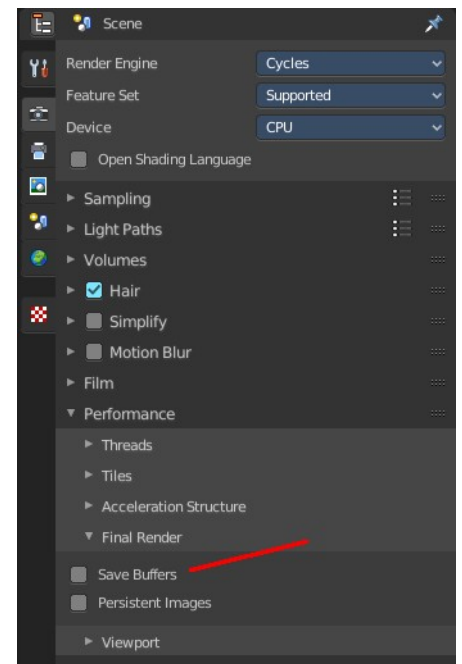

---

## Open Cached Render

To get it to work you need to have Cycles as the renderer selected. This feature does not work with Eevee or Workbench renderer.

Read all the current scene's render layers from cache, as needed. For this feature to work save Buffers needs to be activated in the Performance tab in the render settings.

This feature can be used to save RAM while rendering because the render layers do not have to be saved in RAM. It can also be used to recover some information from a fail render.

## Copy

Copy the image to the clipboard.

## Paste

Paste an image from the clipboard.

---

## Replace Image

Replaces the currently active image by an image that you load.

## Reload Image

Reloads the currently selected image.

Note that the images must already exist somewhere at your hard disk. When you create a new image in Bforartists, then this image isn't saved yet, and so you cannot reload it.

## Edit Externally

Open the image in a defined external image editor like The Gimp or Photoshop.

The image must be saved. And the image editor must be defined in the User Preferences.

## Save Image

Saves the currently selected image without any further questions. Note that the images must already exist somewhere at your hard disk.

## Save As Image

Saves the currently selected image.

## Save Copy

Saves a copy of the currently selected image. This will save the file to a specified name, but will keep the old one open in the Image editor.

## Save all Images

Saves all images.

Note that the images must already exist somewhere at your hard disk so that they can be saved. The item is greyed out as long as the image is not saved to disk.

---

## Invert

Invert is a sub menu where you can invert the colors of the whole image, or just specific colors.

**Note:** This only shows when in the when not viewing the Viewer or Render Result.

## Resize

Allows you to change the dimensions of the image. The tool calls a resize panel.

**Note:** This only shows when in the when not viewing the Viewer or Render Result.

## Transform

**Note:** These only shows when in the when not viewing the Viewer or Render Result.

### Flip Horizontally

Flip the image horizontally around it's central axis.

## Flip Vertically

Flip the image vertically around it's central axis.

## Rotate Clockwise 90°

Rotate the image to the right by 90 degrees.

## Rotate Counter-Clockwise 90°

Rotate the image to the left by 90 degrees.

## Rotate Flip 180°

Rotate the image to the right by 180 degrees and flip the image upside down.

## Pack Image / Pack as PNG

Packs the currently active image into the blend file. When you save the blend file the next time, then this image will be embedded. The Pack menu item turns into an Unpack menu item with packed textures.

Packed images are marked with a pack icon. A click at this icon will unpack the texture, and try to save it to file. Usually to the last existing location before it was packed.

### Warning

You cannot modify packed images. Changes at the image will not be saved. You need to unpack the image when you want to modify it. And repack it after you have done the changes.

## Extract Palette

Allows you to extract a color palette from a loaded image, useful for brush based tools. The result can then be found in the Color Palette panel in the Tools tab in the sidebar with the correct object and being in the right mode, for example in texture painting mode in the 3D View editor.

## **Generate Grease Pencil**

Generates a Grease Pencil object from the image.

## 8.1.5 Editors - Image Editor - Header - Select menu

### Table of content

Image Editor - Select menu.....	1
All.....	1
None.....	1
Inverse.....	1
Box Select.....	1
Circle Select.....	2
Lasso Select.....	2
Linked.....	2
More.....	2
Less.....	2

### Image Editor - Select menu

This menu just appears when you are in Mask mode. And you need to create a new mask layer to set all items active. The select functionality in this menu covers the mask geometry. The splines.

#### All

Toggles between select all and deselect all.

#### None

Select nothing.

#### Inverse

Inverts the current selection.

#### Box Select

Border select enters the Border Select mode. This is a special select mode where you can select elements by dragging a rectangle. And what's inside of the rectangle gets selected then. It adds to selection by default.

To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Lasso Select

A sub menu with the available lasso select modes.

## Linked

Select all vertices linked to the active spline(s). The previous selection gets cleared.

## More

Select more from the current active spline(s).

## Less

Select less from the current active spline(s).

## 8.1.6 Editors - Image Editor - Header - Add menu

## Image Editor - Add menu

This menu just appears when you are in Mask mode.

In this menu you can create circle or square spline curves to use them for masking. They appear at the 2D cursor, and have four handlers.

They can be moved, rotated and resized with the usual W E R keys. See also mask menu, Transform. The handlers allows to change the shape and size too.

You can add multiple spline curves to a mask layer.

### Circle

Adds a circle shaped spline curve.

### Last Operator Add Circle

#### Size

The size of the circle spline curve.

#### Location X Y

The location of the circle spline curve. Calculation happens from the center of the spline. 0 / 0 is down left.

## Square

Adds a square shaped spline curve.

### Last Operator Add Square

#### Size

The size of the square spline curve.

#### Location X Y

The location of the square spline curve. Calculation happens from the center of the spline. 0 / 0 is down left.

## Vertex Slide

Allows you to draw freehand curves by holding down shift and clicking into the viewport. Hotkey only functionality!

### Last Operator Add Vertex and Slide

#### Location X / Y

Adjust the location of the last created curve point.

## Feather vertex slide

Create and define a feathering outline curve.

Usage: Hold down shift + control, click at a vertex, and pull outwards. This will create the feathering outline curve, displayed in green.

### Last Operator Add Feather Vertex and Slide

#### Location X / Y

Adjust the location of the last created feather curve point.

## Image Editor - Mask menu

This menu appears when you are in Mask mode. It contains further functionality to modify the masking spline curves.

### Delete

Deletes the selected spline(s) or spline points.

### Duplicate

Deletes the selected spline(s) or spline points.

### Toggle Cyclic

Closes or opens the spline.

### Switch Direction

A curve has a start point and a end point. Here you can switch them. The end point becomes the starting point and vice versa. As a consequence the handler can switch their location too. With handle type aligned single they can appear outside or inside of the circle.

### Recalc Normals

Recalculating the normals smoothens out the curve, and realigns the handlers. A

square shape with handle type aligned would become round.

## Set Handle Type

Opens a sub menu where you can choose different handle types.

## Last Operator Set Handle Type

### Type

Choose the handle type again.

## Clear Parent

Clears the parent relationship.

## Make Parent

Parents the selected spline points. Mask splines can be parented to motion tracker markers.

## Copy Splines

Copy the selected spline(s) or spline points.

## Paste Splines

Pastes the copied spline(s) or spline points.

---

## Show/Hide

## Show/Hide Faces

This is a sub menu where you can show or hide the selection.

### Show Hidden

Makes hidden splines visible again.

### Hide Selected

Hides the selected spline(s).

### Hide Unselected

Hides the not selected spline(s). The selected spline(s) stays visible.

## Transform

This is a sub menu with some transform menu items. This menu items are hotkey tools!

### Translate

Move the selection.

### Last Operator Move

### Values

Adjust the move amount.

X, Y and Z defines the position.

### Axis Ortho

Along which axis to move

### Orientation

Orientation is a drop-down box where you can choose the type of orientation for the transform action.

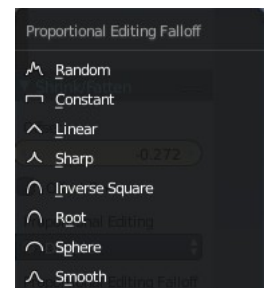

### Proportional Editing

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

### Proportional Editing Falloff

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

### Proportional size

Proportional size is a edit box where you can adjust the strength of the Proportional falloff.

### Connected

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

### Projected ( 2D)

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## Rotate

Rotate the selection.

### ***Last Operator Rotate***

#### Angle

Adjust the angle.

#### Axis

Along which axis to rotate

#### Orientation

Orientation is a drop-down box to choose the type of orientation for the transform action.

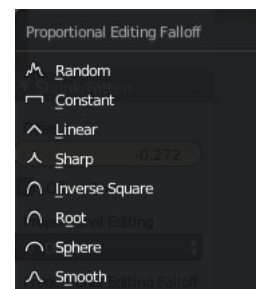

#### Proportional Editing

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

#### Proportional Editing Falloff

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

#### Proportional size

Proportional size is a edit box to adjust the strength of the Proportional falloff.

#### Connected

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

#### Projected ( 2D)

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## Scale

Scale the selection.

### ***Last Operator Resize***

#### Scale X Y Z

Adjust the scaling.

## Orientation

Orientation is a drop-down box to choose the type of orientation for the transform action.

## Proportional Editing

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

## Proportional Editing Falloff

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

## Proportional size

Proportional size is a edit box to adjust the strength of the Proportional falloff.

## Connected

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

## Projected ( 2D)

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## Scale Feather

Scale feather weight for the selected points.

The curve type that is used to create mask splines is almost a Bezier curve. But it has some differences. Smooth edges of the mask are defined by feathering. The curve needed to support feathering in a way that stuck to the curve as you edited it, for ease of editing an animation. These are called S-Curves.

Besides the handles, every control point also has points that define the feather between the current point and the next point on the spline. Each feather point is stored in UV space, where U means position across spline segment, and V means distance between main spline and feather points.

## Last Operator Transform

### Values

Adjust the scale amount.

X, Y and Z defines the position. W defines the rotation.

## Axis

Around which axis to rotate. X, Y or Z.

## Orientation

Orientation is a drop-down box to choose the type of orientation for the transform action.

## Proportional Editing

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

## Proportional Editing Falloff

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

## Proportional size

Proportional size is a edit box to adjust the strength of the Proportional falloff.

## Connected

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

## Projected ( 2D)

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## Clear Feather Weight

Resets the scale to its original dimensions.

## Animation

Masks can be animated.

## Insert Shape Key

Inserts a shape key for the currently selected curve points

## Clear Shape Key

Removes the shape keys for the currently selected curve points at the current frame.

## **Feather Reset Animation**

Resets the feather weight on all selected curve points at the current frame.

## **Re-Key Points of Selected Shapes**

Recalculate animation data for the currently selected curve points for frames that are selected in the dope sheet.

## 8.1 Editors - Image Editor - Header

### Table of content

Image Editor - Header.....	1
Switch to UV / Image editor.....	1
Header right click menus.....	1
Editortype Menu.....	2
Sub Modes.....	2
View Mode.....	2
Paint Mode.....	2
Mask Mode.....	2

## Image Editor - Header

The Header contains various menus, navigation elements, settings and tools for the viewport. This content differs, dependent of the sub mode.

The header is divided into two areas. Left mode and menus. Right settings.

### Switch to UV / Image editor

Sometimes you want to switch from the UV Editor to the Image Editor. Or vice versa. To continue at the unwrap or to paint a texture.

This two editors are connected by a menu that allows exactly that. A button in each header that switches to the other editor.

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

## Editortype Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

## Sub Modes

The Image Editor has three sub modes. View, Paint and Mask.

### View Mode

It is as the name says a pure view mode. You can view your content.

### Paint Mode

Paint mode allows to paint at your image material. The Paint mode is not available when you have a render result selected. You cannot paint at a render result. The render result is a special kind of image in this regards.

### Mask Mode

This mode comes with masking functionality. You can mask out parts of the image.

## 8.2 Editors - Image Editor - Tool Shelf

Mask.....	5

### Tool Shelf in View Mode

This menu just appears when you are in Mask mode.

In this menu you can create circle or square spline curves to use them for masking. They appear at the 2D cursor, and have four handlers.

They can be moved, rotated and resized with the usual W E R keys. See also mask menu, Transform. The handlers allows to change the shape and size too.

You can add multiple spline curves to a mask layer.

## Sample

Samples the color under the mouse cursor. This sampled information is just an information. It has no real use, you don't pick up the color. There is no tool that could use it.

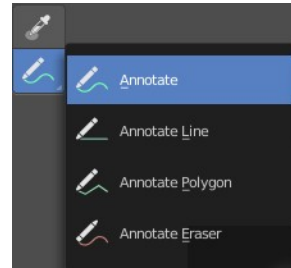

The sample result gets displayed in the footer.

X:256 Y:753 | R:1.00000 G:1.00000 B:1.00000 A:1.0000 | CM R:1.0000 G:1.0000 B:1.0000 H:0.0000 S:0.0000 V:1.0000 L:1.0000

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar. Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate

Draw free-hand strokes in the main window.

### **Tool Settings**

The tool settings for Annotate.

### **Color**

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### **Stabilize Stroke**

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### **Radius**

The radius for the stroke stabilization.

### **Factor**

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

### End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

---

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker where you can define the color for the annotation stroke.

## Annotate Eraser

Click and drag to remove annotate lines.

### Tool Settings

#### Radius

The radius of the eraser pencil.

## Tool Shelf in Paint Mode

The settings for these tools are in the tools tab in the sidebar. This content is explained in the chapter Image Editor - Sidebar. Here we just explain what the tool does and how to use it.

### Draw

The draw brush allows you to draw at the canvas. The color can be adjusted in the brush panel in the sidebar.

The Tools Tab provides you with further options and settings.

### Soften

Softens the image under the brush.

### Smear

Smears the image under the brush.

## Clone

Despite the name it is not a clone tool. It is a stencil map paint tool. You load an image, and can then use it to paint parts of this stencil image onto the canvas.

You can move the stencil image around with the right mouse button.

## Last Operator Grab Clone

### *Delta X Y*

The position of the stencil image. The position gets calculated from the lower left corner. It is not calculated in pixels, but relative to the source image. The width and height of it is the range between 0 and 1

---

## Fill

Fills areas with the same color with another color of your choice. The color can be set in the Brush panel in the sidebar.

## Mask

This tool allows you to mask out image parts.

## Tools Tab

In View and Mask mode you don't have any further content in the Tool tab. But in Paint mode the tools tab contains several panels with functionality for the brushes. It is in big parts similar functionality to the paint tools in the 3D view. The Brush panel shows different content, dependent of which brush is chosen in the tool shelf.

### Save Image

A short warning. A modified image does NOT save with the scene. You have to save out the image when you want to save the changes at the texture. There is no warning. So DON'T FORGET TO SAVE THE IMAGE.

## Brushes Panel

The Brush Panel contains the different Brushes and some Brush settings. Choose and adjust your current active brush.

### Browse Brush

The big image at the top is a drop down box where you can see the current active brush. The content differs, dependent of the active brush. You can add duplicates of this active brush, and customize it to your needs. But the active brush gets chosen in the Tool Shelf at the left of the 3D View.

brushes are hidden before or after the current display.

When you have added a few more brushes then the drop down box may be more than full. You will see some little white arrows then. Either in the top left or in the bottom right corner. They indicate that some

To scroll to this hidden content use the mouse wheel, or the arrow up and down buttons at the keyboard.

## Custom Icon

The button at the right allows you to load a custom icon for your brush. It reveals a file browser below the image browser.

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**The shield icon** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Brush settings Panel

### Brush Panel

The Brush Panel contains the different paint brushes, a color dialog, and some brush settings.

### Blend

Define how the stroke will blend. You can choose between various blend modes.

## Radius

The Radius edit box allows you to adjust the radius of the brush. The button behind the edit box enables tablet pressure sensitivity for radius.

### ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

### ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## Strength

The Strength edit box allows you to adjust the strength of the brush. The button behind the edit box enables tablet pressure sensitivity for strength.

### ***Size Pressure***

The first button behind the edit box enables tablet pressure sensitivity for radius.

### ***Use Unified Radius***

The second button behind the edit box enables global radius size. Any modification at the radius will also modify the radius value for other paint tools.

## Brush Settings Panel - Color Picker Sub panel

Define the color for your brush.

The active color is the left one. When you click the button with the two arrows down right then you can swap the color with the secondary color. Then this secondary color becomes the primary color, and is active.

A click at one of the color fields will open a more detailed color dialog, to set up the color by using rgb, hsv and hex colors and with value sliders.

## Brush colors flip

Flips the primary color with the secondary color.

## Use unified Color

Choose if you want to use global colors or local color just for vertex painting.

## Brush Settings Panel - Color Palette Sub panel

Create a color palette for later reuse.

First create a new palette by clicking at New. Then adjust the color in the color picker. And then click at the add button to add this color to the palette.

To set the color picker to a palette color simply click at this palette color.

To remove a color from the palette, choose it, then click at the remove button. The active palette color that gets removed is the one with the triangle at it.

The color palette cannot be saved externally. It is part of the current blend file. You can however append color palettes from other blend files.

The elements are explained from left to right.

### Palette browser

The button at the left opens a drop down list where you can choose between your palettes.

### Edit Box

Read the name of the currently active palette. You can also rename the palette here. A click into the edit box makes the name editable.

### Number of users

See how many users the palette currently has.

### Fake User

Fake User sets the element to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

### Add palette

Add a new palette.

### Remove Palette

Clicking at this button removes the palette. Note that you need to save, close Bforartists and reload the blend file to remove the palette completely.

## Brush Settings Panel - Advanced Sub panel

This sub panel contains brush specific settings.

### Accumulate

Accumulate stroke daubs on top of each other.

### Affect Alpha

When disabled then the alpha is locked while painting.

### Sharpen / Soften (Soften Brush)

#### Sharp Threshold

The threshold below which no sharpening is performed.

#### Kernel Radius

Radius of kernel used for soften and sharpen in pixels.

#### Blur Mode (Soften Brush)

Choose the blur method. Gaussian or Box.

#### Image (Clone Brush)

Choose an image to clone from.

#### Alpha

The alpha value for the clone image.

#### Anti Aliasing

Smooths the edges of the strokes.

#### Mask Value (Mask brush)

The vertex weight when brush is applied.

## Brush Settings Panel - Texture Sub panel

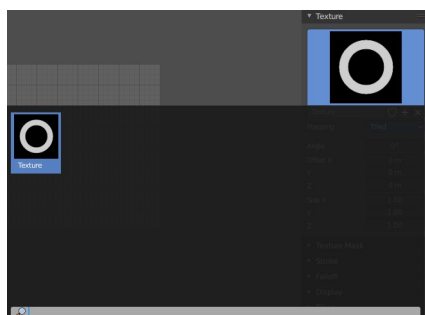

### Texture Panel

The Texture panel allows you to paint with textures. This allows you for example to grab a photo from some fish scales, and simply paint them onto the mesh by using this image as a pencil. Or as a blueprint where you walk through ( Stencil method ).
