The image at the top of the panel is an image browser. Choose a texture that you can choose for painting then. You can also have more than one image loaded at once.

In this shot there is already a texture added. The way to add the texture here is a bit more complicated. And not done with clicking at the New button.

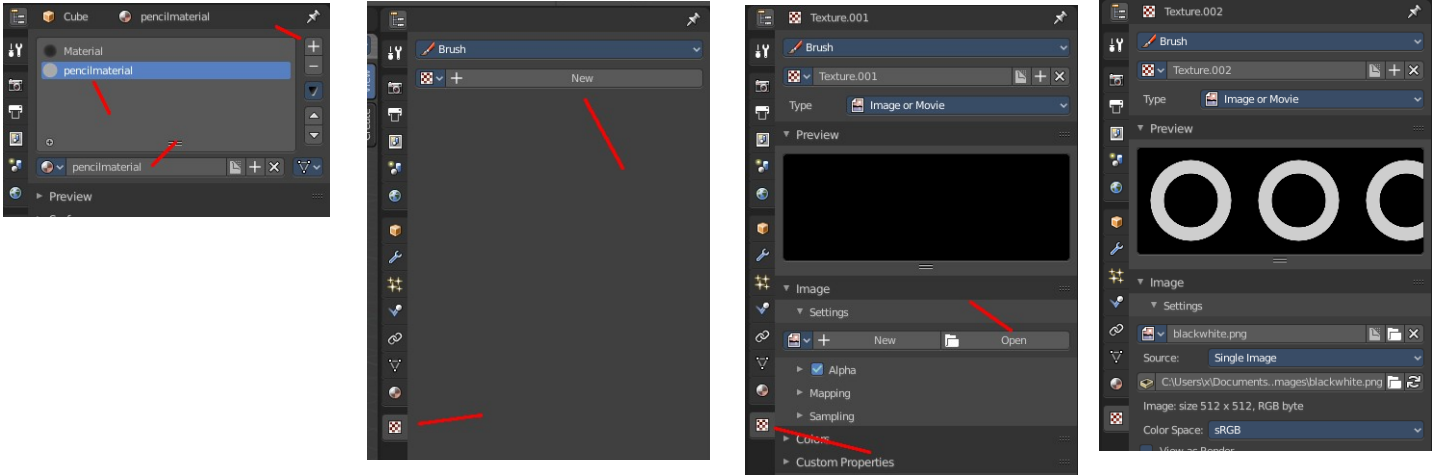

First click at the New button below the image. This will create a new texture slot. This slot is still empty, it displays black.

We need to load a texture in this slot. This must be done in the Properties editor in the Textures tab.

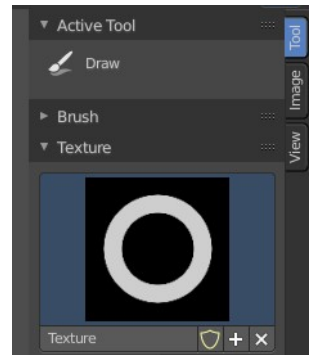

The problem is, we have an object with a material and a texture already selected. And when we change this texture, then we don't get the pencil texture loaded. But we change the texture at our mesh.

What we need to do is to create a material first. And in this material we load our pencil texture then. And then this texture becomes available in the image browser of the Texture panel.

And when we go back to the texture panel, then the texture should be loaded here. And we can work with this texture.

## Texture Edit box

The Texture edit box is the edit box below the Image browser. When there's no image loaded then it displays the New button. When there's an image (or more) loaded, then you will see the name of the current texture.

**The F button** turns this texture into a data block with a fake user. Means it will exist even when there is no data connected to it anymore.

When you activate Fake User, then you may get a value in front of it, which displays how much users this data block (our texture slot) currently has.

**The + Button** adds another texture slot. Note that you will have to load a texture too, as explained above.

**The X button** deletes the texture slot.

## Brush Mapping

Our texture can be mapped in different methods. The Brush mapping is a drop down box where you can choose this different brush mapping methods.

The settings vary. So we will go through them by the different brush

mapping methods.

---

## Brush Mapping with mapping method Tiled

The brush mapping method Tiled tiles the brush stroke at the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

### Angle

The angle of the brush.

### Offset

The offset of the texture in the brush.

### Size

The size of the texture in the brush.

---

## Brush Mapping with mapping method View Plane

The brush mapping method View Plane simply paints onto the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

### Angle

The angle of the brush.

### Rake

The angle follows the direction of the brush stroke.

### Random

The brush angle gets set random.

### Offset

The offset of the texture in the brush.

### Size

The size of the texture in the brush.

## Brush Mapping with mapping method 3D

The brush mapping method 3D paints the texture at the surface, by tiling it 1/1 at the object surface.

### Offset

The offset of the texture in the brush.

### Size

The size of the texture in the brush.

## Brush Mapping with mapping method Random

The brush mapping method Random paints onto the surface, and randomizes the texture position in the brush while that. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

### Angle

The angle of the brush.

### Rake

The angle follows the direction of the brush stroke.

### Random

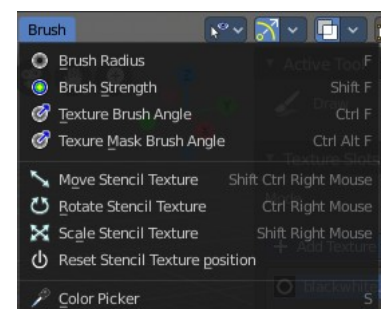

The brush angle gets set random.

## Brush Mapping with mapping method Stencil

The former methods uses the textures for the brush. The method Stencil works different. You have your texture displayed in the workspace above the object, and you paint this texture onto your object with your pencil strokes.

Note that the texture in the 3d space is just visible when you are with the mouse over the viewport.

It gets by default displayed down left. You have to position it where you need it. See Brush menu in the 3D view, Stencil Texture controls.

### **Image Aspect**

Adjust the stencil size to fit to the image aspect ratio.

### **Reset Transform**

Resets the stencil image to be down right in the 3D view.

### **Angle edit box**

Adjust the angle of the brush. The button at the end allows you to set the radius by dragging the mouse. This should be done in the viewport and with the hotkey. This button is just a visible reminder.

### **Offset**

Fine tune the offset of the texture in the brush.

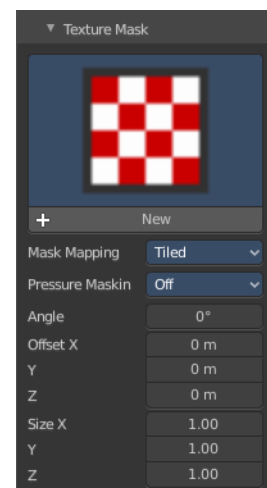

### **Size**

Fine tune the size of the texture in the brush.

## Brush Settings Panel - Texture Mask Sub panel

### **Texture Mask Panel**

The texture mask panel allows you to use a texture as a mask to define the strength of painting. It paints just where the mask texture is bright. You can also use gradients to define the paint strength.

## Browse Texture to be linked

The image at the top of the panel is an image browser. Choose a texture that you can choose for painting then. You can also have more than one image loaded at once.

In this shot there is already two textures added. The way to add the texture here is a bit more complicated. And not done with clicking at the New button.

First click at the New button below the image. This will create a new texture slot. This slot is still empty, it displays black.

We need to load a texture in this slot. This must be done in the Properties editor in the Textures tab.

The problem is, we have an object with a material and a texture already selected. And when we change this texture, then we don't get the pencil texture loaded. But we change the texture at our mesh.

What we need to do is to create a material first. And in this material we load our pencil texture then. And then we can choose this texture in the image browser of the texture.

And when we switch back to the tools tab, then the texture is loaded. And we can work with this texture.

Make sure that you use another texture in the Texture panel than in the Texture Mask panel, or no texture at all. When both is the same then you will get the same result with all Mask Mapping methods since they overlap each other at the very same positions.

## Brush Mapping with mapping method Tiled

The brush mapping method Tiled tiles the brush stroke at the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Pressure Masking

Enable pressure masking when you use a tablet.

## Angle

The angle of the brush.

## Offset

The offset of the texture in the brush.

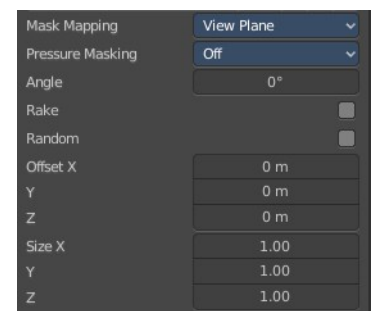

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method View Plane

The brush mapping method View Plane simply paints onto the surface. The mapping happens from the current view. The result may be distorted when the view does not align with the surface of the object.

## Pressure Masking

Enable pressure masking when you use a tablet.

## Angle

The angle of the brush.

## Rake

The angle follows the direction of the brush stroke.

## Random

The brush angle gets set random.

## Offset

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method Random

The brush mapping method Random paints onto the surface, and randomizes the texture position in the brush while that.

## Pressure Masking

Enable pressure masking when you use a tablet.

## Mask Pressure Mode

A drop down box to choose the mask pressure mode for tablets.

## Angle

The angle of the brush.

## Rake

The angle follows the direction of the brush stroke.

## Random

The brush angle gets set random.

## Offset

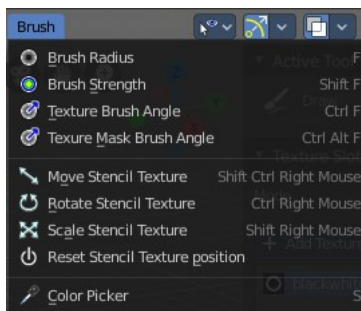

The offset of the texture in the brush.

## Size

The size of the texture in the brush.

## Brush Mapping with mapping method Stencil

The former methods uses the textures for the brush. The method Stencil works different. You have your texture displayed in the workspace above the image, and you paint this texture onto your object with your pencil strokes.

Note that the stencil texture is just visible when you are with the mouse over the viewport. It gets by default

displayed down left. You have to position it where you need it. See Brush menu, Stencil Texture controls.

### **Image Aspect**

Adjust the stencil size to fit to the image aspect ratio.

### **Reset Transform**

Resets the stencil image to be down right in the 3D view.

### **Pressure Masking**

Enable pressure masking when you use a tablet.

### **Angle edit box**

Adjust the angle of the brush. The button at the end allows you to set the radius by dragging the mouse. This should be done in the viewport and with the hotkey. This button is just a visible reminder.

### **Offset**

Fine tune the offset of the texture in the brush.

### **Size**

Fine tune the size of the texture in the brush.

## **Stroke Panel**

### **Stroke Panel**

The Stroke panel contains settings to influence the behavior of the brush stroke. There are various stroke methods available. We will go through them one by one.

### **Stroke method Space**

This is the default Stroke method. The stroke gets added continuously with given settings.

### ***Spacing Edit Box***

The sculpt drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

### ***Spacing Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### **Adjust Strength for Spacing**

Automatically adjust strength to give consistent results for different spacing.

### **Dash Ratio**

Ratio of samples in a cycle that the brush is covering.

### **Dash Length**

Length of a dash cycle measured in stroke samples.

### **Jitter Edit Box**

Add Jitter to the brush while painting.

### ***Spacing Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

### ***Input Samples Edit Box***

Average multiple input samples together to smooth the brush stroke.

---

### ***Smooth Stroke***

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### ***Smooth Stroke Radius Edit Box***

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### ***Smooth Stroke Factor Edit Box***

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

## Stroke method Curve

The Stroke method curve doesn't simply influence the way how the stroke is painted. It is a special method.

First you draw a curve object by holding down ctrl and clicking with right mouse button. Then you tweak the curve. You can click at the curve point, and drag out handlers to make the curve points smooth. This way you get one handler. When you click and drag then you will get two handlers at the curve point.

When done you hit the Draw Curve button or click left outside of the image. And the curve gets drawn onto the surface.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Paint Curve edit box

Here you set the active curve.

**The first element** is a drop down box where you will find your curves objects. You can have more than one.

**The second element** is the edit box that displays the active curve.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**F** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

### ***Draw Curve Button***

A click at it to turns the curve into curve.

### ***Jitter Edit Box***

Add Jitter to the brush while painting.

### ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

### ***Input Samples Edit Box***

Average multiple input samples together to smooth the brush stroke.

### ***Stabilize Stroke***

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### ***Smooth Stroke Radius Edit Box***

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### ***Smooth Stroke Factor Edit Box***

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

## **Stroke method Line**

With Stroke method line you draw a line between a starting point and an endpoint. And when you release the mouse then the line gets drawn.

## Spacing Edit Box

The drawing happens by mapping the pencil onto the mouse position. And when you move the mouse then the next mapping happens. Adjust the spacing after what mouse movement the next mapping should happen. The lower the value, the lower the distance between the single dots.

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### *Jitter Unit*

Jitter in screen space, or relative to the brush size.

## Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

## Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### *Smooth Stroke Radius Edit Box*

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### *Smooth Stroke Factor Edit Box*

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

## Stroke method Anchored

Click and drag to place a dot and to scale it.

### *Edge to edge*

Drag Anchor Brush from edge to edge.

## Jitter Edit Box

Add Jitter to the brush while painting.

### *Jitter Pressure*

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

## ***Input Sample Edit Box***

Average multiple input samples together to smooth the brush stroke.

## ***Stabilize Stroke***

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## ***Smooth Stroke Radius Edit Box***

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

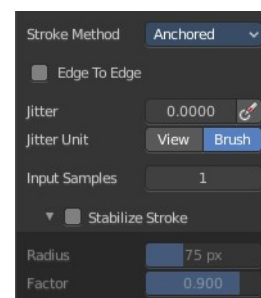

## ***Smooth Stroke Factor Edit Box***

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

## **Stroke method Airbrush**

The stroke acts like an airbrush pencil. The dots gets placed randomly.

## **Rate Edit Box**

Define the rate of the drawing.

## **Jitter Edit Box**

Add Jitter to the brush while painting.

## ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

## ***Input Samples Edit Box***

Average multiple input samples together to smooth the brush stroke.

## ***Stabilize Stroke***

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## ***Smooth Stroke Radius Edit Box***

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

## Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

### Stroke method Drag Dot

Paint a dot and drag it around. The actual painting happens then at releasing the mouse.

### Jitter Edit Box

Add Jitter to the brush while painting.

### Jitter Pressure

The icon behind the edit box enables tablet pressure sensitivity for tablets.

### Jitter Unit

Jitter in screen space, or relative to the brush size.

### Input Samples Edit Box

Average multiple input samples together to smooth the brush stroke.

### Stabilize Stroke

The brush lags behind the mouse position, and produces a much smoother stroke by that.

### Smooth Stroke Radius Edit Box

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

### Smooth Stroke Factor Edit Box

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

---

### Stroke method Dots

The stroke method Dots draws dots of the pencil onto the surface. The mapping happens from the current view. Means you will get distortions when your view is not aligned with the surface of the object.

### Jitter Edit Box

Add Jitter to the brush while painting.

## ***Jitter Pressure***

The icon behind the edit box enables tablet pressure sensitivity for tablets.

## ***Jitter Unit***

Jitter in screen space, or relative to the brush size.

## **Input Samples Edit Box**

Average multiple input samples together to smooth the brush stroke.

## **Stabilize Stroke**

The brush lags behind the mouse position, and produces a much smoother stroke by that.

## **Smooth Stroke Radius Edit Box**

Is just active when Smooth Stroke is activated. Adjust the radius of the smoothing.

## **Smooth Stroke Factor Edit Box**

Is just active when Smooth Stroke is activated. Adjust the factor of the smoothing.

# Brush Settings Panel - Falloff Sub panel

The curve panel allows you to define different falloffs methods for the border of the brush.

## **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## **Adding Points**

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

## Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***Reset Curve***

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve points.

---

## Curve window

Tweak and adjust the falloff curve by clicking at a curve point and dragging it around.

Double click adds a new point.

Holding down ctrl activates temporary snapping.

Holding down shift enables slower movement, which allows more accurate setting.

---

## Curve Presets

Predefined curve presets.

## Brush Settings Panel - Brush Tip Sub panel

Adjust the color and appearance of the brush cursor to custom values.

### Brush Tip Checkbox

Activate the custom settings.

### Cursor Color

Choose another color for the brush cursor. Double clicking at the color field will open a color picker.

### Falloff Opacity

You can turn on the cursor overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

### Override Overlay

Hide the Cursor Overlay when painting.

### Use Cursor Overlay

Turn on Cursor Overlay.

---

### Texture Opacity

This is for the case when you paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

### Override Overlay

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

---

## Mask Texture Opacity

This is for the case when you mask paint with a texture brush. You can turn on the Texture overlay with the eye button at the end. The falloff opacity slider allows you to adjust the opacity of this cursor overlay.

## Override Overlay

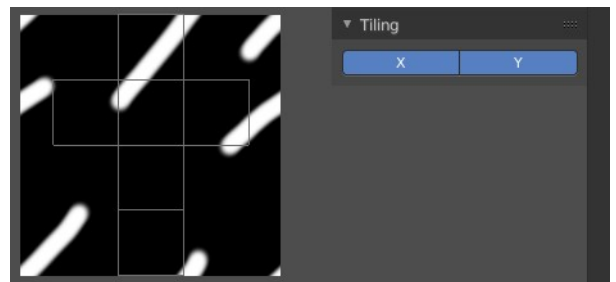

Hide the Texture Overlay when painting.

## Use Cursor Overlay

Turn on Texture Overlay.

## Tiling panel

Tiling allows you to draw over the borders and continue the stroke at the other side of the image. You can tile in X and Y direction.

## Introduction

In the Image tabs you can find further options and image settings. These settings changes, dependent of what you have selected. And in what mode you are

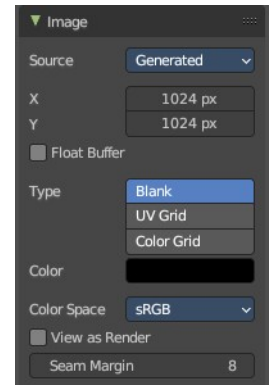

# Image Panel

Find image related settings. Size, type, and so on.

## Source

Choose the image type. This type gets usually automatically set. When you create a new image, then this image is generated. When you load an image then the Source switches to Single Image.

Generated images does not have a path.

## Source Type Generated

### X / Y

The image width and height.

### Float Buffer

Use a floating point buffer. 8 Bit images uses integers. 32 Bit works with floats.

## Generated Type Blank

This type displays an image with one blank color

### Color

The color of the blank image.

## Generated Type UV Grid

This type displays a with a black and white checker texture but colored dots.

## Generated Type Color Grid

This type displays a with a colored checker texture with numbers.

## Color Space

Choose the color space type for the image.

## Half Float Precision

Just with image material that uses 32 bit float. Use just 16 Bit per channel instead of the full 32 bit. This lowers the memory usage while rendering.

## View as Render

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

## Seam Margin

This option belongs to the UV Editor, and has no effect in the Image editor. Take a margin into account when fixing UV seams during painting.

## Source Type Movie + Image Sequence

## Path edit box

## Pack

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

## Path edit box

See and edit the path to your movie or image sequence files.

## **Open**

Open a new movie or image sequence files. A file dialog will appear.

## **Refresh**

Reread the movie or image sequence files.

---

## **Info string**

Some information about the currently loaded movie. Frames, resolution and color space.

---

## **Frames**

The number of frames of the movie or image sequence.

## **Match Movie Length**

Set Users Image Length to the one of this video.

## **Start**

The start frame of the movie or image sequence

## **Offset**

Offset the number of the frame to use in the animation. -1 means off.

## **Cyclic**

Cycle the images in the movie.

## **Auto Refresh**

Always refresh image on frame changes.

## **Deinterlace**

Deinterlace the movie file on load.

---

## **Color Space**

Choose the color space type for the movie or image sequence files.

## Alpha

Choose the alpha channel mode. Straight or Premultiplied.

## Half Float Precision

Just with image material that uses 32 bit float. Use just 16 Bit per channel instead of the full 32 bit. This lowers the memory usage while rendering.

## View as Render

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

## Seam Margin

This option belongs to the UV Editor, and has no effect in the Image editor. Take a margin into account when fixing UV seams during painting.

## Source Type Single Image

## Path edit box

### Pack

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### Path edit box

See and edit the path to your movie or image sequence files.

### Open

Open a new movie or image sequence files. A file dialog will appear.

### Refresh

Reread the movie or image sequence files.

## Color Space

The color space for the image.

## Alpha

How to calculate the alpha channel.

## Half Float Precision

Just with image material that uses 32 bit float. Use just 16 Bit per channel instead of the full 32 bit. This lowers the memory usage while rendering.

## View as Render

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

## Seam Margin

This option belongs to the UV Editor, and has no effect in the Image editor. Take a margin into account when fixing UV seams during painting.

## Source Type Udim

UDIM is an enhancement to the UV mapping and texturing workflow. And does not belong here. But in the UV Editor. It is just in the list because it shares the same menus with the UV Editor.

## Info string

Some information about the currently loaded image. Resolution and color space.

## Color Space

Choose the color space type for the movie or image sequence files.

## Alpha

Choose the alpha channel mode. Straight or Premultiplied.

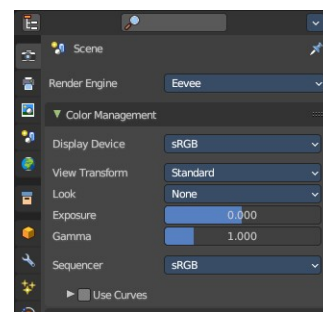

## Half Float Precision

Just with color space sRGB. Use just 16 Bit per channel instead of the full 32 bit. This lowers the memory usage while rendering.

## ***View as Render***

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

## ***Seam Margin***

This option belongs to the UV Editor, and has no effect in the Image editor. Take a margin into account when fixing UV seams during painting.

# UDIM Tiles Panel

Manage UDIM tiles. This panel shows with source type UDIM.

## **UDIM Tile List**

List all UDIM tiles associated with the main index (1000 tile). Double clicking on the tile name allows renaming.

## **Number**

The starting tile index number. UDIMs must start with the 1001 tile and typically increase in incremental order.

## **Drag Handler**

The two vertical lines at the end is a handler with which you can expand the list.

## **Search Field**

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## ***Invert***

Exclude the search term instead of searching for it.

## ***Sort by Name***

Sort the List by name.

## **Add Tile**

Adds new UDIM tiles to the group.

## Add Tile dialog

### **Number**

The UDIM tiles are identified by the number. It is four digits, and with increasing number.

### **Count**

How many tiles to add.

### **Label**

Leave blank to use the Number as the name in the list.

### **Fill**

Fill the new tile with a generated image.

### **Color**

The fill color for generated type Blank.

### **Width / Height**

The dimensions of the image.

### **Alpha**

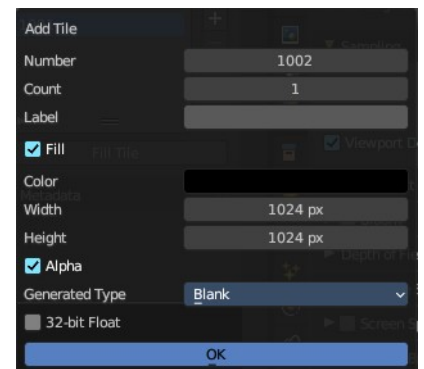

Does the image have an alpha channel.

### **Generated Type**

The generated texture type.

### **32 bit float**

Generate an image with 32 bit floating point bit depth.

## Remove Tile

Remove the selected UDIM tile. Note that the place in the texture will then be blank. The tiles does not resort. The next created UDIM tile will then be placed in this gap.

## Fill Tile

Occupy the UDIM tile with a Generated Image. You can change the fill type and texture tile size of a UDIM tile also afterwards with this fill tool. Note that this overwrites the settings of the currently active UDIM tile.

Warning! If a tile is not filled, it will not be saved with the image.

## Fill tile dialog

### Color

The fill color for generated type Blank.

### Width / Height

The dimensions of the image.

### Alpha

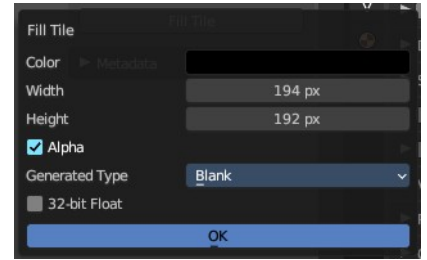

Does the image have an alpha channel.

### Generated Type

The generated texture type.

### 32 bit float

Generate an image with 32 bit floating point bit depth.

## UDIM Workflow

First set up the grid shape for the UDIM tiles.

This panel is in the View tab. And will vanish in the moment you add any texture. So do this setup beforehand. There is no way to show and change this grid panel afterwards.

Unwrap your mesh.

Add a generated texture, with generated type Color Grid (optional), and Tiled ticked.

In the viewport you will now see one square UV space again, with the colored background image. And we have our first UDIM tile in the UDIM Tile list.

In the Tile list click at the Add button. And add another image. This time with another resolution.

The result is that we have two tiles besides each other, with different resolution.

Create a third one. Or as much as you need.

Next move the UV parts to the texture areas where you need them.

Now save the image. And by saving the one UDIM image all the sub images of this UDIM texture gets saved too.

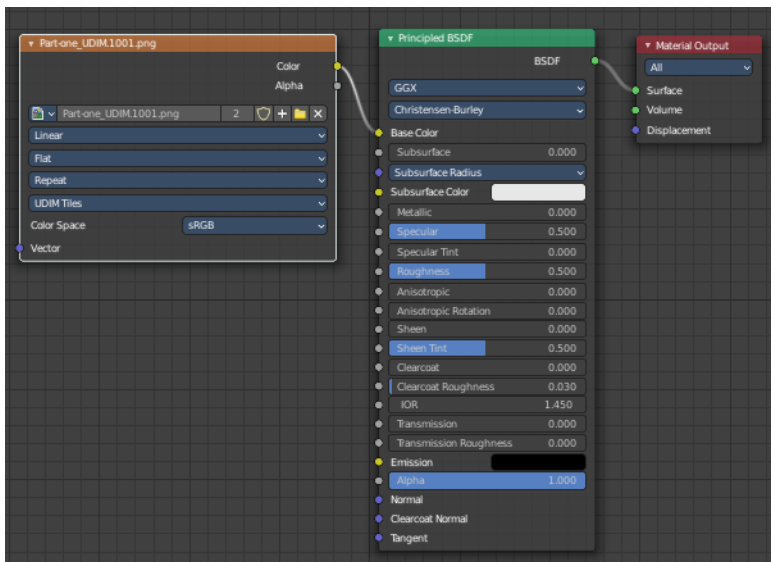

Save the blend file. Modify the textures to your needs.

To reload the modified textures either save, close and open Bforartists and reload the scene. Or use Open Image to open the first image of the UDIM textures. The rest will load automatically.

Next create a material. Add a texture. Choose the UDIM texture. And the material will now render with the UDIM textures applied.

## Metadata Panel

Displays existing meta data of the image file.

## 8.3.3 Editors - Image Editor - Sidebar - View Tab

### Table of content

Introduction.....	1
Display Panel.....	1
Aspect Ratio X , Y.....	1
Repeat.....	1
2D Cursor Panel.....	2
Annotations Panel.....	2
Annotations prop.....	2
Drop down box.....	2
Edit Box.....	2
Fake User.....	2
Add Annotation.....	2
Delete Annotation.....	2
List of Annotation Strokes.....	2
Thickness.....	3
Frame Locked/Unlocked.....	3

## Introduction

The View tab contains some view related settings. And it contains the annotation panel.

## Display Panel

### Aspect Ratio X , Y

Set the aspect ratio of the image.

### Repeat

With this ticked the image is repeated in the UV Image canvas.

## 2D Cursor Panel

See and set the 2D cursor location.

This panel is just visible in Mask mode.

## Annotations Panel

Manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

### Annotations prop

Add, remove and rename new annotations.

### Drop down box

A list of the available annotation layers.

### Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

### Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### Add Annotation

Add a new annotation.

### Delete Annotation

Delete the annotation.

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

---

## **Thickness**

The thickness of the annotation stroke.

## **Frame Locked/Unlocked**

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

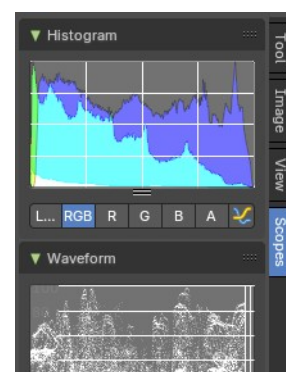

## 8.3.4 Editors - Image Editor - Sidebar - Scopes Tab

## Scopes Tab

The Scopes tab contains several panels with analytic tools.

## Histogram

Histogram is a graph that displays the color distribution of the pixels in the image. The range from left to right goes from 0, which represents black, to 255, which represents white. And the height represents how much pixels in the image have this specific color.

The different display modes are:

### Luma

Shows the luminosity of an image.

### RGB

Shows the RGB channels.

### R/G/B/A

Shows the R, G, B, A channels.

### Show line

Displays lines instead of filled shapes.

---

## Waveform

The waveform graph is another way to display the color information of the image.

### Waveform Opacity

Adjust the opacity of the pixels in the waveform histogram.

### Waveform Mode

This is a drop down box menu where you can choose further options.

#### Luma

Shows the luminosity of an image.

#### Parade

The RGB channels are shown side-by-side.

#### YCbCr (jpeg)

Displays the channels in the YCbCr standard, fitting to Jpg.

#### YCbCr (ITU 709)

Displays the channels in the YCbCr standard, fitting to ITU 709 standard.

## **YCbCr (ITU 601)**

Displays the channels in the YCbCr standard, fitting to ITU 601 standard.

## **Red Green Blue**

Shows the RGB channels overlaid as a “Full color” waveform.

## **Vectorscope**

This is a graph to display the pixel color distribution in the image in a radial way. The radial arrangement allows to display data that is behind the maximum 255 of the normal histogram. This can happen with 32 bit float images for example.

### **Vectorscope Opacity**

Adjust the opacity of the pixels in the waveform histogram.

### **Vectorscope Mode**

How to display the vectoscope.

## **Sample Line**

The Sample Line scope is a graph that allows you to get the sample data from a line.

Click at the Sample Line button above the histogram to draw a line. The pixels under this line will then be used to read the sample data from.

The different display modes are:

### **Luma**

Shows the luminosity of an image.

### **RGB**

Shows the RGB channels.

### **R/G/B/A**

Shows the R, G, B, A channels.

### **Show line**

Displays lines instead of filled shapes.

## Samples

The general sample settings for the above histograms. More accurate or more fast.

## Full Sample

Sample every pixel of the image.

## Accuracy

Proportion of original image source pixel lines to sample.

## Introduction

The mask tab just shows in Mask mode and with an existing mask.

It contains tools and settings for the mask mode. Like a layer system.

## Mask Settings Panel

This values are of interest for the Sequencer, where you work with movies and image sequences.

### Start Frame

Set the first Frame of the mask.

### End Frame

Set the last Frame of the mask.

## Mask Layers Panel

When you add a spline, a circle or a square or a freehand one, then a Mask Layer gets created.

You can create several mask layers and work with them in the sequencer or the Node editors. They can be used to create complex shapes, and define how the splines interact with each other. Splines at the same layer can be animated together.

Splines can be copied and pasted from one layer to another.

### Mask Layer List

The list of available mask layers.

### Restrict View

Don't show this mask layer in the viewport.

## Restrict Select

Selection in the viewport is enabled or disabled. The spline handlers becomes invisible.

## Restrict Render

Don't render this mask layer for the final image(s).

## Drag Handler

The two vertical lines at the end is a handler with which you can expand the list.

## Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## Invert

Exclude the search term instead of searching for it.

## Sort by Name

Sort the List by name.

## Revert

Revert the list. The last list item becomes the first, and vice versa.

---

## Add Mask Layer

Add a new mask layer to the list.

## Last Operator Add Mask Layer

### Name

Rename the new created mask layer.

Note that you can also rename it in the list.

## Remove Mask Layer

Remove the currently selected mask layer from the list.

## Move Layer

Move the selected layer up or downwards in the list.

## Opacity

Set the opacity of the mask layer.

## Invert

Inverts the values (colors) in the mask layer.

## Blend

Adjust the layer blending.

Note, Merge add and Merge subtract should be used with a Feather on overlapping masks to get a better result.

## Falloff

Adjust the Feather falloff

## Overlap

Fill self-intersecting areas.

## Holes

Overlapping splines from the same layer will generate holes in the mask.

# Mask Layers Panel

When there is a spline in the current mask layer, then the Active Spline Panel shows. Adjust some settings for the currently active spline.

## Feather Offset

The method to calculate the feather offset.

## Interpolation

The weight interpolation method.

## Cyclic

Make the spline closed or open.

## Fill

Fill the spline.

## Self Intersection Check

Prevent feather from self intersecting.

## Active Point Panel

When you select a point of one of the splines, then the Active Point Panel will show up.

This panel is of interest for motion tracking. Control Points can be parented to motion tracks. And this allows to mask out parts of the motion tracked footage.

The masking happens at the Viewer Node.

## Parent

Choose the motion track that you want to parent the control point to.

## Parent Type

Choose between the methods Point Track or Plane Track.

## Object

The parent object. Usually the camera where you track from.

## Track

Choose the tracking point that you want to follow with the mask.

## 8.3 Editors - Image Editor - Sidebar

### Table of content

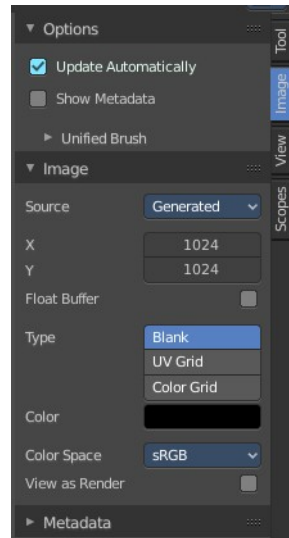

Introduction..... 1  
 Right Click menus..... 1

## Introduction

The Image Editor is made of several areas. At the right side you will find the sidebar. Here you will find further options and settings for the Image Editor and its tools.

The tools tab in paint mode contains several panels with functionality for the brushes. The Image tab contains image related settings. And so on.

The Scopes tab just appears with an image selected.

## Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

## 8 Editors - Image Editor

# Image Editor

In the Image Editor you can show and edit 2D Assets like textures or images. Images created or edited in the Image editor can also be used in the UV Editor and in the different Node Editors.

It is also the editor type in which the final renderings are displayed.

The Image editor is divided into several areas has several tool areas. Tool Settings Area, Viewport, Header, Tool Shelf and Sidebar.

The Tool Settings area contains the same functionality than the Tools tab in the Sidebar. So we won't cover it.

## Navigating in the Image Editor viewport

The Viewport is the place where you view and edit your image content.

### Hotkeys

Pan the view - MMB

Zoom - Mouse Wheel, LMB+CTRL, Numpad + / -

View All - Home

View Fit - Numpad Period

### Navigation Elements

There are also two navigation elements for panning and zoom in the upper right corner. Click at them, hold the mouse button down, and move.

### 2D Cursor

In Mask mode you will see a 2D cursor. It is the center point for tool operations. And can be set with Alt + Right Mouse click.

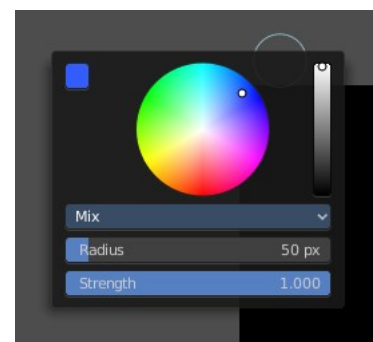

## Viewport context menus

When you double right click into the viewport, then you will open a menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual.

There are two different menus. One in Paint mode. And one in Mask mode. The View mode has no right click menu.

### Double right click in Paint mode

A double right click in paint mode opens a color picker with some further settings.

## Blend Mode

Choose the blend mode for drawing.

## Radius

The Brush radius.

## Strength

The Brush strength.

## Double right click in Mask mode

### Without a mask

#### *New Mask*

Creates a new mask.

#### *Last Operator New Mask*

##### *Name*

Type in the name of the new mask.

### *Add Circle*

Adds a circle shaped spline curve.

#### *Last Operator Add Circle*

##### *Size*

The size of the circle spline curve.

##### *Location X Y*

The location of the circle spline curve. Calculation happens from the center of the spline. 0 / 0 is down left.

### *Add Square*

Adds a square shaped spline curve.

#### *Last Operator Add Square*

##### *Size*

The size of the square spline curve.

## Location X Y

The location of the square spline curve. Calculation happens from the center of the spline. 0 / 0 is down left.

## With existing mask

## Set Handle Type

Opens a sub menu where you can choose different handle types.

## Last Operator Set Handle Type

### Type

Choose the handle type again.

## Switch Direction

A curve has a start point and an end point. Here you can switch them. The end point becomes the starting point and vice versa. As a consequence the handles can switch their location too. With handle type aligned single they can appear outside or inside of the circle.

## Toggle Cyclic

Closes or opens the spline.

## Add Circle

Adds a circle shaped spline curve.

## Last Operator Add Circle

### **Size**

The size of the circle spline curve.

### **Location X Y**

The location of the circle spline curve. Calculation happens from the center of the spline. 0 / 0 is down left.

---

## Add Square

Adds a square shaped spline curve.

## Last Operator Add Square

### **Size**

The size of the square spline curve.

### **Location X Y**

The location of the square spline curve. Calculation happens from the center of the spline. 0 / 0 is down left.

## Copy Splines

Copy's the selected spline(s) or spline points.

## Paste Splines

Pastes the copied spline(s) or spline points.

---

## Re-Key Shape Points

Recalculate animation data for the currently selected curve points for frames that are selected in the dope sheet.

## Clear Feather Weight

Resets the scale to its original dimensions.

## Reset Feather Animation

Resets the feather weight on all selected curve points at the current frame.

---

## Make Parent

Parents the selected spline points. Mask splines can be parented to motion tracker markers.

## Clear Parent

Clears the parent relationship.

## Delete

Deletes the selected spline(s) or spline points.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Image Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

## Radial Control

In Paint modes you can set the strength or radius of the brush not only by the sliders. But also by hotkeys.

Sets the brush radius - F

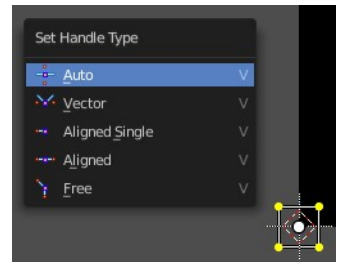

Sets the brush strength - Shift F

Sets the brush direction - Ctrl F

Sets the brush direction - Ctrl Alt F

## Set Handle Type - V

Mask mode with a mask primitive selected. Hotkey V Calls the set handle type menu.

## UV Editor - Header Tools

The header contains several tools, dependent of what you do and what tool set is selected.

### Pivot

What pivot point to use for selected elements.

When you rotate or scale an UV patch, or a group of vertices/edges/faces, you may want to set the pivot point to a specific location of the selection. The names should be self explaining.

### Snapping

Activate snapping when transforming an element.

Snapping can be temporarily activated by holding CTRL key. So no need to turn snapping on and off all the time.

### Snapping Settings

You can snap to various scene elements. This menu allows you to define to which other elements the current active element should snap to. The names should be self explaining. Increment snaps by a grid unit.

### Absolute Grid Snapping

Absolute grid alignment while translation, based on the pivot center.

## Affect

Adjust what transform methods should be affected by snapping.

## Rotation Increment

Snap in adjustable incremental steps.

## Proportional Editing

Enables proportional editing.

Proportional Editing is a way of transforming selected elements (such as vertices) while having that transformation affect other nearby elements with a falloff. For example, moving a single vertex will move unselected vertices within a given range. And the falloff means that selected vertices that are closer to the selected vertex will move more than those farther from it.

## Settings

The settings appears when you activate Proportional Editing. Choose between different falloff methods for the proportional editing. The settings hides when proportional editing is off.

## Proportional Size

When proportional editing is on then you will see a black circle around the selection that defines the influence area of the proportional editing.

This value can be adjusted with the scroll wheel, the page up and page down hotkeys, and in the last operator panel of the transform tools.

## UV Map Property

A mesh can have more than one UV map. You create them in the Properties editor in the Object Data Properties tab in the UV Map Panel.

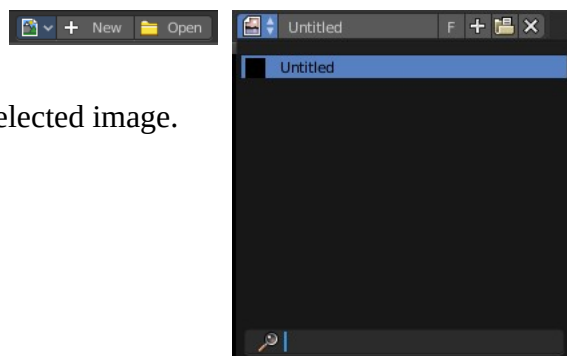

The property in the header allows you to switch to another UV map, and to rename the UV map.

## Image Prop

This property contains the list of loaded images. When no image is loaded then it displays the New and Open Buttons.

When an image exists then it displays the name of the currently selected image.

From left to right ...

## List of images in the scene

This is a list of the images in the scene. This list allows you to switch to other images.

### ***Search form***

Search for specific images.

## Image Edit Box

Read the name of the currently selected image. And you can rename the image here too.

## Number of Fake Users

In case this file has a fake user assigned, then this number displays the number of fake users.

## Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Open

Open a new image.

## Remove

Removes the image.

## ***New Image***

Create a new image.

Creates a new image. You will get a dialog where you can define settings for the new image.

### **Name**

The name of the new image

### **Width**

The width of the new image.

### **Height**

The height of the new image.

### **Color**

Adjust the color of the new image. A click will call a color picker.

### **Alpha**

Check this checkbox if the new image should have an alpha channel.

### **Generated Type**

Here you can define what kind of texture you want to create.

Blank is one plain color.

UV Grid is a checker texture in black and white.

Color Grid is a colored checker texture.

### **32 Bit Float**

Check this checkbox if the image should be in 32 Bit floating point bit depth per channel. Else it is in 8 bit per channel.

### ***Duplicate***

Not supported here.

### ***Unlink Datablock***

This deletes the selected image. Unfortunately not immediately. You need to save the scene and to reload it.

And you need to make sure that it is not linked to anything else. A mesh or a fake user for example. Have a look if there is a number besides the F button. When this is the case then the image has still a user, and so still loads with loading the scene.

### ***Fake User***

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## **Open Image**

Opens the file browser to load an image.

## **Unpack**

Unpack packed files to a directory.

## **User**

The number of users that uses this data. Data with a user number of 0 will be removed with closing Bforartists.

---

## **Use Image Pin**

When you select another object. for UV mapping for example, then usually the connected images for this object gets displayed. Use image pin nails the currently selected image so that it stays displayed.

---

## **Show Overlays**

### **Guides**

#### **Grid**

Display the ground grid.

#### **Dynamic / Fixed / Pixel**

Display the ground grid in defined resolution.

Dynamic adapts to the image size.

Fixed uses a fixed grid resolution. The method Fixed reveals x y edit boxes to set up the fixed resolution.

Pixel orients the grid size at the pixel resolution.

#### **Grid over Image**

Display the grid over the image. This prop just shows when an image is loaded.

#### **Tiles**

Display more tiles in the viewport than just the one in the 0-1 range. This is needed in conjunction with UDIM tiles.

## Display Stretch

Display the uv mapping with different colors, dependant of the stretchiness of the uv mapped mesh. The different colors shows you how distorted the texture at the mesh is displayed. Blue is no stretching. Red is highly distorted stretching.

## Display Stretch Type

### Area

Calculates the stretch between UV and 3D faces.

### Angle

Calculates the angular distortion between UV and 3D faces.

## Geometry

### UV Opacity

The opacity of the UV wireframe.

### Display as

How to display the UV wireframe.

### Modified Edges

Display the edges after the modifiers is applied. Else it shows the edges before the influence of the modifiers.

### Faces

Show the faces in the UV Wireframe. Not available with Display Stretch since Display Stretch needs to display the faces to work.

## Image

### Show Metadata

Display existing metadata in the viewport.

## Display Channels

Adjust what channels of the image gets displayed. It just shows when an image is loaded and active.

### Color and Alpha

Displays the whole image, including alpha channel.

### Color

Displays the whole image, but without alpha channel.

### Alpha

Displays the alpha channel of the image.

### Red

Displays the red channel of the image.

### Green

Displays the green channel of the image.

### Blue

Displays the blue channel of the image.

## Options Panel

### Constrain to Image Bounds

Forces the UV geometry to stay within the image bounds when editing.

### Live Unwrap

Continuously unwrap the selected UV island while transforming pinned vertices.

### Update Automatically

Update other editor windows simultaneously with the changes in the Image Editor.

## **UV local view**

A mesh can have more than one material, and so more than one texture. Display only faces that are assigned to the currently displayed image.

## **Show Metadata**

Draw Metadata properties of the image.

## **Snap to Pixels**

Enables the pixel snapping with two methods. Corner or center.

## 9.1.2 Editors - UV Editor - Header - Quick Menu

### Table of content

Quick Menu.....	1
Adding an operator to the Quick menu.....	1
Adding a menu to the Quick menu.....	1
Order.....	2
Removing an operator from the Quick menu.....	2
Context and mode dependent content.....	2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

Note also that the Quick menu for the UV editor shares the content with the Quick menu from the Image editor.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 9.1.3 Editors - UV Editor - Header - View Menu.odt

# Image Editor - View Menu

The View menu contains all View related tools.

## Toolbar

Shows or hides the tool shelf at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport

## Tool Settings

Shows or hides the tool settings above the header in the 3D view.

## Asset Shelf

Shows or hides the asset shelf at the bottom of the editor.

## Adjust Last Operation

Shows or hides the Adjust Last Operation panel down left.

Note that the Adjust Last Operation menu item in the Edit menu in the main header and the Last button in the toolbar are not related and not functional with this last operator panel. It is an independent element.

## Tool Shelf Tabs

Show or hide the tabs in the tool shelf.

## Legacy

### Set 2D cursor

The old way to set the 2d cursor. Not by the tool shelf tool. Hotkey only tool! Please use the hotkey.

---

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet.

**Note:** *These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.*

### ***Draw Annotation***

Starts the annotation free hand draw tool in the editor.

### ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

### ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

### ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

### ***Add Annotation Layer***

Starts a new annotation layer.

### ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

---

## View Zoom In

Zooms into the viewport.

## View Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Fractional Zoom

A sub menu where you can choose between predefined zoom factors.

## View Selected

View Selected centers the view at the currently selected UV mesh parts.

## View All

View all zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## View Fit

Zooms out or in to fit the image to the viewport.

## Center View to Cursor

Centers the view to the 2D cursor.

## Cursor to Center View

Centers the cursor and the view to the center of the viewport.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the editor.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Select menu

This menu just appears when you are in Mask mode. And you need to create a new mask layer to set all items active. The select functionality in this menu covers the mask geometry. The splines.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

### Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

### Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

## Box Select Pinned

Box select enters the Border Select mode. This is a special select mode where you can select elements by dragging a rectangle. And what's inside of the rectangle gets selected then. It adds to selection by default. Box Select Pinned just selects pinned UV vertices. The other box select method can be found in the tool shelf.

To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Linked

Select all UV vertices linked to the active UV map. The previous selection gets cleared.

---

## Linked Pick

Hotkey Only Tool!

Select all UV vertices linked to the active UV map. The previous selection gets cleared.

## Last Operator Select Linked Pick

### *Extend*

The previous selection gets kept, the selection gets extended.

### *Deselect*

Deselect instead of select

### *Location X / Y*

The mouse position in the UV space, normalized to the 0.0 to 1.0 range of the UV space.

---

## Pinned

Select pinned UV vertices.

## Split

Select only entirely selected faces.

---

## Overlap

Select all UV faces that overlaps each other.

## Last Operator Select Overlap

### *Extend*

Extend the current selection.

---

## Select Similar

Select Similar selects similar elements to the already selected parts. It is mode dependant. When you are in Vertex mode, then it shows just a Vertex related menu. When you are in edge select mode, then a edge related menu. And when you are in face select mode, then a face related menu. And this for both, the UV sync selection off and on.

## Pinned

Select UV patches with pinned vertices.

## Length

Select UV edges that has the same length in the UV Space.

## Length 3D

Select UV edges that has the same length in the 3D View.

## Area

Select UV edges that has the same area in the UV Space.

## Area 3D

Select UV edges that has the same area in the 3D View.

## Material

Select UV faces with the same material.

## Object

Select UV faces at the same object.

## Polygon Sides

Select UV faces that points into the same side in the 3D view.

## Winding

Select UV faces in winding order.

## Amount of Faces

With UV Select Mode Islands. Selects all UV Islands with the same amount of faces.

## Last Operator Select Similar

### Type

The select similar method.

### Compare

Compare if the element to select should be greater, equal or less big than the current selection.

### Threshold

A tolerance setting.

## Shortest Path

Select the shortest path between two selected elements.

Note that shortest path is a hotkey tool. Select the first element, hold down ctrl, select the second element.

## Last Operator Pick Shortest Path

### Face Stepping

Traverse connected faces.

### Topology Distance

Find the minimum number of steps instead of the shortest distance.

## ***Fill Region***

Select the region faces too.

## ***Nth Element***

Don't select the whole path, but just every nth element of it.

## ***Skip***

This is connected to nth element. Number of elements to skip at once.

## ***Offset***

This is connected to nth element. Start with an offset.

---

## **More**

Grow the selection.

## **Less**

Shrink the selection.

### UV Editor - Image Menu

The Image menu contains the load and save functionality.

Not all content shows with all image types. A Render Result shows a different menu content.

## New

Creates a new image. You will get a dialog where you can define settings for the new image.

### Name

The name of the new image

### Width

The width of the new image.

### Height

The height of the new image.

### Color

Adjust the color of the new image. A click will call a color picker.

### Alpha

Check this checkbox if the new image should have an alpha channel.

### Generated Type

Define what kind of texture you want to create.

Blank is one plain color.

UV Grid is a checker texture in black and white.

Color Grid is a colored checker texture.

### 32 Bit Float

Check this checkbox if the image should be in 32 Bit floating point bit depth per channel. Else it is in 8 bit per channel.

## Open

Opens the file browser to load an image.

---

## Open Cached Render

To get it to work you need to have Cycles as the renderer selected. This feature does not work with Eevee or Workbench renderer.

Read all the current scene's render layers from cache, as needed. For this feature to work save Buffers needs to be activated in the Performance tab in the render settings.

This feature can be used to save RAM while rendering because the render layers do not have to be saved in RAM. It can also be used to recover some information from a fail render.

---

## Replace Image

Replaces the currently active image by an image that you load.

## Reload Image

Reloads the currently selected image.

Note that the images must already exist somewhere at your hard disk. When you create a new image in Bforartists, then this image isn't saved yet, and so you cannot reload it.

## Edit Externally

Open the image in a defined external image editor like The Gimp or Photoshop.

The image must be saved. And the image editor must be defined in the User Preferences.

## Save Image

Saves the currently selected image without any further questions. Note that the images must already exist somewhere at your hard disk.

## Save As Image

Saves the currently selected image.

## Save Copy

Saves a copy of the currently selected image. This will save the file to a specified name, but will keep the old one open in the Image editor.

## Save all Images

Saves all images.

Note that the images must already exist somewhere at your hard disk so that they can be saved. The item is greyed out as long as the image is not saved to disk.

## Invert

Invert is a sub menu where you can invert the colors of the whole image, or just specific colors.

**Note:** This only shows when in the when not viewing the Viewer or Render Result.

## Resize

Allows you to change the dimensions of the image. The tool calls a resize panel.

**Note:** This only shows when in the when not viewing the Viewer or Render Result.

## Transform

**Note:** These only shows when in the when not viewing the Viewer or Render Result.

### Flip Horizontally

Flip the image horizontally around it's central axis.

### Flip Vertically

Flip the image vertically around it's central axis.

### Rotate Clockwise 90°

Rotate the image to the right by 90 degrees.

### Rotate Counter-Clockwise 90°

Rotate the image to the left by 90 degrees.

## Rotate Flip 180°

Rotate the image to the right by 180 degrees and flip the image upside down.

## Pack Image / Pack as PNG

Packs the currently active image into the blend file. When you save the blend file the next time, then this image will be embedded. The Pack menu item turns into an Unpack menu item with packed textures.

Packed images are marked with a pack icon. A click at this icon will unpack the texture, and try to save it to file. Usually to the last existing location before it was packed.

### Warning

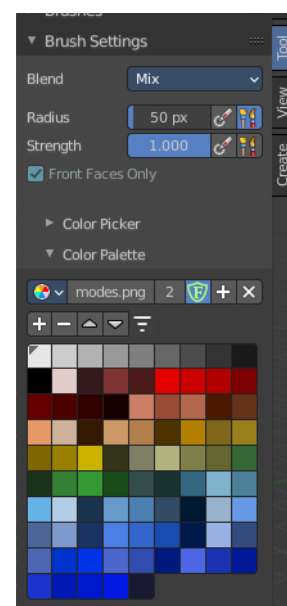

You cannot modify packed images. Changes at the image will not be saved. You need to unpack the image when you want to modify it. And repack it after you have done the changes.

## Extract Palette

Allows you to extract a color palette from a loaded image, useful for brush based tools. The result can then be found in the Color Palette panel in the Tools tab in the sidebar with the correct object and being in the right mode, for example in texture painting mode in the 3D View editor.

**Note:** This only shows when in the when not viewing the Paint or Mask mode on an image that is not the Render Result or the Viewer Result.

## Generate Grease Pencil

Generates a Grease Pencil Object using image as a source. This system generates a grease pencil point cloud in

2D with colored stroke dots. Later you can apply modifiers, edit, animate, sculpt and re-color the grease pencil object in the 3D View editor.

## Generate Grease Pencil using image as source Last Operator

### *Point Size*

The point size of the grease pencil image.

### *Generate Mask*

Create an inverted image for masking using the alpha channel.

# UV menu

The UV header menu contains all the UV related operators in the UV Editor.

## Transform

### Rotate + 90°

Rotates the selection by 90 degree clockwise.

### Rotate - 90°

Rotates the selection by 90 degree counter clockwise.

### *Last Operator Rotate*

#### Angle

The rotation angle.

#### Axis

Defines one axis of the imaginary shear axis plane.

#### Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Shear

Shear shears the selection.

### ***Last Operator Shear***

#### **Offset**

Adjust an offset.

#### **Axis**

Defines one axis of the imaginary shear axis plane.

#### **Axis Ortho**

Defines the other axis of the imaginary shear axis plane.

#### **Orientation**

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Vertex Slide

Slide a vertex along the parent edge of the mesh UV.

**Note:** *This is exclusively a vertex selection mode operator.*

### Last Operator Vertex Slide

#### Factor

The factor of the slide, moving the selection in a positive or negative direction from starting position.

#### Even

Make the edge loop match the shape of the adjacent edge loop.

#### Flipped

When Even mode is active, this will flip between the two adjacent edge loops

#### Clamp

Clamp within the edge constraints.

#### Mirror Editing

Edit it in mirror mode.

---

## Edge Slide

Slide an edge along the adjacent edges of the mesh UV.

**Note:** *This is exclusively an edge selection mode operator.*

### Last Operator Edge Slide

#### Factor

The factor of the slide, moving the selection in a positive or negative direction from starting position.

#### Even

Make the edge loop match the shape of the adjacent edge loop.

#### Flipped

When Even mode is active, this will flip between the two adjacent edge loops

## Clamp

Clamp within the edge constraints.

## Mirror Editing

Edit it in mirror mode.

## Randomize

### *Last Operator Randomize*

#### Random Seed

The seed for the randomization.

#### Randomize Location

Randomize the location values.

#### Location

The maximum distance the objects can spread over each axis.

#### Randomize Rotation

Randomize the rotation values.

#### Rotation

The maximum allowed rotation

#### Randomize Scale

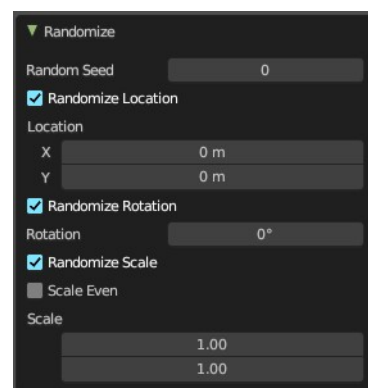

Randomize the scale values.

#### Scale Even

Randomize the scale values.

#### Scale

The maximum scale the objects can scale over each axis.

## Mirror

### Copy Mirrored UV coords

Copies and pastes the selected UV geometry on the X axis based on a mirrored mesh.

Use UV Select Sync must be off. The tool does not work with Use UV Select Sync on. And it is not fully reliable as our example shows.

**X**  
Mirrors the selection in X axis. The mirror point is the pivot of the selection.

**Y**  
Mirrors the selection in Y axis. The mirror point is the pivot of the selection.

### ***Last Operator Mirror***

The Last Operator Mirror panel gives you tools to adjust the mirror action.

#### **Orientation**

Orientation is a drop-down box to choose the type of orientation for the mirroring action.

#### **Constraint Axis**

Constraint Axis gives you the possibility to define the mirror axis. You can choose more than one axis here.

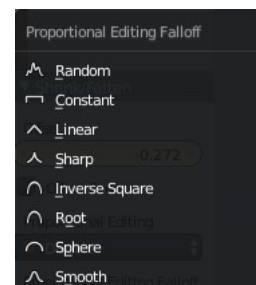

#### **Proportional Editing**

Activates proportional editing.

### ***Proportional Editing Falloff***

Proportional Editing Falloff is a drop-down box to Choose a method for the falloff for the proportional editing.

#### **Connected**

The proportional falloff gets calculated for connected parts only.

#### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius,

then it gets calculated.

## Snap

Snap is a sub menu with some snapping tools. The menu items should be pretty self explaining. Selected to Pixels snaps the selected geometry to the pixels of the image, and so on.

## Last Operator Snap Selection and Snap Cursor

### Target

Set the snap target method again.

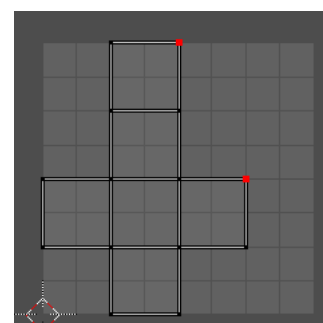

## Pin

Pins the selected vertices. These vertices are now nailed for the unwrap algorithms Angle based and Conformal. Their positions will not change when you repeat the unwrapping. And the algorithms will try to fit the rest of the geometry to this pinned vertices.

Pinned vertices are marked red.

A use case is for example when you have a distorted result for symmetric geometry like a face with the Conformal method. Then you can try to align two center vertices, pin them, and repeat the conformal method. It may be more symmetrical afterwards.

## Unpin

Unpins pinned geometry.

## Invert Pins

This operator inverts the pins to all selected pins, and unpins the set pins. This will only work if you have geometry selected.

### Last operator Pin

This last operator appears in the 3D view to the bottom left of the editor. Pin, Unpin and Invert Pins shares the same last operator.

## Clear

Unpins pinned geometry.

## Invert

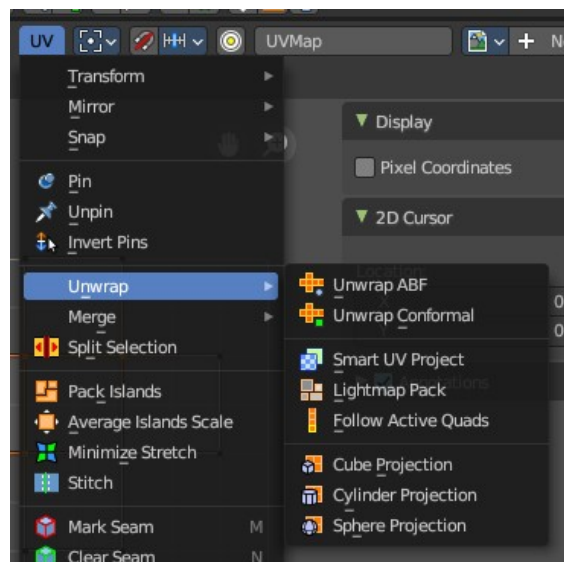

Inverts the pinned geometry to selected geometry, and unpins the set pins.

# Unwrap

## Unwrap ABF

Unwrap ABF unwraps the selected geometry with the method Angle based. ABF stands for Angle Based Flattening. ABF can give a bit better result than LSCM when unwrapping organic shapes.

Note that you need to have the geometry selected in the 3D view.

## Unwrap Conformal

Unwrap ABF unwraps the selected geometry with the method Angle based. ABF stands for Angle Based Flattening. Conformal, also called LSCM, can give a bit better results than ABF with geometric shapes.

Note that you need to have the geometry selected in the 3D view.

## Last Operator Unwrap

The last operator appears in the 3D view. Unwrap ABF and Unwrap LSCM shares the same Last Operator.

### Method

Method is a drop down box to Choose between Unwrap method Angle Based and Conformal.

### Fill Holes

Fill holes in the mesh before unwrapping.

### Correct Aspect

Take the Image Aspect Ratio into account.

## Use Subsurf Modifier

Unwraps an existing Subsurf Modifier. You need to add a Subsurf Modifier first.

## Margin

The distance between the single UV patches.

---

## Smart UV Project

Smart UV Project projects the UV mapping from different angles.

### Smart UV Project Settings dialogue

#### Angle Limit

The Angle Limit defines after which angle the mapping happens from the next side. With an angle of 66 you have around six sides to map from. The calculation is  $360/66$ .

#### Island Margin

Island Margin defines the distance between the UV patches.

#### Area Weight

Weight Projection Vector by faces with larger areas.

#### Correct Aspect

Take the Image Aspect Ratio into account.

### Last Operator Smart UV Project

The Last Operator for Smart UV Project contains the same settings than the Smart UV Project Settings dialogue.

## Lightmap Pack

Lightmap Pack maps each face individually, and puts the result into the UV space. Without margin.

Lightmap Pack has no Last Operator.

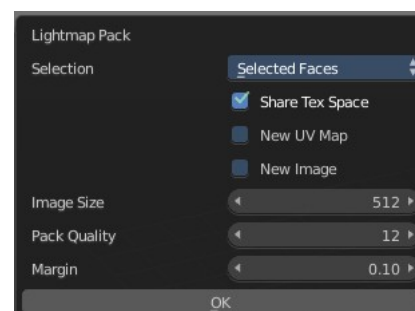

### Settings

#### Selection

Selection is a drop-down box where you can choose what will be packed.

#### Share Tex Space

Map all objects into one lightmap.

## New UV Map

Create a new UV map for every new mesh.

## New Image

Assign new Image to every new mesh.

## Image Size

The size for new images.

## Pack Quality

The pack quality.

## Margin

The distance between the single UV patches.

---

## Follow Active Quads

Follow Active quads maps UV coordinates starting from an active face, and maps all adjacent faces in quad shape then. This way you can for example unwrap a pipe or a road. You first need to have a face selected. Then select everything. And then click at Follow Active Quads.

## Settings

### *Edge Length Mode*

Edge Length Mode is a drop-down box where you can choose the Length method.

### **Last Operator Follow Active Quads**

The Last Operator contains the same settings than the Settings dialogue.

---

## Cube Projection

Cube Projection maps the mesh from six sides, means cubic.

### *Last Operator Cube Projection*

#### **Cube Size**

Cube Size defines the size of the UV mesh in the UV space.

#### **Correct Aspect**

Take Image Aspect ratio into account.

#### **Clip to Bounds**

Clip UV Coordinates to bounds after unwrapping.

## Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

---

## Cylinder Projection

Cylinder Projection tries to map the geometry cylindrical.

### *Last Operator Cylinder Projection*

#### Direction

Direction is a drop-down box where you can choose in which direction the cylindrical projection will be mapped.

#### Align

Align is a drop-down box where you can choose the Align method.

#### Radius

Radius defines the Polar size of the UV mesh in the UV space.

#### Correct Aspect

Take Image Aspect ratio into account.

#### Clip to Bounds

Clip UV Coordinates to bounds after unwrapping.

#### Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

---

## Sphere Projection

Sphere Projection tries to map the geometry spherical.

### *Last Operator Sphere Projection*

#### Direction

Direction is a drop-down box where you can choose in which direction the spherical projection will be mapped.

#### Align

Align is a drop-down box where you can choose the Align method.

#### Correct Aspect

Take Image Aspect ratio into account.

#### Clip to Bounds

Clip UV Coordinates to bounds after unwrapping.

## Scale to Bounds

Scale UV Coordinates to bounds after unwrapping.

## Merge

### At Center

Merges the selected vertices at the center point.

### At Cursor

Merges the selected vertices not only at the cursor. The last operator provides you with four methods.

### *Last Operator Snap Selection*

#### Target

The snapping target. Snap and merge at the following locations.

Adjacent unselected

Cursor ( Offset)

Cursor

Pixels

### By Distance

Merge UV vertices when they are below a merge distance.

### *Last Operator Merge UV's by Distance*

#### Merge Distance

The merge distance below the vertices gets merged.

#### Unselected

Merge selected vertices to unselected vertices.

## Split

Splits the selected geometry. UV Sync Selection needs to be off.

## Pack Islands

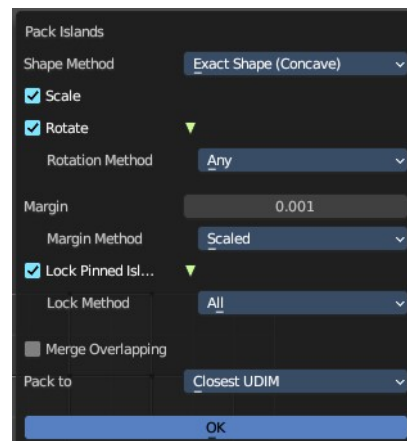

Pack Islands tries to pack the selected UV geometry as close together as possible. Without to waste too much empty space.

Note that the algorithm fails at round geometry. It calculates with rectangle shapes.

### ***Pack Islands Popup***

When you click the operator then you will see a popup panel where you can adjust the further settings.

### **Shape Method**

How the islands are packed.

#### ***Exact Shape (Concave)***

Use exact geometry.

#### ***Boundary Shape (Convex)***

Use a convex hull.

#### ***Bounding Box***

Use a bounding box.

### **Scale**

Scale islands to fill the unit square.

### **Rotate**

Rotate islands to improve layout.

### ***Rotation Method***

The rotation method.

#### **Axis - aligned**

Rotate to a minimal rectangle. Either horizontal or vertical.

#### **Cardinal**

Only 90 degrees rotation are allowed

#### **Any**

Any angle is allowed for rotation.

## Margin

Adjust the margin amount.

### **Margin Method**

What method to use for the margin. UV patches needs a margin between the single patches. So that the pixels of the texture doesn't bleed into other areas.

### **Scaled**

Use scale of existing UV's to multiply margin.

### **Add**

Just add the margin. And don't use the UV scale for calculation too.

### **Fraction**

Specify a precise fraction of final UV output.

## Lock Pinned Islands

Constrain islands that contains any pinned UV's

### **Lock Method**

How to deal with pinned UV islands.

### **Scale**

Pinned islands won't scale.

### **Rotation**

Pinned islands won't rotate.

### **Rotation and Scale**

Pinned islands won't scale and rotate

### **All**

Pinned islands will remain at their initial position and are locked in place.

## Merge Overlapping

Overlapping islands stick together.

## Pack To

### **Closest Udim**

Pack islands to closest UDIM image tile

### **Active Udim**

Pack islands to active UDIM image tile, or to the UDIM grid tile where the 2d cursor is located.

### **Original Bounding Box**

Pack to the starting bounding box of islands.

## Average Island Scale

Scales the selected UV geometry to have the same relative size than the rest of the mesh. So that the texels at the mesh have roughly the same size everywhere.

## Minimize Stretch

You might end in a UV mapping result that still shows unwanted distortions here and there. For example when you UV map a human face. Minimize Stretch tries to minimize this stretching effects in the UV patches.

To view stretched areas at your UV patches, tick Display Stretch in the Overlays panel, and switch from Angle to Area. Then a stretch mask gets displayed. The color range goes from blue to green to red, where blue is minimal stretch and red is maximal stretch.

Let's explain it with an example. A sphere where the cut is nearly at the pole. And UV mapped with Angle Based. The result will of course show heavy stretched areas.

Note that the UV geometry must be selected in the UV Image editor. Now let's use the Minimize stretch tool. The algorithm now first tries its best to find the best fitting result that shows fewest stretching across the overall UV geometry.

The header shows a help text while the algorithm works. The Blend factor is the value between the original unwrapped UV mesh, and the maximum minimized stretch. You can set this value manually by using the scroll wheel at your mouse, or with the + and - keys.

Minimize Stretch. Blend 0.00

## ***Last Operator Minimize Stretch***

### **Fill Holes**

Fill holes virtually fills holes before unwrapping to avoid overlapping and to preserve the geometry.

### **Blend**

The Blend factor is the value between the original and the maximum minimized stretch.

### **Iterations**

Number of iterations for the Minimize stretch algorithm.

---

## **Stitch**

Stitch tries to union UV patches along the selected edges or vertices.

### **Last Operator Stitch**

This last operator appears in the 3D view.

#### ***Use Limit***

Just snap when the elements are below a given distance.

#### **Snap Island**

Snap the whole UV patch, or just the selected edge(s)/vertices

#### ***Limit***

The limit distance for Use Limit.

## **Static Island**

Adjust which island stays in place when stitching.

## **Active Object**

Index of the active object.

## **Snap at Midpoint**

Snap at the center point of the two elements instead the first to the last.

## **Clear Seams**

Unmarks seams when stitching.

## **Operation Mode**

The operation mode. Calculate with Edges or Vertices.

## **Mark Seam**

The unwrap algorithms Angle based and Conformal requires to have edges marked as seams. Think of it as a cutting pattern for a trouser for example. Such a trouser is also made of fabric patterns.

Same goes for the UV patches when you use Angle based or conformal unwrapping. You need to cut your mesh into parts and mark edges as seams, so that the algorithm knows where the seams are.

Mark seam marks the currently selected edge(s) as a seam. Seam edges will be displayed as red in the 3D viewport. But not in the UV Image Editor. The UV patches represents the seams.

You need to unwrap the mesh again when you want to apply changes by the new marked seams.

## **Last Operator Mark Seam**

### **Clear**

Clears the seam instead of marking it.

## **Clear Seam**

Clear seam removes the seam from the currently selected edge(s) in the 3D view.

## Seams from Islands

Unwrapping creates the UV geometry from the 3D object. You mark the seams, then you click at unwrap, and the UV mesh gets created.

Mark Seams from islands goes the other way around for marking seams. It creates the seams at the mesh object in the 3D view from the UV geometry in the UV Image Editor.

A use case is when you import meshes. Then you usually just have the UV patches in the UV Image editor. And when you want to modify the UV's further, then you need the seams at the mesh.

## Align

Align the selected geometry. Affected are the vertices.

## Straighten

Straightens the selected geometry in both directions, X and Y axis.

## Straighten X

Straightens the selected geometry along the X axis.

## Straighten Y

Straightens the selected geometry along the Y axis.

## Align Auto

Aligns the selection. The align axis gets chosen from the selection itself. When it's higher than tall, then it aligns along the Y axis. When it's taller than high, then it aligns along the X axis.

The align point is the pivot of the selection.

## Align X

Aligns the selection along the X axis. The align point is the pivot of the selection.

## Align Y

Aligns the selection along the Y axis. The align point is the pivot of the selection.

## Last operator Align

The Last operator Align unions all the single straighten and align actions in one operator.

## Axis

Lists the straighten and align methods again.

## Align Rotation

Aligns the selected geometry horizontally or vertically. It aligns to the closest angle.

### Last operator Align Rotation

#### Method

#### Geometry

Aligns the whole geometry.

#### Edge

Aligns the geometry along the selected edge.

#### Auto

Checks for selection, and aligns then either the whole geometry or by the selected edge.

## UV Select Mode

This is a double menu by design. It allows you to show and assign shortcuts to the UV Sync selection mode buttons in the header.

## Copy UV

Copy selected UV vertices.

## Paste UV

Pastes copied UV vertices.

## Show / Hide Faces

Show or hide faces. This happens in both, the 3D View and the UV editor.

## Reveal Hidden

Makes all geometry visible again.

## Hide Selected

Hides the selected geometry.

## Hide Unselected

Hides the not selected geometry. The selected geometry stays visible.

## Last Operator Reveal Hidden / Hide Selected

### Select

Define if the selected or the unselected elements gets hidden or revealed.

---

## Reset

Resets the UV projection. Every single face gets fit into the UV space range of 0/1

---

## Export UV Layout

Export the UV layout to an image, so that you can use it as a mask to build your texture in your favorite image editing software like Photoshop. It will open a file dialog, where you can define further export settings down left.

### All UV's

Export all UV's, not just the visible ones.

### Modified

Export UV's from the modified mesh.

### Format

Choose the export format.

### Size

Define the size of the image.

### Fill Opacity

How opaque the wire frame lines are.

## 9.1 Editors - UV Editor - Header

### Table of content

Vertex selection mode.....	4
Edge selection mode.....	4
Face selection mode.....	4

## UV Editor - Header

The Header contains various menus, navigation elements, settings and tools for the viewport. This content differs, dependent of the sub mode.

The header is divided into two areas. Left mode and menus. Right settings.

### Switch to UV / Image editor

Sometimes you want to switch from the UV Editor to the Image Editor. Or vice versa. To continue at the unwrap or to paint a texture.

This two editors are connected by a menu that allows exactly that. A button in each header that switches to the other editor.

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

## Editortype Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

## Sub Modes

The UV Editor has two sub modes. Sync Off and Sync On.

### UV Select Sync off

With **UV Select Sync off** you will be able to modify single UV elements, like whole UV patches. And the 3D view will not change its selection.

When you have some geometry in the 3D view not selected, then it will not show up in the UV image editor neither.

You can switch between the selection modes with hotkeys 1, 2, 3, 4

### Vertex selection mode

Select vertices in the UV geometry.

### Edge selection mode

Select edges in the UV geometry.

### Face selection mode

Select single faces in the UV geometry

### Island selection mode

Select whole UV patches in the UV geometry.

## Sticky Selection mode

This options controls how UV's are selected when Sync Selection is off. This mainly affects vertices. But edge and face selection relies at vertices too.

### **Disabled**

No sticky selection. You can just move one UV vertice at time. In case you have two vertices above each other, like with a UV patch with two faces, then just one vertice gets selected. Even when it's the same UV patch.

### **Shared Location**

Selects all UV vertices under the mouse in case it's part of the same UV patch. Vertices of other UV patches gets ignored.

In this shot the two down left faces are one UV patch.

### **Shared Vertex**

Selects all UV vertices that shares the same vertice at the 3D mesh. Regardless if it's the same UV patch or not.

## UV Select Sync on

With **UV Select Sync on** you will keep selections of UV space and 3D view in sync. But you cannot modify single UV elements anymore. In this mode you work with Vertices, Edges and Faces.

All UV geometry of the object will show up, no matter what's selected in the 3D view.

You can switch between the selection modes with hotkeys 1, 2, 3. Note that this selection mode is in sync with the selection modes in the 3D view. When you change it in the one editor, then it changes in the other editor too.

## Vertex selection mode

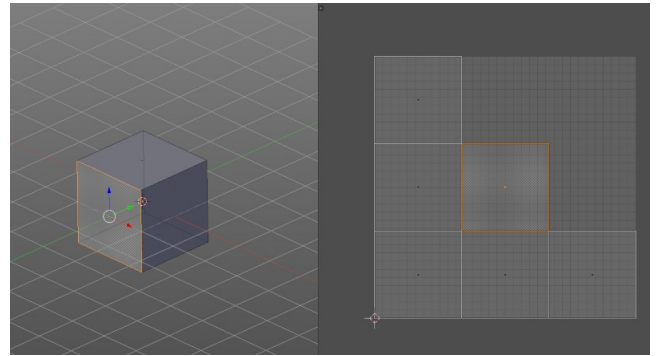

Select vertices in the UV geometry and at the 3D mesh object.

## Edge selection mode

Select edges in the UV geometry and at the 3D mesh object.

## Face selection mode

Select single faces in the UV geometry and at the 3D mesh object.

# Tool Shelf

## Select Tools Group

Tools with a triangle down right are a group of tools. Click and hold to reveal the content. Then choose the tool that you need.

## Tweak

Allows you to select or tweak single elements by clicking at it.

## Select Box

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### *Set a new selection*

### *Extend existing selection*

### *Subtract existing selection*

## Select Circle

Draws a box to select several elements at once. Click at the start point, then drag.

### Tool Settings

#### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

*Set a new selection*

*Extend existing selection*

*Subtract existing selection*

#### Radius

The brush radius.

## Select Lasso

Draws a box to select several elements at once. Click at the start point, then drag.

### Tool Settings

#### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

*Set a new selection*

*Extend existing selection*

*Subtract existing selection*

## Cursor

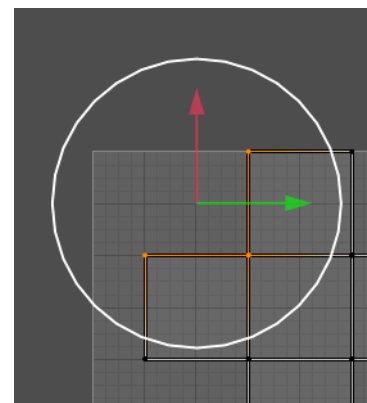

The cursor tool allows you to move the 2d cursor around.

## Move

Activates the move tool. Activating the move tool also reveals a move widget at the object. This widget allows you to move the object around, by using the corresponding axis.

When you click at one of the square buttons at the icon, then you can move the object along the plane of the two adjacent axis. The rectangle buttons between the arrows allows you to move in direction of the blue and green arrows. This can also be done by clicking at the tip of the arrow and holding down shift. Then you can move the cube along the two other axis.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

D: 0.1529 m (0.1529 m) along global Z

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

D: 0.7057 m D: -0.2678 m (0.7548 m) global

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you move the object, and hold down the mouse and type in a value, like 20, then the movement will be performed by the value that you have typed in. In this case by 20 units in direction of the selected axis.

## Move without widget

You don't have to use the widget to move the object. You can also click aside of it, and drag the selection around.

## Limit Axis

When you want to move into a specific axis, then press X or Y to limit the movement to this axis. This can be combined with the numerical input.

## Last Operator Move

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Rotate

Activates the Rotate tool. Activating the move tool also reveals a rotate widget at the object. This widget allows you to rotate the object, by using the corresponding axis.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision rotation

When you hold down shift, then you will have a much slower but also much preciser rotation.

## Header Values

When you rotate your object then you will see some values in the header, which defines the current rotation of the object. The rotation is shown in degrees.

Rot: -3.57 global

## Numerical Input

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in.

## Rotate without widget

You don't have to use the widget to rotate the object. You can also click asides and drag the selection around. This can be combined with the numerical input.

## Limit Axis

When you want to rotate a specific axis, then press X or Y to limit the rotation to this axis.

Rot: -0.08 along normal X

By holding down the mouse button and pressing the X, Y or Z key twice you can toggle this to local. But also to other orientations. This depends in what orientation you start. With normal you can toggle that way between Normal and Global.

## Last Operator Rotate

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

## Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

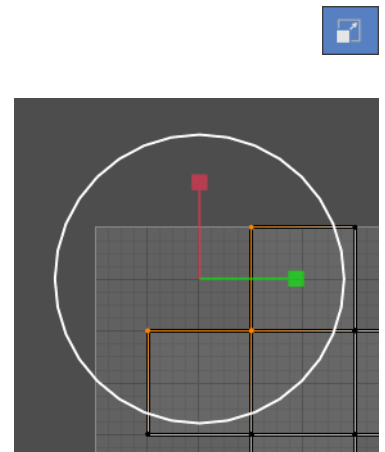

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Scale

Activates the Scale tool. Activating the scale tool also reveals a traditional scale widget at the object. This widget allows you to scale the object, by using the corresponding axis. When you click at the outer white circle and drag, then you can scale the object uniformly.

The rectangle buttons between the arrows allows you to scale in direction of the adjacent arrows. This can also be done by clicking at the tip of the arrow and holding down shift. Then you can scale the cube along the two other axis.

## Snapping

Holding down Ctrl activates temporary global snapping.

## Precision Scale

When you hold down shift, then you will have a much slower but also much preciser scale.

## Header Values

When you scale your object then you will see some values in the header, which defines the

current scale of the object.

These values are always relative to the starting point. You always start with 1, regardless of the real world scale.

## Numerical Input

When you scale the object, and hold down the mouse and type in a value, like 20, then the scale will be performed by the value that you have typed in.

## Scale without widget

You don't have to use the widget to scale the object. You can also click asides and drag the selection around.

## Limit Axis

When you want to rotate a specific axis, then press X or Y to limit the scale to this axis. This can be combined with the numerical input.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Transform

Transform reveals a multi transform widget with all three transform methods available at once. Move, Rotate and Scale.

The rules are the same than for the single tools, and also the last operators. Dependent of which widget part you pull here. So i won't go into detail again here.

Clicking into the area of the widget allows you to move the selection.

Grabbing the sticking out round circle part allows to rotate the selection.

Grabbing one of the corner points allows you to scale the selection.

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar. Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate

Draw free-hand strokes in the main window.

## Tool Settings

The tool settings for Annotate.

## Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

## Stabilize Stroke

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### Radius

The radius for the stroke stabilization.

### Factor

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

### End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for Annotate.

## Color

Clicking at the left color field reveals a color picker where you can define the color for the annotation stroke.

## Annotate Eraser

Click and drag to remove annotate lines.

## Tool Settings

### Radius

The radius of the eraser pencil.

## Rip Region

Rip splits the selected UV edge, and moves it with the mouse.

You need to be in UV selection mode Vertice, Edge or Face, and with Use UV Selection mode off. And you need to select at least one edge that is inside of the UV patch so that there is something to rip at all. In the wrong mode and at the wrong edges you will get an error message.

## Last Operator UV Rip Move

Please ignore the Proportional Editing at the top. That's a bug that will most probably be fixed soon.

### Location X , Y

Mouse location

### Move X , Y , Z

Adjust the position.

### Constraint Axis

Limit the position relative to the source object.

## Orientation

Orientation is a drop-down box to choose the type of orientation for the mirroring action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### *Proportional Falloff*

Adjust the falloff methods.

### *Proportional Size*

See and adjust the falloff radius.

### *Connected*

The proportional falloff gets calculated for connected parts only.

### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Grab

This is a brush tool that has further settings in the Tool tab in the sidebar at the right. Grab allows you to grab and move the geometry under the brush.

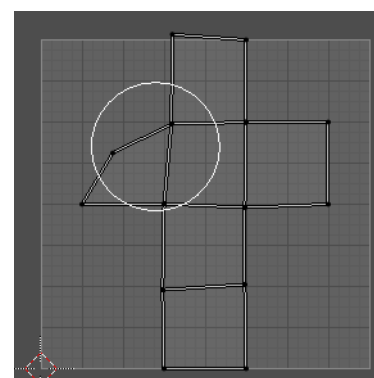

The brush radius can be changed with hotkey F. See also the Tool settings in the Brush panel.

## Relax

This is a brush tool that has further settings in the Tool tab in the sidebar at the right. Relax allows you to relax the geometry under the brush. The vertices are more evenly distributed.

The brush radius can be changed with hotkey F. See also the Tool settings in the Brush panel.

## Pinch

This is a brush tool that has further settings in the Tool tab in the sidebar at the right. Pinch allows you to pinch the geometry under the brush. The vertices comes closer to each other.

The brush radius can be changed with hotkey F. See also the Tool settings in the Brush panel.

## Introduction

In the Image tabs you can find further options and image settings. These settings changes, dependent of what you have selected. And in what mode you are.

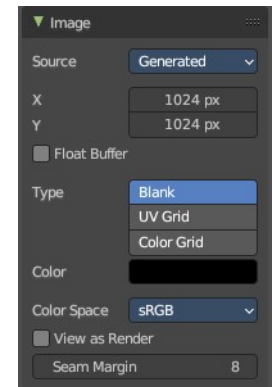

## UV Vertex Panel

This Panel shows the position of the current selection. And here you can change the position too. The range goes from 0 to 1 of the UV space.

## Image Panel

This panel contains image related settings. Size, type, and so on. This panel just shows when an image is loaded.

### Source

Choose the image type. This type gets usually automatically set. When you create a new image, then this image is generated. When you load an image then the Source switches to Single Image.

Generated images does not have a path.

## Source Type Single Image

### Path edit box

### Pack

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### Path edit box

See and edit the path to your movie or image sequence files.

### Open

Open a new movie or image sequence files. A file dialog will appear.

### Refresh

Reread the movie or image sequence files.

---

### Info string

Some information about the currently loaded image. Resolution and color space.

### Color Space

Choose the color space type for the movie or image sequence files.

### Alpha

Choose the alpha channel mode. Straight or Premultiplied.

### View as Render

Display the image with using the color management settings.

## ***Seam Margin***

This belongs to the UV Editor, and has no effect in Image Editor. Take a margin into account when fixing UV seams during painting.

---

## **Source Type Movie + Image Sequence**

## ***Path edit box***

### **Pack**

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### **Path edit box**

See and edit the path to your movie or image sequence files.

### **Open**

Open a new movie or image sequence files. A file dialog will appear.

### **Refresh**

Reread the movie or image sequence files.

---

## ***Info string***

Some information about the currently loaded movie. Frames, resolution and color space.

---

### ***Frames***

The number of frames of the movie or image sequence.

### **Match Movie Length**

Set Users Image Length to the one of this video.

### ***Start***

The start frame of the movie or image sequence

## **Offset**

Offset the number of the frame to use in the animation. -1 means off.

## **Cyclic**

Cycle the images in the movie.

## **Auto Refresh**

Always refresh image on frame changes.

## **Deinterlace**

Deinterlace the movie file on load.

---

## **Color Space**

Choose the color space type for the movie or image sequence files.

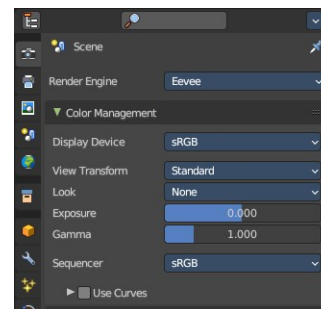

## **Alpha**

Choose the alpha channel mode. Straight or Premultiplied.

## **View as Render**

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

## **Seam Margin**

Take a margin into account when fixing UV seams during painting.

---

## **Source Type Generated**

### **X / Y**

The image width and height.

### **Float Buffer**

Use a floating point buffer. 8 Bit images uses integers. 32 Bit works with floats.

### Generated Type Blank

This type displays an image with one blank color

#### Color

The color of the blank image.

### Generated Type UV Grid

This type displays a with a black and white checker texture but colored dots.

### Generated Type Color Grid

This type displays a with a colored checker texture with numbers.

### Color Space

Choose the color space type for the image.

### View as Render

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

### Seam Margin

Take a margin into account when fixing UV seams during painting.

### Source Type UDIM Tile

UDIM tiles is a way to deal with several textures in different resolution as one texture. Other software like Substance Painter also works with UDIM textures.

Note that you need to have a fitting numbers of UDIM tiles in the UDIM tiles panel. Or not all UDIM textures will be loaded.

## ***Path edit box***

### **Pack**

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### **Path edit box**

See and edit the path to your movie or image sequence files.

### **Open**

Open a new movie or image sequence files. A file dialog will appear.

### **Refresh**

Reread the file.

## ***Color Space***

Choose the color space type for the image.

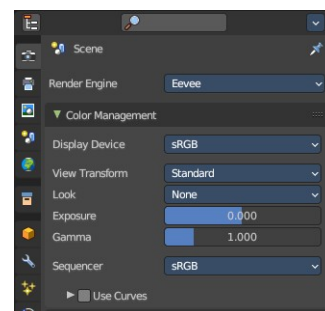

## ***Alpha***

Choose the alpha channel mode. Straight or Premultiplied.

## ***View as Render***

Display the image with using the color management settings. The color management can be adjusted in the properties editor in the Render tab.

## ***Seam Margin***

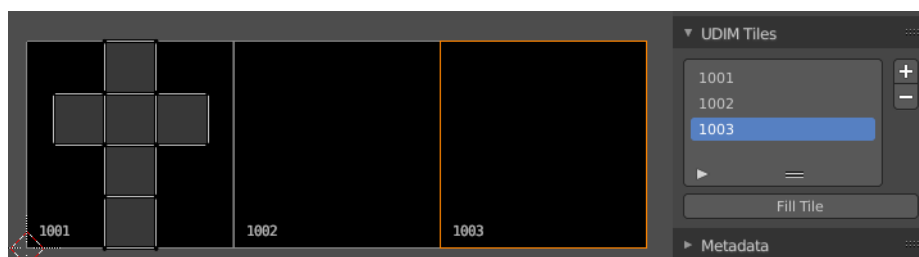

Take a margin into account when fixing UV seams during painting.

## UDIM Tiles Panel

Manage UDIM tiles. This panel shows with source mode UDIM.

### UDIM Tile List

List all UDIM tiles associated with the main index (1000 tile). Double clicking on the tile name allows renaming.

### Number

The starting tile index number. UDIMs must start with the 1001 tile and typically increase in incremental order.

### Drag Handler

The two vertical lines at the end is a handler with which you can expand the list.

### Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

### Invert

Exclude the search term instead of searching for it.

### Sort by Name

Sort the List by name.

### Add Tile

Adds new UDIM tiles to the group.

### Add Tile dialog

#### Number

The UDIM tiles are identified by the number. It is four digits, and with increasing number.

#### Count

How many tiles to add.

#### Label

Leave blank to use the Number as the name in the list.

## **Fill**

Fill the new tile with a generated image.

## **Color**

The fill color for generated type Blank.

## **Width / Height**

The dimensions of the image.

## **Alpha**

Does the image have an alpha channel.

## **Generated Type**

The generated texture type.

## **32 bit float**

Generate an image with 32 bit floating point bit depth.

## **Remove Tile**

Remove the selected UDIM tile. Note that the place in the texture will then be blank. The tiles does not resort. The next created UDIM tile will then be placed in this gap.

## **Fill Tile**

Occupy the UDIM tile with a Generated Image. You can change the fill type and texture tile size of a UDIM tile also afterwards with this fill tool. Note that this overwrites the settings of the currently active UDIM tile.

Warning! If a tile is not filled, it will not be saved with the image.

## **Fill tile dialog**

### **Color**

The fill color for generated type Blank.

### **Width / Height**

The dimensions of the image.

### **Alpha**

Does the image have an alpha channel.

### **Generated Type**

The generated texture type.

## 32 bit float

Generate an image with 32 bit floating point bit depth.

## UDIM Workflow

First set up the grid shape for the UDIM tiles.

This panel is in the View tab. And will vanish in the moment you add any texture. So do this setup beforehand. There is no way to show and change this grid panel afterwards.

Unwrap your mesh.

Add a generated texture, with generated type Color Grid (optional), and Tiled ticked.

In the viewport you will now see one square UV space again, with the colored background image. And we have our first UDIM tile in the UDIM Tile list.

In the Tile list click at the Add button. And add another image. This time with another resolution.

The result is that we have two tiles besides each other, with different resolution.

Create a third one. Or as much as you need.

Next move the UV parts to the texture areas where you need them.

Now save the image. And by saving the one UDIM image all the sub images of this UDIM texture gets saved too.

Save the blend file. Modify the textures to your needs.

To reload the modified textures either save, close and open Bforartists and reload the scene. Or use Open Image to open the first image of the UDIM textures. The rest will load automatically.

Next create a material. Add a texture. Choose the UDIM texture. And the material will now render with the UDIM textures applied.

## Metadata Panel

Displays existing meta data of the image file.

## Grab Relax and Pinch Brush tools

Grab Relax and Pinch tools are drawing tools. And shows some brush related settings when activated. They are equal. Only the Pinch tool shows some extra settings for the relax method.

# Brush Panel

The Brush Panel contains the different brushes. It is in case of Grab Relax and Pinch tools pretty meaningless. Those tools just have a radius, not a brush. But the brush system is global, and reused in this place here.

## Browse Brush

The big image at the top is a drop down box where you can see the current active brush. You can add duplicates of this active brush, and customize it to your needs. But the active brush gets chosen in the Tool Shelf at the left of the 3D View.

When you have added a few more brushes then the drop down box may be more than full. You will

see some little white arrows then. Either in the top left or in the bottom right corner. They indicate that some brushes are hidden before or after the current display.

To scroll to this hidden content use the mouse wheel, or the arrow up and down buttons at the keyboard.

## Custom Icon

Clicking at the custom icon button reveals an edit box to choose a custom icon for the currently active brush.

## Edit Box

The edit box below the Image shows you the name of the current active brush.

**The number** right of it, **in this case 2**, indicates how much number of users ( internally ) this brush uses. This means that this data block (the brush) shares currently settings with at least one other object. Most probably the parent brush where we have created it from. Click at the value to make this brush a single user. The button will vanish then.

**Fake user** set the brush to have a fake user. Zero user data-blocks are normally not saved. But sometimes you want to force the data to be kept even when the data block has no user.

**The + button** allows you to add a new pencil with the current settings. Note that the brushes are NOT saved when you close Bforartists. You can save them into the current blend file. Or you can save the startup file. But be careful here. This saves everything else of the current state of Bforartists too.

**The X button** deletes the brush as the active one. It does NOT delete it from the brushes list.

## Brush Settings Panel

### Radius

The radius of the brush.

The first button behind the edit box enables tablet pressure sensitivity for radius.

The second button is to adjust if the brush radius uses and changes the global radius values. Or if the radius is just adjusted locally for the current tool set.

### Strength

How powerful the effect is applied.

The button behind the edit box is to adjust if the brush strength uses and changes the global strength values. Or if the strength is just adjusted locally for the current tool set.

### Relax

Choose another relaxation method. Default is Laplacian.

### Falloff

Adjust the falloff method of the brush. The drop down box at the top allows you to choose between predefined falloff methods.

The method Custom allows you to create your own falloff curve.

### Custom falloff panel

#### Navigation elements

The navigation elements at the top are described from left to right.

## Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

### **Reset Curve**

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve point.

---

## Curve window

Tweak and adjust the falloff curve by clicking at a curve point and dragging it around.

Double click adds a new point.

Holding down ctrl activates temporary snapping.

Holding down shift enables slower movement, which allows more accurate setting.

---

## Curve Presets

Predefined curve presets.

# Options Panel

## Lock Borders

Disable editing of boundary edges.

## Sculpt all Islands

Brush operates on all islands.

## Display Cursor

Displays the cursor at drawing.

## 9.3.3 Editors - UV Editor - Sidebar - View Tab

### Table of content

View Tab.....	1
Display Panel.....	1
Aspect Ratio.....	1
Repeat Image.....	1
Pixel Coordinates.....	2
2D Cursor panel.....	2

Fake User.....	2
Add Annotation.....	2
Delete Annotation.....	3
List of Annotation Strokes.....	3
Thickness.....	3
Frame Locked/Unlocked.....	3
Onion Skin.....	3

### View Tab

The view tab contains some view related settings.

### Display Panel

#### Aspect Ratio

Set the aspect ratio of the image.

#### Repeat Image

Shows the image not only in the UV range of 0 to 1, but repeats it across the whole canvas. It tiles.

## Pixel Coordinates

Shows the coordinates in the image tab in the UV Vertex panel in pixel coordinates instead of the UV range of 0 to 1.

## 2D Cursor panel

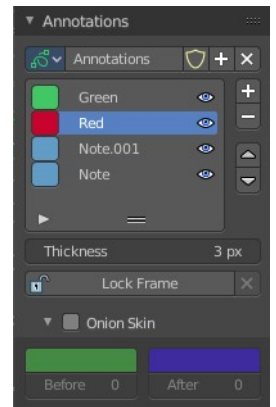

See and edit the position of the 2D cursor.

## Annotations Panel

Manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

## Annotations prop

Add, remove and rename new annotations.

## Drop down box

A list of the available annotation layers.

## Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

## Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

---

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

---

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

---

## Onion Skin

Enable Onion Skinning.

Onion Skinning allows to show ghosts of the keyframes before and after the current frame. In this sub panel you can adjust the color of the onion skin frames.

With the numbers below the colors you can define how many frames before or after are displayed that way.

## 9.3 Editors - UV Editor - Sidebar

### Table of content

Introduction..... 1  
 Right Click menus..... 1

### Introduction

The Image Editor is made of several areas. At the right side you will find the sidebar. Here you will find further options and settings for the Image Editor and its tools.

The tools tab contains panels for functionality of the active tools. The Image tab contains image related settings. And the View tab contains view related options and settings.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

## 9 Editors - UV Editor

## UV Editor

The UV Image Editor is the place where you can display and edit the UV mapping, which doesn't necessarily require to have an image to be loaded.

The functionality of the UV Editor is connected to the 3D view. You need to have a mesh object selected, and you need to be in Edit mode to show the UV wire.

The UV editor is divided into several areas has several tool areas.

Green - Tool Settings Area

Grey - Viewport

Orange - Header

Blue - Tool Shelf

Pink - Sidebar

The Tool Settings area contains the same functionality than the Tools tab in the Sidebar. So we won't cover it.

## Navigating in the UV Image Editor viewport

## Hotkeys

Pan the view - MMB

Zoom - Mouse Wheel, LMB+CTRL, Numpad + / -

## Navigation Elements

There are also two navigation elements for panning and zoom in the upper right corner. Click at them, hold the mouse button down, and move.

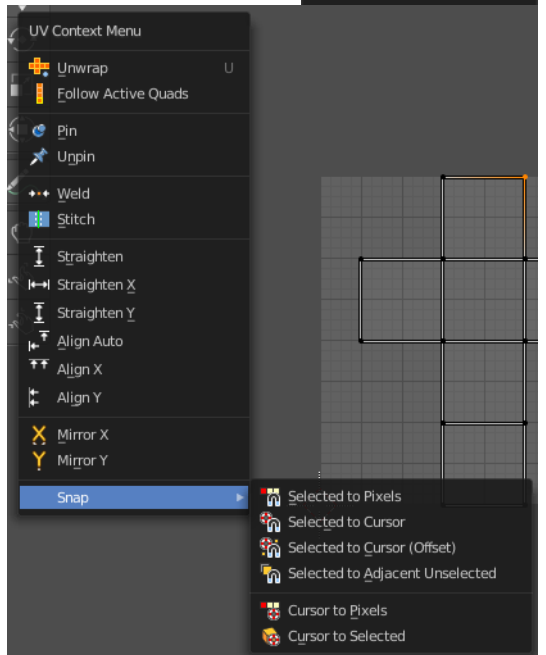

## 2D Cursor

The 2D Cursor is the center point for tool operations. It can be set to mouse position with Alt + Right Mouse click. Or with the Cursor tool in the

## UV context menu

When you double right click into the viewport, then you will open a menu. The UV Context menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual.

## Unwrap

Unwraps the selected geometry with the method Angle based. ABF stands for Angle Based Flattening.

## Last Operator Unwrap

The last operator appears in the 3D view. Unwrap ABF and Unwrap LSCM shares the same Last Operator.

### Method

Method is a drop down box where you can choose between Unwrap method Angle Based and Conformal.

## **Fill Holes**

Fill holes in the mesh before unwrapping.

## **Correct Aspect**

Take the Image Aspect Ratio into account.

## **Use Subsurf Modifier**

Unwraps an existing Subsurf Modifier. You need to add a Subsurf Modifier first.

## **Margin**

The distance between the single UV patches.

---

## **Follow Active Quads**

Follow Active quads maps UV coordinates starting from an active face, and maps all adjacent faces in quad shape then. This way you can for example unwrap a pipe or a road. You first need to have a face selected. Then select everything. And then click at Follow Active Quads.

## **Last Operator Follow Active Quads**

The Last Operator contains the same settings than the Settings dialogue.

## **Edge Length Mode**

Edge Length Mode is a drop-down box where you can choose the Length method.

## **Pin**

Pins the selected vertices . This vertices are now nailed for the unwrap algorithms Angle based and Conformal. Their positions will not change when you repeat the unwrapping. And the algorithms will try to fit the rest of the geometry to this pinned vertices.

Pinned vertices are marked red.

A use case is for example when you have a distorted result for symmetric geometry like a face with the Conformal method. Then you can try to align two center vertices, pin them, and repeat the conformal method. It may be more symmetrical afterwards.

## **Unpin**

Unpins pinned geometry.

---

## Snap

Snap is a sub menu with some snapping tools. The menu items should be pretty self explaining. Selected to Pixels snaps the selected geometry to the pixels of the image, and so on.

## Last Operator Snap Selection and Snap Cursor

### Target

Set the snap target method again.

### Last operator Pin

This last operator appears in the 3D view. Pin and unpin shares the same last operator.

### Clear

Unpins pinned geometry.

## Mirror X

Mirrors the selection along the X axis. The mirror point is the pivot of the selection.

## Mirror Y

Mirrors the selection along the Y axis. The mirror point is the pivot of the selection.

## Last Operator Mirror

The Last Operator Mirror panel gives you tools to adjust the mirror action.

### Orientation

Orientation is a drop-down box where you can choose the type of orientation for the mirroring action.

### Constraint Axis

Constraint Axis gives you the possibility to define the mirror axis. You can choose more than one axis here.

## ***Proportional Editing***

Activates proportional editing

## ***Proportional Editing Falloff***

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Straighten**

Straightens the selected geometry in both directions, X and Y axis.

## **Straighten X**

Straightens the selected geometry along the X axis.

## **Straighten Y**

Straightens the selected geometry along the Y axis.

## **Align Auto**

Aligns the selection. The align axis gets chosen from the selection itself. When it's higher than tall, then it aligns along the Y axis. When it's taller than high, then it aligns along the X axis.

The align point is the pivot of the selection.

## **Align X**

Aligns the selection along the X axis. The align point is the pivot of the selection.

## **Align Y**

Aligns the selection along the Y axis. The align point is the pivot of the selection.

## Last operator Align

The Last operator Align unions all the single straighten and align actions in one operator.

## Axis

Lists the straighten and align methods again.

## Merge

### At Center

Merges the selected vertices at the center.

### At Cursor

Merges the selected vertices at the 2d cursor

### Last operator Snap Selection

#### Target

To which element to snap to.

## By Distance

Merge vertices that are below a specified distance to each other.

### Last operator Merge UVs by Distance

#### Merge Distance

Maximum distance for welding vertices.

#### Unselected

Merge selected vertices to other unselected vertices.

## Stitch

Stitch tries to union UV patches along the selected edges or vertices.

### Last Operator Stitch

This last operator appears in the 3D view.

### Use Limit

Just snap when the elements are below a given distance.

### Snap Island

Snap the whole UV patch, or just the selected edge(s)/vertices

### Limit

The limit distance for Use Limit.

### Static Island

Adjust which island stays in place when stitching.

### Active Object

Index of the active object.

### Snap at Midpoint

Snap at the center point of the two elements instead the first to the last.

### Clear Seams

Unmarks seams when stitching.

### Operation Mode

The operation mode. Calculate with Edges or Vertices.

## Split

## Selection

Split the selected geometry from the not selected geometry.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually an Add to Quick Favorites menu entry.

The Quick Favorites Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Image Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

## Loop Select - Alt Left Mouse

Select an edge loop.

## Loop Select - Shift Alt Left Mouse

Select an edge loop. Adds to selection.

## Edge Ring Select - Ctrl Alt Left Mouse

Select an edge ring.

## Edge Ring Select - Shift Ctrl Alt Left Mouse

Select an edge ring. Adds to selection.

---

## Unwrap - U

Unwraps the selected geometry. This operator starts with the method Angle based.

### Last Operator Unwrap

The last operator appears in the 3D view. Unwrap ABF and Unwrap LSCM shares the same Last Operator.

#### **Method**

Method is a drop down box to choose between Unwrap method Angle Based and Conformal.

#### **Fill Holes**

Fill holes in the mesh before unwrapping.

#### **Correct Aspect**

Take the Image Aspect Ratio into account.

#### **Use Subsurf Modifier**

Unwraps an existing Subsurf Modifier. You need to add a Subsurf Modifier first.

#### **Margin**

The distance between the single UV patches.

---

## Pick shortest path

Click at the first edge or vertice, hold down ctrl, click at the last edge or vertice.

## Last operator Pick shortest path

### ***Face stepping***

Traverse connected faces. Including diagonals and edge rings.

### ***Topology Distance***

Find the minimum number of steps. And ignore the spatial distance.

### ***Deselected***

Don't select the whole path, but just every nth element of it.

### ***Selected***

This is connected to nth element. Number of elements to skip at once.

### ***Offset***

This is connected to nth element. Start with an offset.

## Add menu - Matte

These nodes give you the essential tools for creating a Matte for images that do not already have their own Alpha Channel. One usage scenario is blue-screen or green-screen footage, where live action is shot in front of a blue or green backdrop for replacement by a matte painting or virtual background.

In general, hook up these nodes to a viewer, set your Image Editor to show the

Viewer node, and play with the sliders in real-time using a sample image from the footage, to get the settings right. In some cases, small adjustments can eliminate artifacts or foreground image degradation. Taking out too much green can result in foreground actors looking flat or blueish/purplish.

You can and should chain these nodes together, improving your masking and color correction in successive refinements, using each node's strengths to operate on the previous node's output. Keying Node is the closest to a "does-it-all" node for green screens, but the best results stem from a combination of techniques.

### Note!

Garbage Matte is not a node, but a technique selecting what to exclude from an image. It is a Mask used to identify content to be removed from an image that cannot be removed by an automatic process like chroma keying. It is used either to select specific content to be removed, or it is the inverse of a rough selection of the subject; removing everything else.

Some nodes accept a garbage matte directly. For those that don't, you can still apply one by subtracting the garbage matte from the matte generated by the node.

Simple garbage mattes can be created with the Box Mask or the Ellipse Mask. More complicated matte shapes using a Double Edge Mask or using a Mask.

## Channel Key

The Channel Key node determines background objects from foreground objects by the difference in the selected channel's levels.

For example in YUV color space, this is useful when compositing stock footage of explosions (very bright) which are normally shot against a solid, dark background.

### Inputs

#### *Image*

Standard image input.

### Properties

#### *Color Space*

This button selects what color space the channels will represent.

RGB, HSV, YUV, YCbCr

#### *Key channel*

This button selects the channel, defined by the Color Space, to use to determine the matte.

#### *Algorithm*

Max or Single.

## **Limit**

It is possible to have a separation between the two values to allow for a gradient of transparency between foreground and background objects.

## **High**

Determines the lowest values that are considered foreground. (Which is supposed to be – relatively – height values: from this value to 1.0.)

## **Low**

Determines the highest values that are considered to be background objects. (Which is supposed to be – relatively – low values: from 0.0 to this value.)

## **Outputs**

### **Image**

Image with an alpha channel adjusted for the keyed selection.

### **Matte**

A black-and-white alpha mask of the key.

---

## **Chroma Key**

The Chroma Key node determines if a pixel is a foreground or background (and thereby should be transparent) based on its chroma values.

Use this, for example, to composite images that have been shot in front of a green or blue screen.

## **Inputs**

### **Image**

Standard image input.

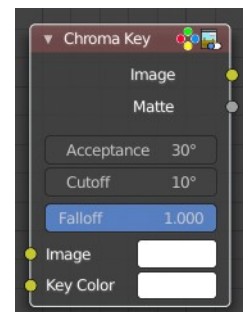

### **Key Color**

The background color usually selected using the color picker and the original image.

## **Properties**

### **Acceptance**

An angle on the color wheel that represents how tolerant the keying color is. Larger angles allow for larger variation in the keying color to be considered background pixels.

## **Cutoff**

Controls the level that is considered the pure background. Higher cutoff levels mean more pixels will be 100% transparent if they are within the angle tolerance.

## **Falloff**

Increase to make nearby pixels partially transparent producing a smoother blend along the edges.

## **Outputs**

### **Image**

Image with its alpha channel adjusted for the keyed selection.

### **Matte**

A black-and-white alpha mask of the key.

---

## **Color Key**

The Color Key node creates a matte based on a specified color of the input image.

## **Inputs**

### **Image**

Standard image input.

## **Properties**

### **Color**

The sliders represent threshold values. Higher values in this node's context mean a wider range of colors from the specified will be added to the matte.

Hue, Saturation, Value

## **Outputs**

### **Image**

Image with its alpha channel adjusted for the keyed selection.

### **Matte**

A black-and-white alpha mask of the key.

---

## **Color Spill**

The Color Spill node reduces one of the RGB channels so that it is not greater than any of

the others.

This is common when compositing images that were shot in front of a green or blue screen. In some cases, if the foreground object is reflective, it will show the green or blue color; that color has “spilled” onto the foreground object. If there is light from the side or back, and the foreground actor is wearing white, it is possible to get “spill” green (or blue) light from the background onto the foreground objects, coloring them with a tinge of green or blue. To remove the green (or blue) light, you use this fancy node.

## Inputs

### ***Image***

Standard image input.

### ***Factor***

Standard Factor.

## Properties

### ***Despill Channel***

R, G, B

### ***Algorithm***

Simple or Average.

### ***Limiting Channel***

R, G, B

### ***Ratio***

Scale limit by value.

### ***Unspill***

Allows you to reduce the selected channel’s input to the image greater than the color spill algorithm normally allows. This is useful for exceptionally high amounts of the color spill.

R, G, B

## Outputs

### ***Image***

The image with the corrected channels.

## Difference Key

This node produces a matte that isolates foreground content by comparing it with a reference background image.

### Inputs

#### *Image*

Contains foreground content against the background that is to be removed.

#### *Image*

The reference background image.

### Properties

#### *Tolerance*

Where pixels match the reference background to within the specified threshold, the matte is made transparent.

#### *Falloff*

Increase to make nearby pixels partially transparent producing a smoother blend along the edges.

### Outputs

#### *Image*

Image with its alpha channel adjusted for the keyed selection.

#### *Matte*

A black-and-white alpha mask of the key.

## Distance Key

The Distance Key node determines a pixel's alpha value based on the three-dimensional distance between the image pixel color and the key color in a 3D color space.

This key works well when trying to single out a specific color in a background (not necessarily green).

### Inputs

#### *Image*

Standard image input.

#### *Key Color*

The color that is to be keyed.

## Properties

### **Tolerance**

A threshold what the node considers a match between the key color and the foreground pixel. The tolerance affects how close a pixel needs to be to the background pixel to be considered an absolute match.

### **Falloff**

When the Falloff value is high, pixels that are close to the Key Color are more transparent than pixels that are not as close to the Key Color (but still considered close enough to be keyed). When the Falloff value is low, it does not matter how close the pixel color (Image) is to the Key Color, it is transparent.

### **Color Space**

RGB, YCC

It is also possible to work with YCbCr color space, but only the Cb and Cr channels are taken into consideration for determining the distance between the foreground and background pixels.

## Outputs

### **Image**

The image with an alpha channel adjusted for the keyed selection.

### **Matte**

A black-and-white alpha mask of the key.

## **Double Edge Mask**

The Double Edge Mask node creates a gradient between two masks.

## Inputs

### **Inner Mask**

A mask representing the inside shape, which will be fully white.

### **Outer Mask**

A mask representing the outside shape, which will fade from black at its edges to white at the Inner Mask.

## Properties

### **Inner Edge**

#### **All**

All shapes in the Inner Mask contribute to the gradient, even ones that do not touch the Outer Mask shape.

## Adjacent Only

Only shapes in the Inner Mask that overlap with the Outer Mask contribute to the gradient.

## Buffer Edge

### Keep In

Parts of the Outer Mask that touch the edge of the image are treated as if they stop at the edge.

### Bleed Out

Parts of the Outer Mask that touch the edge of the image are extended beyond the boundary of the image.

## Outputs

### Mask

Standard mask output.

## Keying

The Keying node is a one-stop-shop for “green screen” / “blue screen” removal. It performs both chroma keying to remove the backdrop and despill to correct color cast from the backdrop. Additionally, you can perform common operations used to tweak the resulting matte.

## Inputs

### Image

Standard image input.

### Key Color

The color of content to be removed. This may be a single color, or a reference image such as generated by the Keying Screen Node.

### Garbage Matte

An optional mask of area(s) to always exclude from the output. This is removed from the chroma key generated matte.

### Core Matte

An optional mask of area(s) to always include in the output. This is merged with the chroma key generated matte.

## **Properties**

### ***Pre Blur***

Reduce the effects of color noise in the image by blurring only color by the given amount, leaving luminosity intact. This will affect matte calculation only, not the result image.

### ***Screen Balance***

This is the balance between color channels compared with the key color. 0.5 will average the other channels (red and blue in the case of a green screen).

This may be tweaked in tandem with Clip Black and Clip White while checking the Matte output to create a mask with optimal separation.

### ***Despill Factor***

Controls how much color bleed from the key color is removed from the input image: 0 means no despilling, 1 means all possible spilling will be removed. The underlying implementation is the same as adjusting the Unspill amount of the Color Spill Node.

### ***Despill Balance***

This controls how the color channels are compared when computing spill, affecting the hue and shade of the corrected colors. It is similar to setting the Limiting Channel in the Color Spill Node.

### ***Edge Kernel Radius***

Defines the radius in pixel used to detect an edge.

### ***Edge Kernel Tolerance***

Defines threshold used to check if pixels in radius are the same as current pixel: if the difference between pixel colors is higher than this threshold then the point will be considered an edge.

### ***Clip Black***

This sets the threshold for what becomes fully transparent in the output (black in the matte). It should be set as low as possible. Uneven backdrops will require this value to be increased. Use of the Keying Screen Node can help keep this value low. You may also use a Garbage Matte to exclude problematic areas.

This value does not impact areas detected as edges to ensure edge detail is preserved.

### ***Clip White***

This sets the threshold for what becomes fully opaque in the output (white in the matte). It should be set as high as possible. Colors close to green in the foreground may require reducing this value and/or adjusting the Screen Balance. Particularly problematic parts can be fixed with a Core Matte instead of a low Clip White.

This value does not impact areas detected as edges to ensure edge detail is preserved.

### ***Dilate/Erode***

Enlarge (positive numbers) or shrink (negative numbers) the matte by the specified number of pixels. This is

similar to using the Dilate/Erode Node on the matte.

This a simple way to include more or less along the edges of the matte, particularly combined with Post Blur.

### ***Feather Falloff***

The rate of the falloff at the edges of the matte when feathering, to manage edge detail.

### ***Feather Distance***

Controls how much the matte is feathered inwards (negative number) or outwards (positive number).

### ***Post Blur***

Make the matte less sharp, for smoother transitions to the background and noise reduction.

## **Outputs**

### ***Image***

Processed image with the Matte applied to the images' alpha channel.

### ***Matte***

Output matte to use for checking the quality of the key, or to manually apply using a Set Alpha Node or Mix Node.

### ***Edges***

Shows what edges were detected on the matte. Useful for adjusting the Edge Kernel Radius and Edge Kernel Tolerance.

#### **Tip**

If there are problems with the edges of the matte, it may help to start with adjusting the Edge Kernel parameters before adjusting feathering. Detected edges are not subject to Clip Black / Clip White thresholds to preserve fine edge detail. You can check edge detection by connecting a Viewer Node to the Edges output.

Sharper detected edges (smaller Edge Kernel Radius, like 2 / larger Edge Kernel Tolerance, like 0.4) will create a sharper matte, but may loose some detail like stray hairs. A sharp matte is good, but disappearing or flickering hairs are distracting.

Fat edges (larger Edge Kernel Radius, like 8 / smaller Edge Kernel Tolerance, like 0.05) will capture more edge detail, but may also produce a halo around the subject. The halo can be adjusted with Feather controls along with Dilate/Erode.

## Keying Screen

The Keying Screen node creates plates for use as a color reference for keying nodes. It generates gradients from sampled colors on motion tracking points on movie clips. It can be used to deal with uneven colors of green screens.

## Properties

### Movie Clip

The selectable clip data-block used as input for the gradient colors.

The movie needs to be loaded already. You cannot load it from here, just choose.

### Tracking Object

Tracking Object to generate the gradient. You will probably want to create new a tracking object in the Object panel, because tracks used for gradients can not actually be used for camera/object tracking. After this tracks might be placed in places where gradient colors should be sampled. These tracks could be tracked or moved manually, so gradients would be updating automatically along the movie. Tracks might have an offset for easier tracking of feature-less screens.

## Outputs

### Screen

Gradient image output.

## Luminance Key

The Luminance Key node determines background objects from foreground objects by the difference in the luminance (brightness) levels.

Stock footage of explosions, smoke or debris are normally shot against a solid, dark background rather than a green screen. This node can separate the foreground effect from the background. It can also be used for sky replacement for overexposed or gray skies that aren't suitable for chroma keying.

### Tip

When compositing footage of something that emits light and has a dark background, like fire, a Mix Node using a Screen or Add operator will produce better results.

## **Inputs**

### ***Image***

Standard image input.

## **Properties**

### ***Limit***

#### **High**

Determines the lowest values that are considered foreground. (Which is supposed to be – relatively – light: from this value to 1.0.)

#### **Low**

Determines the highest values that are considered to be background objects. (Which is supposed to be – relatively – dark: from 0.0 to this value.)

Note. Brightness levels between the two values form a gradient of transparency between foreground and background objects.

## **Outputs**

### ***Image***

Image with an alpha channel adjusted for the keyed selection.

### ***Matte***

A black-and-white alpha mask of the key.

## Add menu - Matte

These nodes give you the essential tools for creating a Matte for images that do not already have their own Alpha Channel. One usage scenario is blue-screen or green-screen footage, where live action is shot in front of a blue or green backdrop for replacement by a matte painting or virtual background.

In general, hook up these nodes to a viewer, set your Image Editor to show the Viewer node, and play with the sliders in real-time using a sample image from the footage, to get the settings right. In some cases, small adjustments can eliminate artifacts or foreground image degradation. Taking out too much green can result in foreground actors looking flat or blueish/purplish.

You can and should chain these nodes together, improving your masking and color correction in successive refinements, using each node's strengths to operate on the previous node's output. Keying Node is the closest to a "does-it-all" node for green screens, but the best results stem from a combination of techniques.

### Note!

Garbage Matte is not a node, but a technique selecting what to exclude from an image. It is a Mask used to identify content to be removed from an image that cannot be removed by an automatic process like chroma keying. It is used either to select specific content to be removed, or it is the inverse of a rough selection of the subject; removing everything else.

Some nodes accept a garbage matte directly. For those that don't, you can still apply one by subtracting the garbage matte from the matte generated by the node.

Simple garbage mattes can be created with the Box Mask or the Ellipse Mask. More complicated matte shapes using a Double Edge Mask or using a Mask.

## Cryptomatte

The Cryptomatte node uses the Cryptomatte standard to efficiently create mattes for compositing. Cycles outputs the required render passes, which can then be used in the Compositor or another Compositor with Cryptomatte support to create masks for specified objects.

Unlike the Material and Object Index passes, the objects to isolate are selected in compositing, and mattes will be anti-aliased and take into account effects like motion blur and transparency.

## Usage

Enable Cryptomatte Object render pass in the Passes panel, and render.

In the compositing nodes, create a Cryptomatte node and link the Render Layer matching Image and Cryptomatte passes to it.

Attach a Viewer node to the Pick output of the Cryptomatte node.

Use the Cryptomatte Add/Remove button to sample objects in the Pick Viewer node.

Use the Matte output of the Cryptomatte node to get the alpha mask.

## Inputs

### Image

Standard image input.

## Properties

### Render / Image

Use the render result or an external image as the base image for cryptomatte.

### Render

Use Cryptomatte data that are stored as part of the render.

### Scene Property

Pick the scene that you want to use.

### Cryptomatte Layer

Pick the cryptomatte layer that you want to use.

### Image

Use Cryptomatte data that are stored inside a multilayered OpenEXR image.

### Image Property

Pick the image that you want to use.

### Cryptomatte Layer

Pick the cryptomatte layer that you want to use.

## Matte ID

List of object and material crypto IDs to include in matte. This can be used for example to quickly clear all mattes by deleting the text or used to copy-and-paste crypto IDs from other software.

## Outputs

### Image

A colored output of the input image with the matte applied to only include selected layers.

### Matte

A black-and-white alpha mask of the all the selected crypto layers.

### Pick

A colored representation of the Cryptomatte pass which can be used with a Viewer node to select which crypto passes are used to create the matte image.

---

## Cryptomatte (Legacy)

This is the legacy node version.

The Cryptomatte node uses the Cryptomatte standard to efficiently create mattes for compositing. Cycles outputs the required render passes, which can then be used in the Compositor or another Compositor with Cryptomatte support to create masks for specified objects.

Unlike the Material and Object Index passes, the objects to isolate are selected in compositing, and mattes will be anti-aliased and take into account effects like motion blur and transparency.

## Usage

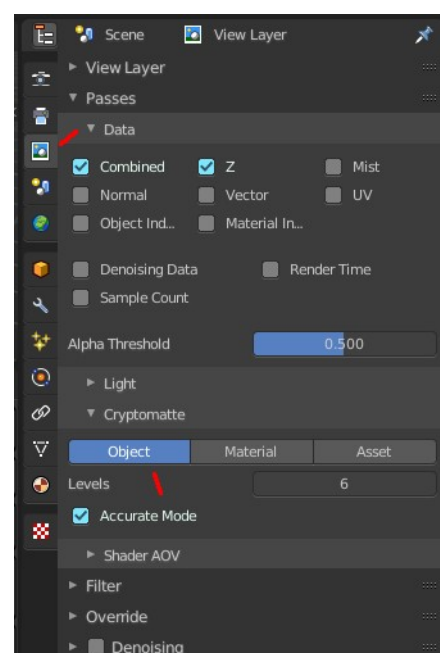

Enable Cryptomatte Object render pass in the Passes panel, and render.

In the compositing nodes, create a Cryptomatte node and link the Render Layer matching Image and Cryptomatte passes to it.

Attach a Viewer node to the Pick output of the Cryptomatte node.

Use the Cryptomatte Add/Remove button to sample objects in the Pick Viewer node.

Use the Matte output of the Cryptomatte node to get the alpha mask.

## ***Adding/Removing Layers***

By default there are only four crypto layers available as inputs to the Cryptomatte node. You can add or remove layer inputs through Sidebar > Item > Properties > Add/Remove Crypto Layer. These operators will add/remove layers from the bottom of the pass inputs.

## **Inputs**

### ***Image***

Standard image input.

### ***Crypto Passes***

Each crypto layer will be given its own render pass; each of these render passes must be connected to one of these crypto layer inputs. By default there are only four layers, see Adding/Removing Layers to add more.

## **Properties**

### ***Add/Remove***

Adds/Removes an object or material from matte, by picking a color from the Pick output.

### ***Matte ID***

List of object and material crypto IDs to include in matte. This can be used for example to quickly clear all mattes by deleting the text or used to copy-and-paste crypto IDs from other software.

## **Outputs**

### ***Image***

A colored output of the input image with the matte applied to only include selected layers.

### ***Matte***

A black-and-white alpha mask of the all the selected crypto layers.

### ***Pick***

A colored representation of the Cryptomatte pass which can be used with a Viewer node to select which crypto passes are used to create the matte image.

---

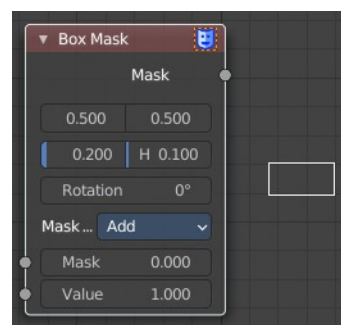

## **Box Mask**

The Box Mask node creates an image suitable for use as a simple matte.

## **Inputs**

### ***Mask***

An optional mask to use as the base for mask operations.

## **Value**

Intensity of the generated mask.

## **Properties**

### **X, Y**

Position of the center of the box as a fraction of the total width or height. (0.5, 0.5 creates a centered box; 0.0, 0.0 creates a box in the lower left.)

### **Width**

Width of the box as a fraction of the total image width.

### **Height**

Height of the box as a fraction of the total image width, not height.

### **Rotation**

Rotation of the box around its center point.

### **Mask Type**

Operation to use against the input mask.

#### **Add**

This yields the union of the input mask and the generated mask: Areas covered by the generated mask are set to the specified Value. Other parts of the input mask are passed through unchanged, or set to black if there is no input mask.

#### **Subtract**

Values of the input mask have the specified Value subtracted from them.

#### **Multiply**

This yields the intersection of this generated mask and the input mask: Values of the input mask are multiplied by the specified Value for the area covered by the generated mask. All other areas become black.

#### **Not**

Any area covered by both the input mask and the generated mask becomes black. Areas covered by the generated mask that are black on the input mask become the specified Value. Areas uncovered by the generated mask remain unchanged.

## **Outputs**

### **Mask**

A generated rectangular mask merged with the input mask. The created mask is the size of the current scene render dimensions.

Tip. For soft edges, pass the output mask through a slight Blur node.

## Ellipse Mask

The Ellipse Mask node creates an image suitable for use as a simple matte or vignette mask.

### Inputs

#### **Mask**

An optional mask to use as the base for mask operations.

#### **Value**

Intensity of the generated mask.

### Properties

#### **X, Y**

Position of the center of the ellipse as a fraction of the total width or height. (0.5, 0.5 creates a centered ellipse; 0.0, 0.0 creates an ellipse with its center in the lower left.)

#### **Width**

Width of the ellipse as a fraction of the total image width.

#### **Height**

Height of the ellipse as a fraction of the total image width, not height. Equal Width and Height values with produce a circle.

#### **Rotation**

Rotation of the ellipse around its center point.

#### **Mask Type**

What operation to use against the input mask.

#### **Add**

This yields the union of the input mask and the generated mask: Areas covered by the generated mask are set to the specified Value. Other parts of the input masked are passed through unchanged, or set to black if there is no input mask.

#### **Subtract**

Values of the input mask have the specified Value subtracted from them.

#### **Multiply**

This yields the intersection of this generated mask and the input mask: Values of the input mask are multiplied by the specified Value for the area covered by the generated mask. All other areas become black.

## Not

Any area covered by both the input mask and the generated mask becomes black. Areas covered by the generated mask that are black on the input mask become the specified Value. Areas uncovered by the generated mask remain unchanged.

## Outputs

### Mask

A generated elliptical mask merged with the input mask. The created mask is the size of the current scene render dimensions.

Tip. For soft edges, pass the output mask through a slight Blur node. For a vignette, pass the output of this through a heavy blur.

## Double Edge Mask

The Double Edge Mask node creates a gradient between two masks.

## Inputs

### Inner Mask

A mask representing the inside shape, which will be fully white.

### Outer Mask

A mask representing the outside shape, which will fade from black at its edges to white at the Inner Mask.

## Properties

### Inner Edge

#### All

All shapes in the Inner Mask contribute to the gradient, even ones that do not touch the Outer Mask shape.

#### Adjacent Only

Only shapes in the Inner Mask that overlap with the Outer Mask contribute to the gradient.

### Buffer Edge

#### Keep In

Parts of the Outer Mask that touch the edge of the image are treated as if they stop at the edge.

## Bleed Out

Parts of the Outer Mask that touch the edge of the image are extended beyond the boundary of the image.

## Outputs

### *Mask*

Standard mask output.

---

## ID Mask

The ID Mask Node can be used to access an alpha mask per object or per material.

## Inputs

### *ID value*

Input for the Object Index or Material Index render pass. Which is an output of the Render Layers node or the Image node with a multi-layer format.

## Properties

### *Index*

Selection of the previously specified index.

### *Anti-Aliased*

This post-process function refines the mask. See anti-aliasing.

## Outputs

### *Alpha*

The mask is white where the object is and black where it is not. If the object is transparent, the alpha mask represent that with gray values.

## Setup

An index can be specify for any object or Cycles material in the scene. The Object Index can be set in the Relations panel in the Object tab in the Properties Editor. And for Cycles in the Settings Panel in the Material tab in the Properties editor. To be accessible after rendering, Object Index or Material Index render pass has to be enabled in the Passes panel in the View Layer properties tab in the Properties editor.

## Add menu - Tracking

The Tracking menu contains nodes for tracking motion data.

### Plane Track Deform

The Plane Track Deform Node is used to incorporate the special “plane track” in your composite by checking areas which are planes, and replacing their footage with some other image.

#### Plane Track

Before using this node, plane track for the footage should be made in the Movie Clip Editor.

#### Inputs

#### Image

Image to put in place of the plane track, and thus, override that area in the movie clip.

### Properties

#### **Movie Clip**

Used to select the movie clip whose plane track to use. For controls see Data-Block Menu.

#### **Object**

Used to select the object to which the plane track is linked.

#### **Track**

Used to select the plane track to use.

#### **Motion Blur**

Specify whether to use blur caused by motion of the plane track or not.

## Samples

Motion Blur setting. Set the number of samples to take for each frame. The higher this number, the smoother the blur effect, but the longer the render, as each virtual intermediate frame has to be rendered.

Note. Samples are taken only from the next frame, not the previous one. Therefore the blurred object will appear to be slightly ahead of how it would look without motion blur.

## Shutter

Motion Blur setting. Time (in frames) the shutter is open. If you are rendering at 24 fps, and the Shutter is set to 0.5, the time in between frames is 41.67 ms, so the shutter is open for half that, 20.83 ms.

## Outputs

### Image

The output by perspective wrapping the image to that plane track.

### Plane

Produces a black-and-white mask of the plane track.

## Stabilize 2D

The Stabilize 2D node stabilizes the footage according to the settings set in Movie Clip Editor in the Sidebar in the Stabilization tab in the 2D Stabilization panel. For more information, see the chapter there.

## Inputs

### Image

Standard image input.

## Properties

### Movie Clip

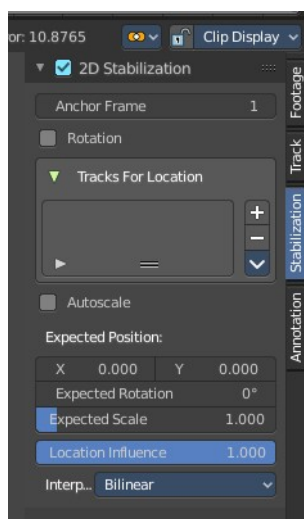

The movie clip whose stabilization to use.

### Filter

Filter methods for the stabilization.

### Invert

Invert the stabilization. If the stabilization calculated is to move the movie clip up by 5 units, this will move the movie clip down by 5 units.

## Outputs

### *Image*

Standard image input.

---

## Track Position

The Track Position node is used to return information about a tracking marker to the Compositor. You need a tracking project here.

## Properties

### *Movie Clip browser*

Choose a loaded movie file.

### *Open*

Open a movie file.

### *Name*

Read and edit the name of the video.

### *Fake User*

Assign a fake user to this video. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### *Load File*

Load a new video.

### *Delete File*

Delete this video.

### *Tracking Object*

Camera object to get track information from.

### *Track Name*

The name of the track to get track information from.

## ***Position***

Which marker position to use for output.

### **Absolute**

Outputs an absolute position of a marker.

### **Relative Start**

Outputs the positions of a marker relative to the first marker of a track.

### **Relative Frame**

Outputs the positions of a marker relative to the markers of the given Frame.

### **Absolute Frame**

Outputs the absolute positions of a marker at the given Frame.

## **Outputs**

### ***X/Y***

The marker's X and Y location.

### ***Speed***

The velocity of the marker, measured in pixels per frame. This could be used to fake effects like motion blur by connecting it to the Vector Blur Node.

## Add menu - Transform

These nodes distort the image in some fashion. They work either on the whole image, or by using a mask to vary the effect over the image.

## Rotate

This node rotates an image.

### Inputs

#### *Image*

Standard image input.

#### *Degr*

Rotation angle in degree. Positive values rotate clockwise and negative ones counterclockwise.

### Properties

#### *Filter*

Interpolation Methods.

#### **Nearest**

No interpolation. This method uses the nearest neighboring pixel.

#### **Bilinear**

Simple interpolation between adjacent pixels.

#### **Bicubic**

Highest quality interpolation.

### Outputs

#### *Image*

Standard image output.

## Scale

The Scale node scales the size of an image.

### Inputs

#### *Image*

Standard image input.

## X, Y

Scale in the axis directions, only available if Space is set to Relative or Absolute.

## Properties

### Space

Coordinate Space to scale relative to.

### Relative

Percentage values relative to the dimensions of the image input.

### Absolute

Size of an image by using absolute pixel values.

### Scene Size

Sizes an image to the size of the final render resolution for the scene. For example, rendering a scene at the standard 1080p resolution but setting the render percentage at 50%, will produce a 1080p image with the scene scaled down 50% and leaving the rest of the image as alpha.

### Render Size

Image dimensions set in the Render panel.

### Stretch, Fit, Crop

Render Size setting. Stretch distorts the image so that it fits into the render size. Fit scales the image until the bigger axis “fits” into the render size. Crop cuts the image so that it is the same aspect ratio as the render size.

## X, Y

Render Size setting. Offset factor for the final scaled image.

## Outputs

### Image

Standard image output.

## Transform

The Transform node combines the functionality of three other nodes: Scale, translate, and rotate nodes.

## Inputs

### Image

Standard image input.

## ***X, Y***

Used to move the input image horizontally and vertically.

## ***Angle***

Used to rotate an image around its center. Positive values rotate counter-clockwise and negative ones clockwise.

## ***Scale***

Used to resize the image. The scaling is relative, meaning a value of 0.5 gives half the size and a value of 2.0 gives twice the size of the original image.

## **Properties**

### ***Filter***

Interpolation Methods.

#### **Nearest**

No interpolation, uses nearest neighboring pixel.

#### **Bilinear**

Simple interpolation between adjacent pixels.

#### **Bicubic**

Highest quality interpolation.

## **Outputs**

### ***Image***

Standard image output.

## **Translate**

The Translate node moves an image.

Could also be used to add a 2D camera shake.

## **Inputs**

### ***Image***

Standard image input.

## ***X, Y***

Used to move the input image horizontally and vertically.

## Properties

### **Relative**

Percentage translation values relative to the input image size.

### **Wrapping**

Repeat pixels on the other side when they extend over the image dimensions.

None, X Axis, Y Axis, Both Axis

## Outputs

### **Image**

Standard image output.

## Corner Pin

The Corner Pin node uses explicit corner values for a plane warp transformation. It works like the Plane Track Deform node, but without using “plane track” data from the Movie Clip Editor.

### Inputs

#### **Image**

Standard image input.

#### **Corners**

Four vector inputs to define the plane warping. (Z component of vector inputs is ignored.)

### Outputs

#### **Image**

Standard image output. (The image after distorting.)

#### **Plane**

A black-and-white alpha mask of the plane.

## Crop

The Crop Node takes an input image and crops it to a selected region.

### Inputs

#### *Image*

Standard image input.

### Properties

#### *Crop Image Size*

When enabled, the image size is cropped to the specified region. When disabled, the image remains the same size, and uncropped areas become transparent pixels.

#### *Relative*

When enabled, crop dimensions are a percentage of the image's width and height. When disabled, the range of the Crop Region Values are the width and height of the image in pixels.

#### *Crop Region Values*

Define borders of the crop region. Lower, upper, left, right.

### Outputs

#### *Image*

Standard image output.

## Displace

The Displace Node displaces the pixel position based on an input vector.

This node could be used to model phenomena, like hot air distortion, refraction's of uneven glass or for surreal video effects.

### Inputs

#### *Image*

Standard image input.

#### *Vector*

Input of the displacement map. If the a color output is implicitly converted in the vector input, the first channel (red) value determines displacement along X axis. The second channel (green) the displacement along Y axis. If the input is a greyscale image, where both the channel values are equal, the input image will be displaced equally in both X and Y directions.

## Scale X, Y

Separate scaling of the vector input in X and Y direction. Acting as multipliers by increasing or decreasing the strength of the displacement along their respective axes.

## Outputs

### Image

Standard image output.

## Flip

This node flips an image at defined axis.

You can use this node to just flip or use it as a part of mirror setting. Mix half of the image to be mirrored with its flipped version to produce mirrored image.

## Inputs

### Image

Standard image input.

## Properties

### Axis

This can be either X or Y. Also, flipping can be done on both X and Y axis simultaneously.

Flip X, Flip Y, Flip X & Y

## Outputs

### Image

Standard image output.

## Map UV

With the Map UV node objects can be “re-textured” after they have been rendered.

To apply a texture to individual enumerated objects the ID Mask Node could be used.

## Inputs

### Image

The new 2D texture.

## UV

The input for UV render pass. See Cycles render passes.

Hint. To store the UV pass a multi-layer OpenEXR format could be used.

## Properties

### Filter Type

#### Nearest

Using the nearest filtering method. Used for NPR Workflows, eg palette based remapping of colors.

#### Anisotropic

Using the Anisotropic filtering method.

### Alpha

Alpha threshold is used to fade out pixels on boundaries.

## Outputs

### Image

The resulting image is the input image texture distorted to match the UV coordinates. That image can then be overlay mixed with the original image to paint the texture on top of the original. Adjust alpha and the mix factor to control how much the new texture overlays the old.

Hint. When painting the new texture, it helps to have the UV maps for the original objects in the scene, it is recommended to keep those UV texture outlines around even, when shooting is done.

---

## Lens Distortion

Use this node to simulate distortions that real camera lenses produce.

### Inputs

#### Image

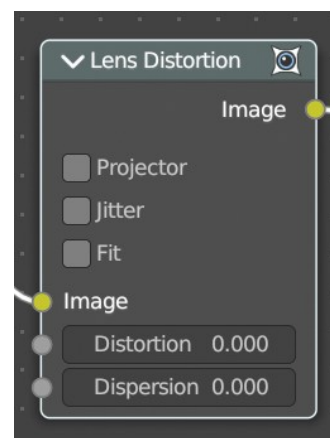

Standard image input.

#### Distortion

This creates a bulging or pinching effect from the center of the image.

#### Dispersion

This simulates chromatic aberrations, where different wavelengths of light refract slightly differently, creating a rainbow colored fringe.

## Properties

### **Projector**

Enable or disable slider projection mode. When on, distortion is only applied horizontally. Disables Jitter and Fit.

### **Jitter**

Adds jitter to the distortion. Faster, but noisier.

### **Fit**

Scales image so black areas are not visible. Only works for positive distortion.

## Outputs

### **Image**

Standard image output.

## Movie Distortion

In the real world, all camera lenses produce some or the other sort of lens distortion. But, whatever we render has got no distortion. So, this node helps in removing distortion from movies or adding distortion to render to make our render blend in with the movie clip.

Usually, it is used while motion tracking.

## Distortion vs Undistortion

Although, both, distortion of render and undistortion of movie clip are possible, and produce similar results, there is a difference between these two methods.

There are two kinds of lens distortion possible and, in simple terms, they can be said as:

When the movie clip is bulging out.

When the movie clip is bulging in.

For the first case, it is recommended to distort the render and leave the movie clip as it is, because, undistorting the movie clip will require extra pixel information, which is not available to Blender. Similarly, in the second case, it is recommended to undistort the movie clip and leave the render as it is, because, distorting the render will require those extra unavailable pixels. Doing the wrong method in the wrong case can create weird results around the edges, such as in the image shown.

## Calculating Distortion

Before using this node, one has to calculate the lens distortion of the clip. This can be done by adjusting K1, K2 and K3 values in Movie Clip Editor > Properties ? Lens. For more information on how to edit those values, check this out.

## Inputs

### *Image*

Standard image input.

## Properties

### *Movie Clip*

Used to select the movie clip whose distortion is to be used. This can be useful if more than one movie clips are present, each having a different distortion setting. For controls see Data-Block Menu.

### *Distortion Method*

#### **Undistort**

Used to undistort the image received, and is usually used for the raw distorted movie clip.

#### **Distort**

Used to distort the image received, and is usually used for rendered images.

## Outputs

### *Image*

Standard image output.

---

## Add menu - Utilities

Here you find nodes that are used as utilities.

## Map Range

This node allows to convert (map) an input value range into a destination range. By default, values outside the specified input range will be proportionally mapped as well. This node is similar to Map Value node but provides a more intuitive way to specify the desired output range.

### Usage

One important use case is to easily map the original range of the Z-depth channel to a more usable range (i.e: 0.0 - 1.0) for use as a matte for colorization or filtering operations.

### Inputs

#### Value

Standard value input.

#### From Min/Max

Start/End of the input value range.

#### To Min/Max

Start/End of the destination range.

### Properties

#### Clamp

Clamps values to Min/Max of the destination range.

### Outputs

#### Value

Standard value output.

---

## Map Value

Map Value node is used to scale, offset and clamp values.

### Inputs

#### Value

Standard Value input. (Value refers to each vector in the set.)

## Properties

### Offset

Factor added to the input value.

### Size

Scales (multiply) the input value.

### Use Minimum, Maximum

Enable this to activate their related operation.

### Min, Max

Defines a range between minimum and maximum to clamp the input value to.

## Outputs

### Value

Standard value output.

---

## Math

The Math Node performs math operations.

## Inputs

### Value

First numerical value. The trigonometric functions accept values in radians.

### Value

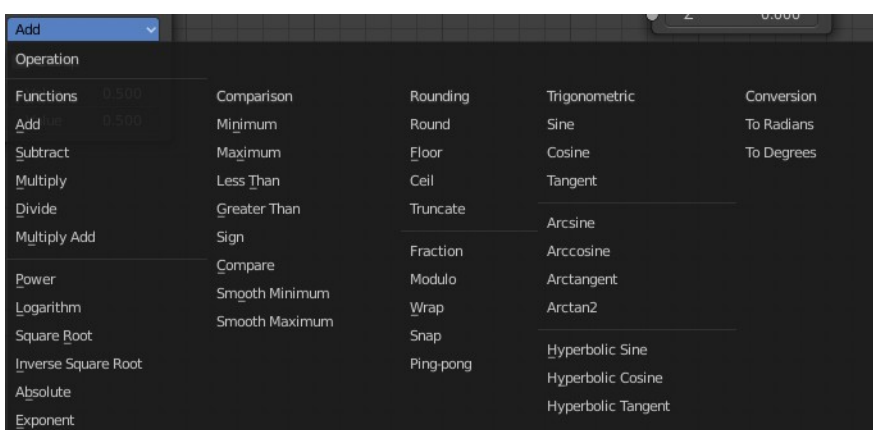

Second numerical value. This value is not used in functions that accept only one parameter like the trigonometric functions, Round and Absolute.

## Properties

### Operation

Here you can choose what mathematical operation to perform.

## ***Clamp***

Limits the output to the range (0 to 1). See clamp.

## **Outputs**

### ***Value***

Numerical value output.

---

## **Normalize**

Find the minimum and maximum values of a single channel. Then map the values to a range of 0 and 1.

## **Inputs**

### ***Value***

Standard value input.

## **Outputs**

### ***Value***

Standard value output.

---

## **Levels**

The Levels Node read the inputs color channels and outputs analytical values.

## **Inputs**

### ***Image***

The image input.

## **Properties**

### ***Channel***

The channels. C (Combined RGB), R (Red), G (Green), B (Blue), L (Luminance)

## Outputs

1D values based on the levels of an image.

### **Mean**

The mean is the average value of all image pixels in specified channel (combined, red, green, blue, luminance). It tells you how dark or bright the image is and can be used as such for setups that depend on how is input “bright” or “dark”.

### **Std Dev (Standard deviation)**

How much those pixel values differ from the mean. A low standard deviation indicates that the pixel values tend to be very close to the mean. A high standard deviation indicates that the values are spread out over a large range of values.

The visualization of such data is just a gray rectangle.

---

## Split

Allows to combine two images horizontally or vertically

### Inputs

#### **Image**

The first image.

#### **Image**

The second image.

### Properties

#### **Axis**

If to split the image horizontally or vertically.

#### **Factor**

How much percent the first image or the second image is visible.

### Outputs

#### **Image**

Image output.

## Switch

The Switch node is akin to a boolean, where you can use a toggle to choose what is shown with on or off.

## Properties

### Switch

The toggle that turns the switch on or off resulting in the final output being whatever is in the on or off input.

## Inputs

### Off

The image that is shown when the toggle is off.

### On

The image that is shown when the toggle is on.

### Image

Standard RGB image output.

## Switch View

The Switch View node combines the views (left and right) into a single Stereo 3D output. This can be useful if for example, you need to treat the view as separate images by combining each of the views.

## Inputs

### Left

Left-eye image input.

### Right

Right-eye image input.

## Outputs

### Image

Stereo 3D image output.

## Add menu - Vector

Here you find mainly nodes for vector data manipulation.

### Combine XYZ

Same as with Combine RGB node. It combines color values. But instead combining rgb values, which are in the range of 0 to 255, it uses values in the range from 0 to 1.

#### Input

##### *X Y and Z*

X, Y and Z values.

#### Output

##### *Color*

Color output.

### Separate XYZ

Same as with Separate RGB node. It separates color values. But instead separating rgb values, which are in the range of 0 to 255, it uses a vector with the values in the range from 0 to 1.

#### Input

##### *Vector*

The Input vector.

#### Output

##### *X, Y and Z*

The output vectors for X, Y and Z

## Normal

The Normal node generates a normal vector and a dot product.

### Inputs

#### *Normal*

Normal vector input.

### Properties

#### *Normal Direction*

To manually set a fixed normal direction vector. LMB click and drag on the sphere to set the direction of the normal. Holding Ctrl while dragging snaps to 45 degree rotation increments.

### Outputs

#### *Normal*

Normal vector output.

#### *Dot*

Dot product output. The dot product is a scalar value.

If two normals are pointing in the same direction the dot product is 1.

If they are perpendicular the dot product is zero (0).

If they are anti parallel (facing directly away from each other) the dot product is -1.

---

## Vector Curves

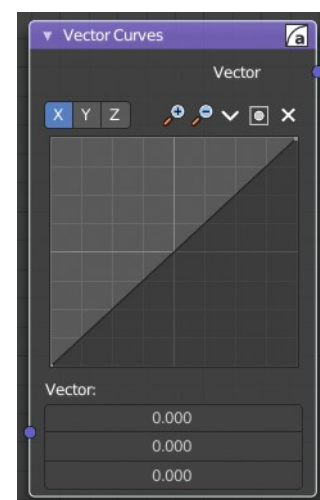

The Vector Curves node maps an input vector components to a curve.

### Inputs

In the shader context the node also has an additional Factor property.

#### *Vector*

Standard vector input.

## Properties

### Channel

#### Channel buttons

X, Y, Z. Clicking on one of the channels displays the curve for each.

#### Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

#### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

#### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

#### Navigation elements

The navigation elements at the top are described from left to right.

#### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

#### Tools

Tools is a menu where you can find some curve related tools.

#### Reset View

Resets the curve windows zoom.

#### Vector Handle

Set handle type to Vector.

#### Auto Handle

Set handle type to Auto.

#### Auto Clamped Handle

Set handle type to Auto Clamped.

#### Extend horizontal

Extends the curve before the first curve point and behind the last curve point horizontally.

### ***Extend extrapolated***

Extends the curve before the first curve point and behind the last curve point extrapolated.

### ***Reset Curve***

Resets the curve to the initial shape.

### **Use Clipping**

Clipping options. Set up clipping for the stroke.

### **Delete Points**

Deletes selected curve points.

## **Outputs**

### ***Vector***

Standard vector output.

---

# 10.1.16 Editors - Compositor Editor - Header - Add Menu - Layout

## Table of content

- Add menu - Layout..... 1
- Frame..... 1
  - Adding and Removing Nodes..... 1
  - Resizing Frame..... 2
  - Label and Color..... 2
- Reroute..... 2
  - Move, Rotate, Scale..... 2
- Switch..... 2

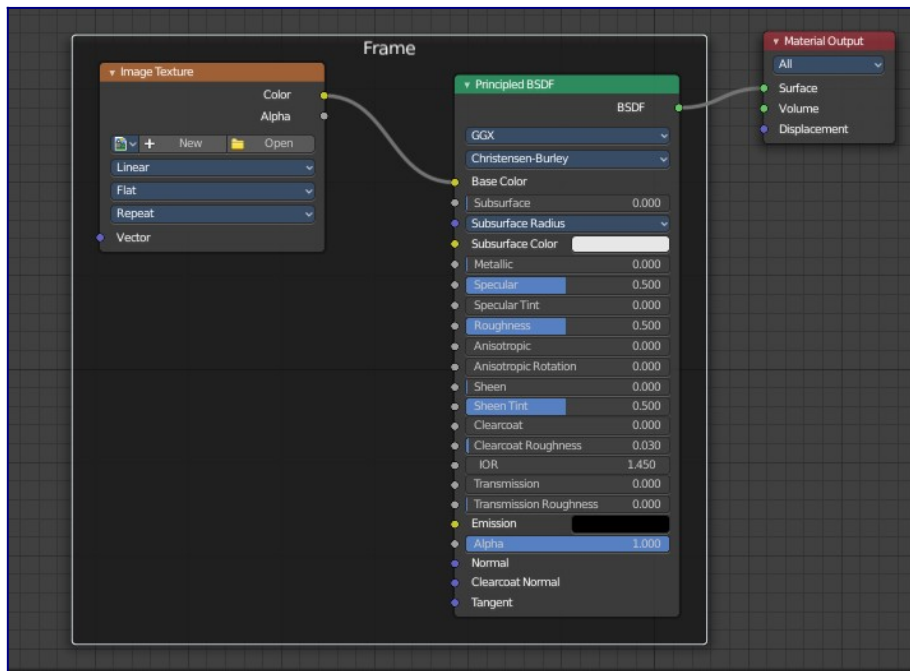

## Add menu - Layout

These nodes helps organizing the node layout.

## Frame

The Frame node allows you to drop nodes into a frame. This frame can be dragged around as a whole.

## Adding and Removing Nodes

Nodes can be added by simply dropping them onto the frame. Or with the Join in New Frame menu item in the Node menu.

To remove a node from the frame use Remove from Frame.

## Resizing Frame

When the Frame node is first placed in the node editor workspace you can resize it by dragging one of the edges.

Once a node is placed in the Frame, the Frame shrinks around the nodes. You cannot resize it anymore with handlers. Just by dragging around the nodes inside of the frame.

This behavior can be changed by disabling the *Shrink* option in the Item tab in the Properties panel. Then you can resize the frame again by dragging the edges.

## Label and Color

You can change the name of a frame in the Node panel. And you can give it a custom color by checking the Color checkbox and adjusting the color then.

## Reroute

Adds a reroute point that can be used to reroute connections. It allows just one input, but allows multiple output connections.

To quickly add a Reroute node into an existing connection, hold Shift and Right Mouse and drag the mouse to cut through the link. A new reroute node will be added.

When you exceed a specific angle amount between the reroute nodes, then the node connection becomes a sharp corner, and not longer a Bezier like soft curve.

## Move, Rotate, Scale

A normal node has a handler. The reroute dot not. You can't simply move it around with the mouse by clicking at the top area. It has none. You have to use the move, rotate and scale commands. They can be found in the View menu.

## Switch

Allows you to switch between two images.

# 10.1.17 Editors - Compositor Editor - Header - Add Menu - Group

## Table of content

Add menu - Group.....	1
Make Group.....	1
Insert into Group.....	2
Ungroup.....	2
Toggle Edit Group.....	3
Group Input.....	3
Group Output.....	3
List of Node Groups.....	3

## Add menu - Group

Node groups allows you to group different nodes of the material together to reduce the visual complexity. A node group acts like any other node.

Material node groups should not include Input nodes, like Image nodes, or Output nodes.

If you include a source node in your group, you will end up having the source node appearing twice: once inside the group, and once outside the group in the new material node tree.

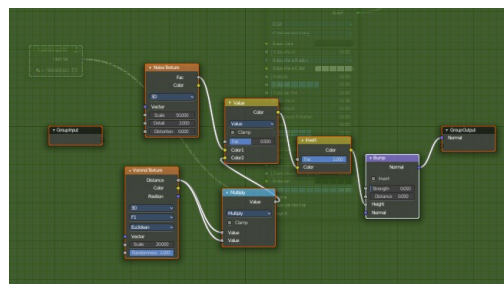

If you include an output node in the group, there will not be an output socket available from the group!

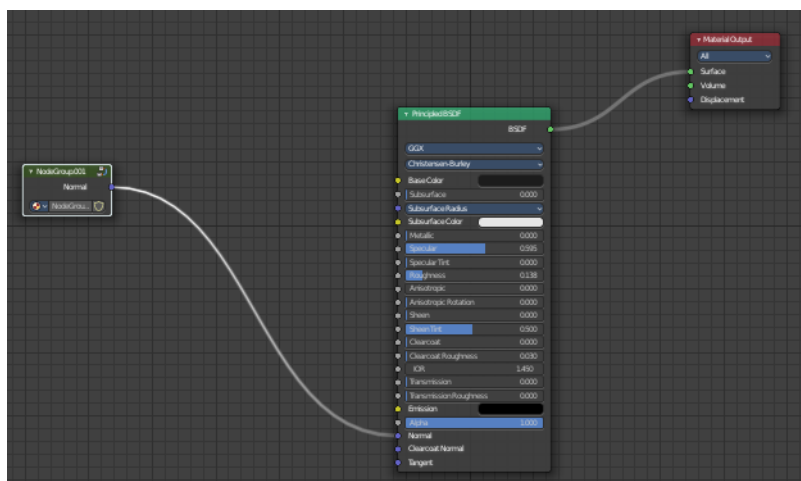

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item in the sidebar in the Relations tab in the Group panel. That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Insert into Group

Allows you to insert a node into a node group.

Select the node, hold down Shift, then select the node group so that both are selected. Then perform the operator.

## Ungroup

Ungroups an existing group. You need to be outside of the group edit mode.

## Toggle Edit Group

Enters a node group for editing. Or when you are in a node group, exits the node group editing.

---

## Group Input

Adds a Group Input node. This node is usually already part of a new created group.

## Group Output

Adds a Group Output node. This node is usually already part of a new created group.

---

## List of Node Groups

Once you have created a node group it will also show up in the group menu. Groups can be inserted to other materials too.

## Node menu

This menu contains further node functionality.

### Move

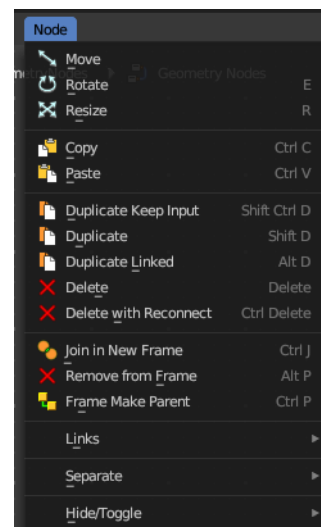

Moves the selected nodes.

### Rotate

You can't rotate single nodes, obviously. But when you have more than one selected then you can rotate them around their center point.

### Resize

You can't resize single nodes, obviously. But when you have more than one selected then you can scale them around their center point.

### Copy

Copies the selected node(s).

### Paste

Pastes the selected node(s).

### Duplicate Keep Input

This works at nodes that have a connected input. Duplicating will keep the input connections established in the duplicated node. The output connections will be removed.

### Duplicate

Duplicates the selected node(s). All connections will be removed in the duplicated node.

### Duplicate Linked

Duplicates the selected node(s), but not their node trees.

### Delete

Deletes the selected node(s).

## Delete with Reconnect

Deletes the selected node(s). When this node is in the middle of a connection, then the connections will be reconnected.

---

## Join new Frame

Frame node functionality. Adds the selected node to a frame.

## Remove from Frame

Frame node functionality. Removes the selected node from a frame.

## Frame Make Parent

Frame node functionality. Adds the selected node to a frame.

---

## Links

### Make Links

Tries to connect nodes where it makes sense. For example, the BSDF output of a Principled shader with the Surface input of the Material Output node.

### Make and Replace Links

Same as Make Links. But it will replace existing links.

### Detach Links

Removes all connections from the selected node, but tries to reconnect the remaining nodes.

### Detach Links Move

Removes all connections from the selected node by dragging.

### Mute Links

Mute links with the mouse.

---

## Separate

Node group functionality. You need to be in edit group mode.

## Copy

Copies the selected node, and pastes a copy of it outside of the node group. The node group remains unchanged.

## Move

Moves the selected to outside of the node group, and removes it from the node group.

## Show/Hide

Here you find hide options to make the display of nodes more compact.

Demonstration happens at an image node.

## Hide

Hides everything but input and output dots. To view the full node again perform the operator again. It's a toggle. Or click at the triangle left besides the node name.

## Toggle Node Mute

Deactivates the node.

## Toggle Node Preview

This is a compositor feature for the preview image. It does not belong here, but shares the same menu. It shows or hides the preview image.

## Toggle hidden node sockets

Toggles away the unused node sockets. In this case the vector input node socket and the alpha output node socket will be hidden.

## Toggle Node Options

Hides away the properties.

## **Collapse and Hide Unused Sockets**

Like Hide. Hides everything but the node sockets. But it also hides the unused node sockets.

## 10.1.1 Editors - Compositor - Header - Tools and Options

### Table of content

Options.....	1
Use Nodes.....	1
Pin (pin icon).....	1
Parent Node Tree.....	1
Backdrop.....	1
Background Image Move.....	2
Background Image Zoom in and out.....	2
Background Image Fit.....	2
Display channels.....	2
Snap.....	2
Node Editor Overlays.....	2
Show Overlays.....	2
Wire Colors.....	2
Reroute Auto Labels.....	2
Context Path.....	3
Annotation.....	3
Previews.....	3
Timings.....	3

## Options

At the right side of the header you will see the options.

### Use Nodes

The Use Nodes setting is mostly a legacy setting and should always be checked for materials.

### Pin (pin icon)

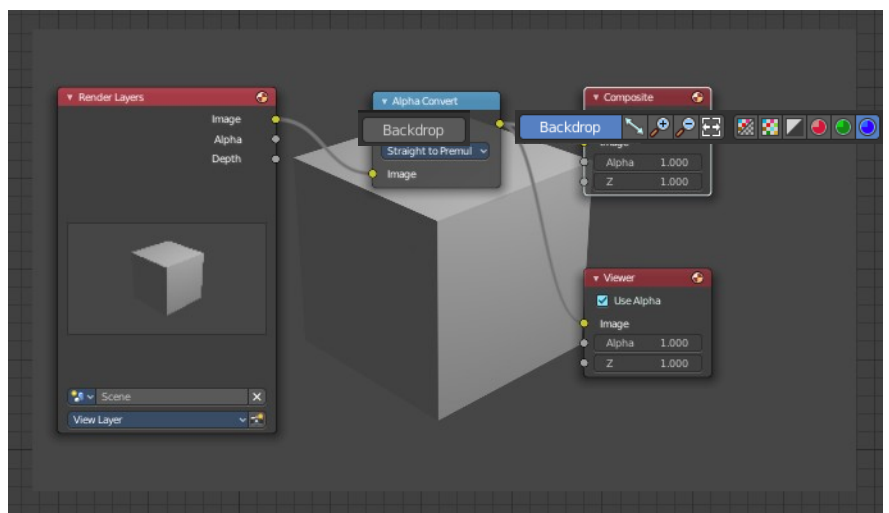

The pin button will keep the current material selection fixed. When a material is pinned, it will remain visible in the shader editor even when another object or material is selected elsewhere.

### Parent Node Tree

Grouping nodes can simplify a node tree by allowing instancing and hiding parts of the tree. Both material and composite nodes can be grouped. This button becomes active when you work with such grouped nodes, and you are in a child group. it allows you to switch to the parent group.

### Backdrop

By adding a viewer node you can display the compositing result as a background in the viewport. Here you can activate it, and adjust the look. It

also contains controls to adjust the zoom and position of the backdrop image.

## Background Image Move

Move the background image. A click confirms. Watch the hotkey.

## Background Image Zoom in and out

Zoom in and out the Background image.

## Background Image Fit

Fits the background image into the view.

## Display channels

What channels to display in the backdrop.

## Snap

Activates snapping. When the tool is activated, then you will also reveal the snap settings where you can choose different snap methods.

## Node Editor Overlays

Activates the node editor overlays. When the tool is activated, then you will also overlays settings in the editor. The drop down arrow to the right shows different overlay types.

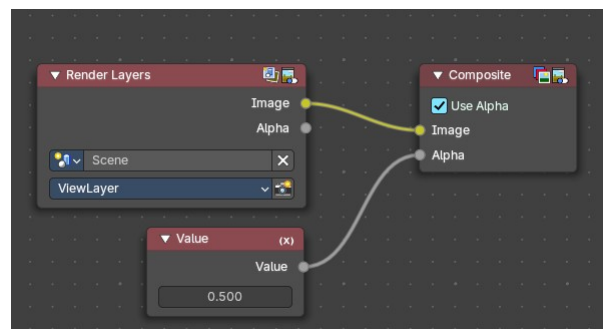

## Show Overlays

Show or hide the overlays.

## Wire Colors

Color node links based on their connected sockets.

**Example:** The color Image socket is yellow that makes a yellow line, and the Value socket is grey that makes a grey line.

## Reroute Auto Labels

Label reroute nodes based on the label of connected reroute nodes.

**Example:** The first reroute label to the right has concurring reroute labels

down the line. If you toggle this off, the concurring reroute labels down the line won't contain labels.

## Context Path

Display breadcrumbs for the editor's context.

## Annotation

Shows annotations for this editor view that have been drawn by the annotation tool.

## Previews

Shows each nodes preview thumbnails if the node has previews toggled on.

## Timings

Shows a timing box above each node to indicate the evaluation time of it.. This option is only available for compositing and geometry nodes.

# 10.1.2 Editors - Compositor - Header - Quick Menu

## Table of content

- Quick Menu..... 1
  - Adding an operator to the Quick menu..... 1
  - Adding a menu to the Quick menu..... 1
  - Order..... 2
  - Removing an operator from the Quick menu..... 2
  - Context and mode dependent content..... 2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 10.1.3 Editors - Compositor Editor - Header - View Menu

### Table of content

View Menu.....	1
Toolbar.....	1
Sidebar.....	2
Annotations (Legacy).....	2
Draw Annotation.....	2
Draw Line Annotation.....	2
Draw Polyline Annotation.....	2
Erase Annotation.....	2
Add Annotation Layer.....	2
Erase Annotation Active Keyframe.....	2
Zoom In.....	2
Zoom Out.....	2
Zoom Border.....	3
View Selected.....	3
View All.....	3

Vertical Split.....	3
Duplicate Area into New Window.....	3
Toggle Maximize Area.....	3
Toggle Full screen Area.....	4
Close Area.....	4
View Menu with Backdrop.....	4
Set Viewer Region.....	4
Clear Viewer Region.....	4

## View Menu

The View menu contains all View related tools.

The content is the same in all sub modes.

### Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

---

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet.

**Note:** *These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.*

### ***Draw Annotation***

Starts the annotation free hand draw tool in the editor.

### ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

### ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

### ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

### ***Add Annotation Layer***

Starts a new annotation layer.

### ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

---

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## View Selected

Zooms to the selection.

## View All

View all zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the editor.

# View Menu with Backdrop

When you activate the Backdrop in the header, then the View menu reveals some more functionality.

## Set Viewer Region

Allows you to define an area of the Backdrop. Then just this area gets processed.

## Clear Viewer Region

Removes the Viewer Region.

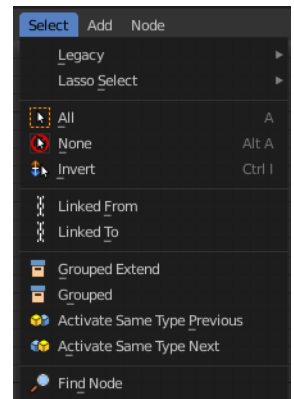

## 10.1.4 Editors - Compositor Editor - Header - Select Menu

### Table of content

Select menu.....	1
Legacy.....	1
Box select.....	1
Circle select.....	1
All.....	2
None.....	2
Inverse.....	2
Linked From.....	2
Linked To.....	2
Grouped.....	2
Grouped Extend.....	2
Activate same type previous.....	2
Activate same type next.....	2
Find Node.....	2

## Select menu

Here you will find the select functionality.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

### Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

### Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

---

### Linked From

Select the nodes that are linked from the currently selected nodes. The nodes before in the hierarchy.

### Linked To

Select the nodes that are linked to the currently selected nodes. The nodes behind in the hierarchy.

---

### Grouped

Select grouped nodes.

### Grouped Extend

Select grouped nodes, and extend from the current selection.

### Activate same type previous

Activate same node type before the current selection, step by step.

### Activate same type next

Activate same node type after the current selection, step by step.

---

## Find Node

This button will open a search dialog where you can search for node types and select them in the current hierarchy.

## 10.1.5 Editors - Compositor Editor - Header - Add Menu

### Table of content

Add menu..... 1  
 Add menu – Search..... 1

### Add menu

Here you will find all the nodes that you need for compositing. A click at one of the items will create the node in the workspace at the mouse position right under the menu. It is already selected, and you can drag it around.

Note that the content may differ, dependent of which renderer you use. Some nodes just works with specific renderers. They will be marked as such.

Note also that some shaders are real resource hogs, and can slow down rendering times significantly.

### Add menu – Search...

You can click on the search operator to bring up a Pop-up to search the Add menu where you can find specific node types in all categories.

To use, click on the operator or alternatively press spacebar or type in the term that you want to find.

**Note:** You can call the add menu then immediately start searching at any time.

## Add menu - Input

The Input menu contains Input node types.

The content is the same for all three sub modes. Note that you need to tick Use Nodes to activate the menu items when you are in Line Style sub mode.

## Constant – Sub Menu

The Constant Sub-menu contains Constant node types such as Value and RGB.

### RGB

Set a color.

#### Properties

The RGB node uses the color picker widget.

#### Outputs

##### Color / RGBA

A single RGBA color value.

### Value

The Value Node is a simple node to input numerical values to other nodes in the tree.

#### Properties

##### Default Value

Type in a single numerical value (floating point).

#### Outputs

##### Value

The value set in the options.

## Bokeh Image

The Bokeh Image node generates a special input image for use with the Bokeh Blur filter node.

The Bokeh Image node is designed to create a reference image which simulates optical parameters such as aperture shape and lens distortions which have important impacts on bokeh in real cameras.

### Properties

The first three settings simulate the aperture of the camera.

#### *Flaps*

Sets an integer number of blades for the cameras iris diaphragm.

#### *Angle*

Gives these blades an angular offset relative to the image plane.

#### *Rounding*

Sets the curvature of the blades with (0 to 1) from straight to bringing them to a perfect circle.

#### *Catadioptric*

Provides a type of distortion found in mirror lenses and some telescopes. This can be useful to produce a visual complex bokeh.

#### *Lens Shift*

Introduces chromatic aberration into the blur such as would be caused by a tilt-shift lens.

### Outputs

#### *Image*

The generated bokeh image.

## Image

Image input. For further image settings see also the Properties Panel in the Item Tab in the Sidebar.

## Properties

### *Image Prop*

This property contains the list of loaded images. When no image is loaded then it displays the New and Open Buttons. When an image exists then it displays the name of the currently selected image.

From left to right ...

### List of images in the scene

This is a list of the images in the scene. This list allows you to switch to other images.

### Search form

Search for specific images.

### Image Edit Box

Read the name of the currently selected image. And you can rename the image here too.

### Number of Fake Users

In case this file has a fake user assigned, then this number displays the number of fake users.

### Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

### Open

Open a new image.

### Remove

Removes the image.

### New

Create a new image.

Creates a new image. You will get a dialog where you can define settings for the new image.

### **Name**

The name of the new image

### **Width**

The width of the new image.

### **Height**

The height of the new image.

### **Color**

Adjust the color of the new image. A click will call a color picker.

### **Alpha**

Check this checkbox if the new image should have an alpha channel.

### **Generated Type**

Here you can define what kind of texture you want to create.

Blank is one plain color.

UV Grid is a checker texture in black and white.

Color Grid is a colored checker texture.

### **32 Bit Float**

Check this checkbox if the image should be in 32 Bit floating point bit depth per channel. Else it is in 8 bit per channel.

### **Duplicate**

Not supported here.

### **Unlink Datablock**

This deletes the selected image. Unfortunately not immediately. You need to save the scene and to reload it.

And you need to make sure that it is not linked to anything else. A mesh or a fake user for example. Have a look if there is a number besides the F button. When this is the case then the image has still a user, and so still loads with loading the scene.

### **Fake User**

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

### **Open Image**

Opens the file browser to load an image.

## Unpack

Unpack packed files to a directory.

## User

The number of users that uses this data. Data with a user number of 0 will be removed with closing Bforartists.

---

## Source

What kind of image it is. The terms should be self explaining.

## Color Space

What color space is used for the image.

## Alpha

What alpha mode is used for the image.

---

## Outputs

### Image

Standard image output.

### Alpha

Separate Alpha value.

### Depth

Z depth layer. This output just shows with specific image types.

Note. When a multi-layer file format, like EXR, is loaded, each layer is made available as a socket.

---

## Mask

The Mask node can be used to select a Mask data. This node can be used with other nodes, for example to Invert, Multiply or Mix, or used as a factor input.

Masks can be created in the Image and Movie Clip editors, by changing the mode to Mask in the header. So you first need to create one in one of those editors.

## Properties

### Masks

The available mask data. If the label is left blank, the mask name will be set.

### Feather

Use or ignore feather points defined for splines see Mask Feathers for more details.

### Size Source

Scene Size will give an image the size of the render resolution for the scene, scaling along when rendering with different resolutions. Fixed gives a fixed size in pixels. Fixed/Scene gives a size in pixels that still scales along when changing the render resolution percentage in the scene.

### Motion Blur

For animated masks, creating a motion blurred mask from the surrounding frames, with a given number of samples (higher gives better quality), and a camera shutter time in seconds.

### Samples

The number of motion blur samples.

### Shutter

Expose for motion blur as a factor of Frames per Seconds.

## Outputs

### Mask

The black-and-white output of the mask.

## Movie Clip

This node is a special node that uses some of the values taken from footage cameras and trackings and links them to the output. It is possible to load image sequences, but only Image and Alpha values

will be available, because the other outputs will not have any values associated with them. When a tracked clip is chosen, Blender will fulfill the outputs using internal values taken from the tracking. So the controls for start and end frames will be defined at the Movie Clip editor.

## Properties

### *Movie Clip*

Select the movie clip.

Once loaded you will see a preview image of the movie. Scrolling through the timeline will display the corresponding frame in this preview image.

### **File browser**

Choose an already loaded video.

### **Name**

Read and edit the name of the video.

### **Fake User**

Assign a fake user to this video. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### **Load File**

Load a new video.

### **Delete File**

Delete this video.

## Outputs

### **Image**

Outputs the entire image at the specified color space.

### **Alpha**

The alpha value taken from the movie or image.

### **Offset X**

The X offset value from the footage camera or tracking.

### **Offset Y**

The Y offset value from the footage camera or tracking.

## Scale

The scale of the image taken from the footage camera or tracking.

## Angle

The lens angle taken from the footage camera or tracking.

---

## Texture

The Texture node allows you to use 3D textures in the Compositor. They can be created in the Texture tab in the Properties editor.

### Inputs

#### **Offset**

A vector (XYZ) transforming the origin of the texture.

#### **Scale**

A vector (XYZ) to scale the texture.

### Properties

#### **Texture**

The texture could be selected from a list of textures available in the current blend-file or link in textures. The textures themselves could not be edited in this note, but in the Texture panel.

### Outputs

#### **Value**

Gray-scale color values.

#### **Color**

Color values.

## Scene – Sub Menu

The Scene Sub-menu contains scene node types such as Render Layers and Scene Time.

## Render Layers

Inputs the available render layers.

This node is the starting place for getting a picture of your scene into the compositing node map.

The input happens through the properties.

### Properties

#### Scene

Usually you don't need to select anything here when you work with just one Scene file. But in Bforartists you can work with more than one scene in a blend file. The scene information taken is the raw footage (pre-compositing and pre-sequencing).

Hint. To use composited footage from another scene, it has to be rendered into a multi-layer frame set (e.g. OpenEXR) as an intermediate file store and then imported with Image input node again.

#### Render layer

A list of available Render Layers. The render button allows you to re-render the active scene with one click.

### Outputs

#### Image

The rendered image.

#### Alpha

The Alpha channel.

### Render passes sockets

Depending on the Render passes that are enabled, other sockets are available. See Cycles and Eevee render passes. The Workbench renderer does not have extra render passes sockets. It just provides Image and Alpha output.

## Depth

By default the Z depth pass is enabled.

---

## Scene time

Outputs the current scene time in seconds or in frames.

The Frame output is a float value to make subframe rendering for motion blur possible.

## Outputs

### Seconds

Output in seconds.

### Frame

Output in Frames.

---

## Time Curve

The Time node generates a factor value that changes according to the curve as time progresses through the Timeline. The range goes from 0.0 to 1.0. The default is a linear line from 0.0 to 1.0. But the curve can be adjusted.

## Properties

### Navigation elements

The navigation elements for the curve. They are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Extend Horizontal**

Extends the curve horizontally before the first point and behind the last point.

### **Extend Extrapolated**

Extends the curve extrapolated before the first point and behind the last point.

### **Reset Curve**

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke.

---

## Curve window

Tweak and adjust the falloff curve by clicking at a curve point and dragging it around.

Double click adds a new point.

Holding down ctrl activates temporary snapping.

Holding down shift enables slower movement, which allows more accurate setting.

### **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### **Adding Points**

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***X and Y value edit box***

The X and Y value for the currently selected curve point.

### ***Start / End***

Start frame and End frame of the range of time specifying the values the output should last. This range becomes the X axis of the graph. The time input could be reversed by specifying a start frame greater than the end frame.

### ***Delete Points***

Deletes selected curve points.

---

## ***Outputs***

### **Factor**

A speed of time factor (from 0.00 to 1.00) relative to the frame rate defined in the Render Dimensions Panel. The factor changes according to the defined curve.

Hint. By using curves it is possible that the Time node may output a number larger than one or less than zero. To be safe, you should use the Min/Max clamping function of the Map Value node to limit output.

---

## Add menu - Output

Here you will find nodes to output the result.

### Composite

The Composite node is where the actual output from the Compositor is connected to the renderer. This node is updated after each render, but also reflects changes in the node tree (provided at least one finished input node is connected).

### Inputs

Connecting a node to the Composite node will output the result of the prior tree of that node to the Compositor.

### Image

RGB image. The default is black, so leaving this node unconnected will result in a blank image.

### Alpha

Alpha channel.

### Z

Z depth.

### Properties

#### Use Alpha

Used alpha channel, colors are treated alpha premultiplied. If disabled, alpha channel gets set to 1, and colors are treated alpha straight, i.e. color channels does not change.

Note that if multiple Composite nodes are added, only the active one will be used.

### Split Viewer

The Split Viewer node takes two images and displays them side-by-side as backdrop or as a Viewer Node output. This allows you to toy around with values in direct comparison to the original. Or to compare frames with each other.

## Inputs

### *Image*

The first image input

### *Image*

The second image input

## Properties

### *Axis*

X tiles the images horizontal. Y tiles the images vertical.

### *Factor*

Percentage factor setting the space distribution between the two images.

## Viewer

Displays the output as a backdrop in the viewport or in the Image editor. This allows you to inspect the outputs everywhere in the node hierarchy.

You can have more than one viewer nodes in the node editor. Just the output of the active Viewer node will be displayed. Click at a node to set it active.

When a Viewer node is selected, then the backdrop shows a widget cage that allows you to resize the backdrop image by its handlers.

## Input

### *Image*

RGB image. The default is black, so leaving this node unconnected will result in a blank image.

### *Alpha*

Alpha channel.

### *Z*

Z depth.

## Properties

### *Use Alpha*

Used alpha channel, colors are treated alpha premultiplied. If disabled, alpha channel gets set to 1, and colors

are treated alpha straight, i.e. color channels does not change.

## File Output

This node writes out an image as part of a frame set sequence. This happens for each specified frame range and specified to the entered filename.

This node can be used as a way to automatically save the image after a render; In addition, since this node can be hooked in anywhere in the node tree, it can also save intermediate images automatically.

## Inputs

### Image

The image(s) will be saved on rendering, writing to the current frame. An entire sequence of images will be saved, when an animation is rendered.

Note. To support subsequent arrangement and layering of images, the node can supply a Z-depth map. However, please note that only the OpenEXR image formats save the Z information.

## Properties

### Base Path

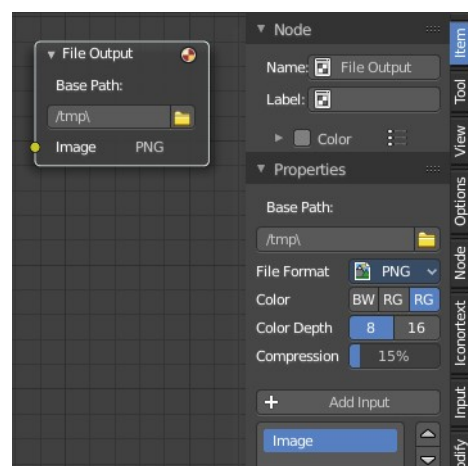

Unlike the render output file path, this node uses a base directory and an image name, by default the output path is composed of: {base path}/{file name}{frame number}.{extension}.

Besides being split into two settings, in all other respects, this setting is treated the same as the render output path.

### File Format label

Shows the selected File Format.

You can find further export options in the sidebar in the Item tab in the Properties panel.

## Add menu - Color

Here you find color related nodes.

### Adjust – Sub Menu

The Adjust sub menu where you can find nodes that adjust color.

### Bright/Contrast

Adjust the brightness and contrast.

#### Inputs

#### Color

Standard input.

#### Brightness

An additive-type factor by which to increase the overall brightness of the image. Use a negative number to darken an image.

#### Contrast

A scaling type factor by which to make brighter pixels brighter, but keeping the darker pixels dark. Higher values make details stand out. Use a negative number to decrease the overall contrast in the image.

## Properties

### Convert Premultiplied

Converts foreground image to premultiplied alpha format.

The Alpha Over node is designed to work with premultiplied alpha color format. Use Convert Premul when you know that your image has straight alpha color values, to perform the correct over operation. Result will be still premultiplied alpha.

## Outputs

### Color

Standard output.

**Note:** It is possible that this node will put out a value set that has values beyond the normal range, i.e. values greater than one and less than zero. If you will be using the output to mix with other images in the normal range, you should clamp the values using the Map Value node (with the Min and Max enabled), or put through a Color Ramp node (with all normal defaults).

## Color Balance

The Color Balance node can adjust the color and values of an image.

### Inputs

#### Factor

Controls the amount of influence the node exerts on the output image.

#### Image

Standard image input.

## Properties

### Correction Formula

Two different correction formulas could be selected.

### Lift/Gamma/Gain

#### Lift

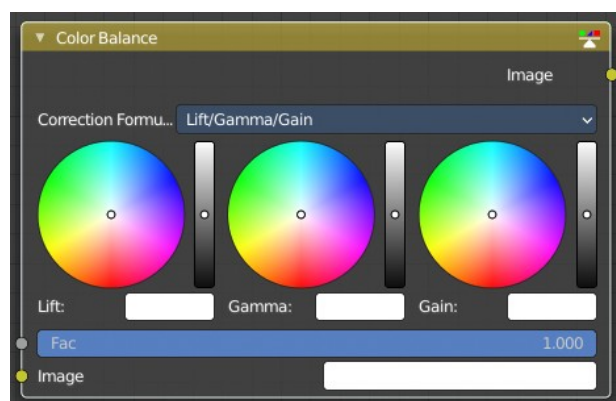

Increases the value of dark colors.

#### Gamma

Will adjust mid tones.

#### Gain

Adjusts highlights.

## **Offset/Power/Slope (ASC-CDL)**

### **Offset**

Summand. (Adjusts the overall brightness.)

### **Basis**

Additional offset, allows to specify a negative Offset value.

### **Power**

Over-all exponent. (Adjusts the mid tones.)

### **Slope**

Multiplier. (Adjusts the highlights.)

## **Outputs**

### **Color**

The output image.

## **Advanced**

### **The Offset/Power/Slope Formula**

$$\text{out} = (i \times s + o)^p$$

where:

out: The color graded pixel code value.

i: The input pixel code value (0 to 1) (black to white).

s: Slope (any number 0 or greater, nominal value is 1.0).

o: Offset (any number, the nominal value is 0).

p: Power (any number greater than 0, nominal value is 1.0).

## **Color Correction**

With the Color Correction node you can adjust the color of an image. Separated in several tonal ranges (highlights, mid tones and shadows) and only affect the necessary RGB channels.

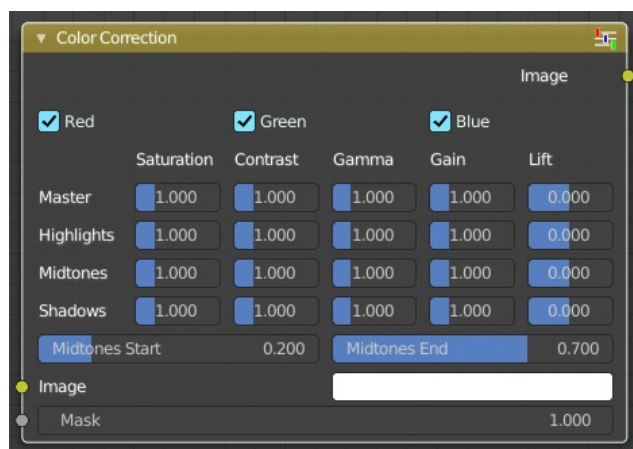

### **Input**

### **Image**

Image Input.

### **Mask**

Input a mask to cover parts of the image so that they are affected.

## ***Properties***

### **Red, Green, Blue**

Specifies which RGB channels will be affected by correction.

### **Correction Tools (Columns)**

#### ***Saturation***

Adjusts the image's saturation.

#### ***Contrast***

Adjust image contrast.

#### ***Gamma***

Exponential gamma correction, affecting the mid tones of the image. (Works like Power in the Color Balance node.)

#### ***Gain***

Multiplier, stronger influence on the highlights. (Works like Slope in the Color Balance node.)

#### ***Lift***

This value (can be negative) will be added (+), linear lightens or darkens the image. (Works like Offset in the Color Balance node.)

### **Tonal Ranges (Rows)**

#### ***Master***

These sliders affect the entire tonal range.

#### ***Highlights***

These sliders only affect the highlights.

#### ***Mid tones***

These sliders only affect the mid tones.

#### ***Shadows***

Affects the dark tones of an image often affecting the shadows.

### **Mid tones Start, Mid tones End**

Defines the start and the end of mid tones range, i.e. values where the whole tonal range is divided into the highlights, mid tones and shadows (there is also a smooth transition between the ranges of width 0.2 units).

## ***Outputs***

### **Color**

The image output.

---

## Exposure

The Exposure Node node allows you to make areas of an image brighter or dimmer.

### Inputs

#### Image

Standard image input.

#### Exposure

The scalar factor to adjust the exposure of the image.

### Outputs

#### Image

Standard image output.

## Gamma

Use this node to apply a gamma correction.

### Inputs

#### Image

Image input.

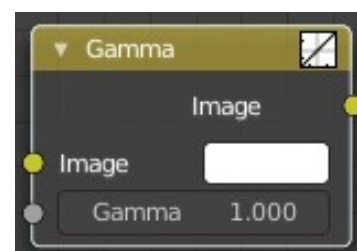

#### Gamma

An exponential brightness factor.

### Outputs

#### Image

Image output.

## Hue Correct

With the Hue Correct Node you can adjust the Hue, Saturation, and Value of an image with an input curve.

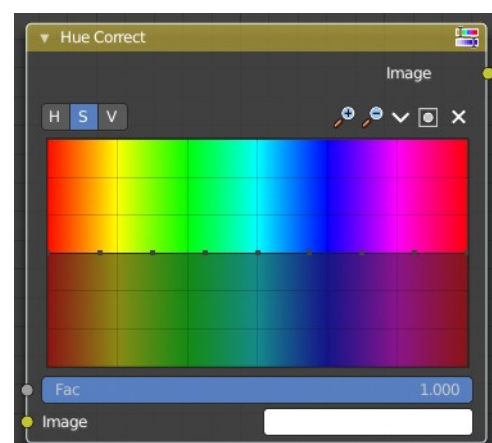

### Inputs

#### Factor

Controls the amount of influence the node exerts on the output image.

#### Image

Standard image input.

## Properties

### Level

H (Hue), S (Saturation), V (Value). Choose which curve you want to modify.

### Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Hue/Saturation/Value

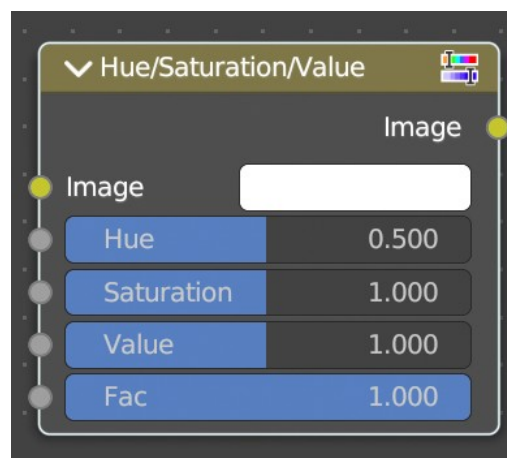

The Hue Saturation Node applies a color transformation in the HSV color space. Called “Hue Saturation Value” in shader and texture context.

### Inputs / Properties

The inputs also works as properties when nothing is connected.

#### Image

Plug in an image.

#### Hue

Specifies the hue rotation of the image. 360° are mapped to (0 to 1). The hue shifts of 0 (-180°) and 1 (+180°) have the same result.

#### Saturation

A saturation of 0 removes hues from the image, resulting in a gray scale image. A shift greater than 1.0 increases saturation.

#### Value

Value is the overall brightness of the image. De/Increasing values shift an image darker/lighter.

#### Factor

Controls the amount of influence the node exerts on the output image.

#### Image

Standard input.

### Outputs

#### Image

Standard output.

## Hue/Saturation Tips

Some things to keep in mind that might help you use this node better:

Hues are vice versa

A blue image, with a Hue setting at either end of the spectrum (0 or 1), is output as yellow (recall that white, minus blue, equals yellow). A yellow image, with a Hue setting at 0 or 1, is blue.

Hue and Saturation work together.

So, a Hue of 0.5 keeps the blues the same shade of blue, but Saturation can deepen or lighten the intensity of that color.

Gray & White are neutral hues

A gray image, where the RGB values are equal, has no hue. Therefore, this node can only affect it with Value. This applies to all shades of gray, from black to white; wherever the values are equal.

Changing the effect over time

The Hue and Saturation values can be animated with a Time Node or by animating the property.

## RGB Curves

The RGB Curves Node allows color corrections for each color channel and levels adjustments in the compositing context.

### Inputs

#### Factor

Controls the amount of influence the node exerts on the output image.

#### Image

Standard image input.

#### Black Level

Defines the input color that is (linear) mapped to black.

#### White level

Defines the input color that is (linear) mapped to white.

### Properties

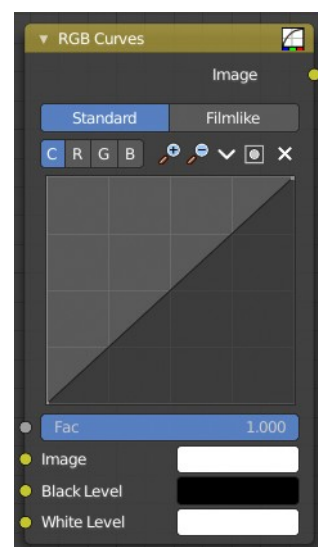

#### Tone

What tone mapping to use. Standard or Film like.

#### Curve Field

##### Channel buttons

Clicking on one of the channels displays the curve for each.

C (Combined RGB), R (Red), G (Green), B (Blue).

### Navigation elements

They are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

### Use Clipping

Clipping options. Set up clipping for the stroke.

### Tools

Tools is a menu where you can find some curve related tools.

### Reset View

Resets the curve windows zoom.

### Extend horizontal

Extends the curve before the first curve point and behind the last curve point horizontally.

### Extend extrapolated

Extends the curve before the first curve point and behind the last curve point extrapolated.

### Reset Curve

Resets the curve to the initial shape.

### Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### Curve point settings

When you have a point selected then you will reveal further settings at the bottom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

## **Outputs**

### **Color**

Standard output.

## **Tonemap**

Tone mapping is a technique used in image processing and computer graphics to map one set of colors to another in order to approximate the appearance of high dynamic range images in a medium that has a more limited dynamic range.

Tone mapping addresses the problem of strong contrast reduction from the scene values (radiance) to the displayable range, while preserving the image details and color appearance. This is important to appreciate the original scene content.

### **Inputs**

#### **Image**

Plug in the HDR image.

### **Properties**

#### **Type**

There are two methods of tone mapping. Rh Simple and R/D Photo receptor.

#### **Rh Simple**

##### **Key**

The value the average luminance is mapped to.

##### **Offset**

Normally always 1, but can be used as an extra control to alter the brightness curve.

##### **Gamma**

If not used, set to 1.

#### **R/D Photo receptor**

##### **Intensity**

A value smaller than zero darkens image. A value greater than zero makes it brighter.

## Contrast

Set to 0 to use estimate from input image.

## Adaptation

If 0, global; if 1, based on pixel intensity.

## Color Correction

If 0, same for all channels; if 1, each independent.

## Outputs

### Image

The Image output.

---

## Mix – Sub Menu

The Mix sub menu is where you can find nodes for mixing colors.

## Alpha Over

The Alpha Over node is used to layer images with an alpha channel on top of one another.

Where the foreground image pixels have an alpha greater than 0, the background image will be overlaid.

## Inputs

### Factor

Controls the amount of foreground image. A factor less than 1 will make the foreground more transparent.

### Image

Input for the background image.

### Image

Input for the foreground image.

## Properties

### Convert Premultiplied

Converts foreground image to premultiplied alpha format.

The Alpha Over node is designed to work with premultiplied alpha color format. Use Convert Premul when you

know that your image has straight alpha color values, to perform the correct over operation. Result will be still premultiplied alpha.

## Premultiply

The Premul slider allows to mix between the using premultiplied or non premultiplied alpha.

When set to 1, the foreground color values will be multiplied by alpha, i.e. premultiplied. This is equivalent to enabling the Convert Premul option. When set to 0, color values does not change.

If Premultiply is not zero, Convert Premul will be ignored.

Note that this is a legacy option.

## Outputs

### Image

The image output.

### Tools

Tools is a menu where you can find some curve related tools.

### Reset View

Resets the curve windows zoom.

### Vector Handle

Set handle type to Vector.

### Auto Handle

Set handle type to Auto.

### Auto Clamped Handle

Set handle type to Auto Clamped.

### Extend horizontal

Extends the curve before the first curve point and behind the last curve point horizontally.

### Extend extrapolated

Extends the curve before the first curve point and behind the last curve point extrapolated.

### Reset Curve

Resets the curve to the initial shape.

### Use Clipping

Clipping options. Set up clipping for the stroke.

### Delete Points

Deletes selected curve points.

### Curve

By default, the curve is a straight line, meaning there is no change. The spectrum allows you to raise or lower HSV levels for each range of pixel colors. To change an

H, S, or V level, move the curve points up or down. Pixels with hue values each point in the horizontal position of the graph will be changed depending on the shape of the curve.

### ***X / Y***

The x y position of the currently selected curve point.

## **Outputs**

### **Image**

Image output.

---

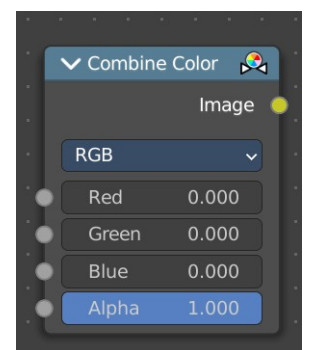

## **Combine Color**

Combine single RGBA floating point channels into a single image.

### ***Input***

### ***Mode***

- **RGB** colour processing
- **HSV** colour processing
- **HSL** colour processing
- **YcbCr** converts an YCbCrA image to RGBA color space and unions the channels.
  - Y: Luminance, 0=black, 1=white
  - Cb: Chrominance Blue, 0=Blue, 1=Yellow
  - Cr: Chrominance Red, 0=Red, 1=Yellow
- **YUV** converts an YUVA image to RGBA color space. Note that U and V values range from -0.5 to +0.5.

### ***Input – RGB mode***

### ***R, G, B and A***

The red, green, blue and alpha channels of an image.

### ***Input – HSV mode***

### ***H, S and V***

The Hue, Saturation and Value channels of an image.

## ***Input – HSL mode***

### **H , S and L**

The Hue, Saturation and Luminescence channels of an image.

## ***Input – YCbCRA mode***

### **Y, Cb, Cr and A**

Luminance, Chrominance Blue, Chrominance Red and Alpha input.

## **Properties**

### ***Modes***

ITU 601, ITU 709, Jpeg. These are encoding standards for the YCbCrA color space.

## ***Input – YUVA mode***

### **Y, U, V and A**

Luminance, Chrominance U, Chrominance V and Alpha channel.

---

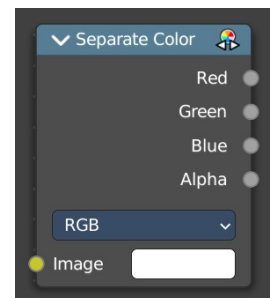

## **Separate Color**

Separates the single RGBA channels from a single image.

### ***Input***

### ***Mode***

- **RGB** colour processing
- **HSV** colour processing
- **HSL** colour processing
- **YcbCr** converts an YCbCrA image to RGBA color space and unions the channels.
  - Y: Luminance, 0=black, 1=white
  - Cb: Chrominance Blue, 0=Blue, 1=Yellow
  - Cr: Chrominance Red, 0=Red, 1=Yellow
- **YUV** converts an YUVA image to RGBA color space. Note that U and V values range from -0.5 to +0.5.

## ***Output – RGB mode***

### **R, G, B and A**

The red, green, blue and alpha channels of an image.

## ***Output – HSV mode***

### **H , S and V**

The Hue, Saturation and Value channels of an image.

## ***Output – HSL mode***

### **H , S and L**

The Hue, Saturation and Luminescence channels of an image.

## ***Output – YCbCrA mode***

### **Y, Cb, Cr and A**

Luminance, Chrominance Blue, Chrominance Red and Alpha input.

## **Properties**

### ***Modes***

ITU 601, ITU 709, Jpeg. These are encoding standards for the YCbCrA color space.

## ***Output – YUVA mode***

### **Y, U, V and A**

Luminance, Chrominance U, Chrominance V and Alpha channel.

## **Mix Color**

The Mix Node mixes images by working on the individual and corresponding pixels of the two input images. Called “MixRGB” in the shader and texture context.

### ***Inputs***

### **Factor**

Controls the amount of influence the node exerts on the output image.

### ***Image 1***

Usually the background image. The image size and resolution sets the dimensions of the output image.

### ***Image 2***

Usually the foreground image.

## ***Properties***

### **Mix**

Choose the different blending modes.

Add, Subtract, Multiply, Screen, Divide, Difference, Darken, Lighten, Overlay, Color Dodge, Color Burn, Hue, Saturation, Value, Color, Soft Light, Linear Light.

## Clamp

Limit the highest color value to not exceed 1.

## Outputs

### Image

Image output.

---

## Z Combine

The Z Combine node combines two images based on their Z-depth maps. It overlays the images using the provided Z values to detect which parts of one image are in front of the other.

## Inputs

### Image

The background image.

### Z

Z depth of the background image.

### Image

The foreground image.

### Z

Z depth of the foreground image.

## Properties

### Use Alpha

The chosen Image pixel alpha channel is also carried over. If a pixel is partially or totally transparent, the result of the Z Combine will also be partially transparent; in which case the background image will show through the foreground (chosen) pixel.

### Anti-Alias Z

Applies Anti-Aliasing to avoid artifacts at sharp edges or areas with a high contrast.

## Outputs

### Image

If both Z values are equal, it will use the foreground image. Whichever Z value is less decides which image pixel is used. See Z-buffer.

## Z

The combined Z depth, which allows to thread multiple Z-combines together.

---

## Alpha Convert

This node converts the alpha channel interpretation of an image from pre-multiplied to straight or vice versa. With a straight alpha channel you might run into artifacts at the borders when the pixels in the semi transparent areas.

### Input

#### *Image*

The input image.

### Properties

#### *Mapping Type*

Convert straight to premultiplied. Or convert premultiplied to straight.

### Output

#### *Image*

The image output.

---

## ColorRamp

The Color Ramp Node is used for mapping values to colors with the use of a gradient.

### Inputs

#### *Factor*

The Factor input is used as an index for the color ramp.

### Properties

#### *Color Ramp*

Color Ramps enables the user to specify a range of colors based on color stops. The color between the color stops gets interpolated.

## Controls

+

Add a stop to your color ramp. The stop will be added after the selected one, in the middle to the next one.

-

Deletes the selected color stop from the list.

## Tools menu

### Flip Color Ramp

Flips the gradient, inverting the values of the color ramp.

### Distribute Stops from Left

Rearrange the stops so that every step has the same space to the right.

### Distribute Stops Evenly

Space between all neighboring stops becomes equal.

### Eyedropper (pipette icon) E

An Eyedropper to sample a color or gradient from the interface to be used in the color ramp.

### Reset Color Ramp

Resets the color ramp to its default state.

## Color Mode

### RGB

Blends color by mixing each color channel and combining.

### HSV/HSL

Blends colors by first converting to HSV or HSL, mixing, then combining again. This has the advantage of maintaining saturation between different hues, where RGB would de-saturate, this allows for a richer gradient.

## Interpolation

### Ease

Uses an Ease Interpolation for the color stops.

### Cardinal

Uses a Cardinal Interpolation for the color stops.

### Linear

Uses a Linear Interpolation for the color stops.

### B-Spline

Uses a B-Spline Interpolation for the color stops.

### Constant

Uses a Constant Interpolation for the color stops.

## Color Ramp

The color band. A click at one of the color stops makes it the active one. You can

move the color stops by clicking at them and dragging them around.

### ***Active Color Stop elements***

Adjust the active color stop.

### **Choose active color stop**

Choose the color stop by index.

### **Pos**

The position of the active color stop. The range goes from 0.000 to 1.000

## **Outputs**

### ***Image***

Image output.

### ***Alpha***

Alpha channel output.

## **Convert Colorspace**

Convert between color spaces.

Note that the conversion is skipped when converting between the same color spaces or to or from data spaces.

## **Input**

### ***Image***

The input image.

## **Properties**

### ***From***

The current color space.

## **To**

The destination color space.

## **Output**

### **Image**

The image output.

## **Set Alpha**

The Set Alpha Node adds an alpha channel to an image.

## **Inputs**

### **Image**

Standard image input.

### **Alpha**

The amount of Alpha can be set for the whole image by using the input field or per pixel by connecting to the socket.

## **Outputs**

### **Image**

The image output.

## **Invert Color**

The Invert Node inverts the colors in the input image, producing a negative.

## **Inputs**

### **Factor**

Controls the amount of influence the node exerts on the output image.

## ***Color***

Standard input.

## **Properties**

### ***RGB***

Invert the RGB values.

### ***Alpha***

Invert the Alpha values.

## **Outputs**

### ***Color***

Standard image output.

---

## **RGB to BW**

The RGB to BW Node converts an RGB color image to a gray-scale image based at its luminance.

## **Inputs**

### ***Image***

Color image input.

## **Outputs**

### ***Value***

Gray-scale value output.

---

## 10.1.9 Editors - Compositor Editor - Header - Add Menu - Filter

### Table of content

Detailed table of content.....	1

## Add menu - Filter

The Filter add menu contains multiple filters you can use on image data, including blurs and other lens effects.

### Blur – Sub Menu

This sub menu contains blur nodes.

### Bilateral Blur

The Bilateral Blur node performs a high-quality adaptive blur on the source image, allowing to blur images while retaining their sharp edges.

It can be used for various purposes like: smoothing noisy render passes to avoid longer computation times in example ray-traced ambient occlusion, blurry refraction's/reflections, soft shadows, or to make non-photo realistic compositing effects.

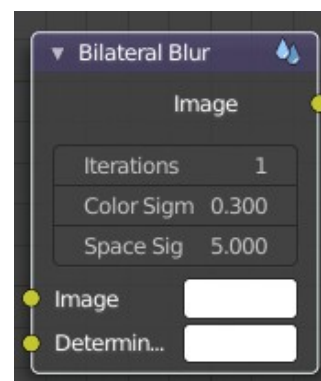

#### Inputs

##### Image

Standard image input. If only the image input is connected, the node blurs the image depending on the edges present in the source image.

##### Determinator

Which is non-obligatory and if the Determinator is connected, it serves as the source for defining edges/borders for the blur in the image. This has great advantage in case the source image is too noisy, but normals in combination with Z-buffer can still define exact borders/edges of objects.

## Properties

### Iterations

Defines how many times the filter should perform the operation on the image. It practically defines the radius of blur.

### Color Sigma

Defines the threshold for which color differences in the image should be taken as edges.

### Space Sigma

A fine-tuning variable for blur radius.

## Outputs

### Image

Standard image output.

## Blur

The Blur node provides several blur modes to blur an image. The icon top right allows you to collapse and show the image part of the node.

## Inputs

### Image

Standard image input.

### Size

The optional Size input will be multiplied with the X and Y blur radius values. It accepts also a value image, to control the blur radius with a mask. The values should be mapped between (0 to 1) for an optimal effect.

## Properties

### Filter Type

The difference between the types is in the way they handle sharp edges, smooth gradients and preserve the highs and the lows.

### Flat

Simply blurs everything uniformly.

### Tent

Preserves the high and the lows better by making a linear falloff.

### Quadratic

Looks similar to Gaussian but can be a little faster but slightly worse looking.

### ***Cubic***

Preserve the highs, but give an almost out-of-focus blur while smoothing sharp edges.

### ***Gaussian***

Gives the best looking results but tends to be the slowest.

### ***Fast Gaussian***

An approximation of the Gaussian.

### ***Catmull-Rom***

Catmull-Rom keeps sharp contrast edges crisp.

### ***Mitch***

Preserve the highs, but give an almost out-of-focus blur while smoothing sharp edges.

### **Variable Size**

Allows a variable blur radius, if the size input is an image.

### ***Bokeh***

The Bokeh button will force the Blur node to use a circular blur filter. This gives higher quality results, but is slower than using a normal filter.

### ***Gamma***

The Gamma button applies a gamma correction on the image before blurring it.

### ***Relative***

Percentage Value of the blur radius relative to the image size.

### **Aspect Correction**

A subset of the Relative property. None, Y, X

### **X, Y**

Values set the ellipsoid radius in numbers of pixels over which to spread the blur effect.

### **Extend Bounds**

Allows the image, that is being blurred, to extend past its original dimension.

### ***Outputs***

#### **Image**

Standard image output.

## Bokeh Blur

The Bokeh Blur node generates a bokeh type blur similar to Defocus. Unlike defocus an in-focus region is defined in the Compositor.

Several performance optimizations are also available such as OpenCL support, calculation area restriction and masking.

### Inputs

#### Image

Standard image input.

#### Bokeh

This is an input for the Bokeh Image node.

#### Size

Size controls the amount of blur. Size can either be a single value across the entire image or a variable value controlled by an input image. In order to use the latter, the Variable Size option must be selected. See the examples section below for more on how to use this.

#### Bounding Box

This can be used with a Box Mask matte node or with a Mask input node to restrict the area of the image the blur is applied to. This could be helpful, for example, when developing a node system by allowing only a small area of the image to be filtered thus saving composite time each time adjustments are made.

### Properties

#### Variable Size

Allows a variable blur radius, if the Size input is an image.

#### Max blur

Max blur is intended to act as an optimization tool by limiting the number of pixels across which the blur is calculated.

#### Extend Bounds

Extend the bounds of the input image to fully fit the blurred image.

### Outputs

#### Image

Image output.

## Defocus

It is typically used to emulate depth of field (DOF) using a post-processing method with a Z-buffer input. But also allows to blur images that are not based on Z depth too.

### Inputs

#### Image

Standard image input.

#### Z

Z-buffer input, but could also be a (greyscale) image used as a mask, or a single value input.

### Properties

#### Bokeh Type

The number of iris blades of the virtual camera's diaphragm.

Disk (to emulate a perfect circle) or Triangle (3 blades), Square (4 blades), Pentagon (5 blades), Hexagon (6 blades), Heptagon (7 blades) or Octagon (8 blades).

#### Angle

This button is deactivated, if the Bokeh Type is set to Disk. It can be used to add a rotation offset to the Bokeh shape. The value is the angle in degrees.

#### Gamma Correction

Applies a gamma correction on the image before and after blurring it.

#### F-Stop

This option controls the amount of focal blur in the same way as a real camera. It simulates the aperture  $f$  of a real lens' iris, without modifying the luminosity of the picture. The default value 128 is assumed to be infinity: everything is in perfect focus. Half the value will double the amount of blur. This button is deactivated, if No Z-buffer is enabled.

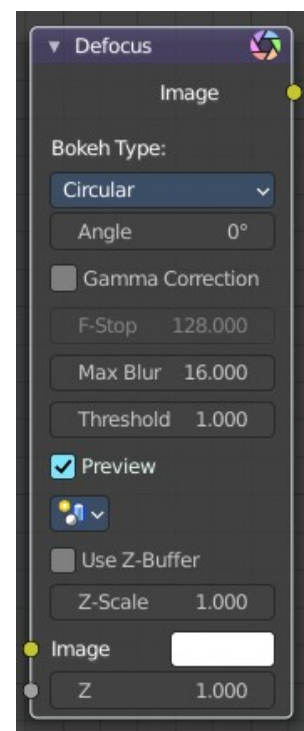

#### Max Blur

This value limits the amount of blur by setting a maximum blur radius. Could be used to optimize the performance. The default value of 0 means no limit.

#### Threshold

Some artifacts, like edge bleed, may occur, if the blur difference between pixels is large. This value controls how large that blur difference considered to be safe.

Tip! Only change this value, if there is an occurring problem with an in-focus object.

## Preview

If enabled a limited amount of (quasi-)random samples are used to render the preview. This way of sampling introduces additional noise, which will not show up in the final render.

## Scene

Select the linked scene. Scenes can be created in the properties editor in the Scene properties tab in the Scene panel.

## Use Z-buffer

Should be activated for a non Z-buffer in the Z input. No Z-buffer will be enabled automatically whenever a node that is not image based is connected to the Z input.

## Z Scale

Only active when No Z-buffer is enabled. When No Z-buffer is used, the input is used directly to control the blur radius (similar to F-Stop when using the Z-buffer). This parameter can be used to scale the range of the Z input.

## Outputs

### Image

Image output.

## Directional Blur

Blurs an image in a specified direction and magnitude. Can be used to fake motion blur.

### Inputs

#### Image

Standard image input.

### Properties

#### Iterations

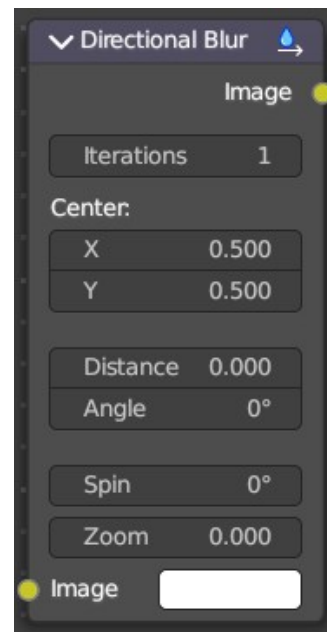

Controls how many times the image is duplicated to create the blur effect. Higher values give smoother results.

#### Center X, Y

Sets the position where the blur center is. This makes a difference if the angle, spin, and/or zoom are used.

#### Distance

How large the blur effect is.

## Angle

Image is blurred at this angle from the center.

## Spin

Rotates the image each iteration to create a spin effect, from the center point.

## Zoom

Scales the image each iteration, creating the effect of a zoom.

## Outputs

### Image

Image output.

## Vector Blur

The Vector Blur node is a fast method for simulating Motion blur in compositing. It uses the vector speed render pass to blur the image pixels in 2D.

### Inputs

#### Image

Image input, to be linked to the “Combined” render pass.

#### Z

Z depth, to be linked to the “Depth” render pass.

#### Speed

Input for the “Vector” render pass. See Cycles render passes.

### Properties

#### Samples

Quality factor.

#### Blur

Scaling factor for the motion vector (actually the “shutter speed” in frames).

#### Speed

The vector blur could produce artifacts like streaks, lines and other. To tackle these problems, the filter applies clamping, which can be used to limit which pixels get blurred. The speed is set in pixel units.

#### Min

The minimum threshold for moving pixels can separate the hardly moving pixels from the moving ones.

Especially when the camera itself moves, the vector mask can become the entire image.

### **Max**

The maximum threshold. The majority of artifacts are caused by pixels moving too fast.

## **Outputs**

### **Image**

Motion blurred image output.

---

## **Anti-Aliasing**

Adds antialiasing to edges in an image.

### **Inputs**

#### **Image**

Standard image input.

### **Properties**

#### **Threshold**

Threshold to detect edges.

## ***Contrast Limit***

How much to eliminate suspicious edges to avoid artifacts.

## ***Corner Rounding***

How much sharp corners will be rounded.

## **Outputs**

### ***Image***

Standard image output.

---

---

## **Denoise**

The Denoise node is used to denoise renders from Cycles and other ray tracing renderers. This helps to significantly reduce render time by rendering with fewer samples.

It uses Open Image Denoise, which transforms noisy images into clean images with machine learning.

## **Inputs**

### ***Image***

Noise image input.

### ***Normal***

Optional normal render pass to better preserve detail. For Cycles, it is recommended to use the Denoising Normal render pass, which is available when enabling the Denoising Data passes.

### ***Albedo***

Optional Albedo render pass to better preserve detail. For Cycles, it is recommended to use the Denoising Albedo render pass, which is available when enabling the Denoising Data passes.

## **Properties**

### ***HDR***

Preserve colors outside the 0 to 1 range.

## Outputs

### *Image*

Denoised image output.

---

## Despeckle

The Despeckle node is used to smooth areas of an image in which noise is noticeable, while leaving complex areas untouched.

This works by the standard deviation of each pixel and its neighbors is calculated to determine if the area is one of high complexity or low complexity. If the complexity is lower than the threshold then the area is smoothed using a simple mean filter.

## Inputs

### *Factor*

Controls the amount the filter effects the image.

### *Image*

Standard image input.

## Properties

### *Threshold*

The threshold to control high/low complexity.

### *Neighbor*

The threshold to control the number of pixels that must match.

## Outputs

### *Image*

Standard image output.

---

## Dilate/Erode

The Dilate/Erode node provides a morphology (mathematical shape analysis) filter.

## Inputs

### **Mask**

Single color channel (or a black-and-white image) input.

## Properties

### **Mode**

There are four different dilate / erode modes. Step, Threshold, Distance and Feather.

### **Distance**

The Distance is the filter radius. A positive value of Distance dilates (expands) the influence of a pixel on its surrounding pixels. A negative value erodes (shrinks) its influence.

## Outputs

### **Mask**

The filtered mask output.

## Inpaint

The Inpaint node is used to extend borders of an image into transparent or masked regions. This can be useful to solve problems like “wire removal” and holes created during chroma keying.

## Inputs

### **Image**

Standard image input.

## Properties

### **Distance**

The number of times to extend the image.

## Outputs

### **Image**

Standard image output.

## Filter

The Filter node implements various common image enhancement filters.

## Inputs

### **Factor**

Controls the amount of influence the node exerts on the output image.

### **Image**

Standard image input.

## Properties

### **Filter Type**

The available filter types. Soften, Laplace, Sobel, Prewitt and Kirsch all perform edge detection (in slightly different ways) based on vector calculus and set theory equations.

### **Soften**

Slightly blurs the image.

### **Sharpen**

Increases the contrast, especially at edges.

### **Laplace**

Softens around edges.

### **Sobel**

Creates a negative image that highlights edges.

### **Prewitt**

Tries to do Sobel one better.

### **Kirsch**

Giving a better blending than Sobel or Prewitt, when approaching an edge.

### **Shadow**

Performs a relief, emboss effect, darkening outside edges.

## Outputs

### **Image**

Standard image output.

## Glare

The Glare node is used to add lens flares, fog, glows around exposed parts of an image and much more.

### Inputs

#### *Image*

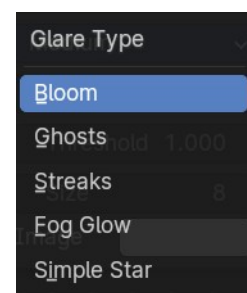

Standard image input.

### Properties

Note that some of the properties just appears with the corresponding glare type and the corresponding quality setting.

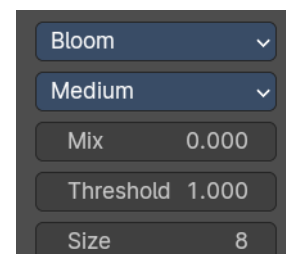

### *Glare Type*

### **Bloom**

Creates a bloom effect.

### *Quality*

If not set to something other the High, then the glare effect will only be applied to a low resolution copy of the image. This can be helpful to save render times while only doing preview renders.

### *Mix*

Value to control how much of the effect is added on to the image. A value of -1 would give just the original image, 0 gives a 50/50 mix, and 1 gives just the effect.

### *Threshold*

Pixels brighter than this value will be affected by the glare filter.

### *Size*

Scale of the glow relative to the size of the original bright pixels.

## Ghosts

Creates a haze over the image.

### Quality

If not set to something other the High, then the glare effect will only be applied to a low resolution copy of the image. This can be helpful to save render times while only doing preview renders.

### Iterations

The number of times to run through the filter algorithm. Higher values will give more accurate results but will take longer to compute. Note that, this is not available for Fog Glow as it does not use an iterative-based algorithm.

### Color Modulation

Used for Streaks and Ghosts to create a special dispersion effect.

Johannes Itten describes this effect, Color Modulation, as subtle variations in tones and chroma.

### Mix

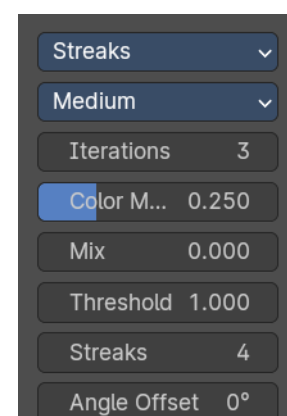

Value to control how much of the effect is added on to the image. A value of -1 would give just the original image, 0 gives a 50/50 mix, and 1 gives just the effect.

### Threshold

Pixels brighter than this value will be affected by the glare filter.

## Streaks

Creates bright streaks used to simulate lens flares.

### Quality

If not set to something other the High, then the glare effect will only be applied to a low resolution copy of the image. This can be helpful to save render times while only doing preview renders.

### **Iterations**

The number of times to run through the filter algorithm. Higher values will give more accurate results but will take longer to compute. Note that, this is not available for Fog Glow as it does not use an iterative-based algorithm.

### **Color Modulation**

Used for Streaks and Ghosts to create a special dispersion effect.

Johannes Itten describes this effect, Color Modulation, as subtle variations in tones and chroma.

### **Mix**

Value to control how much of the effect is added on to the image. A value of -1 would give just the original image, 0 gives a 50/50 mix, and 1 gives just the effect.

### **Threshold**

Pixels brighter than this value will be affected by the glare filter.

### **Streaks**

Total number of streaks.

### **Angle Offset**

The rotation offset factor of the streaks.

---

### **Fog Glow**

Looks similar to Ghost. However, it is much smaller in size and gives more of an atmospheric haze or “glow” around the image.

### **Quality**

If not set to something other than High, then the glare effect will only be applied to a low resolution copy of the image. This can be helpful to save render times while only doing preview renders.

### **Mix**

Value to control how much of the effect is added on to the image. A value of -1 would give just the original image, 0 gives a 50/50 mix, and 1 gives just the effect.

### **Threshold**

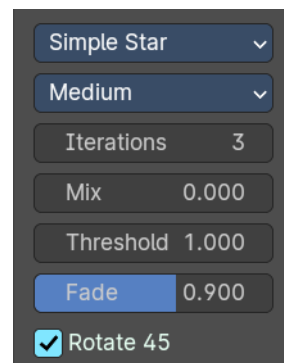

Pixels brighter than this value will be affected by the glare filter.

### **Size**

Scale of the glow relative to the size of the original bright pixels.

## Simple Star

Works similar to Streaks but gives a simpler shape looking like a star.

## Quality

If not set to something other the High, then the glare effect will only be applied to a low resolution copy of the image. This can be helpful to save render times while only doing preview renders.

## Iterations

The number of times to run through the filter algorithm. Higher values will give more accurate results but will take longer to compute. Note that, this is not available for Fog Glow as it does not use an iterative-based algorithm.

## Mix

Value to control how much of the effect is added on to the image. A value of -1 would give just the original image, 0 gives a 50/50 mix, and 1 gives just the effect.

## Threshold

Pixels brighter than this value will be affected by the glare filter.

## Fade

Fade out factor for the streaks.

## Rotate 45

Rotate the streaks by 45°.

## Outputs

### Image

Standard image output.

---

## Kuwahara

Kuwahara is a filter that converts a realistic image into a stylized image.

## Inputs

### *Image*

Standard image input.

## Properties

### *Kuwahara Filter*

There are two Kuwahara variations available. Classic and Anisotropic.

#### **Classic**

##### *Size*

The size of the Kuwahara filter.

#### **Anisotropic**

##### *Size*

The size of the Kuwahara filter.

##### *Smoothing*

Smoothing degree before applying filter.

#### **High Precision**

Uses a more precise but slower method.

## Outputs

### *Image*

Standard image output.

## Pixelate

Add this node in front of a Scale node to get a pixelated (non-smoothed) image from the resultant upscaled image.

## Inputs

### *Color*

Standard image input.

## Outputs

### *Color*

Image output.

## Posterize

The Posterize node reduces the number of colors in the image to a palette. The exact number of output colors is not to set. Just a number of steps to reduce the existing colors.

### Inputs

#### *Image*

The image to reduce the colors at.

#### *Steps*

The number of steps to perform a color reduction.

### Outputs

#### *Image*

Standard image output.

## Sun Beams

The Sun Beams node provides a computationally cheap way of creating the name giving effect based on the image brightness alone.

Sun Beams is a 2D effect for simulating the effect of bright light getting scattered in a medium (Crepuscular Rays). This phenomenon can be created by renderers, but full volumetric lighting is a rather arduous approach and takes a lot of render time.

### Inputs

#### *Image*

Standard image input.

### Properties

#### *Source width, height*

Source point of the rays as a factor of the image dimensions.

#### *Ray length*

Length of the rays as a factor of the image size.

## **Outputs**

### ***Image***

Image output.

## 10.1 Editors - Compositor - Header

### Table of content

Shader Editor - Header..... 1  
 Header Tabs..... 1  
 Header right click menus..... 1  
 Editortype Menu..... 1

## Compositor Editor - Header

The Header contains various menus, navigation elements, settings and tools for the viewport. The content of the menus may differ, dependent of the chosen renderer.

The header is divided into two areas. Left menus. Right settings.

## Header Tabs

The tabs at the very left allows you to switch between the most important node editor types by one click. Compositor Editor, Geometry Nodes Editor and Shader Editor.

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

## Editortype Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

# Tool Shelf

## Select Tools Group

Tools with a triangle down right are a group of tools. Click and hold to reveal the content. Then choose the tool that you need.

## Tweak

Allows you to select or tweak single elements by clicking at it.

## Select Box

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### *Set a new selection*

### *Extend existing selection*

### *Subtract existing selection*

## Select Circle

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### Set a new selection

### Extend existing selection

### Subtract existing selection

### Radius

The brush radius.

## Select Lasso

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### Set a new selection

### Extend existing selection

### Subtract existing selection

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar.

Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate

Draw free-hand strokes in the main window.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Stabilize Stroke

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### Radius

The radius for the stroke stabilization.

### Factor

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

## End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

---

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker where you can define the color for the annotation stroke.

---

## Annotate Eraser

Click and drag to remove annotate lines.

### Tool Settings

#### Radius

The radius of the eraser pencil.

---

## Links Cut

This tools allows you to cut connections.

Node Tab - Properties Panel with Movie Clip node.....	8
Color Space.....	8

## Node Tab - Node Panel

The node panel allows you to give nodes and node groups a name and a label, and change its color.

### Name

The type of the node.

### Label

The label name of the node.

### Color sub menu

### Color checkbox

The Color checkbox turns custom color on or off.

### Presets

Store some color presets and reuse them. They are stored globally, and transfers to other blend files.

### Color

Choose a custom color. A click at the color field will open a color picker.

### Node color specials

#### Copy Color

Allows you to copy the color.

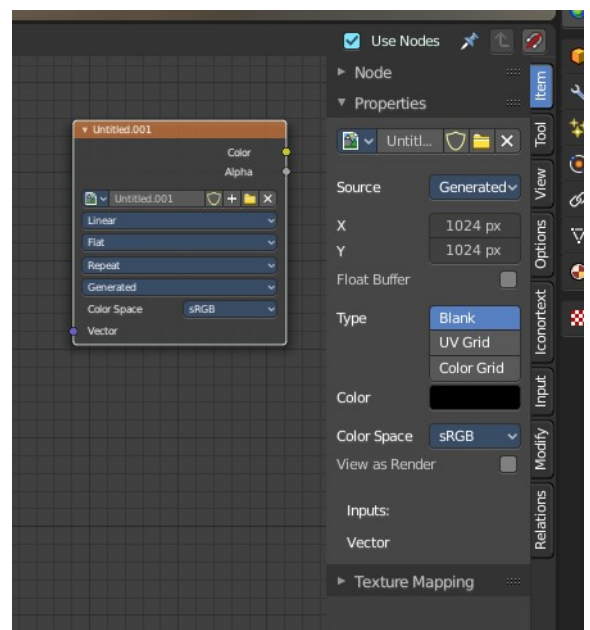

## NodeTab - Properties Panel

This panel shows usually the same properties than the properties at the node. These properties are already explained in the Add menu chapters. So we won't repeat them here.

But there are exceptions like the Image node. Here the Properties panel shows much more options than at the node. It shows all the possible image settings. We will explain the extra options here.

## Node Tab - Properties Panel with Image node

Contains image related settings. Size, type, and so on.

### Image Property

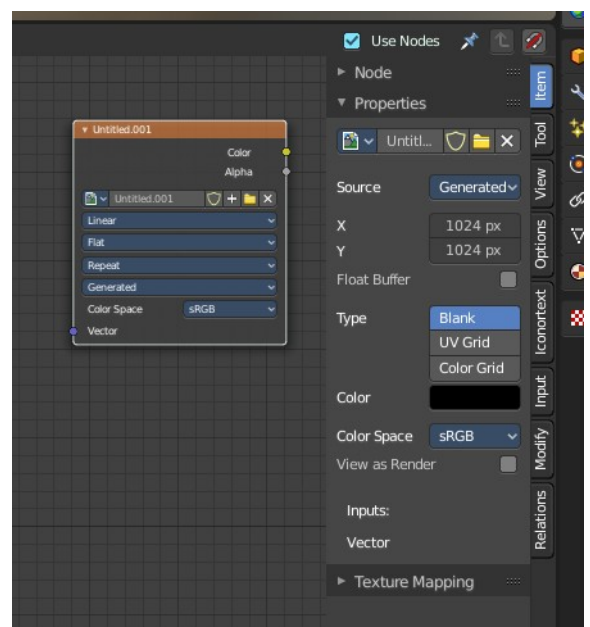

Load an image and / or switch to other images.

From left to right ...

### Image Browser

This is a list of the images in the scene. Allows you to switch to

other images.

## New / Open

When nothing is loaded then you will see the New / Open buttons to load a new image, or to create a new one.

## Image Edit Box

The name of the currently selected image. And you can rename the image here too.

## Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Open Image

Load an image

## Remove

Delete the image.

---

## Source

Choose the image type. This type gets usually automatically set. When you create a new image, then this image is generated. When you load an image then the Source switches to Single Image.

Generated images does not have a path.

---

## Source Type Generated

### *X / Y*

The image width and height.

### *Float Buffer*

Use a floating point buffer. 8 Bit images uses integers. 32 Bit works with floats.

---

## Generated Type Blank

This type displays an image with one blank color

## Color

The color of the blank image.

---

## Generated Type UV Grid

This type displays a with a black and white checker texture but colored dots.

## Generated Type Color Grid

This type displays a with a colored checker texture with numbers.

## Color Space

Choose the color space type for the image.

## View as Render

Displays the image with the color management settings.

## Source Type Movie + Image Sequence

## ***Path edit box***

### **Pack**

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### **Path edit box**

See and edit the path to your movie or image sequence files.

### **Open**

Open a new movie or image sequence files. A file dialog will appear.

### **Refresh**

Reread the movie or image sequence files.

---

## ***Info string***

Some information about the currently loaded movie. Frames, resolution and color space.

---

## ***Frames***

The number of frames of the movie or image sequence.

### **Match Movie Length**

Set Users Image Length to the one of this video.

### **Start**

The start frame of the movie or image sequence

### **Offset**

Offset the number of the frame to use in the animation. -1 means off.

### **Cyclic**

Cycle the images in the movie.

### **Auto Refresh**

Always refresh image on frame changes.

### **Deinterlace**

Deinterlace the movie file on load.

---

## Color Space

Choose the color space type for the movie or image sequence files.

## Alpha

Choose the alpha channel mode. Straight or Premultiplied.

## View as Render

Display the image with using the color management settings.

---

## Source Type Single Image

### Path edit box

### Pack

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### Path edit box

See and edit the path to your movie or image sequence files.

### Open

Open a new movie or image sequence files. A file dialog will appear.

### Refresh

Reread the movie or image sequence files.

---

## Info string

Some information about the currently loaded image. Resolution and color space.

## Color Space

Choose the color space type for the movie or image sequence files.

## Alpha

Choose the alpha channel mode. Straight or Premultiplied.

## View as Render

Display the image with using the color management settings.

# Node Tab - Properties Panel with Movie Clip node

## Color Space

Choose the color space for the imported movie.

## 10.3.2 Editors - Compositor Editor - Sidebar - Tool Tab

### Table of content

Tool Tab..... 1

### Tool Tab

The settings of the currently active tool in the tool shelf.

In the node editor we don't have something special here. The tool related settings are explained in the tool shelf chapter.

## 10.3.3 Editors - Compositor Editor - Sidebar - View Tab

### Table of content

View Tab - Backdrop Panel.....	1
Backdrop checkbox.....	1
Zoom.....	1
Offset.....	1
View Tab - Annotation Panel.....	1
Annotations prop.....	2
Drop down box.....	2
Edit Box.....	2
Fake User.....	2
Add Annotation.....	2
Delete Annotation.....	2
List of Annotation Strokes.....	2
Thickness.....	3
Frame Locked/Unlocked.....	3
Onion Skin.....	3

### View Tab - Backdrop Panel

When you add and connect a Viewer node, then you can display the result as a backdrop in the node editor viewport. Here you can find some further Backdrop settings.

#### Backdrop checkbox

Turn on or off the display of the backdrop image.

#### Zoom

The zoom factor of the image. A value of 1 displays the image in original size.

#### Offset

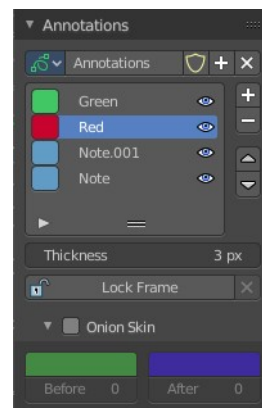

The position of the image in the viewport.

### View Tab - Annotation Panel

View related settings. Which is in the node editor just the Annotations panel where you can manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

## Annotations prop

Add, remove and rename new annotations.

## Drop down box

A list of the available annotation layers.

## Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

## Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

---

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

---

## Onion Skin

Enable Onion Skinning.

Onion Skinning allows to show ghosts of the keyframes before and after the current frame. In this sub panel you can adjust the color of the onion skin frames.

With the numbers below the colors you can define how many frames before or after are displayed that way.

## 10.3.4 Editors - Compositor Editor - Sidebar - Options Tab

### Table of content

Options Tab - Performance panel.....	1
Device.....	1
CPU.....	1
GPU.....	1
Precision.....	1
Auto.....	1
Full.....	1
Viewer Region.....	1

### Options Tab - Performance panel

In the Options tab you will find general options for performance. The Performance panel provides you with settings that improves the performance and how the compositor renders. Here you can get faster results.

#### Device

The hardware device used to render the image.

##### CPU

Uses the CPU to calculate.

##### GPU

Uses the GPU to calculate, which uses parallel processing for near real time results.

#### Precision

The quality and precision of the compositor intermediate results when editing the image.

##### Auto

Automatically optimizes the precision dynamically.

##### Full

Final quality precision.

#### Viewer Region

Use boundaries for viewer nodes and composite backdrop.

## 10.3.5 Editors - Compositor Editor - Sidebar - Add Tab

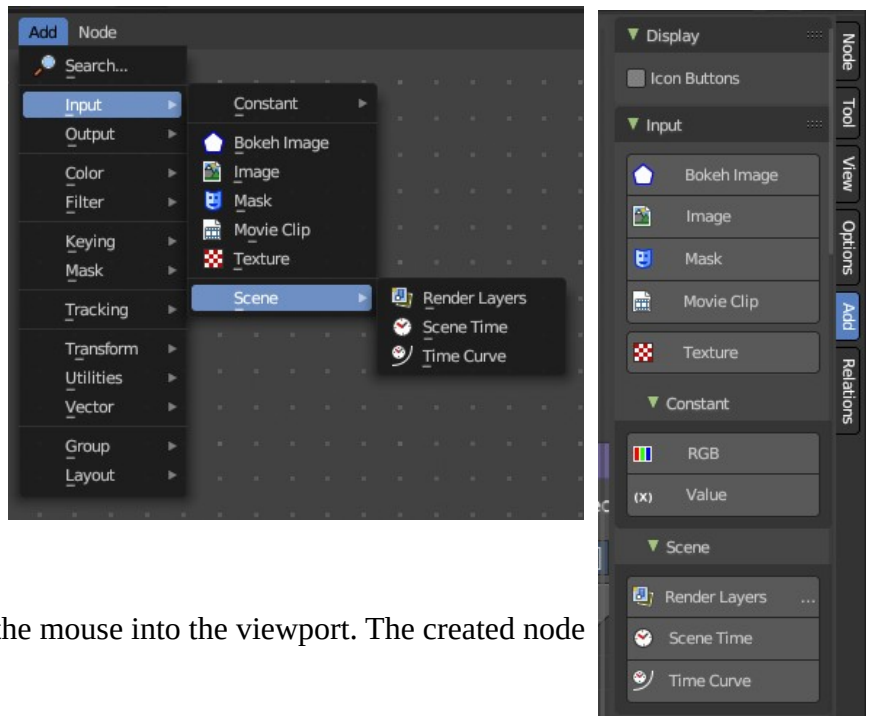

### Table of content

Add Tab.....	1
Usage.....	1
Add tab - Display Panel.....	1
Icon Buttons.....	1

### Add Tab

Here you can find the same nodes than in the Add menu. Panels are more convenient to use. They stay open for example. It's your decision with what system you want to work.

We won't explain the content of the panels again. The single nodes are explained in the add menu chapter.

### Usage

Click at one of the node buttons, then move the mouse into the viewport. The created node sticks at the mouse. Click again to release it.

### Add tab - Display Panel

#### Icon Buttons

You can display the nodes in the panels either as text buttons or as pure icon buttons.

## 10.3.6 Editors - Compositor Editor - Sidebar - Relations tab

### Table of content

Relations tab - Display Panel.....	1
Icon Buttons.....	1
Relations tab - Group Panel.....	1
Make Group.....	2
Group Insert.....	3
Usage.....	3
Group Input.....	3
Group Output.....	3

Relations tab - Node Group Panel.....	3
Relations tab - Layout Panel.....	3
Frame.....	3
Adding and Removing Nodes.....	4
Resizing Frame.....	4
Label and Color.....	4
Reroute.....	4
Move, Rotate, Scale.....	5

## Relations tab - Display Panel

### Icon Buttons

You can display the nodes in the panels either as text buttons or as pure icon buttons.

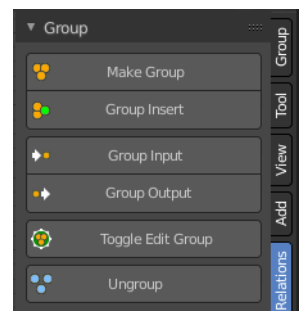

## Relations tab - Group Panel

Node groups allows you to group different nodes of the material together to reduce the visual complexity. A node group acts like any other node.

Material node groups should not include Input nodes, like Image nodes, or Output nodes.

If you include a source node in your group, you will end up having the source node appearing twice: once inside the group, and once outside the group in the new material node tree.

If you include an output node in the group, there will not be an output socket available from the group!

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item . That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Group Insert

Inserts the selected node into the selected group.

## Usage

Select the node.

Hold down shift, and select the group.

Click the Group Insert button. The node will now be part of the group, and you will land in group edit mode.

Press tab to exit the group edit mode.

## Group Input

Adds a group input node.

**Note:** When at a top level, this node is unavailable. These are only available when inside a node group.

## Group Output

Adds a group output node.

**Note:** When at a top level, this node is unavailable. These are only available when inside a node group.

## Toggle Edit Group

Enter or exit the edit group mode.

## Ungroup

Ungroups an existing group. You need to be outside of the group edit mode.

## Relations tab - Node Group Panel

When you create a node group, then this node group is listed here. And can be dragged from there for reuse too.

## Relations tab - Layout Panel

These nodes help organizing the node layout.

## Frame

The Frame node allows you to drop nodes into a frame. This frame can be dragged around as a whole.

## Adding and Removing Nodes

Nodes can be added by simply dropping them onto the frame. Or with the Join in New Frame menu item in the Node menu.

To remove a node from the frame use Remove from Frame.

## Resizing Frame

When the Frame node is first placed in the node editor workspace you can resize it by dragging one of the edges.

Once a node is placed in the Frame, the Frame shrinks around the nodes. You cannot resize it anymore with handlers. Just by dragging around the nodes inside of the frame.

This behavior can be changed by disabling the *Shrink* option in the Item tab in the Properties panel. Then you can resize the frame again by dragging the edges.

## Label and Color

You can change the name of a frame in the Node panel. And you can give it a custom color by checking the Color checkbox and adjusting the color then.

## Reroute

Adds a reroute point that can be used to reroute connections. It allows just one input, but allows multiple output connections.

To quickly add a Reroute node into an existing connection, hold Shift and Right Mouse and drag the mouse to cut through the link. A new reroute node will be added.

When you exceed a specific angle amount between the reroute nodes, then the node connection becomes a sharp corner, and not longer a Bezier like soft curve.

## Move, Rotate, Scale

A normal node has a handler. The reroute dot not. You can't simply move it around with the mouse by clicking at the top area. It has none. You have to use the move, rotate and scale commands. They can be found in the View menu.

## 10.3.7 Editors - Compositor Editor - Sidebar - Group tab

### Table of content

Group tab - Introduction.....	2

## Group tab - Introduction

The Compositor sidebar Group tab at the right side contains options and settings for node groups and socket input and output properties.

## Properties Panel

### Name

Change the name of the current node group. Type in a new name and hit enter.

### Description

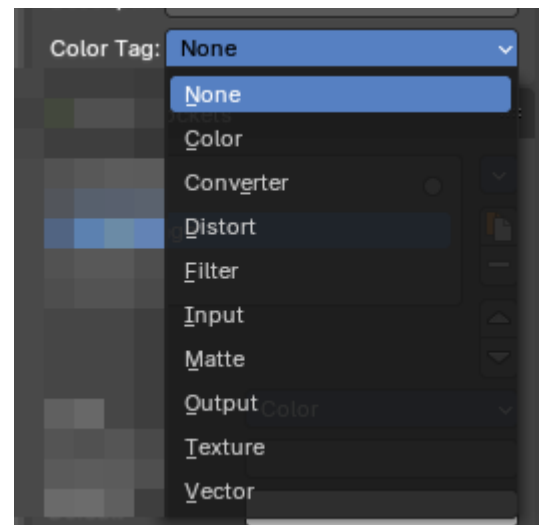

Change the description of the current node group. Type in a new name and hit enter.

### Color Tag

Changes the header color of the current node group.

#### Color Tag Types:

- Color
- Converter
- Distort
- Filter
- Input
- Matter
- Output
- Texture
- Vector

## Group Sockets Panel

Manage the input and output properties of the Group Input and Output nodes.

More than one input and output slot can be useful when you want to modify compositor sockets in the node group in more than one way.

### Group Socket List

List of available input and output sockets.

**Note:** *The list can be sorted by dragging the items around.*

#### List

The list of input and output sockets.

#### Name

Change the name of the current selected input socket by double clicking on the socket in the list. Type in a new name and hit enter.

#### New Item

Adds a new input sockets to the list.

#### Input

Adds a new input sockets to the list.

#### Output

Adds a new output socket to the list.

#### Panel

Adds a new panel socket to the list.

#### Duplicate Item

Duplicates the active socket.

#### Remove Item

Removes the selected input socket from the list.

## Move Item Up/Down

Moves the active item to the specified direction. You can move the active item up or down the list.

**Note:** You can also alternatively drag and drop the active item to re-order.

## Inputs

Inputs are characterized by the colored dot to the left. These are manifested in the Group Input node.

## Outputs

Outputs are characterized by the colored dot to the right. These are manifested in the Group Output node.

## Type

What kind of node group input or output type it is. To know more about the properties of the socket types, refer to the next section.

- Vector
- Float
- Color

# Socket Type Properties

## Description

Add a tooltip to the socket description.

## Default

The default value for the socket.

## Min

The minimum value for the socket.

**Note:** This is only available for vector and float types.

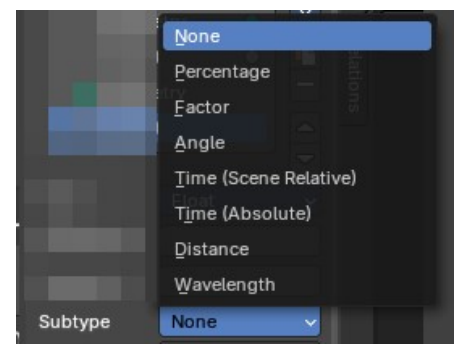

## Max

The maximum value for the socket.

**Note:** This is only available for vector and float types.

## Subtype

Some node types have a subtype dropdown menu, such as the vector or float. The subtype menu allows you to define the socket type sliders and

read-out.

## **Hide Value**

Hide the input value even when the socket is not connected.

## 10.3 Editors - Compositor Editor - Sidebar

### Table of content

Introduction.....	1
Right Click menus.....	1

### Introduction

The Compositor Editor is made of several areas. At the right side you will find the sidebar. Here you will find further options and settings for the Shader Editor nodes and its tools.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

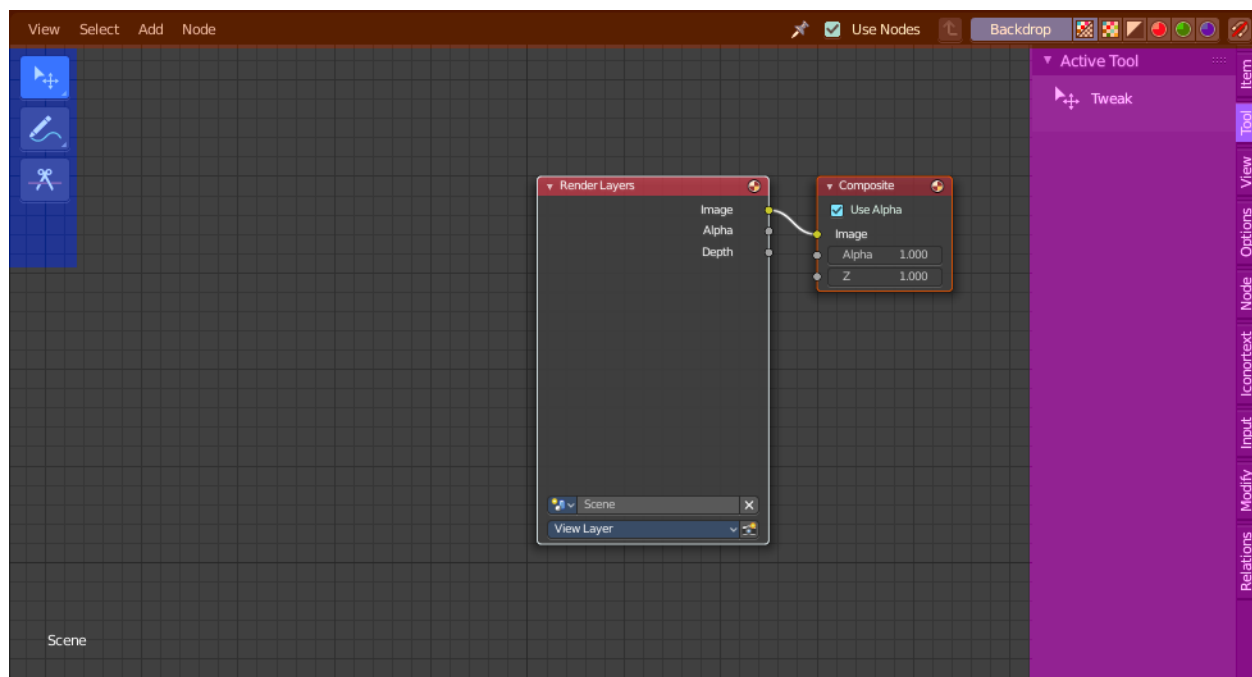

## 10 Editors - Compositor

## Compositor Editor

The Compositing editor allows you to do compositing. This means to modify and combine image layers in many different ways and by lots of available nodes. You can glue two pieces of footage together, colorize a whole image sequence at once and do all the traditional compositing steps that you usually would do in a 2d software.

The editor is divided into several areas.

Yellow – Header

Blue - Tool Shelf

Pink - Sidebar

Note that the editor does not have a tool area above the header. All tool settings are in the sidebar in the Tool tab.

## Navigating in the Compositing Editor viewport

### Hotkeys

Pan the view - MMB

Zoom - Mouse Wheel, MMB+CTRL, Numpad + / -

View All - Home

# Preview Image in nodes

Some nodes has two icons up right. The right icon is a button that allows you to expand the node and to show a preview image.

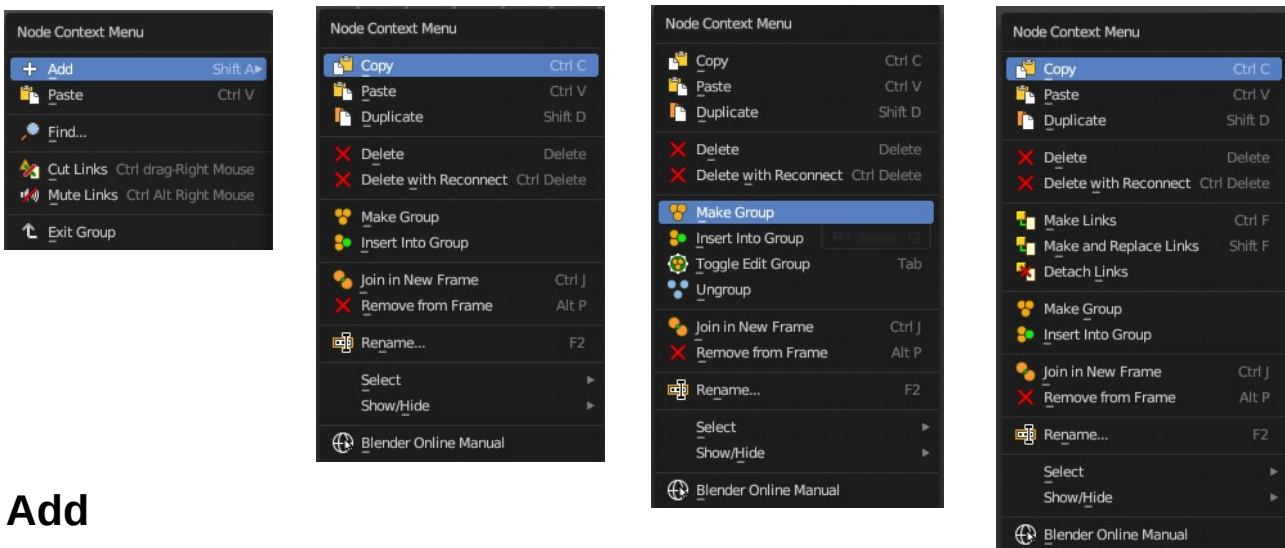

You can also toggle all node previews from the overlays drop down to the top right of the header.

# Node context menu

When you double right click into the viewport, then you will open a menu. The UV Context menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual. It does though show different content under different circumstances.

## Add

The whole add menu from the header.

## Find

Search for nodes, and highlight them. When you are in a node group then it lists the content of the node group.

## Cut Links

Calls a cut tool with which you can cut links between nodes

## Mute Links

Calls a cut tool with which you mute cut links between nodes. To unmute the links use the same tool again.

## Exit Group

Same as Edit Group. When you are in a group then you can end editing with this operator.

## Copy

Copies the selected nodes.

## Paste

Pastes the copied nodes.

## Duplicate

Duplicates the selected nodes.

## Rename

Allows you to rename the current active node. A popup opens up where you can type in another name.

## Delete

Deletes the selected nodes. All Connections gets removed.

## Delete with Reconnect

Deletes the selected nodes. Existing connections gets bypassed as if the node would not have existed.

---

## Make Links

Shows when you have at least two nodes connected.

Tries to connect nodes where it makes sense. For example, the BSDF output of a Principled shader with the Surface input of the Material Output node.

## Make and Replace Links

Shows when you have at least two nodes connected.

Same as Make Links. But it will replace existing links.

## Detach Links

Shows when you have at least two nodes connected.

Removes all connections from the selected node, but tries to reconnect the remaining nodes.

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item in the sidebar in the Relations tab in the Group panel. That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left

corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

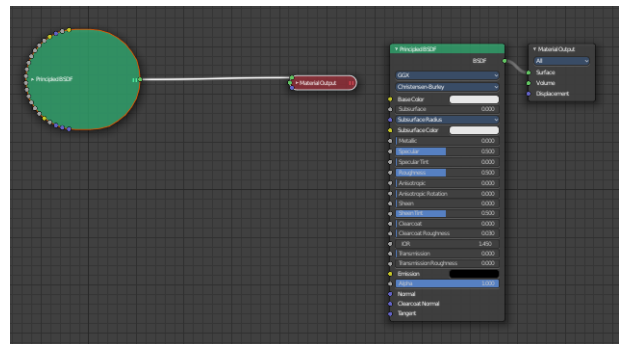

## Insert into Group

Allows you to insert a node into a node group.

Select the node, hold down Shift, then select the node group so that both are selected. Then perform the operator.

## Toggle Edit Group

Enters a node group for editing. Or when you are in a node group, exits the node group editing.

## Ungroup

Removes the selected nodes from a group.

## Join new Frame

Frame node functionality. Adds the selected node to a frame.

## Remove from Frame

Frame node functionality. Removes the selected node from a frame.

## Rename

Allows you to rename a node.

## Select submenu

### Grouped

Select grouped nodes.

### Linked From

Select the nodes that are linked from the currently selected nodes. The nodes before in the hierarchy.

### Linked To

Select the nodes that are linked to the currently selected nodes. The nodes behind in the hierarchy.

### Activate same type previous

Activate same node type before the current selection, step by step.

### Activate same type next

Activate same node type after the current selection, step by step.

## Show/Hide submenu

Here you find hide options to make the display of nodes more compact.

Demonstration happens at an image node.

## Hide

Hides everything but input and output dots. To view the full node again perform the operator again. It's a toggle. Or click at the triangle left besides the node name.

## Toggle Node Mute

Deactivates the node.

## Toggle Node Preview

This is a compositor feature for the preview image. It does not belong here, but shares the same menu. It shows or hides the preview image.

## Toggle hidden node sockets

Toggles away the unused node sockets. In this case the vector input node socket and the alpha output node socket will be hidden.

## Toggle Node Options

Hides away the properties.

## Collapse and Hide Unused Sockets

Like Hide. Hides everything but the node sockets. But it also hides the unused node sockets.

## Toggle Node Options

Shows or hides the node options.

## Collapse and Hide Unused Sockets

Shows or hides unused sockets.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Favorites Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Image Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

## Back image Sample - Alt Right Mouse

Displays the color information of the Background Image under the current mouse position. Position, RGB Values, HSV, etc. . You need to have a Viewer node in the compositing chain, and the background image must show.

## 11 Editors - Texture Node Editor

### Table of content

Texture Node Editor..... 1

## Texture Node Editor

The texture node system is in its current form legacy and will be replaced by a new system. Due to this, the manual is not up to date with the latest version of Blender and Bforartists. This editor is currently simply dysfunctional. And will most probably stay dysfunctional for while.

## 12.1.10 Editors - Geometry Nodes Editor - Header - Add Menu - Output

## Add menu - Geometry - Read

Here you find nodes to modify the geometry.

### ID

Retreive the ID of the object.

### Outputs

#### *ID*

The ID of the object.

### Index

Retreives an integer value indicating the position of each element in the list. This list depends on the internal order of the data in the geometry, which is not necessarily visible in the 3D Viewport. However, the index value is visible in the left-most column in the Spreadsheet Editor.

### Outputs

#### *Index*

Integer value which enumerates each point on the geometry.

## Named Attribute

Adds a field input.

### Input

#### *Name*

The input name for the field.

### Input

#### *Data Type*

What data type to use.

### Output

#### *Attribute*

The output attribute name.

## Normal

Returns a vector for each evaluated point indicating the normal direction. The output can depend on the attribute domain used in the node evaluating the field, but the output is always a normalized unit vector.

The output depends on where you plug in the normal node.

### Face

On the face domain, the normal is the “up” direction of the face.

### Mesh Vertices

For mesh vertices, the normal is an average of the surrounding face normals. If the vertex does not have any connected faces, the output is simply the normalized position of that vertex.

### Edge

The normal output for each edge is the average of the edge’s two vertex normals.

### Face Corner

The output for each face corner is the same as the face normal of the corresponding face.

## Curve Control Points

The output of this node when used for curve geometry is the evaluated normal of the curve, which depends on the twist method. The normal vector is always perpendicular to the direction of the curve's path at every point.

### Warning!

Please keep in mind that for NURBS and Bézier spline curves the value retrieved from this node is the value at every control point. Which may not correspond to the visible evaluated points. For NURBS splines the difference may be even more pronounced and the result may not be as expected. A Resample Curve Node can be used to create a poly spline, where there is a control point for every evaluated point.

## Outputs

### *Normal*

The normal vector output.

## Position

The Position node outputs a vector of each point of the geometry the node is connected to.

The node can work on geometry domains besides points. In that case, the position data will be automatically interpolated to the new domain. For example, when used as part of the input to the mesh edge split node, the position for each edge will be the average position of the edges two vertices.

For instances, the output is the origin of each instance. However, if the node is for a geometry node that adjusts data inside instances, the position output of this node will be in the local space of each instance.

## Outputs

### *Position*

The position vector output.

## Radius

Retrieve the radius of the object.

## Outputs

### *Radius*

The radius output.

## Selection – Tool Mode

User selection of the edited geometry, for tool execution. When using this node, this gets the selection of the active object to use in the Node Tree.

**Example:** You can select faces on an object in Edit Mode in the 3D View editor then run the Node Group Tool on only the selected faces by getting the Selection from this node.

## Outputs

### *Selection*

The selection output.

## Active Element – Tool Mode

Retrieve the index of the active elements. This is used for tool execution.

## Properties

### *Domain*

What kind of element to retrieve.

## Outputs

### *Index*

The selection output.

### *Exists*

True if element exists.

## Add menu - Geometry - Sample

Here you find nodes to modify the geometry.

### Geometry Proximity

This node finds the closest position on the target for each point in the input geometry.

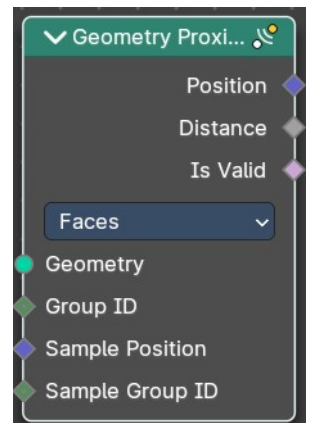

#### Inputs

##### Geometry

The target object.

##### Group ID

Is evaluated on the face domain, and splits the input mesh into multiple parts, each with its own id.

## **Sample Position**

The position where the computed location is stored.

## **Sample Group ID**

Determines in which group the closest nearest surface is detected.

## **Properties**

### **Target Geometry**

The element of the target geometry to calculate the distance from.

## **Outputs**

### **Position**

Closest location on the surface of the target mesh, or the closest point in the target point cloud in Points mode.

### **Distance**

Distance from the source position to the closest location in the target.

### **Is Valid**

Whether the sampling was successful. It is false when the sampled group is empty.

## **Index of Nearest**

Retrieve values from specific geometry elements.

## **Inputs**

### **Position**

The position of the nearest element.

### **Group ID**

The group ID of the nearest element.

## **Outputs**

### **Index**

The Index of the nearest element.

### **Has Neighbor**

Has this element a neighbor.

## Raycast

This node sends a raycast and retrieves data from the hit target.

### Inputs

#### Target Geometry

This is actually the source object that sends the ray.

#### Attribute

Attribute input.

#### Source Position

Source position input.

#### Ray Direction

A vector 3 for the ray direction.

#### Ray Length

The length of the ray.

### Properties

#### Data Type

What data to calculate on hit.

#### Mapping

Mapping from the target geometry to hit points. Interpolated or nearest.

### Output

#### Is Hit

Has the raycast hit something?

#### Hit Position

The hit position if any.

## ***Hit Normal***

The normal of the hit point.

## ***Hit Distance***

The distance of the hit point.

## ***Attribute***

The attribute of the hit object.

---

## **Sample Index**

Retrieve values from specific geometry elements.

### **Inputs**

#### ***Geometry***

The source object to take the data from.

#### ***Value***

The value to retrieve.

#### ***Index***

The index position of the value.

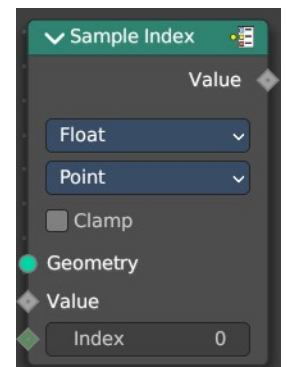

### **Properties**

#### ***Data Type***

The type for the source and result data.

#### ***Domain***

What kind of data to process.

## ***Clamp***

Clamp the indices to the size of the attribute domain.

## **Output**

### ***Value***

The output value.

---

## **Sample Nearest**

Retrieves the element of a geometry closest to a position.

## **Inputs**

### ***Geometry***

The source object to take the data from.

### ***Sample Position***

The position of the source object.

## **Properties**

### ***Domain***

What data to process.

## **Output**

### ***Index***

The index output.

## Add menu - Geometry - Write

Here you find nodes to modify the geometry.

### Set Geometry Name

Sets the name of the target geometry.

#### Inputs

##### **Geometry**

Geometry input.

##### **Name**

The name that you want to set

#### Outputs

##### **Geometry**

Geometry output.

### Set ID

Sets the ID of the target geometry.

#### Inputs

##### **Geometry**

Geometry input.

##### **Selection**

Selection input.

##### **ID**

ID Input

## Outputs

### Geometry

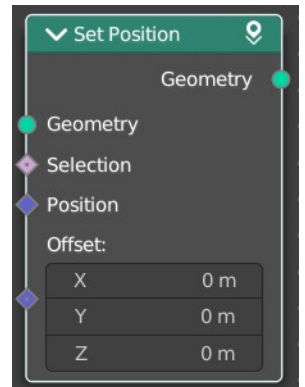

Geometry output.

---

## Set Position

The Set Position node controls the location of each point, the same way as controlling the position attribute. If the input geometry contains instances, this node will affect the location of the origin of each instance.

The input node for this data is the Position Node.

## Inputs

### Geometry

Geometry input.

### Selection

Whether or not to change the position of each point or instance. True values mean the position will be changed, false values mean it will remain the same.

### Position

The new position for selected elements. By default, this is the same as if the Position Node was connected, meaning the node will do nothing.

### Offset

An optional translation for each point. This is evaluated at the same time as the Position input, meaning that fields evaluated for it will not reflect the changed position.

## Outputs

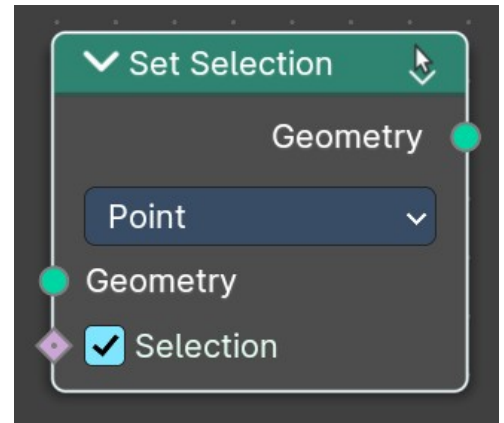

### Geometry

Geometry outputs.

## Set Selection – Tool Mode

Sets the selection of the edited geometry, for tool execution. When using this node, this set the selection of the active object to use in the Node Tree.

**Example:** *You can deselect faces on an object in Edit Mode in the 3D View editor after you have run the Node Group Tool on only the selected faces. This can also be used in the execution of a tree to change the selection to run another chain of nodes on a different selection.*

### Inputs

#### Geometry

Geometry input.

#### Domain type

What domain the Set Selection node affects, be it points, edges, face or spline.

#### Selection

Whether or not to change the selection status (selected/deselected). True values mean the selection will be changed, false values mean it will remain the same.

### Outputs

#### Geometry

Geometry outputs.

## Add menu - Geometry - Operations

Here you find nodes to modify the geometry.

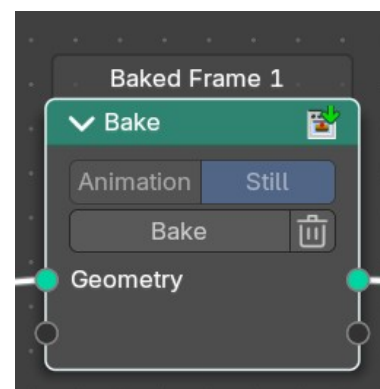

## Bake

Allows saving and loading per-calculated geometry node data. This allows you to bake and “freeze” node tree parts to achieve better performance, where any data up to the node will no-longer be evaluated. Another use is to bake data for use with a render engine.

To bake, the file must be saved first.

**Note:** When baked, the header of the node will show how many frames have been baked.

## Input

### Geometry

Standard geometry input. You can bake multiple geometry inputs.

## Properties

### Animation / Still

Bake an animation or a single frame. Note that the bake node does not do automatic caching.

## Operators

### Bake

The bake operator button. Press this to bake.

### Delete Geometry Node Bake

Delete baked data of a single bake node or simulation.

## Output

### Geometry

Standard geometry output.

## Bounding Box

The Bounding Box geometry node allows you to work with the values of a bounding box.

## Inputs

### Geometry

Standard geometry input.

## Output

### ***Bounding Box***

Standard output.

### ***Min***

The minimum values of the bounding box.

### ***Max***

The maximum values of the bounding box.

---

## Convex Hull

The node allows you to work with the values of a convex hull of this object.

## Inputs

### ***Geometry***

Standard geometry input.

## Output

### ***Convex Hull***

Standard output.

---

## Delete Geometry

The node allows you to work with the values of a convex hull of this object.

## Inputs

### ***Geometry***

Standard geometry input.

### ***Selection***

A selection of the geometry

## Properties

### ***Domain***

What element to delete.

## Mode

Delete mode. Names should be self explaining.

## Output

### Geometry

Standard output.

## Duplicate Elements

Duplicates a part of a geometry a dynamic number of times.

## Inputs

### Geometry

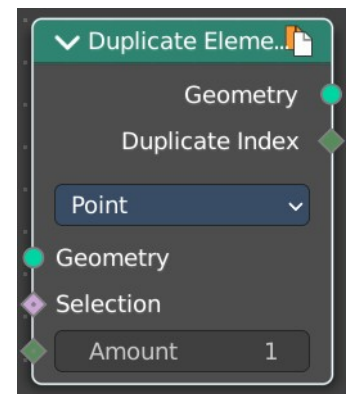

Standard geometry input.

### Selection

A selection of the geometry.

### Amount

Number of times the geometry should be duplicated.

## Properties

### Domain

What element to duplicate.

## Output

### Geometry

Standard output.

### Duplicate Index

The index of the duplicated elements.

## Sort Elements

The *Sort Elements* node rearranges geometry elements by changing their indices.

### Input

#### **Geometry**

The input geometry.

#### **Selection**

A selection of the input geometry. If left blank, all elements are sorted. Non selected elements will be keep their current indices.

#### **Group ID**

Group ID input value. A group is defined as all elements with the same group id. Elements with the same group ID are sorted together. If this is not a field, the node has no affect.

#### **Sort Weight**

The sorted values used to do the reordering. If this is not a field, the node has no affect.

## Properties

### **Domain**

#### **Point**

The fields are evaluated on points, control points, and vertices.

#### **Face**

The fields are evaluated on the edges of the mesh component.

#### **Edge**

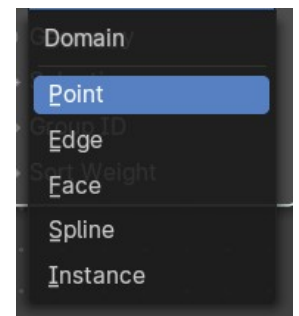

The fields are evaluated on the faces of the mesh component.

#### **Spline**

The fields are evaluated on the splines in the curve component.

#### **Instance**

The fields are evaluated on the top-level instances. Realized instances are ignored.

## Output

### **Geometry**

The output geometry.

---

## Merge by Distance

Welds the selected geometry below a given distance into one vertice.

### Input

#### **Geometry**

The input geometry.

#### **Selection**

A selection of the input geometry.

#### **Distance**

The merge distance. Everything below this distance will be merged into one vertice.

### Properties

#### **Mode**

##### **All**

Merges all vertices in reach.

##### **Connected**

Merges just vertices that are connected by edges.

## Output

### **Geometry**

The output geometry.

## Transform Geometry

Move, rotate or scale the geometry. The transformation is applied to the entire geometry, and not per element. For example, you can not rotate individual point cloud points with this node.

### Mode

The transformation mode for the node.

### Components

Uses single values and vectors.

### Inputs

#### Geometry

Standard geometry input.

#### Translation

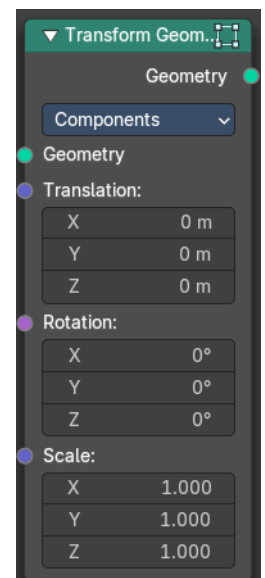

Translates the geometry in local space of the modified object.

#### Rotation

Euler rotation in local space.

#### Scale

Scale to transform the geometries in local space.

### Output

#### Geometry

Standard geometry output.

### Matrix

Uses a matrix to transform.

### Inputs

#### Geometry

Standard geometry input.

#### Transform

Transform matrix input

## Output

### **Geometry**

Standard geometry output.

## Separate Components

Splits a geometry into its components.

## Inputs

### **Geometry**

Geometry input.

## Outputs

### **Mesh**

Mesh component of the input geometry.

### **Point Cloud**

Point cloud component of the input geometry.

### **Curve**

Curve component of the input geometry.

### **Volume**

Volume component of the input geometry.

In case that the input contains multiple volume instances, only the first volume component will be calculated.

### **Instance**

The single instances of the geometry.

## Separate Geometry

Separates a selection of a geometry into its own object.

Tip: when you combine it with the Compare Floats nodem then you get a more precise control of which parts are separated to a given output geometry.

## Inputs

### **Geometry**

Geometry input.

## Selection

Selection input.

## Properties

### Domain

What kind of geometry to separate.

Note that when selecting a domain that doesn't modify all components, the unmodified components will appear in both outputs.

## Outputs

### Selection

Separated selection.

### Inverted

The inverted separated selection.

## Split to Instances

This node allows splitting up a geometry into groups. A group is defined as all elements with the same group id.

The node supports meshes, curves, point clouds and instances. Note that it only works on the top-level geometry. It does not go into nested instances because it also generates new instances.

## Inputs

### Geometry

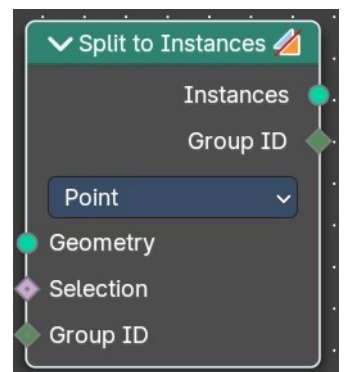

Geometry input.

### Selection

Selection input.

### Group ID

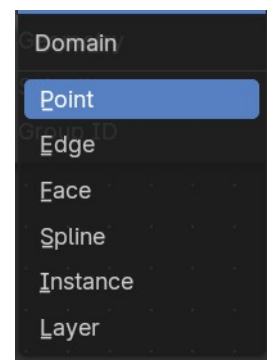

Group ID input value.

## Properties

### Domain

What kind of geometry to separate.

Note that when selecting a domain that doesn't modify all components, the unmodified components will appear in both outputs.

## **Outputs**

### **Instances**

Instances output. An Instance per group.

### ***Group ID***

Group ID output value.

Here you find nodes to modify the geometry.

### Geometry to Instance

Turns every connected input geometry into an instance. These instances can then for example be used in the Instance on Points node.

### Inputs

#### Geometry

The input geometry.

## Outputs

### *Instances*

The output instances.

---

## Join Geometry

The Join Geometry enables you to merge separately generated pieces of geometry into a single one. In case that the inputted pieces contain different types of geometry, the output will contain multiple types of geometry.

## Inputs

### *Geometry*

Standard geometry input.

## Output

### *Geometry*

Standard geometry output.

## Add - Curve - Read

Here you find curve related nodes.

### Curve Handle Positions

Get the position of the left or right handle of a curve point.

### Outputs

#### *Left*

The left handle of the curve point.

#### *Right*

The right handle of the curve point.

### Curve Length

Retrieves the length of all splines added together.

### Inputs

#### *Curve*

The input curve.

### Outputs

#### *Length*

The length of the curve.

## Curve Tangent

Retrieve the tangent direction of a curve. The output values are normalized vectors.

Note that for NURBS and Bézier spline curves the value retrieved from this node is the value at every control point, which may not correspond to the visible evaluated points. For NURBS splines the difference may be even more pronounced and the result may not be as expected. A Resample Curve Node node can be used to create a poly spline, where there is a control point for every evaluated point.

### Outputs

#### *Factor*

The vector of the tangent.

## Curve Tilt

Outputs the angle used to turn the curve normal around the direction of the curve tangent in its evaluated points.

The output is per control point. For NURBS and Bézier splines, the values will be interpolated to the final evaluated points.

### Outputs

#### *Tilt*

The tilt angle for the normal in radians.

## Endpoint Selection

The Endpoint Selection node allows for the Selection of an arbitrary number of endpoints from each spline in a curve. The start and end inputs are evaluated on the spline domain. The result is outputted as a boolean field on the point domain.

### Input

#### *Start Size*

The start point of the spline.

#### *End Size*

The end point of the spline.

## Outputs

### **Selection**

Selection output.

---

## Handle Type Selection

Creates a selection based on the handle types of the control points.

### Properties

#### **Left / Right**

Whether to check for the type of handles.

#### **Handle Type**

What handle type to compare.

### Output

#### **Selection**

The selection.

---

## Is Spline Cyclic

Retrieve if the curve is set to cyclic.

### Outputs

#### **Cyclic**

If the spline is cyclic or not.

---

## Spline Length

Retrieve the total length of each spline in a curve.

### Outputs

#### **Length**

The length of each spline in the curve.

#### **Point Count**

Integer Field input of the number of control points on each spline in the spline domain. Or in the point domain,

it is the number of points on the spline that contains the given control point.

## Spline Parameter

The Curve Parameter node outputs how far along each spline a control point is, with a value between zero and one. The output is different from dividing the index by the total number of control points, because the control points might not be equally spaced along the curve.

The first value is zero, so the output corresponds to the length at the control point rather than including the length of the following segment.

When used on the spline domain, the node outputs the portion of the total length of the curve (including all splines) has been traversed at the start of each spline. The order of the curve's splines is visible in the Spreadsheet Editor.

Note that for NURBS and Bézier spline curves the value retrieved from this node is the value at every control point, which may not correspond to the visible evaluated points. For NURBS splines the difference may be even more pronounced and the result may not be as expected. A Resample Curve Node node can be used to create a poly spline, where there is a control point for every evaluated point.

## Outputs

### **Factor**

The factor of the curve.

### **Length**

The length of the curve.

### **Index**

The index of the curve.

## Spline Resolution

Retrieve the curve resolution. Means the number of spline points.

## Outputs

### **Resolution**

The spline resolution.

## Add - Curve - Sample

Here you find curve related nodes.

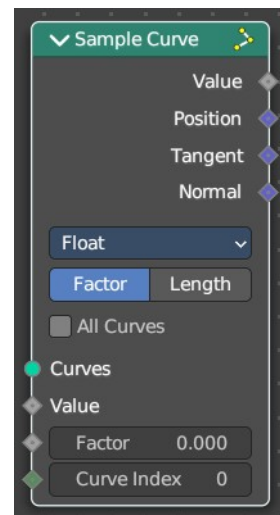

### Sample Curve

Calculates a point on a curve at a certain distance from the start of the curve, specified by the length or factor inputs. It also outputs data retrieved from that position on the curve.

The sampled values are linearly interpolated from the values at the evaluated curve points at each side of the sampled point.

In case that the curve contains multiple splines, the sample position is found based on the total accumulated length, including the lengths of all previous splines. The order of the splines is the same order as displayed in the Spreadsheet Editor.

### Input

#### **Curve**

The input geometry.

#### **Value**

Input Value.

#### **Mode Factor**

#### **Factor**

The resample amount with method Factor.

#### **Curve Index**

The curve index.

#### **Mode Factor**

#### **Factor**

The resample amount with method Factor.

#### **Length**

The resample amount with method Length.

## Properties

### **Data Type**

What data to calculate.

### **Sample Curve Mode**

How to calculate the curve. By a factor, or by its length.

### **All Curves**

Sample lengths based on the length of all curves.

### **Output**

#### **Value**

Output Value.

#### **Position**

The position at the sample along the spline.

#### **Tangent**

The normalized curve tangent at the sample.

#### **Normal**

The normalized curve normal at the sample.

## Add - Curve - Write

Here you find curve related nodes.

### Set Curve Normal

Set the evaluation mode for curve normals.

#### Input

##### **Curve**

The input curve.

##### **Selection**

A selection of the input curve.

#### Properties

##### **Mode**

The evaluation mode for the curve normals.

#### Outputs

##### **Curve**

The curve output.

### Set Curve Radius

Set the curve radius.

#### Input

##### **Geometry**

The input curve.

## ***Selection***

A selection of the input curve.

## ***Radius***

The radius to set.

## **Outputs**

### ***Geometry***

Standard geometry output.

---

## **Set Curve Tilt**

Controls the tilt angle at each curve control point.

### **Input**

#### ***Geometry***

The input curve.

#### ***Selection***

Whether or not to change the value on each control point. True values mean the value will be changed, false values mean the value will remain the same.

#### ***Tilt***

The tilt rotation.

### **Outputs**

#### ***Curve***

Standard geometry output.

---

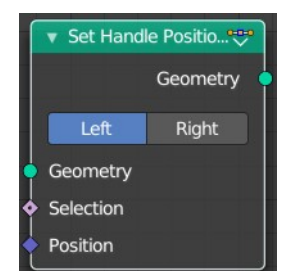

## **Set Handle Positions**

Set the handle positions of bezier curves

### **Input**

#### ***Geometry***

The input curve.

## ***Selection***

A selection of the input curve.

## ***Position***

The position of the handle.

## **Properties**

### ***Mode***

Left or right handles.

## **Outputs**

### ***Geometry***

Standard geometry output.

## **Set Handle Type**

Sets a handle type for the curve points of a bezier curve. Handle types determines how the interpolation before and after the curve point happens.

## **Input**

### ***Curve***

The input curve.

### ***Selection***

A selection of the input curve.

## **Properties**

### ***Mode***

Left or right handles.

### ***Handle Type***

The different available handle types.

### **Free**

The handles can be adjusted individually.

### Auto

The left and the right handle will always point to each other. The length of the handles will start in equal size.

### Vector

The handles can be adjusted individually.

### Aligned

The left and the right handle will always point to each other.

### Output

#### Curve

Standard geometry output.

---

## Set Spline cyclic

Sets the spline cyclic. Means looping.

### Input

#### Geometry

The input curve.

#### Selection

A selection of the input curve.

#### Cyclic

Cyclic or not

### Outputs

#### Geometry

Standard geometry output.

## Set Spline Resolution

Sets the resolution of the spline. Means how many evaluated points should be generated on the curve for each control point.

### Input

#### **Geometry**

The input curve.

#### **Selection**

A selection of the input curve.

#### **Resolution**

The resolution of the spline.

### Outputs

#### **Geometry**

Standard geometry output.

## Set Spline Type

Change the curve spline type.

### Input

#### **Curve**

The input curve.

#### **Selection**

A selection of the input curve.

### Properties

#### **Spline Type**

The spline type to set the curve to.

Note that when converting from a NURBS spline to a Bézier spline, at least six points are needed. When the number of points is not a multiple of three a full conversion is not possible and the spline has to be truncated.

## **Output**

### ***Curve***

Standard geometry output.

## Add - Curve

Here you find curve related nodes.

### Curve to Mesh

Converts a curve object to a mesh object. Optionally, a profile curve can be provided to give the curve a custom shape.

#### Inputs

##### Curve

The input curve.

##### Profile Curve

If a profile curve is provided, it will be extruded along all splines. Otherwise the generated mesh will just be a chain of edges.

##### Fill Caps

For cyclic profile curve. Fill the ends of the generated mesh for each spline combination with an N-gon.

The resulting mesh is Manifold, the two new faces for each spline are simply connected to existing edges.

#### Outputs

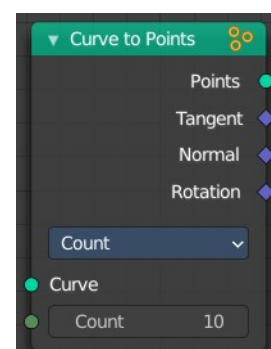

##### Mesh

Standard mesh output.

### Curve to Points

Converts a curve object to a Point cloud.

## Inputs

### **Curve**

The input curve.

## Properties

### **Mode**

How to generate points from the input curve.

### **Evaluated**

Create points from the evaluation points of the curve. This is based on the resolution attribute for nurbs and bezier splines.

### **Count**

Sample each spline by evenly distributing the specified number of points along the spline.

### **Count Input**

The number of points to distribute along the spline.

### **Length**

Sample each spline by splitting the spline into segments by the specified length.

### **Length Input**

The length of the single segments.

## Outputs

### **Point**

Generated point cloud.

### **Tangent**

The normalized curve tangent at the sampled position, or the direct evaluated normal in Evaluated mode.

### **Normal**

The normal value from the evaluated curve at each result point. This is the same value from the Normal Node at those positions.

### **Rotation**

The Euler rotation build from the Tangent and Normal outputs.

## Deform Curves on Surface

Curves that are attached to a surface can follow the surface at modification.

### Inputs

#### Curves

The input curve.

### Outputs

#### Curves

The output curve.

---

## Fill Curve

Fills the curve with mesh geometry. The mesh is only generated flat with a local Z of 0.

### Inputs

#### Curve

The input curve.

#### Group Input

An index used to group curves together. Filling is done separately for each group.

### Properties

#### Mode

#### Triangles or N-gons

Fill the curve with either triangles, or use N-Gon geometry.

### Outputs

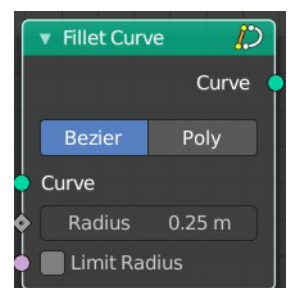

#### Mesh

The output as mesh.

---

## Fillet Curve

The Fillet Curve rounds corners on curve control points, similar to the effect of the Bevel Modifier on a 2D mesh.

A key difference is that the rounded portions created by the Fillet Curve node are always portions of a circle.

## Input

### **Curve**

The input curve.

### **Count**

Polymode. Define the number of vertices that are created.

### **Radius**

The radius of the arc

### **Limit Radius**

Prevent overlapping when the defined radius exceeds the maximum possible radius for a given point.

## Properties

### **Mode**

#### **Bezier**

Creates a circular arc at vertices by changing handle lengths (applicable only for Bezier splines).

#### **Poly**

Creates a circular arc by creating vertices (as many as defined by the Count fields input) along the arc (applicable for all spline types).

## Outputs

### **Curve**

Standard geometry input with a curve component.

## Interpolate Curves

Generates new curve parts by interpolating between existing curves.

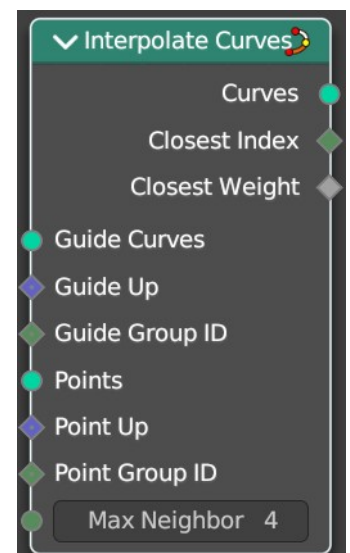

## Input

### **Guide Curves**

The base curves to interpolate from.

### **Guide Up**

An optional up vector that is typically a surface normal. Providing this up vector can improve the quality of the interpolation.

This up direction can be retrieved with a combination of the Sample UV Surface Node using the same geometry that the points were distributed on, and the Normal Node.

### **Guide Group ID**

Splits guides into separate groups. New curves interpolate existing curves from a single group.

### **Points**

The positions of the first root control points of the newly generated interpolated curves.

### **Points Up**

Optional up vector that is typically a surface normal.

### **Point Group ID**

The curve group to interpolate in.

### **Max Neighbor**

Maximum amount of close guide curves that are taken into account for interpolation.

## **Outputs**

### **Curves**

The new curve.

### **Closest Index**

Index of the closest guide curve for each generated curve.

Note that internally this node mixes the data from multiple guide curves, with the maximum number of sources depending on the Max Neighbor input. This output is only the index of the curve with the largest weight.

### **Closest Weight**

Weight of the closest guide curve for each generated curve.

## **Resample curve**

Creates a poly spline for each input spline. In the Count and Length modes, the control points of the new poly splines will have uniform spacing.

### **Input**

#### **Curve**

The input geometry.

## ***Selection***

A selection of the input geometry

## ***Count***

The number of control points on the new splines.

## ***Length***

The approximate length between the control points of the new splines.

## **Properties**

### ***Mode***

The resample mode.

### **Evaluated**

Use the resolution attribute for spline and bezier curves.

### **Count**

Use the count of the curve points.

### **Length**

Use the length of the curve.

## **Output**

### ***Curve***

Standard geometry output.

---

## **Reverse Curve**

Reverses the direction of the spline. The start point becomes the end point and vice versa. The shape of the spline is not modified.

## **Inputs**

### ***Curve***

The input curve.

### ***Selection***

An optional selection attribute to determine which part of the spline should be reversed.

## Outputs

### Curve

Standard geometry output.

---

## Subdivide Curve

Subdivides the curve. The shape is not changed.

### Inputs

#### Geometry

The input curve.

#### Cuts

The number of cuts per segment.

### Outputs

#### Geometry

Standard geometry output.

---

## Trim Curve

The Curve Trim node shortens each spline in the curve by removing sections at the start and end of each spline.

Bézier splines will still output as Bézier splines. The first and last control point and its handles will be moved as necessary to preserve the shape. But NURBS splines will be transformed into poly splines in order to be trimmed.

Cyclic splines are currently not supported.

Note that if the Start input is larger than the End, then the resulting spline will have a single point, located at the sample location of the Start value.

### Inputs

#### Curve

The input curve.

#### Selection

A selection of the curve.

### ***Start***

The start point of the spline, as a factor.

### ***End***

The end point of the spline, as a factor.

## **Properties**

### ***Mode***

How to find endpoint positions for the trimmed spline.

### **Factor**

The endpoint positions of each spline's length is determined by a factor. The input values should be between 0 or 1.

### **Length**

The endpoint positions of each spline is determined by a length from the start of each spline. The input values should be between 0 and the length of the splines.

## **Outputs**

### ***Curve***

Standard geometry output.

### Introduction

This chapter here is about the tools, modes and options elements in the header of the geometry nodes editor.

The text menus are covered in an individual chapter each. They vary too much, dependent of mode and object type.

## Header Tabs

The tabs at the very left allows you to switch between the most important node editor types by one click. Compositor Editor, Geometry Nodes Editor and Shader Editor.

## Geometry Nodes Type

This drop down is to change the Geometry Nodes Type, which are contextual modes that you can choose to create a node-group-defined tool that will later show in the interface as act once operators or as procedural modifiers.

Any geometry node group can then be stored as assets, linked and/or appended to other files.

**Example:** You can create a node tree in the Tools mode of the Geometry Nodes editor that randomly extrudes then deletes faces, then use that as an Act Once operator on your meshes to model destructively in a linear workflow.

## Modifier

The context mode to create procedural modifier stack tool.

## Tool

The context mode to create act once operator tools. In this mode some exclusive nodes are displayed in the Add header menu and Add sidebar.

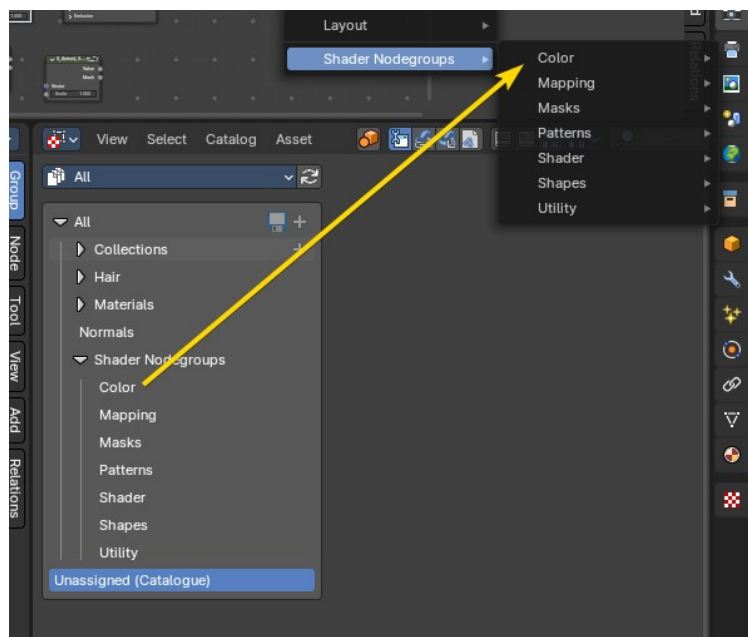

## Use

### Creating a Tool

Switch the Geometry Nodes Type to Tool, then create a new Node Group Tool. Create your operation using Geometry Nodes.

When ready, define the Mode and Data-Type, Asset status, and Catalog assigned to this Node Group Tool, then the Node Group will now become an act-once operator accessible from in the interface.

**Note:** *New node groups created in the tool context will be enabled as Tool in the sidebar by default, though to share them in other files you may need to link, append or mark as asset with the Asset Browser for later use.*

### Defining as an Asset

To share a node group as a tool in other \*.blend files, you need to store the node group as an asset for the Asset Browser. The asset catalog you assign the asset to will be used to determine where the tool will go in the designated menus.

To define where the Node Group Tool is located in the interface, you need to assign the asset to a catalogue in the Asset Browser Editor. If the catalog name matches an existing menu in the interface, the tool will be appended to that specific menu. Assets that have no catalog assigned to them, or local tools, are exposed in the “Unassigned (Catalogue)” menu.

**Note:** *To define if a node group is exposed in the Modifier add menu or into the Tool add menus, go to the sidebar to define it.*

### Modifier

When assigning as a Modifier, the nodegroup asset will show up in the Add menu of the Modifier Stack in the Properties Editor under the assigned asset catalogue name.

**Example:** *In the image to the right, the marked nodegroup has the*

catalogue “Tool” assigned. You can also see the “Essentials” node groups also designated as modifier nodegroups.

## Tool

When assigning as a Tool, the geometry nodes tool nodegroup will show up in the 3D View Editor in the header under the assigned Asset catalogue name – otherwise it will be assigned to the Unassigned (Catalogue) header menu.

**Note:** You can have both a geometry nodes tool and modifier stack nodegroup simultaneously.

**Example:** In the image to the right, the marked nodegroup has the catalogue “Object” and a sub catalogue “Quick Effects” assigned. It now is located in the existing in the header.

## Unassigned (Catalogue)

When a nodegroupd stored as a Modifier or Tool without a catalogue, it will be exposed in the submenu called “Unassigned (Catalogue)”. Both marked and unmarked nodegroups will display here if there is not catalogue assigned from the Asset Browser.

## Defining Modes and Data-Types

Node group tools must specify which modes and object types they support to determine where the tool is exposed in the user interface.

### Types

The type of object where the tool is contextually accessible.

### Modes

The mode where the tool is contextually accessible.

## Tool-specific Nodes

The following nodes are only supported in the *Tool* context:

- Add>Input>Scene>3D Cursor Node
- Add>Mesh>Read>Face Set Node
- Add>Geometry>Read>Selection Node
- Add>Mesh>Read>Set Face Set Node
- Add>Geometry>Write>Set Selection Node

**Note:** *The Self Object node returns the Active object when inside a Tool node group.*

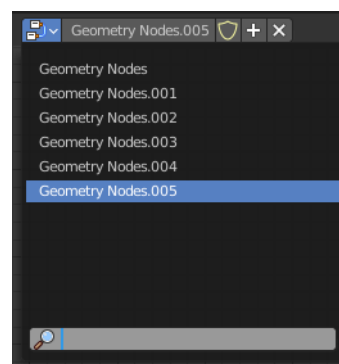

## Geometry Nodes Prop

Manage the nodes. If there is no geometry node tree for the current object, then you will see the New button

## Data Browser

The list of available geometry node trees in the scene.

## Edit box

The name of the current active geometry node tree. Here you can also rename the node tree.

## Add Fake User

With this button you assign a fake user to this selected geometry node tree.

Data, like node trees, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## User

The number of users that uses this data. Data with a user number of 0 will be removed with closing Bforartists.

## Remove

Removes the geometry node tree. To delete it completely you need to purge it. See Fake user.

## Options

At the right side you will see some options.

### Pin (pin icon)

The pin button will keep the current node tree selection fixed. When a node tree is pinned, it will remain visible in the shader editor even when another object is selected.

### Parent Node Tree

Grouping nodes can simplify a node tree by allowing instancing and hiding parts of the tree. Nodes can be grouped. This button becomes active when you work with such grouped nodes, and you are in a child group. It allows you to switch to the parent group.

### Snap

Activates snapping. When the tool is activated, then you will also reveal the snap settings where you can choose different snap methods.

## Geometry node Overlays

### Show Overlays

Show or hide the overlays.

## Node Editor Overlays

Activates the node editor overlays. When the tool is activated, then you will also overlays settings in the editor. The drop down arrow to the right shows different overlay types.

### Wire Colors

Color node links based on their connected sockets.

**Example:** The Geometry socket is green that makes a green line, and the Integer socket is dark green that makes a dark green line.

### Reroute Auto Labels

Label reroute nodes based on the label of connected reroute nodes.

**Example:** The first reroute label to the right has concurring reroute labels down the line. If you toggle this off, the concurring reroute labels down the line won't contain labels.

### Context Path

Display breadcrumbs for the editor's context.

### Annotations

Shows annotations for this editor view that have been drawn by the annotation tool.

### Timings

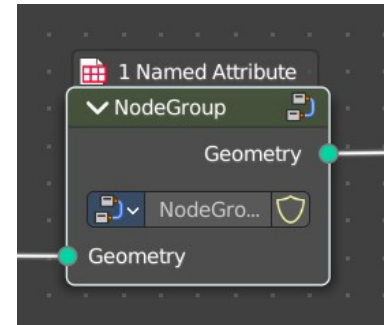

Shows a timing box above each node to indicate the evaluation time of it.. This option is only available for compositing and geometry nodes.

## Named Attributes

Adds an overlay that helps users to see where named attributes are used with node groups

This helps to see where named attributes are used.

## Add menu - Curve Primitives

Add curve primitives in different shapes.

### Arc

Adds a bezier curve segment in the shape of an arc

### Inputs

#### Resolution

The number of edges on the curve.

#### in Radius mode

#### Radius

Just Radius mode. The radius of the arc.

#### Start Angle

Just Radius mode. The start angle of the arc.

#### Sweep Angle

Just Radius mode. The sweep angle of the arc.

#### In Points Mode

#### Start

The start point vector of the ark.

#### Middle

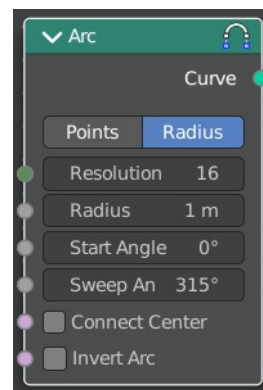

The middle point vector of the ark.

#### End

The end point vector of the ark.

#### Offset Angle

The offset angle of the ark.

## **Connect Center**

Connect the start and endpoints to the center.

## **Invert Arc**

Inverts the arc.

## **Properties**

### **Mode**

Point or Radius mode.

Radius mode (default): Generates a fixed radius arc on XY plane with controls for Angle, Sweep and Invert.

Points mode: Generates a three point curve arc from Start to End via Middle with an Angle Offset and option to invert the arc. There are also outputs for arc center, radius and normal direction relative to the Z-axis.

## **Outputs**

### **Curve**

Curve output.

### **In Points Mode**

### **Center**

The center vector of the arc.

### **Normal**

The normal of the arc.

### **Radius**

The radius of the arc.

---

## **Bezier Segment**

Adds a bezier curve segment.

## **Inputs**

### **Resolution**

The number of edges on the curve.

### **Start, End**

Positions of the start and end control point of the curve.

## ***Start Handle, End Handle***

Positions of the handles used to define the shape of the curve.

## **Properties**

### ***Mode***

### **Position**

The handle inputs are the absolute positions of the handles in 3D space.

### **Offset**

The handle positions are relative to the control point on the curve. The handle inputs give the offset from the control points.

## **Outputs**

### ***Curve***

Bezier spline generated from the inputs.

## **Curve Circle**

Adds a curve in circle shape.

## **Inputs**

### ***Resolution***

Number of edges on the circle.

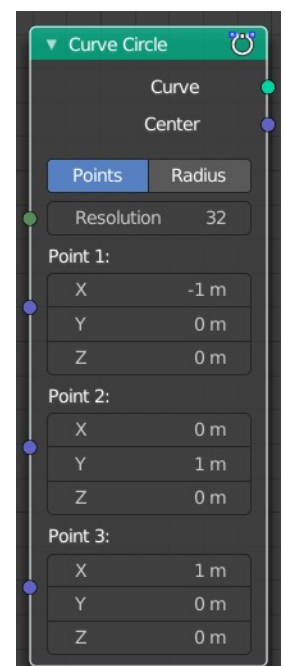

### ***Radius***

The radius of the circle.

### ***Point 1, Point 2, Point 3***

Appears when you change the method to Points. Defines three points on the circle. The order of the points determines the direction (clockwise or counterclockwise) of the circle.

Note that because of the finite resolution, the three points do not necessarily lie on the generated curve.

## Properties

### Mode

### Points

The position and radius of the circle is defined by three points. The center of the circle is also given as an output. If the three points lie on one line, no geometry is generated.

### Radius

The circle is defined by the radius.

## Outputs

### Curve

Poly spline generated from the inputs.

### Center

Appears when you change the method to Points. The center of the circle defined by the three points.

## Curve Line

Adds a curve in the shape of a straight line.

## Properties

### Points

Calculates the curve by a start and end point.

### Start

The start point of the curve.

### End

The end point of the curve.

### Direction

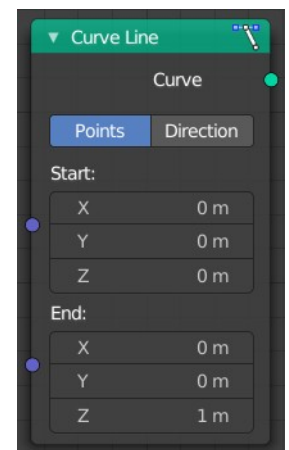

Calculates the curve by a start point, a direction vector and the length of the curve.

### Start

The start point of the curve.

### Direction

The direction vector.

## Length

The length of the curve.

## Outputs

### Curve

The created curve.

---

## Curve Spiral

Adds a curve in spiral shape. By default the spiral twists clockwise.

## Inputs

### Resolution

Number of edges for each full rotation.

### Rotations

Number of times the spiral makes a full rotation.

### Start Radius, End Radius

Radius of the start point and end point of the spiral. The radius of the spiral changes linearly between the two values over the whole spiral.

### Height

Height of the spiral.

### Reverse

Boolean value that changes the direction from clockwise to counterclockwise when turned on.

## Outputs

### Curve

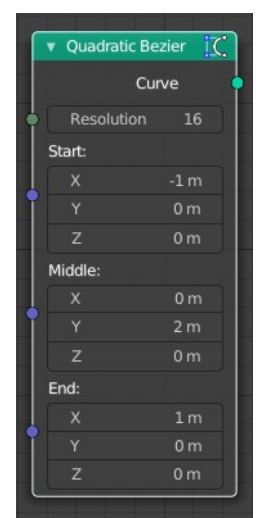

Poly spline generated from the inputs.

---

## Quadratic Bezier

Adds a curve from the given control points. The generated shape is a parabola.

## Inputs

### **Resolution**

The number of edges on the curve.

### **Start, Middle, End**

Positions of the three control points. The generated curve passes through the two end points, and is tangent to the lines between the middle point and the two end points.

## Outputs

### **Curve**

Poly spline generated from the inputs.

## Quadrilateral

Adds a curve in different geometric shapes.

Note that the names does not necessarily fit to the generated geometry.

### **Input**

The input nodes may vary. See Properties.

### **Properties**

#### **Mode**

#### **Rectangle**

creates a straight line in y direction.

#### **Width**

The length of the straight line.

#### **Parallelogram**

Creates a straight line that is adjustable in x and y direction.

#### **Height**

The height of the line.

### Offset

The width of the line.

### Trapezoid

#### Height

The height of the trapez.

#### Bottom Width

The width of the bottom line of the trapez.

#### Top Width

The width of the top line of the trapez.

#### Offset

The offset of the top line of the trapez.

### Kite

creates a straight line in y direction. The curve end points are separately adjustable

#### Bottom Height

The length of the bottom part of the line.

#### Top Height

The length of the top part of the line.

### Points

Creates a rectangle. Each point of the rectangle is independantly adjustable in x, y and z position.

### Star

Adds a curve in star shape.

This is done by connecting alternating points of two circles. The points on the inner circle

are offset by a rotation so that they lie in between the points on the outer circle. This offset can be changed with the twist input.

## **Inputs**

### ***Points***

Number of points on each of the circles.

### ***Inner Radius, Outer Radius***

Radii of the two circles. The inner radius can be bigger than the outer radius.

### ***Twist***

Angle offset of the inner circle. The twist value rotates the points on the circle corresponding with the inner radius counterclockwise by the given angle.

## **Outputs**

### ***Curve***

Poly spline generated from the inputs.

Curve topology related nodes.

### Curve of Point

Retrieve the curve of which the control point is part of.

#### Inputs

##### *Point Index*

The point index of the curve.

##### *Offset*

Offset of the point index.

#### Outputs

##### *Curve Index*

The curve of which the control point is part of.

##### *Index in Curve*

How far along the curve the control point is.

### Offset Points in Curve

Offset a control point index in the curve.

#### Inputs

##### *Point Index*

The point index of the curve.

##### *Offset*

Offset of the point index.

## Outputs

### ***Is Valid Offset***

Outputs true if the evaluated controlpoint plus the offset is a valid index.

### ***Point Index***

The index of the control point plus the offset.

---

## Points of Curve

Retrieve a point index within a curve.

## Inputs

### ***Curve Index***

The curve to retrieve the data from

### ***Weights***

Values to sort the curve points.

### ***Sort Index***

The point to output.

## Outputs

### ***Point Index***

The output point.

### ***Total***

The number of points in the curve.

## Add menu - Instances

### Instance on Points

Instances geometry on points.

#### Inputs

##### **Points**

Standard points input.

##### **Selection**

A selection of the point cloud.

##### **Instance**

Instance input.

##### **Pick Instance**

Select an instance of the point cloud.

##### **Instance Index**

The instance of the index

##### **Rotation**

The initial rotation. This is a rotation socket.

##### **Scale**

The initial scale.

## Output

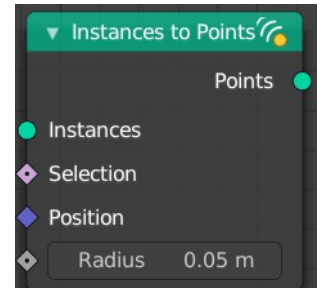

### Instances

Instances output.

---

## Instances to Points

This node takes a geometry set with instances as input, and outputs points located on the origins of the top level of instances in the geometry set (not nested instances). It also has position and radius inputs to allow overriding the default, and a selection input to only generate points for some instances.

## Inputs

### Instances

Instances input.

### Selection

A selection of the instance.

### Position

The position of the instance.

### Radius

The radius of the points.

## Output

### Instances

Points output.

---

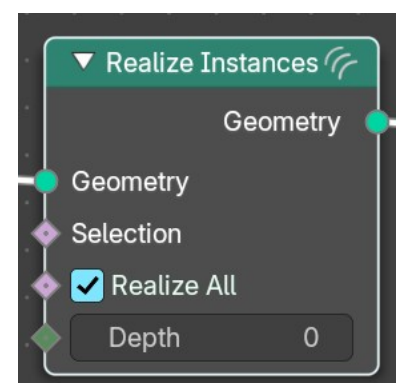

## Realize Instances

Makes the instances in the geometry input real. This means each instance becomes its own object with unique mesh data. This node is useful to realize instances either on everything or to a level of instance depth.

## Inputs

### Geometry

Geometry Input.

## Selection

Geometry Input.

## Realize All

Boolean Input. This realizes all level of nested instances for a top-level realization of instances. This overrides the value of the Depth input.

## Depth Input

Number of levels of nested instances to realize for each top-level instance.

**Note:** Only relevant when Realize All is toggled off.

## Outputs

### Geometry

Geometry outputs.

## Rotate Instances

Rotates the instances of a geometry.

### Inputs

#### Geometry

Standard geometry input.

#### Selection

A selection of the geometry.

#### Rotation

The initial rotation.

#### Pivot Point

The pivot point position to rotate around.

#### Local Space

Rotate in world space or in Local Space of the object.

### Output

#### Geometry

Standard geometry output.

## Scale Instances

Rotates the instances of a geometry.

### Inputs

#### **Geometry**

Standard geometry input.

#### **Selection**

A selection of the geometry.

#### **Scale**

The initial scale.

#### **Center**

The pivot point position to scale around.

#### **Local Space**

Rotate in world space or in Local Space of the object.

### Output

#### **Geometry**

Standard geometry output.

## Translate Instances

Rotates the instances of a geometry.

## Inputs

### **Geometry**

Standard geometry input.

### **Selection**

A selection of the geometry.

### **Translation**

The amount to move.

### **Local Space**

Rotate in world space or in Local Space of the object.

## Output

### **Geometry**

Standard geometry output.

## Set Instance Transform

This node allows replacing the transformation of every instance by providing a matrix.

## Inputs

### **Instances**

The input instances.

### **Selection**

A selection of the geometry.

### **Transform**

The transform matrix that you want to apply to every instance.

## Output

### **Instances**

The output instances.

## Instance Transform

Retrieves the transform of the instances.

### Output

#### *Transform*

Transform Field output.

---

## Instance Rotation

Retrieves the rotation of the instances.

### Output

#### *Rotation*

Vector Field output

---

## Instance Scale

Retrieves the scale of an instances.

### Output

#### *Scale*

Vector Field output

## Add menu - Mesh - Read

Nodes to modify the mesh geometry.

### Edge Angle

Calculates the angle in radians between two faces that meet at an edge. Without two faces on the edge, the angle will be 0.

#### Outputs

##### *Unsigned Angle*

The unsigned output angle. The shortest angle will be picked.

##### *Signed Angle*

The signed angle between the two faces, where Convex angles are positive and Concave angles are negative. This calculation is slower than the unsigned angle.

### Edge Neighbours

Outputs the number of faces connected to each edge.

#### Outputs

##### *Face Count*

The number of faces.

### Edge Vertices

Outputs the index and position of the two vertices that defines an edge. Index outputs an integer. Position a vector.

## Outputs

### ***Vertex Index 1***

The index of the first vertice.

### ***Vertex Index 2***

The index of the second vertice.

### ***Position 1***

The position of the first vertice.

### ***Position 2***

The position of the second vertice.

---

## Edges to Face Group

Group Faces into regions, surrounded by the selected boundary edges.

## Inputs

### ***Boundary Edges***

The input edges.

## Outputs

### ***Face Group ID***

The output face group.

---

## Face Area

Gives each face area a unique id. Which can be used in a capture attribute for example, to create instances of other geometry to this now unique face areas.

## Outputs

### ***Area***

The face area output.

## Face Group Boundaries

Find edges on the boundaries between face sets

### Inputs

#### Face Set

The input face sets to calculate the boundaries from.

### Outputs

#### Boundary Edges

The edges that lies on the boundaries between the different face sets

#### Face Count

The face count for the face neighbors.

---

## Face Neighbours

Outputs the number of vertices or faces connected to each face.

### Outputs

#### Vertex Count

The vertex count for the face neighbors.

#### Face Count

The face count for the face neighbors.

---

## Face Sets – Tool Mode

Get each face's sculpt face set value to use in the geometry node tree.

This node is only available in the Tool Mode for Node Group Tools assets.

### Outputs

#### Face Set

A face set ID output as integer fields.

#### Exists

A boolean field output that shows where a face set exists or not.

## Is Face Planar

Returns true if all of the points of the evaluated face are on the same plane.

### Inputs

#### *Threshold*

The threshold to consider the points to be at the same plane.

### Outputs

#### *Planar*

True if the face is planar.

---

## Is Face Smooth

Retreives if the face is shaded smooth.

### Outputs

#### *Smooth*

Smooth output.

---

## Is Edge Smooth

Retreives if the edge is shaded smooth.

### Outputs

#### *Smooth*

Smooth output.

---

## Mesh Island

Outputs a separate index for each mesh island. The indices are based on the order of the lowest-numbered vertex in each island.

### Outputs

#### *Index*

The index output.

## Shortest Edge Path

Calculates the shortest path from multiple start points.

### Input

#### ***End Vertex***

The last point of the path.

#### ***Edge Cost***

The amount of calculation to find the shortest path.

### Outputs

#### ***Next Vertex Index***

The vertices index of the shortest path.

#### ***Total Cost***

The calculation amount.

## Vertex Neighbors

Outputs the number of vertices or faces connected to each vertex.

### Outputs

#### ***Vertex Count***

The vertex count for the vertex neighbors.

#### ***Face Count***

The face count for the vertex neighbors.

## Add menu - Mesh - Sample

Nodes to modify the mesh geometry.

### Sample Nearest Surface

Calculate the interpolated value of a mesh attribute on the closest point of its surface.

#### Inputs

##### **Mesh**

Input mesh.

##### **Value**

The value to calculate.

##### **Group ID**

Is evaluated on the face domain, and splits the input mesh into multiple parts, each with its own id.

##### **Sample Position**

The sample position to calculate.

##### **Sample Group ID**

Determines in which group the closest nearest surface is detected.

#### Properties

##### **Data Type**

Which data to calculate.

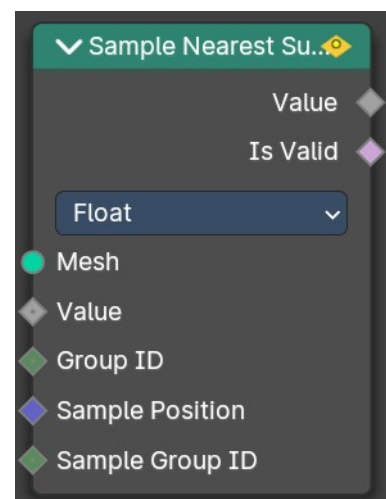

#### Outputs

##### **Value**

The output value.

##### **Is Valid**

Whether the sampling was successful. It is false when the sampled group is empty.

## Sample UV Surface

Calculate the interpolated value of a mesh attribute at a UV coordinate.

### Inputs

#### **Mesh**

Input mesh.

#### **Value**

The value to calculate.

#### **Source UV Map**

The input UV map.

#### **Sample UV**

The sample position to calculate.

### Properties

#### **Data Type**

Which data to calculate.

### Outputs

#### **Value**

The output value.

#### **Is Valid**

Whether the node could find a single face to sample at the uv coordinate.

# Add menu - Mesh - Write

These are nodes for working with Mesh data.

## Set Face Set – Tool Mode

Set sculpt face set values for faces based on a selection and face set ID, for tool execution.

This node is only available in the Tool Mode for Node Group Tools assets.

### Input

#### **Mesh**

Geometry Input mesh.

#### **Selection**

A selection of the input mesh,

### Outputs

#### **Mesh**

Geometry output mesh.

## Set Shade Smooth

Retrieves if the geometry is shaded smooth.

### Input

#### **Geometry**

Input mesh.

#### **Selection**

A selection of the input mesh.

#### **Shade Smooth**

Set the shading to smooth.

## **Properties**

### ***Domain***

#### **Edge**

Set Edge to smooth.

#### **Face**

Set Face to smooth

## **Outputs**

### ***Geometry***

Geometry output.

## Add menu - Mesh - Operations

Nodes to modify the mesh geometry.

### Dual Mesh

The Dual Mesh node calculates the dual of the input mesh. This means that faces get replaced with vertices and vertices with faces.

#### Inputs

##### *Mesh*

The input mesh.

##### *Keep Boundaries*

Keep the (non-manifold) boundaries of the mesh intact.

#### Outputs

##### *Dual Mesh*

The output mesh.

### Edge Paths to Curves

Converts Edge Paths to Curves.

#### Inputs

##### *Mesh*

The input mesh.

## ***Start Vertices***

The start vertices of the edge path.

## ***Next Vertex Index***

The edge path by index.

## **Outputs**

### ***Curves***

The output curve.

## **Edge Path to Selection**

Calculates an edge path, and converts it to a selection

## **Inputs**

### ***Start Vertices***

The start vertices of the edge path.

### ***Next Vertex Index***

The edge path by index.

## **Outputs**

### ***Selection***

The selection

## **Extrude Mesh**

Extrudes out geometry at the selection by a given amount.

## **Inputs**

### ***Mesh***

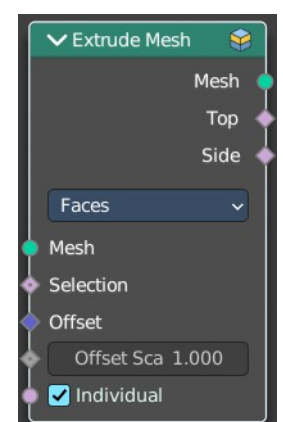

The input mesh.

### ***Selection***

A selection of the mesh.

### ***Offset***

The offset amount.

## **Offset Scale**

The offset scale. Without an offset this is equal the amount.

## **Individual**

Just Faces mode. Extrude out individual faces.

## **Properties**

### **Mode**

What kind of elements to extrude out. Vertices, Edges or Faces.

## **Outputs**

### **Mesh**

The output mesh.

### **Top**

The top elements of the extrusion.

### **Side**

The side elements of the extrusion.

---

## **Flip Faces**

Flips the winding order of the selected faces.

Blender developers decided not to call it Flip Normals. Since "normals are derived data, changing them is only a side effect." However, what the node does is in fact to flip the normals.

## **Inputs**

### **Mesh**

The input mesh.

### **Selection**

A selection of the input mesh.

## **Outputs**

### **Dual Mesh**

The output mesh.

## Mesh Boolean

The Boolean Node allows you to cut, subtract, and join the geometry of two inputs. This node offers the same operations as the Boolean modifier.

### Inputs

#### **Geometry 1, 2**

Standard geometry input.

#### **Self Intersect**

Allow self intersection.

#### **Hole Tolerant**

Allow holes.

### Properties

#### **Operation**

The boolean operation.

#### **Intersect**

Produce a new geometry containing only the volume inside of both geometry 1 and geometry 2.

#### **Union**

The two input pieces of geometry are joined, then any interior elements are removed.

#### **Difference**

Geometry 2 is subtracted from geometry 1 (everything outside of geometry 2 is kept).

#### **Solver**

#### **Float**

Simple solver for the best performance. Does not support overlapping geometry.

#### **Exact**

Exact solver for the most accurate result.

### Output

#### **Geometry**

Standard geometry output.

## Mesh to Curve

Converts a mesh geometry to a curve geometry.

### Inputs

#### *Mesh*

Input mesh.

#### *Selection*

A selection of the input mesh.

### Outputs

#### *Curve*

Standard curve output.

## Mesh to Points

Converts a mesh geometry to a point geometry.

### Inputs

#### *Mesh*

Input mesh.

#### *Selection*

A selection of the input mesh.

#### *Position*

The position of the points.

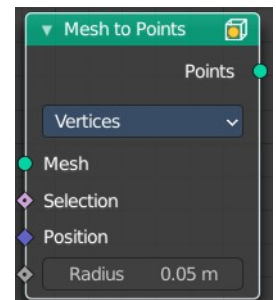

#### *Radius*

The radius of the points

### Properties

#### *Mode*

What geometry to convert to points.

## Outputs

### **Curve**

Standard curve output.

## Mesh to Volume

Converts a mesh geometry to a Volume.

## Inputs

### **Mesh**

Input mesh.

### **Density**

The density of the volume

### **Voxel Amount / Voxel Size**

The voxel amount / the voxel size

### **Exterior Bandwidth**

How much exterior bandwidth is calculated outside of the mesh. The larger the value the more unnecessary ray calculations happens.

### **Interior Bandwidth**

Where to start the calculation inside of the volume.

## Properties

### **Resolution**

How to calculate the volume. Based of the size or based at the amount.

## Outputs

### **Volume**

The volume output.

## Scale Elements

Allows to scale the selected elements.

### Inputs

#### Geometry

Standard geometry input.

#### Selection

A selection of the geometry.

#### Scale

The scale factor

#### Center

The center of the scaling.

#### Axis

Scale Mode Single axis only. Scale the selection separately along its single axis.

### Properties

#### Domain

What kind of elements to scale.

#### Scale Mode

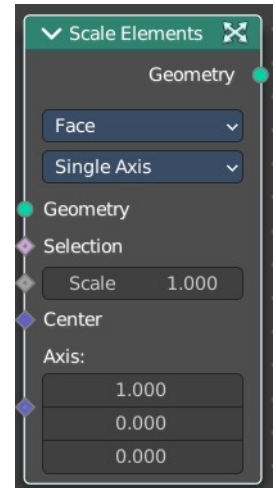

Uniform scales uniformly in all three world coordinates.

Single Axis scales separately in the single axis.

### Outputs

#### Geometry

The output geometry.

## Split Edges

Splits the edges of the geometry.

Note that splitting edges breaks the mesh topology.

### Inputs

#### **Mesh**

Input mesh.

#### **Selection**

A selection of the input mesh.

### Outputs

#### **Mesh**

Standard Mesh output.

## Subdivide Mesh

Subdivides the geometry by a simple division.

### Inputs

#### **Geometry**

Standard geometry input.

#### **Level**

To which degree the geometry will be deformed.

### Outputs

#### **Geometry**

Standard geometry output.

## Subdivision Surface

The Subdivision Surface node subdivides the geometry using Catmull-Clark deformation.

## Inputs

### **Geometry**

Standard geometry input.

### **Level**

To which degree the geometry will be deformed.

### **Creases**

Control how smooth edges should be with Weighted Edge Creases.

## Properties

### **UV Smooth**

The method to deal with smoothing the UV.

### **Boundary Smooth**

Controls if open boundaries and corners are smooth.

## Outputs

### **Geometry**

Standard geometry output.

---

## Triangulate

The Triangulate node triangulates all faces in a mesh.

## Inputs

### **Geometry**

Standard geometry input.

### **Minimum Vertices**

Minimum number of vertices a face must have to be triangulated. For example, setting this value to 5, will prevent triangulation of Quads and only triangulate N-gons.

## Properties

### ***Quad Method***

A quad is a polygon with four edges.

### **Beauty**

Split the quads in nice triangles, slower method.

### **Fixed**

Split the quads on their 1st and 3rd vertices.

### **Fixed Alternate**

Split the quads on their 2nd and 4th vertices.

### **Shortest Diagonal**

Split the quads based on the diagonal distance between their vertices.

### ***Polygon Method***

Meant are N-Gons. Faces with more than four edges. Tris, Quads and N-Gons are all Polygons.

### **Beauty**

Arrange the new triangles nicely, slower method.

### **Clip**

Split the polygons using an ear-clipping algorithm (gives similar results to the tessellation used for the viewport rendering).

## Outputs

### ***Geometry***

Standard geometry output.

## Add menu - Mesh - Primitives

Nodes to modify the mesh geometry.

### Cone

Cone creates a Cone mesh.

### Input

#### **Vertices**

Number of vertices.

#### **Radius Top**

The initial radius at the top.

#### **Side Segments**

Adjust the number of segments at the side.

#### **Fill Segments**

Adjust the number of segments at the fill faces.

#### **Radius Bottom**

The initial radius at the bottom.

#### **Depth**

The initial height.

### Properties

#### **Fill Type**

Defines how the Circle mesh is filled.

#### **None**

pure edge geometry.

## N-Gon

The circle face is a N-Gon face.

## Triangles

The circle face is triangulated.

## Outputs

### Geometry

Standard geometry output.

---

## Cube

Cube creates a Cubeoid mesh.

## Input

### Size

The initial size in X , Y and Z dimensions

### Vertices

How much vertices the single edges has. This allows to subdivide the cube.

## Output

### Geometry

Standard geometry output.

---

## Cylinder

Cylinder creates a Cylinder mesh.

## Input

### Vertices

Number of vertices.

### Side Segments

Adjust the number of segments at the side.

## **Fill Segments**

Adjust the number of segments at the fill faces.

## **Radius**

The initial radius.

## **Depth**

The initial height.

## **Properties**

### **Fill Type**

Defines how the Circle mesh is filled.

### **None**

pure edge geometry.

### **N-Gon**

The circle face is a N-Gon face.

### **Triangles**

The circle face is triangulated.

## **Outputs**

### **Geometry**

Standard geometry output.

## **Grid**

Grid creates a grid mesh.

## **Input**

### **Size**

The initial size.

### **Vertices X**

The initial number of vertices in X direction.

### **Vertices Y**

The initial number of vertices in Y direction.

## Outputs

### **Geometry**

Standard geometry output.

---

## Ico Sphere

Ico Sphere creates a ico Sphere mesh.

### Input

#### **Radius**

The initial radius.

#### **Subdivisions**

The initial subdivisions.

### Outputs

#### **Geometry**

Standard geometry output.

---

## Mesh Circle

Circle creates a Circle mesh.

### Input

#### **Vertices**

Number of vertices.

#### **Radius**

The initial radius.

### Properties

#### **Fill Type**

Defines how the Circle mesh is filled.

## None

pure edge geometry.

## N-Gon

The circle face is a N-Gon face.

## Triangles

The circle face is triangulated.

## Outputs

### **Geometry**

Standard geometry output.

## Mesh Line

Line creates a line mesh.

### Input

#### **Count**

The initial number of segments.

#### **Start Location**

The initial location.

#### **Offset**

The initial offset.

### Properties

#### **Mode**

#### **Offset**

Specify the offset from one vertice to the next.

#### **End Points**

Specify the line start and endpoints.

#### **Count Mode**

#### **Count**

Specify the number of total vertices.

## End Points

Specify the distance between the vertices.

## Outputs

### Geometry

Standard geometry output.

---

## UV Sphere

UV Sphere creates a uv sphere mesh.

## Input

### Segments

The initial number of segments.

### Rings

The initial number of edgerings.

### Radius

The initial radius.

## Outputs

### Geometry

Standard geometry output.

Mesh topology related nodes.

### Corners of Edge

Retrieve the corners that makes up a edge.

#### Input

##### **Face Index**

The face to get the data from.

##### **Weights**

Values used to sort the corners of the face.

##### **Sort Index**

Which of the corners to output.

#### Outputs

##### **Corner Index**

The output corner.

##### **Total**

The number of corners in the face.

### Corners of Face

Retrieve the corners that makes up a face.

## Input

### **Face Index**

The face to get the data from.

### **Weights**

Values used to sort the corners of the face.

### **Sort Index**

Which of the corners to output.

## Outputs

### **Corner Index**

The output corner.

### **Total**

The number of corners in the face.

---

## Corners of Vertex

Retrieve face corners connected to vertices.

## Input

### **Vertex Index**

The vertice to get the data from.

### **Weights**

Values used to sort the corners attached to the vertice.

### **Sort Index**

Which of the corners to output.

## Outputs

### **Corner Index**

The output corner.

### **Total**

The number of corners connected to each vertice.

## Edges of Corner

Retrieve the edges of both sides of a corner.

### Input

#### **Corner Index**

The corner to retrieve the data from.

### Outputs

#### **Next Edge Index**

The edge behind the corner.

#### **Previous Edge Index**

The edge before the corner.

---

## Edges of Vertex

Retrieve the edges connected to each vertex.

### Input

#### **Vertex Index**

The vertice to get the data from.

#### **Weights**

Values used to sort the edges attached to the vertice.

#### **Sort Index**

Which of the edges to output.

### Outputs

#### **Edge Index**

The output edge.

#### **Total**

The number of edges connected to each vertice.

## Face of Corner

Retrieve the faces connected to each corner.

### Input

#### **Corner Index**

The corner to get the data from.

### Outputs

#### **Face Index**

The output faces.

#### **Index in Face**

The index of the corner, starting from the first corner in the face.

## Offset Corner in Face

Retrieve corners within the same face as another

### Input

#### **Corner Index**

The corner to get the data from.

#### **Offset**

The numbers of corners to move around the face before getting the result. It circles around the start of the face if necessary.

### Outputs

#### **Corner Index**

The index of the offset corner.

## Vertex of corner

Retrieve the vertex each corner is attached to.

## **Input**

### ***Corner Index***

The corner to get the data from.

### ***Offset***

The numbers of corners to move around the face before getting the result. It circles around the start of the face if necessary.

## **Outputs**

### ***Vertex Index***

The vertex each corner is attached to.

## Add menu - UV

Here you find nodes to modify the UV mapping.

### Pack UV Islands

Pack the UV islands to get the most out of the UV mapping.

#### Inputs

##### *UV*

The input UV geometry.

##### *Selection*

A selection of the UV geometry.

##### *Margin*

How big the gap between the single UV patches should be.

##### *Rotate*

Rotate the UV patches while packing or not.

#### Outputs

##### *UV*

The output UV geometry.

### UV Unwrap

Unwrap the mesh to give it an UV mapping.

#### Inputs

##### *Selection*

Which faces of the mesh should be unwrapped.

##### *Seam*

Mark edges as a seam for unwrapping.

### ***Margin***

How big the gap between the single UV patches should be.

### ***Fill Holes***

Virtually fill holes before unwrapping the mesh. This preserves symmetry and can avoid overlaps.

### **Outputs**

#### ***UV***

The output UV geometry.

# 12.1.2 Editors - Geometry Node Editor - Header - Quick Menu

## Table of content

- Quick Menu..... 1
  - Adding an operator to the Quick menu..... 1
  - Adding a menu to the Quick menu..... 1
  - Order..... 2
  - Removing an operator from the Quick menu..... 2
  - Context and mode dependent content..... 2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

### Add menu - Mesh - Normals

Here you find nodes to modify the UV mapping.

This is a Node Groups found in the Essentials Library included with Bforartists. Node groups differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

Node groups are not available in the sidebar.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

## Smooth by Angle

Pack the UV islands to get the most out of the UV mapping.

### Inputs

#### *Mesh*

The input geometry.

#### *Angle*

Everything higher than this angle will be smoothed.

### Outputs

#### *Mesh*

The output geometry.

## Add menu - Point

## Distribute Points In Volume

Distributes points randomly in a volume.

Point, corner and polygon attributes of the input geometry are transferred to the generated points. That includes vertex weights and UV maps. Additionally, the node has Normal and Rotation outputs.

The node also generates a stable ID, which is then stored in the built-in id attribute. It is used as a stable identifier for each point. When the geometry is deformed or the density changes the values will be consistent for each remaining point. This attribute is used in the Random Value and Instance on Points nodes.

### Inputs Random mode

#### **Volume**

The volume to import the points to.

#### **Density**

Density of the points.

#### **Seed**

The random seed for the point distribution.

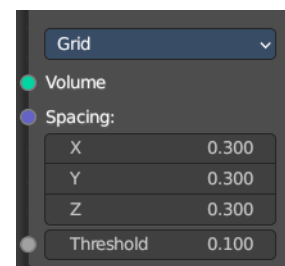

### Inputs Grid mode

#### **Volume**

The volume to import the points to.

#### **Spacing**

The spacing between the grid points.

#### **Threshold**

Minimum density of a volume cell to contain a grid point.

## Properties

### *Distribution method*

#### Random

Distributes the points randomly. This allows overlappings.

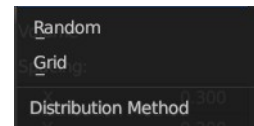

#### Grid

Distributes the points along a grid with given width.

## Output

### Points

Points output.

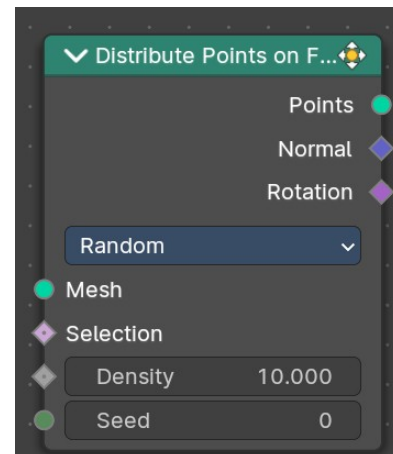

## Distribute Points on Faces

Distributes points randomly on the faces of a mesh geometry.

Point, corner and polygon attributes of the input geometry are transferred to the generated points. That includes vertex weights and UV maps.

Additionally, the node has Normal and Rotation outputs.

The node also generates a stable ID, which is then stored in the built-in id attribute. It is used as a stable identifier for each point. When the mesh is deformed or the density changes the values will be consistent for each remaining point. This attribute is used in the Random Value and Instance on Points nodes.

## Inputs Random mode

### *Mesh*

Standard geometry input.

### *Selection*

The selection of which face corners should be considered for point distribution.

### *Density*

Density of the points.

### *Seed*

The random seed for the point distribution.

## Inputs Poisson Disk mode

### **Mesh**

Standard geometry input.

### **Selection**

The selection of which face corners should be considered for point distribution.

### **Distance Min**

The minimum distance that two points can have.

### **Distance Max**

The maximum distance that two points can have.

### **Density Factor**

Density of the points.

### **Seed**

The random seed for the point distribution.

## Properties

### **Distribution method**

#### **Random**

Distributes the points randomly. This allows overlappings.

#### **Poisson Disk**

Distributes the points randomly, but prevents overlappings by defining a minimum and maximum distance.

## Output

### **Points**

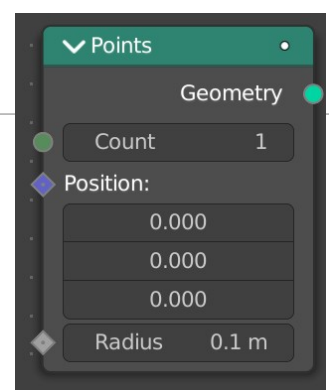

Points output.

### **Normal**

Normal output.

### **Rotation**

Euler Rotation output. Please note that the Z axis of the result rotation will be arbitrary. The mesh normal used to create the rotation does not have enough information to set all three rotation axes.

## Points

Generates a single point or points with position, count and radius.

### Inputs

#### **Count**

The count of the generated points as an integer.

#### **Position**

The position of the points as a vector. This is a field meaning you can set the position per index or ID of the point.

#### **Radius**

The radius of the points as a float. This is a field meaning you can set the scale per index or ID of the point.

### Outputs

#### **Mesh**

Standard mesh output.

---

## Points to Cuves

Generates a mesh vertex in the output geometry for each point cloud point in the input geometry.

### Inputs

#### **Points**

Points input.

#### **Curve Group ID**

A curve is created from every distinct group ID. All points with the same ID are put into the same curve.

#### **Selection**

Selection input.

### Outputs

#### **Mesh**

Standard mesh output.

## Points to Vertices

Generates a mesh vertex in the output geometry for each point cloud point in the input geometry.

### Inputs

#### *Points*

Points input.

#### *Selection*

Selection input.

### Outputs

#### *Mesh*

Standard mesh output.

## Points to Volume

Creates a fog volume sphere around every point in the input geometry. The new volume grid is then called density.

### Inputs

#### *Geometry*

Points input.

#### *Density*

The density of the volume.

#### *Voxel Amount*

Voxel amount of the volume.

#### *Radius*

The radius of the generated volume around each point.

### Properties

#### *Resolution*

Base the voxel resolution at the amount or the size of the point cloud.

## Outputs

### **Geometry**

Standard geometry output.

---

## Set Point Radius

The Set Point Radius node controls the size each selected point cloud point should display with in the viewport.

## Inputs

### **Points**

Geometry input.

### **Selection**

Selection input.

### **Radius**

The radius of the points.

## Outputs

### **Points**

Standard geometry output.

## Add menu - Volume

Here you find nodes to modify the volume.

### Volume Cube

The Volume Cube node generates a voxel based volume cube primitive that can be used for volume conversion to mesh in conjunction with the Volume to Mesh node.

#### Inputs

##### Geometry

Standard geometry input.

##### Density

Volume density per voxel. Higher values makes it more dense.

##### Background

Value per voxel outside the cube domain.

##### Min:

Minimum boundary of the volume cube.

##### Max:

Maximum boundary of the volume cube.

##### Resolution X

Number of volume voxules in the X axis.

##### Resolution Y

Number of volume voxules in the Y axis.

##### Resolution Z

Number of volume voxules in the Z axis.

## Volume to Mesh

The Volume to Mesh node generates a mesh on the “surface” of a volume. The surface is defined by a threshold value. All voxels with a larger value than the threshold are considered to be outside.

Note that currently this node only works on volumes generated using geometry nodes.

## Inputs

### **Geometry**

Standard geometry input.

### **Density**

The density input of the volume object. Either a tag or the information from another node.

### **Threshold**

The voxel amount to use.

### **Adaptivity**

The input radius.

## Properties

### **Resolution**

Base the voxel resolution at the gridsize, the amount or the size of the point cloud.

## Output

### **Geometry**

Standard geometry output.

## Add menu - Simulation

Here you add nodes to use a simulation zone. Simulation zones allow the result of one frame to influence the next one. The most common use is physics simulation, with specific solvers for physical phenomena.

**Note:** In the example above every frame will transform the geometry by 0.2m in the X axis. With this principle you can set rules that will evaluate per frame.

## Simulation Zone

When adding a simulation zone, two nodes are added, defining between them a “Simulation Zone”.

The Geometry inputs that are connected to the Simulation Input node are evaluated once per frame. At the beginning of the simulation, geometry is passed to the next frame and eventually output at the end of the zone in the Simulation Output node.

You can also get other nodes with their data and link them into the simulation region from the outside to re-evaluate geometry data per frame.

**Note:** *It is not possible to set data outside the Simulation Zone, you can only get data from outside the Simulation Zone. The result of the simulation can only be accessed via the Simulation Output node.*

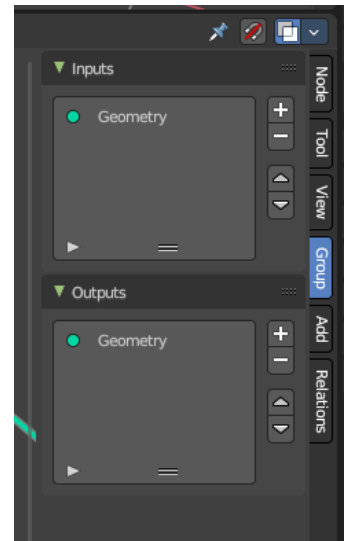

## Clock

The simulation is tied to the animation system found in the Animation Editor, with support for sub-steps. The simulation will only be evaluated while the animation frame changes, and each frame is cached during playback.

## Properties

In the Node Editor the inputs can be renamed, shuffled and removed in the Group tab of the Node Editor Property shelf to the right.

**Note:** *When you add a new input or output, both nodes input and output nodes will update their sockets.*

## Baking

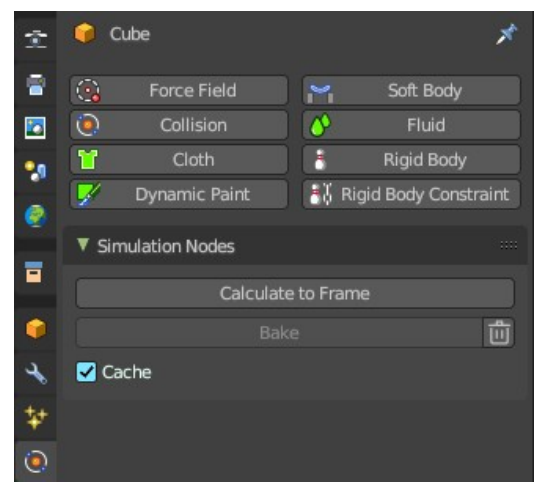

The simulation is automatically cached during playback. The evaluated cache can be seen as a colored line in the Timeline editor.

Cached frames in the Timeline show up as a coloured bar at the bottom.

## Caching to Disk

To render, the simulation should be cached to disk. To do this, switch to the Properties Editor > Physics Properties > Simulation Nodes panel, then Bake or Calculate to Frame.

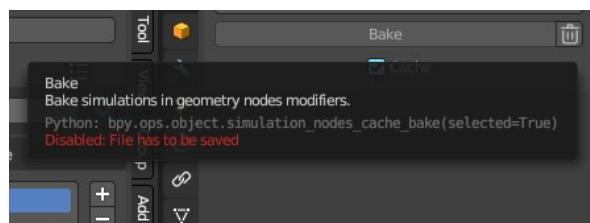

**Note:** You can also playback from the timeline to bake.

## Calculate to Frame

Calculate the simulations in Geometry Nodes modifiers from the start to current frame.

## Bake

Bake simulations in all geometry node modifiers to disk. You can define the path where these will bake per Geometry Nodes modifier. If not defined, it will default to the \*.blend file location. To bake, you must save the file first.

## Delete Cached Bake

The trashcan icon will erase the baked collection from disk.

## Cache

This checkbox toggles the feature to cache frames on playback. When you turn this off, then the automatic caching on playback will not bake to disk.

**Note:** Baking the simulation will bake all the simulations in all modifiers in the scene.

## Simulation Bake Directory

In the Geometry Nodes modifier in the Modifier stack under the Internal Dependencies sub-panel, here you can define the path and location of the cached bake data.

**Note:** The path is automatically generated the first time the modifier is baked through a timeline playback. The default path is relative to the .blend file.

## Simulation Zone Input

This node is the beginning of the Simulation Zone. Custom input and output sockets can be defined in the property shelf to the right in the Group tab.

## Inputs

### **Geometry**

Standard geometry input.

## Output

### **Delta Time**

Returns a float value with the amount of elapsed time that has passed in a linear way. This is used to ensure that the simulation runs smoothly and consistently based on elapsed time, regardless of the playback frame rate or starting frame.

### **Geometry**

Standard geometry output.

## Simulation Zone Output

This node is the end of the Simulation Zone. Custom input and output sockets can be defined in the property shelf to the right in the Group tab.

## Properties

### **Skip**

A boolean. This forwards the output of the simulation input node directly to the output node and ignore the nodes in the simulation zone – like a bypass. This will essentially “skip” the evaluation like an overall switch boolean of all evaluated nodes in the simulation zone.

## Inputs

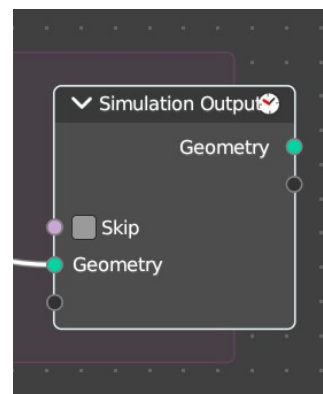

### **Geometry**

Standard geometry input.

## Output

### **Geometry**

Standard geometry output.

## Add menu - Material

Nodes to modify the material.

### Replace Material

Replace an existing material by a new material.

#### Inputs

##### *Geometry*

The geometry that you want to assign the material to.

##### *Old*

The old material.

##### *New*

The new material.

#### Outputs

##### *Geometry*

Standard geometry output.

### Material Index

Retrieves the material index.

#### Output

##### *Material Index*

The material index.

### Material Selection

Select geometry by Material.

Since the material index is stored on each face, the output will be implicitly interpolated to

a different element when necessary. For example, every vertex connected to a selected face will be selected.

## Inputs

### **Material**

The material.

## Outputs

### **Geometry**

Standard geometry output.

---

## Set Material

Assign a material to a mesh or a selection of a mesh.

## Inputs

### **Geometry**

The geometry that you want to assign the material to.

### **Selection**

The selection that you want to assign the material to.

### **Material**

The material that you want to assign.

## Output

### **Geometry**

Standard geometry output.

---

## Set Material Index

Assigning a material index to a mesh or a selection of a mesh.

## Inputs

### **Geometry**

The geometry that you want to assign the material to.

### **Selection**

The selection that you want to assign the material to.

## ***Material Index***

The material index that you want to assign.

## **Output**

### ***Geometry***

Standard geometry output.

## Add menu - Texture

Texture nodes.

### Brick Texture

The Brick Texture node is used to add a procedural brick texture.

#### Inputs

##### **Color 1, Color 2 and Mortar**

Color of the bricks and mortar.

##### **Scale**

Overall texture scale.

##### **Mortar Size**

The size of the filling between the bricks known as “mortar”; 0 means no mortar.

##### **Mortar Smooth**

Blurs/softens the edge between the mortar and the bricks. This can be useful with a texture and displacement textures.

##### **Bias**

The color variation between Color 1/2. Values of -1 and 1 only use one of the two colors; values in between mix the colors.

##### **Brick Width**

The width of the bricks.

## **Row Height**

The height of the brick rows.

## **Properties**

### **Offset**

Determines the brick offset of the various rows.

### **Frequency**

Determines the offset frequency. A value of 2 gives an even/uneven pattern of rows.

### **Squash**

Amount of brick squashing.

### **Frequency**

Brick squashing frequency.

## **Outputs**

### **Color**

Texture color output.

### **Factor**

Mortar mask (1 = mortar).

---

## **Checker Texture**

Adds a checker texture.

## **Inputs**

### **Vector**

Vector input.

### **Color 1**

The first checker color.

### **Color 2**

The second checker color.

## ***Scale***

The scale of the checker texture.

## **Properties**

### ***Gradient Type***

What gradient type to use.

## **Output**

### ***Color***

The checker texture output.

### ***Factor***

Factor output.

## **Gradient Texture**

Add a gradient texture.

## **Inputs**

### ***Vector***

Vector input.

## **Properties**

### ***Gradient Type***

What gradient type to use.

## **Output**

### ***Factor***

Factor output.

## Color

Color output.

## Image Texture

The Image Texture is used to add an image file as a texture.

## Inputs

### Image

The Image input. Open an image, choose an existing image, or generate a new image.

When you click at Open then a file browser opens up. When you click at New then a popup dialog opens up where you can create a new image.

### Image Browser

The image browser at the left allows you to pick an already existing texture.

### New/Open

Create a new image, or open an image.

### Image Edit Box

The name of the image.

### Fake User

Keep the texture in the blend file even if it is not used.

### New Image

Create a new image.

The settings of this image can be further adjusted in the sidebar of the UV Editor.

### Open Image

Open an image.

### Remove

Remove the image. Note that it is still in the blend file as long as it has users, and as long as you haven't purged it. By saving and reloading the blend file for example.

## **Vector**

Texture coordinate for texture look-up. If this socket is left unconnected, UV coordinates from the active UV render layer are used.

## **Frame**

The frame of an image sequence, if available.

---

## **Properties**

### **Interpolation**

Method to scale images up or down for rendering.

#### **Linear**

Regular quality interpolation.

#### **Closest**

No interpolation, use only closest pixel for rendering pixel art.

#### **Cubic**

Smoother, better quality interpolation. For bump maps this should be used to get best results.

### **Extension**

Extension defines how the image is extrapolated past the original bounds:

#### **Repeat**

Will repeat the image horizontally and vertically giving tiled-looking result.

#### **Extend**

Will extend the image by repeating pixels on its edges.

#### **Clip**

Clip to the original image size and set all the exterior pixels values to transparent black.

## **Outputs**

### **Color**

RGB color from image. If the image has alpha, the color is premultiplied with alpha if the Alpha output is used, and unpremultiplied or straight if the Alpha output is not used.

### **Alpha**

Alpha channel from image.

---

## Magic Texture

The Magic Texture node is used to add a procedural psychedelic color texture.

### Inputs

#### **Vector**

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

#### **Scale**

Scale of the texture.

#### **Distortion**

Amount of distortion.

### Properties

#### **Depth**

Number of iterations.

### Outputs

#### **Color**

Texture color output.

#### **Factor**

Texture intensity output.

## Noise Texture

The Noise Texture node evaluates a fractal Perlin noise at the input texture coordinates. This node allows great control over how noise octaves are combined.

### Inputs

The inputs are dynamic, they become available if needed depending on the node properties.

#### **Vector**

Texture coordinate to evaluate the noise at; defaults to Generated texture coordinates if the socket is left unconnected.

#### **Normalize**

Normalize the output to the 0 - 1 range.

#### **W**

Texture coordinate to evaluate the noise at. Appears with 4 dimensions.

#### **Scale**

Scale of the base noise octave.

#### **Detail**

Number of noise octaves. The fractional part of the input is multiplied by the magnitude of the highest octave. Higher number of octaves corresponds to a higher render time.

#### **Roughness**

Adds a roughness noise.

#### **Lacunarity**

The scale of a perlin noise octave relative to the perlin noise octave from the previous octave.

#### **Offset**

An added offset to each octave, determines the level where the highest octave will appear.

## Gain

An extra multiplier to tune the magnitude of octaves.

## Distortion

Amount of distortion.

## Properties

### *Dimensions*

The dimensions of the space to evaluate the noise in.

### **1D**

Evaluate the noise in 1D space at the input W.

### **2D**

Evaluate the noise in 2D space at the input Vector. The Z component is ignored.

### **3D**

Evaluate the noise in 3D space at the input Vector.

### **4D**

Evaluate the noise in 4D space at the input Vector and the input W as the fourth dimension.

## Type

Type of the perlin noise texture.

### **Multifractal**

The result is more uneven (varies with location), more similar to a real terrain. Uses a multiplicative cascade.

### **Ridged Multifractal**

Creates sharp peaks. Calculates the absolute value of the noise, creating “canyons”, and then flips the surface upside down.

### **Hybrid Multifractal**

Creates peaks and valleys with different roughness values, like real mountains rise out of flat plains. Combines the additive cascade with a multiplicative cascade.

### **fBM (fractal Brownian Motion)**

Produces an unnatural homogeneous and isotropic result. Uses an additive cascade, the values are simply added together.

### **Hetero Terrain (Heterogeneous Terrain)**

Similar to Hybrid Multifractal creates a heterogeneous terrain, but with the likeness of river channels.

## Outputs

### **Factor**

Value of fractal noise.

### **Color**

Color with different fractal noise in each component.

## Voronoi Texture

Add a voronoi texture.

## Inputs

### **Vector**

Vector input

### **Scale**

The scale of the voronoi texture.

### **Randomness**

The detail of the voronoi texture.

## Properties

### **Dimensions**

How many dimensions to use for the voronoi texture.

### **Feature Output**

Feature output mode.

### **F1**

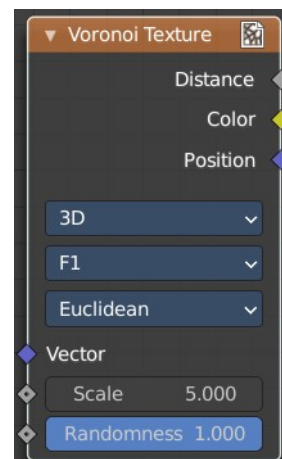

Computes the distance to the closest point as well as its position and color.

### **F2**

Computes the distance to the second closest point as well as its position and color.

### **Smooth F1**

Smoothed version of F1. Weighted sum of neighbor voronoi cells.

## Distance to Edge

Computes the distance to the edge of the voronoi cell.

## N-Sphere Radius

Computes the radius of the n-sphere inscribed in the voronoi cell.

## Distance Metric

Distance calculation mode. The modes are different mathematical methods.

## Output

### Factor

Factor output.

### Color

Color output.

---

## Wave Texture

The Wave Texture node adds procedural bands or rings with noise distortion.

## Inputs

### Vector

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

### Scale

Overall texture scale.

### Distortion

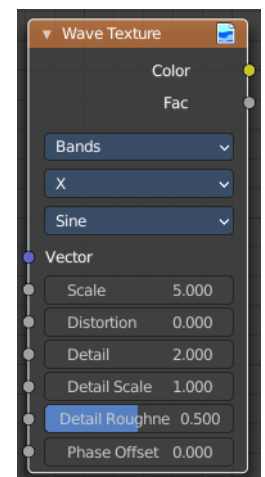

Amount of distortion of the wave (similar to the Marble texture in Blender Internal).

### Detail

Amount of distortion noise detail.

### Detail Scale

Scale of distortion noise.

## ***Detail Roughness***

Adds a roughness noise.

## ***Phase Offset***

Set an offset for the phase.

## **Properties**

### ***Wave Type***

Bands or Rings shaped waves.

### ***Bands direction***

In which direction the bands should point.

### ***Wave Profile***

Controls the shape and look of the wave type.

### ***Saw***

Uses a saw tooth profile.

### ***Sine***

Uses the standard sine profile.

### ***Triangle***

Uses a triangle shape.

## **Outputs**

### ***Color***

Texture color output.

### ***Factor***

Texture intensity output.

---

## **White Noise Texture**

Add a white noise texture.

## Inputs

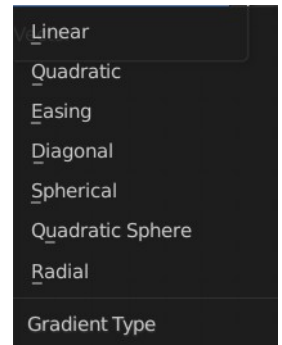

### ***Vector***

Vector input.

## Properties

### ***Gradient Type***

What gradient type to use.

## Output

### ***Vector***

Factor output.

### ***Color***

Color output.

## Add menu - Utilities - Color

Here you find mainly nodes to convert color values.

### Blackbody

The Blackbody node converts a blackbody temperature to RGB value. This can be useful for materials that emit light at natural occurring frequencies.

## Inputs

### **Temperature**

The temperature in Kelvin.

## Outputs

### **Color**

RGB color output.

## Color Ramp

The Color Ramp Node is used for mapping values to colors with the use of a gradient.

## Inputs

### **Factor**

The Factor input is used as an index for the color ramp.

## Properties

### **Color Ramp**

Color Ramps enables the user to specify a range of colors based on color stops. The color between the color stops gets interpolated.

### **Controls**

+

Add a stop to your color ramp. The stop will be added after the selected one, in the middle to the next one.

-

Deletes the selected color stop from the list.

### **Tools menu**

#### **Flip Color Ramp**

Flips the gradient, inverting the values of the color ramp.

#### **Distribute Stops from Left**

Rearrange the stops so that every step has the same space to the right.

#### **Distribute Stops Evenly**

Space between all neighboring stops becomes equal.

#### **Eyedropper (pipette icon) E**

An Eyedropper to sample a color or gradient from the interface to be used in the color ramp.

## Reset Color Ramp

Resets the color ramp to its default state.

## Color Mode

### RGB

Blends color by mixing each color channel and combining.

### HSV/HSL

Blends colors by first converting to HSV or HSL, mixing, then combining again. This has the advantage of maintaining saturation between different hues, where RGB would de-saturate, this allows for a richer gradient.

## Interpolation

### Ease

Uses an Ease Interpolation for the color stops.

### Cardinal

Uses a Cardinal Interpolation for the color stops.

### Linear

Uses a Linear Interpolation for the color stops.

### B-Spline

Uses a B-Spline Interpolation for the color stops.

### Constant

Uses a Constant Interpolation for the color stops.

## Color Ramp

The color band. A click at one of the color stops makes it the active one. You can move the color stops by clicking at them and dragging them around.

## Active Color Stop elements

Adjust the active color stop.

## Choose active color stop

Choose the color stop by index.

## Pos

The position of the active color stop. The range goes from 0.000 to 1.000

## Outputs

### Image

Standard image output.

### Alpha

Standard Alpha Output.

## RGB Curves

Adjust the RGB channels by curves.

### Input

#### **Factor**

The blend factor.

#### **Color**

The input color.

## Combine Color

Combine the single RGBA channels into a single image.

### Input

#### **Mode**

- **RGB** colour processing
- **HSV** colour processing
- **HSL** colour processing

### Input – RGB mode

#### **R, G and B**

The red, green and blue channels of an image.

### Input – HSV mode

#### **H, S and V**

The Hue, Saturation and Value channels of an image.

### Input – HSL mode

#### **H, S and L**

The Hue, Saturation and Luminescence channels of an image.

## Tools

Tools is a menu where you can find some curve related tools.

#### **Reset View**

Resets the curve windows zoom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

### **Extend horizontal**

Extends the curve before the first curve point and behind the last curve point horizontally.

### **Extend extrapolated**

Extends the curve before the first curve point and behind the last curve point extrapolated.

### **Reset Curve**

Resets the curve to the initial shape.

## **Output**

### **Color**

Color output.

### **Use Clipping**

Clipping options. Set up clipping for the stroke.

### **Delete Points**

Deletes selected curve points.

---

## **Mix Color**

The mix Color node is in real the Mix node in Color mode. It is shared across editors.

The Mix node is meant to mix values. This can be colors, or also a vector or a single value.

Note that the Mix Color node does not start in Color mode when you insert it from the sidebar due a technical limitation in the Blender Python api. Here you have to manually switch to the color mode.

## **Data Type**

The mode in which the node works.

## Color

The Mix Node in color mode mixes images by working on the individual and corresponding pixels of the two input images. Called “MixRGB” in the shader and texture context.

### Inputs

#### Factor

Controls the amount of influence the node exerts on the output image.

#### Color 1

Usually the background image. The image size and resolution sets the dimensions of the output image.

#### Color 2

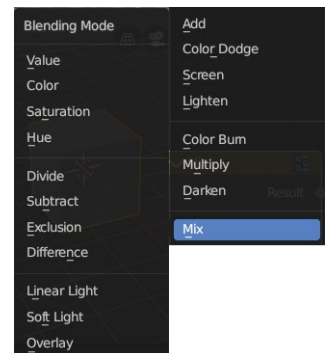

Usually the foreground image.

### Properties

#### Mix

Choose the different blending modes.

Add, Subtract, Multiply, Screen, Divide, Difference, Darken, Lighten, Overlay, Color Dodge, Color Burn, Hue, Saturation, Value, Color, Soft Light, Linear Light.

#### Clamp Result

Clamp the result to 0, 1 range.

#### Clamp Factor

Clamp the factor to 0, 1 range.

### Outputs

#### Result

Standard output.

### Vector

The vector mode allows you to mix vectors.

### Inputs

#### Factor

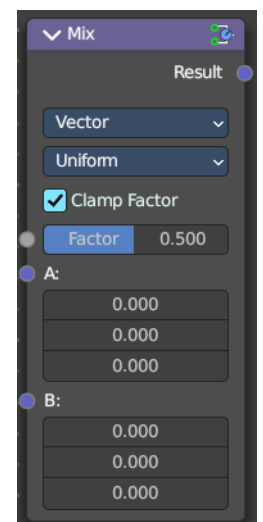

Controls the amount of influence.

#### A

The input vector.

#### B

The output vector.

## Properties

### **Factor Mode**

Use a single factor for all values, or a factor per value.

### **Clamp Factor**

Clamp the factor to 0, 1 range.

## Outputs

### **Result**

Standard output.

### **Float**

The vector mode allows you to mix vectors.

## Inputs

### **Factor**

Controls the amount of influence.

### **A**

The input value.

### **B**

The output value.

## Properties

### **Clamp Factor**

Clamp the factor to 0, 1 range.

## Outputs

### **Result**

Standard output.

## Properties

### **Curve Field**

#### **Channel buttons**

Clicking on one of the channels displays the curve for each.

C (Combined RGB), R (Red), G (Green), B (Blue).

## Navigation elements

They are described from left to right.

### **Zoom in and out**

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Extend horizontal**

Extends the curve before the first curve point and behind the last curve point horizontally.

### **Extend extrapolated**

Extends the curve before the first curve point and behind the last curve point extrapolated.

### **Reset Curve**

Resets the curve to the initial shape.

## Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

### **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### **Adding Points**

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### **Curve point settings**

When you have a point selected then you will reveal further settings at the bottom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

---

## **Output**

### **Color**

The color output.

---

## **Separate Color**

Combine the single RGBA channels into a single image.

### **Input**

#### **Mode**

- **RGB** colour processing
- **HSV** colour processing
- **HSL** colour processing

### **Image**

The image input.

## **Output**

### **Red, Green, Blue and Alpha**

The red, green, blue and alpha channels of an image.

## Add menu - Utilities - Text

Text object related nodes.

### Join Strings

Allows you to join several string into a text string.

## Inputs

### **Delimiter**

Add a delimiter character.

### **Strings**

The strings that you want to join into one text string.

## Output

### **String**

The output string.

---

## Replace Strings

Find and replace strings inside of the input string.

## Inputs

### **String**

The input string.

### **Find**

The string part that you want to replace.

### **Replace**

The string part that you use to replace the selected string part.

## Output

### **String**

The strings that you want to join into one text string.

---

## Slice String

Allows you to extract a string from a substring at given position with given length.

## Inputs

### **String**

The source string.

## **Position**

The start position of the sub string.

## **Length**

The length of the substring.

## **Outputs**

### **String**

The output substring.

## **String length**

Gives back the number of characters in this string.

## **Inputs**

### **String**

The string that you want to calculate.

## **Outputs**

### **Length**

How many characters the string has.

## **String to Curves**

Converts the letters of a text into curve objects.

## **Inputs**

### **String**

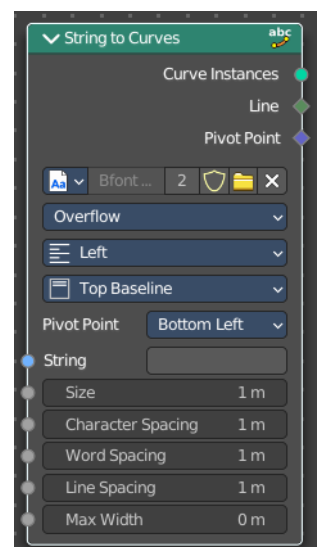

The text string to convert.

### **Size**

Size of the string.

### **Character Spacing**

The character spacing of the string.

## **Word Spacing**

The word spacing of the string.

## **Line Spacing**

The line spacing of the string.

## **Max Width**

The maximum width of the string.

## **Properties**

### **Font property**

#### **Font browser**

A list of the loaded fonts.

#### **Font Edit Box**

The active font.

#### **Number of Users**

The number of users for this font.

#### **Fake User**

Keep this font in the blender file even when it has no users. The default font is special in this regards. It will not vanish when you close the file, even when it has no fake user assigned.

#### **Open Font**

Load a system font.

#### **Remove**

Removes the active font. The default font is special in this regards. You cannot delete it.

#### **Overflow**

The overflow method for the text.

#### **Align X**

How to align the text horizontally

## ***Align Y***

How to align the text vertically.

## **Output**

### ***Curve Instances***

The curves output.

### ***Line***

Outputs the line number of the character.

### ***Pivot Point***

Outputs the selected pivot point position per character.

## **Value to String**

Converts a value to a string.

## **Inputs**

### ***Value***

The input value.

### ***Decimals***

How many decimals the value has.

## ***Outputs***

### **String**

The output string.

## **Special Character**

Adds special characters to the text string.

## **Outputs**

### ***Line Break***

Adds a Line Break to the text string.

## ***Tab***

Adds a tab to the text string.

## Add menu - Vector

Vector nodes are for calculating vector operations.

## Vector Curves

The Vector Curves node maps an input vector components to a curve.

### Inputs

#### Factor

Standard vector input.

#### Vector

Standard vector input.

### Properties

#### Channel

#### Channel buttons

X, Y, Z. Clicking on one of the channels displays the curve for each.

### Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

#### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

#### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

### ***Zoom in and out***

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***Extend horizontal***

Extends the curve before the first curve point and behind the last curve point horizontally.

### ***Extend extrapolated***

Extends the curve before the first curve point and behind the last curve point extrapolated.

### ***Reset Curve***

Resets the curve to the initial shape.

---

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve points.

---

## Outputs

### ***Vector***

Standard vector output.

---

## Vector Math

The Vector Math node performs the selected math operation on the input vectors.

### Inputs

The inputs of the node are dynamic. Some inputs are only available in certain operations. For instance, the Scale input is only available in the Scale operator.

#### **Vector**

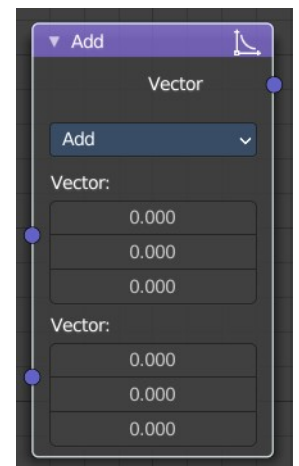

Input vector A.

#### **Vector**

Input vector B.

#### **Scale**

Input Scale.

### Properties

#### **Operation**

The vector math operator to be applied on the input vectors.

### Outputs

The output of the node is dynamic. It is either a vector or a scalar depending on the operator. For instance, the Length operator have a scalar output while the Add operator have a vector output.

#### **Vector**

Output vector.

#### **Value**

Output value.

## Vector Rotate

The Vector Rotate node allows rotations by a vector.

### Inputs

The inputs of the node are dynamic. Some inputs are only available in certain operations. For instance, the Angle input is just available with the Axis Angle type.

#### **Vector**

Input vector.

#### **Center**

Input Center

#### **Axis**

Input Axis.

#### **Angle**

Input Angle

### Properties

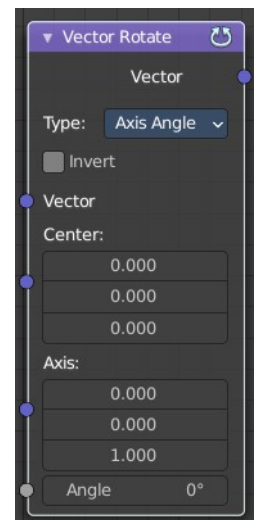

#### **Type**

The rotation type.

### Outputs

#### **Vector**

The Output vector.

## Combine XYZ

The Combine XYZ Node combines a vector from its individual components.

### Input

#### **X Y and Z**

X, Y and Z values.

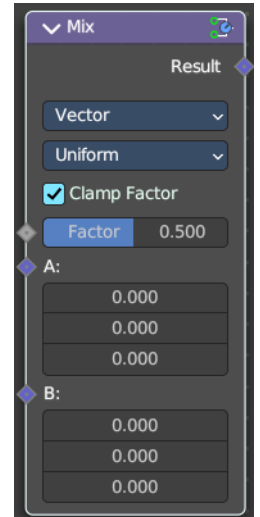

## Output

### Color

Color output.

## Mix Vector

Allows to mix values and vectors in various ways. The node has three different modes. Float, Vector and Color. This here is the node in Vector mode.

## Input

### Factor

The mix factor. With mode Uniform it is a single value. With mode Non Uniform it is a vector.

### A

Vector A input.

### B

Vector B input.

## Properties

### Data Type

Which mode to use. We cover here the Vector mode.

## **Factor Mode**

Use a single value or a vector for the factor.

## **Output**

### **Result**

The output value or vector.

---

## **Separate XYZ**

The Separate XYZ Node splits a vector into its individual components.

## **Input**

### **Vector**

The Input vector.

## **Output**

### **X, Y and Z**

The output vectors for X, Y and Z.

## Add menu - Utilities - Field

Field nodes.

### Accumulate Field

Creates a running total of a given Vector, Float, or Int field.

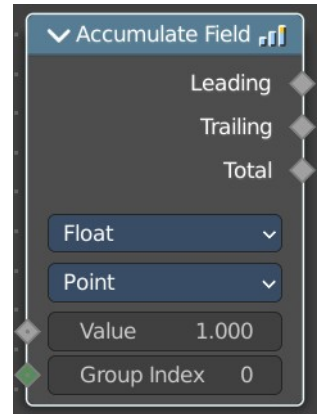

#### Inputs

##### Value

The field to be accumulated.

##### Group Index

The values of this input are used to aggregate the input into separate 'bins', creating multiple accumulations.

#### Properties

##### Data Type

What data type to work with.

##### Domain

From which domain to use the data.

#### Outputs

##### Leading and Trailing

Returns the running totals starting at either the first value of each accumulations or 0 if there is no data

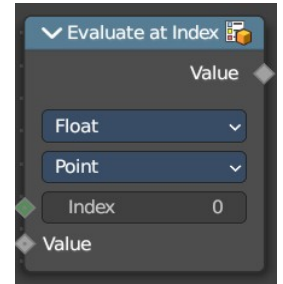

##### Total

Returns the total accumulation at all positions of the field.

## Evaluate at Index

This node allows accessing data of other elements in the context geometry.

It is similar to the Transfer Attribute node in Index mode. The main difference is that this node does not require a geometry input, because the context is used.

### Inputs

#### *Index*

Input Index.

#### *Value*

Input Value.

### Properties

#### *Data Type*

What data type to calculate.

#### *Domain*

What geometry to calculate.

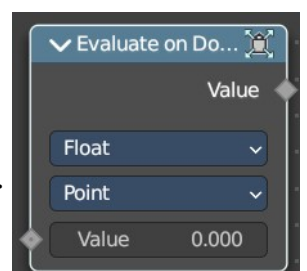

### Output

#### *Value*

The output value.

## Evaluate on Domain

This node evaluates an existing field on a separate domain in a larger field context - an alternative to the Capture Attribute node. This node gets the field type of an existing field from the input socket and interpolates the field type as an array in the output socket.

## Inputs

### *Value*

The input value to get the field.

## Properties

### *Data Type*

Select the Data Type - which can be float, integer, vector, color and boolean.

### *Domain*

The domain the Field evaluates. This gets and filters the field type. The domain can be point, edge, face, face corner, spline or instance.

## Outputs

### *Value*

The output value.

## 12.1.3 Editors - Geometry Nodes Editor - Header - View Menu

Duplicate Area into New Window.....	3
Toggle Maximize Area.....	3
Toggle Full screen Area.....	4
Close Area.....	4

## View Menu

The View menu contains all View related tools.

The content is the same in all sub modes.

### Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

---

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet.

**Note:** *These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.*

### ***Draw Annotation***

Starts the annotation free hand draw tool in the editor.

### ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

### ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

### ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

### ***Add Annotation Layer***

Starts a new annotation layer.

### ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

---

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Frame Selected

Zooms to the selection.

## Frame All

View all zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI any more.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

### **Toggle Full screen Area**

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

### **Close Area**

Closes the area window.

## Add menu - Utilities - Matrix

Matrix nodes.

### Combine Matrix

Combines values into a matrix. A matrix is something like a transform cage. A vector 4 in 4 dimensions.

### Inputs

#### Column 1, 2, 3, 4

Allows you to combine values into the matrix. A matrix is made of four vector 4 in 4 dimensions. So 16 values.

### Output

#### Matrix

The output matrix.

## Combine Transform

Combines transforms.

### Inputs

#### **Translation**

The translation input vector.

#### **Rotation**

The rotation input vector.

#### **Scale**

The scale input vector.

### Output

#### **Transform**

The output transform.

## Invert Matrix

Inverts the matrix values.

### Inputs

#### **Matrix**

The input matrix.

### Output

#### **Matrix**

The output matrix.

#### **Invertible**

The inverted values.

## Multiply Matrix

Multiplies the values of two matrices.

## Inputs

### **Matrix, Matrix**

The input matrices

## Output

### **Matrix**

The output matrix.

---

## Project Point

Projects a transform point by a vector.

## Inputs

### **Vector**

The input vector

### **Transform**

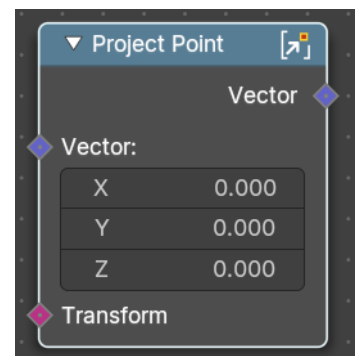

The input transform point

## Output

### **Vector**

The output vector.

---

## Separate Matrix

Extract single values from a matrix. A matrix is something like a transform cage. A vector 4 in 4 dimensions.

## Inputs

### **Matrix**

The input matrix.

## Output

### **Column 1 , 2, 3, 4**

Extract the values from a row in a column. A matrix is made of four vector 4 in 4 dimensions. So 16 values.

## Separate Transform

Extracts the translation, rotation or scale values from a transform.

## Inputs

### **Transform**

The input transform.

## Output

### **Translation**

The translation output vector.

### **Rotation**

The rotation output vector.

### **Scale**

The scale output vector.

## Transform Direction

Set the direction of a transform.

## Inputs

### **Direction**

The input vector 3.

### **Transform**

The input transform.

## Output

### *Direction*

The output direction.

---

## Transform Point

Transform a transform point.

## Inputs

### *Vector*

The input vector 3.

### *Transform*

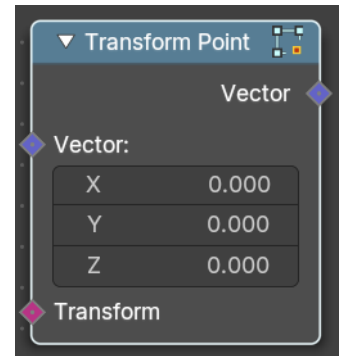

The input transform.

## Output

### *Direction*

The output vector.

---

## Transpose Matrix

Retrieve the transpose matrix from a matrix.

## Inputs

### *Matrix*

The input matrix.

## Output

### *Matrix*

The output transpose matrix.

---

## Add menu - Utilities - Math

Utility nodes are mainly for mathematical operations.

### Boolean Math

The Boolean Math node performs a basic logical operation between its inputs.

#### Inputs

##### *Boolean*

Two standard Boolean inputs.

#### Properties

##### *Operation*

##### **And**

True if both inputs are true.

##### **Or**

True if either or both inputs are true.

##### **Not**

True if both inputs are false.

##### **Not And (NAND)**

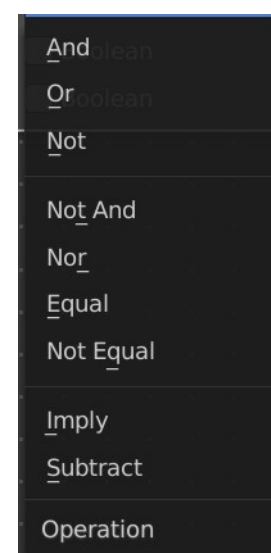

True when at least one input is false.

##### **Nor (NOR)**

True when both inputs are false.

##### **Equal (XNOR)**

True when both inputs are equal.

## Not Equal (XOR)

True when both inputs are different.

## Imply (IMPLY)

True unless the first input is true and the second is false.

## Subtract (NIMPLY)

True when the first input is true and the second is false.

## Output

### *Boolean*

Standard Boolean output.

---

## Clamp

Clamps a value between a minimum and a maximum.

## Inputs

### *Value*

The input value to be clamped.

### *Min*

The minimum value.

### *Max*

The maximum value.

## Properties

### *Clamp Type*

#### **Min Max**

Clamp values using Min and Max values.

#### **Range**

Clamp values between Min and Max range.

## Outputs

### *Result*

The input value after clamping.

---

## Compare

The Compare node takes two inputs and does a math comparison between them.

### Inputs

#### **A, B**

Standard float value input.

### Properties

### *Input Type*

What kind of data to compare.

### *Operation*

#### **A is less than B**

True if A is smaller than B.

#### **A is lesser than or equal B**

True if A is smaller or equal than B.

#### **A is greater than B**

True if A is bigger than B.

#### **A is greater than or equal B**

True if A is bigger or equal than B.

#### **A is equal B**

True if A and B are the same.

#### **A is not equal B**

True if A and B are different.

### Output

#### **Result**

Standard Boolean output.

## Float Curve

The Float Curve node maps an input float to a curve and outputs a float value. This curve can then be used for profiles for example.

### Inputs

#### **Factor**

How strong the input influences the output value.

#### **Attribute**

The input value.

## Properties

### **Curve Field**

#### **Channel buttons**

Clicking on one of the channels displays the curve for each.

C (Combined RGB), R (Red), G (Green), B (Blue).

#### **Navigation elements**

They are described from left to right.

#### **Zoom in and out**

The two buttons with the magnifying glass at it zooms in and out in the curve window.

#### **Use Clipping**

Clipping options. Set up clipping for the stroke.

### **Tools**

Tools is a menu where you can find some curve related tools.

#### **Reset View**

Resets the curve windows zoom.

#### **Extend horizontal**

Extends the curve before the first curve point and behind the last curve point horizontally.

#### **Extend extrapolated**

Extends the curve before the first curve point and behind the last curve point extrapolated.

## Reset Curve

Resets the curve to the initial shape.

---

## Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### Curve point settings

When you have a point selected then you will reveal further settings at the bottom.

### Vector Handle

Set handle type to Vector.

### Auto Handle

Set handle type to Auto.

### Auto Clamped Handle

Set handle type to Auto Clamped.

---

## Output

### Value

The output value.

---

## Float to Integer

Converts a floating point value into an integer value.

## Inputs

### *Float*

The input float value.

## Properties

### *Rounding Mode*

How the float value should be converted.

## Outputs

### *Integer*

The output integer value.

## Map Range

This node converts (maps) an input value range into a destination range. By default, values outside the specified input range will be proportionally mapped as well. This node is similar to Map Value node but provides a more intuitive way to specify the desired output range.

## Inputs

### *Value*

Standard value input.

### *From Min*

Start of the input value range.

### *From Max*

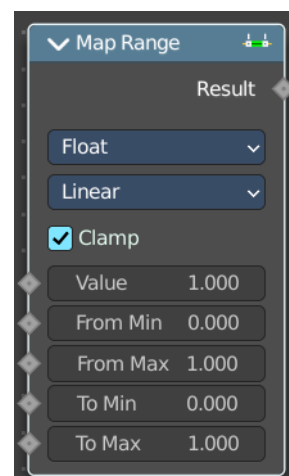

End of the input value range.

### *To Min*

Start of the destination range.

### *To Max*

End of the destination range.

## Properties

### **Data Type**

The data type to calculate.

### **Interpolation Type**

how to interpolate the values between min and max.

### **Clamp**

Clamps values to Min/Max of the destination range.

## Outputs

### **Value**

Standard value output.

## Math

The Math Node performs math operations.

### Inputs

The inputs of the node are dynamic. Some inputs are only available with certain operations. For example, the Addend input is only available in the Multiply Add operator.

### **Value**

Input Value. Trigonometric functions read this value as radians.

### **Addend**

Input Addend.

### **Base**

Input Base.

### **Exponent**

Input Exponent.

### **Epsilon**

Input Epsilon.

### **Distance**

Input Distance.

## **Min**

Input Minimum.

## **Max**

Input Maximum.

## **Increment**

Input Increment.

## **Scale**

Input Scale.

## **Degrees**

Input Degrees.

## **Radians**

Input Radians.

## **Properties**

### **Operation**

The mathematical operator to be applied to the input values:

Functions	Comparison	Rounding	Trigonometric	Conversion
Add	Minimum	Round	Sine	To Radians
Subtract	Maximum	Floor	Cosine	To Degrees
Multiply	Less Than	Ceil	Tangent	
Divide	Greater Than	Truncate	Arcsine	
Multiply Add	Sign	Fraction	Arccosine	
Power	Compare	Modulo	Arctangent	
Logarithm	Smooth Minimum	Wrap	Arctan2	
Square Root	Smooth Maximum	Snap	Hyperbolic Sine	
Inverse Square Root		Ping-pong	Hyperbolic Cosine	
Absolute			Hyperbolic Tangent	
Exponent				

## **Functions**

### **Add**

The sum of the two values.

### **Subtract**

The difference between the two values.

### **Multiply**

The product of the two values.

### **Divide**

The division of the first value by the second value.

### **Multiply Add**

The sum of the product of the two values with Addend.

### **Power**

The Base raised to the power of Exponent.

### ***Logarithm***

The log of the value with a Base as its base.

### ***Square Root***

The square root of the value.

### ***Inverse Square Root***

One divided by the square root of the value.

### ***Absolute***

The input value is read with without regard to its sign. This turns negative values into positive values.

### ***Exponent***

Raises Euler's number to the power of the value.

### **Comparison**

#### ***Minimum***

Outputs the smallest of the input values.

#### ***Maximum***

Outputs the largest of two input values.

#### ***Less Than***

Outputs 1.0 if the first value is smaller than the second value. Otherwise the output is 0.0.

#### ***Greater Than***

Outputs 1.0 if the first value is larger than the second value. Otherwise the output is 0.0.

#### ***Sign***

Extracts the sign of the input value. All positive numbers will output 1.0. All negative numbers will output -1.0. And 0.0 will output 0.0.

#### ***Compare***

Outputs 1.0 if the difference between the two input values is less than or equal to Epsilon.

#### ***Smooth Minimum***

Smooth Minimum.

#### ***Smooth Maximum***

Smooth Maximum.

### **Rounding**

#### ***Round***

Round the input value to the nearest integer.

#### ***Floor***

Rounds the input value down to the nearest integer.

### ***Ceil***

Rounds the input value up to the nearest integer.

### ***Truncate***

Outputs the integer part of the value.

### ***Fraction***

Fraction.

### ***Modulo***

Outputs the remainder once the first value is divided by the second value.

### ***Wrap***

Outputs a value between Min and Max based on the absolute difference between the input value and the nearest integer multiple of Max less than the value.

### ***Snap***

Round the input value to down to the nearest integer multiple of Increment.

### ***Ping-pong***

The output value is moved between 0.0 and the Scale based on the input value.

## **Trigonometric**

### ***Sine***

The Sine of the input value.

### ***Cosine***

The Cosine of the input value.

### ***Tangent***

The Tangent of the input value.

### ***Arcsine***

The Arcsine of the input value.

### ***Arccosine***

The Arccosine of the input value.

### ***Arctangent***

The Arctangent of the input value.

### ***Arctan2***

Outputs the Inverse Tangent of the first value divided by the second value measured in radians.

### ***Hyperbolic Sine***

The Hyperbolic Sine of the input value.

### ***Hyperbolic Cosine***

The Hyperbolic Cosine of the input value.

## **Hyperbolic Tangent**

The Hyperbolic Tangent of the input value.

## **Conversion**

### **To Radians**

Converts the input from degrees to radians.

### **To Degrees**

Converts the input from radians to degrees.

### **Clamp**

Limits the output to the range (0.0 to 1.0). See Clamp.

## **Outputs**

### **Value**

Numerical value output.

## **Use Clipping**

Clipping options. Set up clipping for the stroke.

## **Delete Points**

Deletes selected curve point.

## **Curve window**

Tweak and adjust the falloff curve by clicking at a curve point and dragging it around.

Double click adds a new point.

Holding down ctrl activates temporary snapping.

Holding down shift enables slower movement, which allows more accurate setting.

## **X / Y values**

The x and y value of the currently selected point.

## **Mix**

Allows to mix values and vectors in various ways. The node has three different modes. Float, Vector and Color. This node covers the Float mode

## Input

### *Float*

#### **Factor**

The mix factor.

#### **A**

Float value A input.

#### **B**

Float value B input.

## Properties

### *Clamp Factor*

Clamp the factor to 0-1 range.

## Output

### *Result*

The output value or vector.

## Add menu - Utilities - Rotation

Utility nodes are mainly for mathematical operations.

### Align Rotation to Vector

Aligns a rotation to a vector.

#### Inputs

##### **Rotation**

The input euler rotation vector.

##### **Factor**

The factor to align the euler value to the vector.

##### **Vector**

The vector to align to.

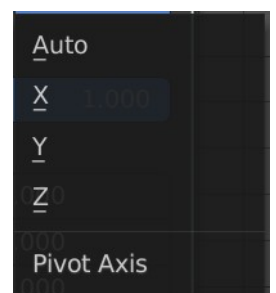

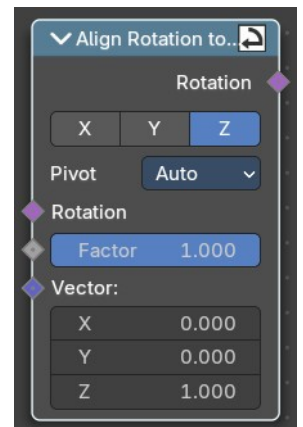

#### Properties

##### **Align Axis**

To which axis to align the vector.

##### **Pivot**

The pivot axis.

## Output

### *Rotation*

The output rotation euler angle.

---

## Axes to rotation

Creates a rotation from a primary and a secondary axis. The axis should be ideally orthogonal.

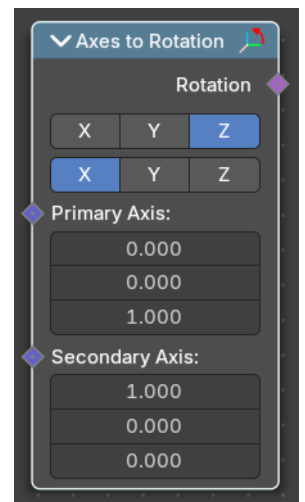

## Inputs

### *Primary Axis*

The axis to rotate around.

### *Secondary Axis*

The secondary axis that gives the alignment.

## Properties

### *Primary axis*

Which axis to rotate around.

### *Secondary Axis*

Which axis to align to.

## Output

### *Rotation*

The output rotation euler angle.

---

## Axis Angle to Rotation

Converts an axis angle to a rotation.

## Inputs

### *Axis*

The input axis.

## ***Angle***

The input angle.

## **Output**

### ***Rotation***

The output rotation value.

---

## **Euler to Rotation**

Converts an euler angle to a rotation.

## **Inputs**

### ***Euler***

The input euler angle vector.

## **Output**

### ***Rotation***

The output rotation value.

---

## **Invert Rotation**

Inverts a rotation

## **Inputs**

### ***Rotation***

The input rotation vector.

## **Output**

### ***Rotation***

The output rotation value.

---

## Rotate Rotation

Rotates an euler rotation by another euler rotation.

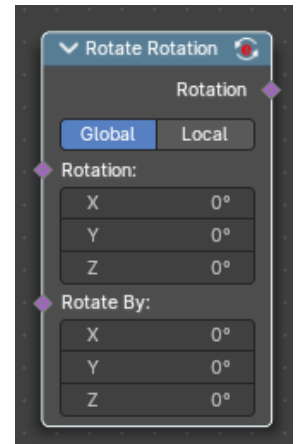

### Inputs

#### *Rotation*

Use the rotation of an existing geometry.

#### *Rotate By*

The input rotation.

### Properties

#### *Rotate Space*

##### **Global**

Rotate by the global orientation

##### **Local**

Rotate by the local orientation

### Outputs

#### *Rotation*

The euler angle output.

## Rotate Vector

Rotates a vector

### Inputs

#### *Vector*

The input vector.

#### *Rotation*

The input rotation.

### Output

#### *Rotation*

The output rotation value.

## Rotate Vector

Rotates a vector.

### Inputs

#### **Vector**

The input vector.

#### **Rotation**

The input rotation.

### Output

#### **Rotation**

The output rotation value.

---

## Rotation to Euler

Converts a rotation vector to euler angle.

### Inputs

#### **Rotation**

The input rotation.

### Output

#### **Euler**

The output euler angle.

---

## Rotation to Quaternion

Converts a rotation vector to a quaternion.

### Inputs

#### **Rotation**

The input rotation.

---

## Output

***W, X, Y, Z***

The single output values of the quaternion.

---

## Quaternion

Converts a rotation vector to a quaternion.

### Inputs

***W, X, Y, Z***

The single input values of the quaternion.

### Output

***Rotation***

The output rotation.

These deprecated nodes are kept for compatibility reasons.

### Align Euler to Vector (Deprecated)

Aligns a euler value to a vector.

#### Inputs

##### **Rotation**

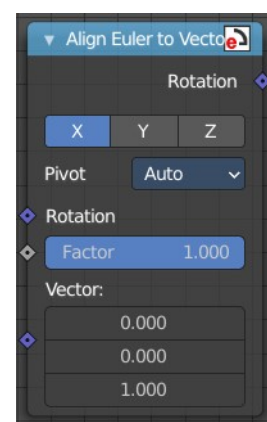

The input euler rotation vector.

##### **Factor**

The factor to align the euler value to the vector.

##### **Vector**

The vector to align to.

#### Properties

##### **Align Axis**

To which axis to align the vector.

##### **Pivot**

The pivot axis.

#### Output

##### **Rotation**

The output rotation euler angle.

## Rotate Euler (Deprecated)

Rotates an euler rotation. This node will be removed in the near future. Alternatively use the Rotate Rotation node.

### Inputs

#### ***Rotation***

Use the rotation of an existing geometry.

#### ***Rotate By***

The input rotation.

### Properties

#### ***Rotate Type***

#### **Axis Angle**

Rotate around an axis by an angle.

#### **Euler**

Rotate around the x, y and z axis.

#### ***Rotate Space***

#### **Object**

Rotate points in the local space of the object.

#### **Point**

Rotate every point in its local space.

### Outputs

#### ***Rotation***

The euler angle output.

## Add menu - Utilities

Utility nodes are mainly for mathematical operations.

### Index Switch

The Index Switch node is meant as a simpler version of the Menu Switch node. It doesn't allow naming items or displaying them in a dropdown, but still allows choosing between an arbitrary number of items, unlike the regular Switch node where you can just switch between two states.

### Inputs

#### Index

Which input to choose.

#### 0, 1 ...

The available input index types that you want to switch between. You can define more input sockets in the sidebar.

### Properties

#### Data Type

What input type to evaluate.

## Outputs

### Output

The output index.

## Menu Switch

The Menu Switch node selects and computes one input based on a user-defined menu. Only the selected input is computed.

Menu entries can be added, removed, renamed, and reordered. Renaming keeps existing input links.

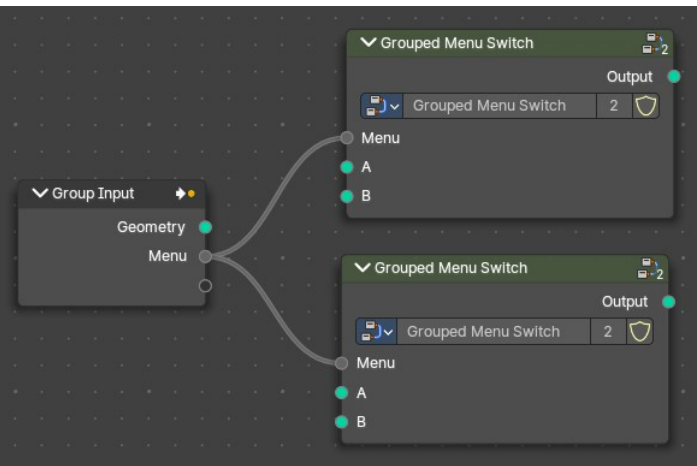

The menu can be used in node groups and the nodes modifier UI. Connecting the menu to a Group Input node exposes it as a group input. A menu needs to be connected to a Menu Switch node to work. An unconnected menu is empty.

Connecting multiple Menu Switch nodes to the same output creates a conflict. To avoid this, a menu switch can be grouped. Multiple groups of the same type can connect to the same menu.

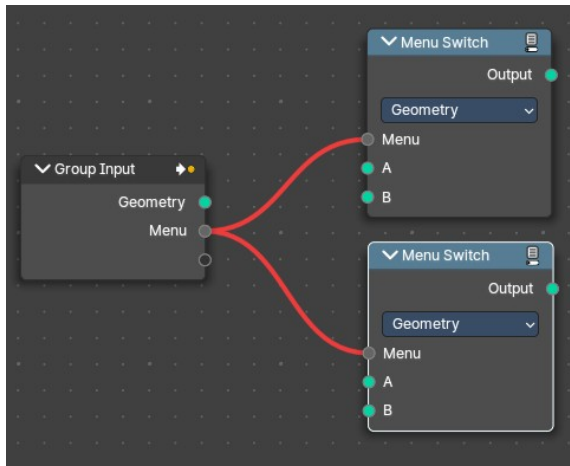

**Note:** You cannot plug in the same value socket into the Menu selector. If you'd like to use the same value for various Menu Switches, group the Menu Switch into a Node Group and use the top-level switch override.

Top Level Grouped Menu Switches with same inputs:

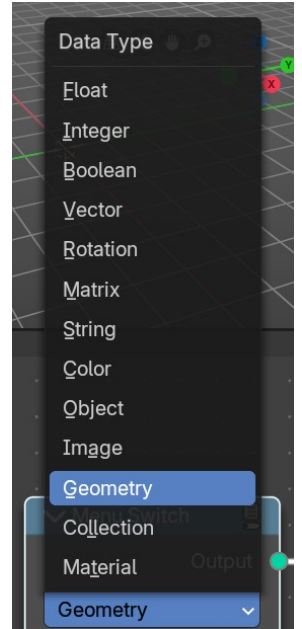

Conflict caused by Same Level menu Switch inputs:

## Inputs

### Data Type

Determines the data type the menu switch will operate in.

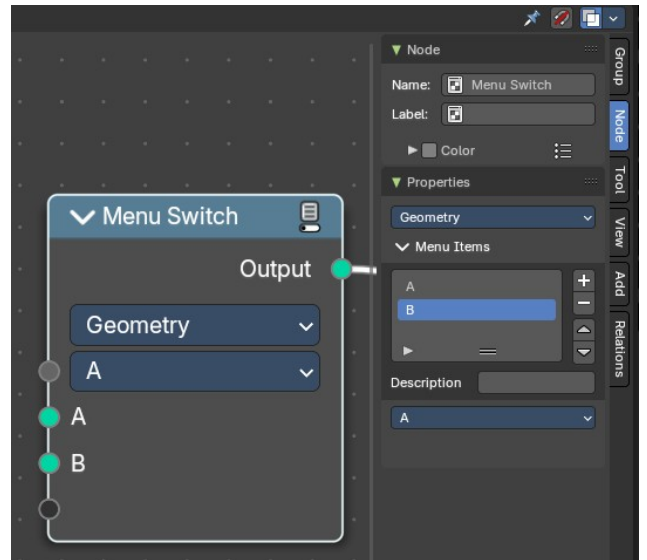

### Menu

Determines which of the input options will be selected and passed through as the default.

### A , B ...

The available input index types that you want to switch between. You can define more input sockets in the sidebar Menu Switch panel.

**Note:** You can add more menu switch options to the empty socket.

## Properties

### Data Type

Determines the type of the data that is handled by the node.

## Outputs

### *Output*

The output index.

---

## Random Value

Generates a random value.

### Input

#### Min

The minimum value of the range. This input is only available for Float, Integer, and Vector types.

#### Max

The maximum value of the range. This input is only available for Float, Integer, and Vector types.

#### ID

An ID to drive the random number generator seed. By default, this input uses the same value as if the ID Node, which is the id attribute of the context geometry if it exists, and otherwise the index.

#### Seed

The random seed for the random number generation.

## Properties

### *Data Type*

What kind of random value to create. The items should be self explaining.

### Output

#### *Value*

The output value.

---

## Repeat Zone

When adding a repeat zone, two nodes are added with a “zone” set between them. The inputs connected to the *Repeat Input* node reads and gets data at the beginning of the loop before starting the looping - then the data is processed within the zone, here you can set any changes to the data to then repeat the execution again at the beginning of the chain for the next iteration of the loop. This chain of operations is repeated the specified number of times in the *Repeat Input* node.

In the example in the image above, we duplicate the cube, transform it with a rotation, then join it together again. We do this 8 times in a loop, creating a circular array.

**Note:** *It is not possible to set data outside the Repeat Zone, you can only get data from outside the Repeat Zone. Any data connected from the outside of the zone are constant throughout every iteration based on their value at the current frame. The result of the looping can only be accessed via the Repeat Output node.*

### Repeat Zone Input

The beginning of the iteration or loop.

## Input

### **Iterations**

Number of repetitions or loops.

### **Geometry**

Standard geometry input.

## Output

### **Geometry**

Standard geometry output.

## **Repeat Zone Output**

The result and output of the iteration or loop. You can define custom attributes outputs here from the

## Input

### **Geometry**

Standard geometry output.

## Output

### **Geometry**

Standard geometry output.

---

## Switch

Switch between two inputs values based on a boolean.

## Inputs

### **Switch**

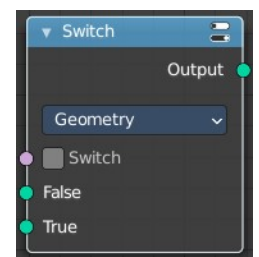

The boolean switch.

### **A**

The input value A. Used when the switch is off.

### **B**

The input value B. Used when the switch is on.

## Properties

### *Input Type*

What input type the values are, which defines what type to output then.

## Outputs

### *Output*

Numerical value output.

---

# 12.1.45 Editors - Geometry Nodes Editor - Header - Add Menu - Group

## Table of content

Add menu - Group.....	1
Make Group.....	1
Insert into Group.....	2
Ungroup.....	3
Toggle Edit Group.....	3
Group Input.....	3
Group Output.....	3
List of Node Groups.....	3

## Add menu - Group

Node groups allows you to group different nodes of the material together to reduce the visual complexity. A node group acts like any other node.

Material node groups should not include Input nodes, like Image nodes, or Output nodes.

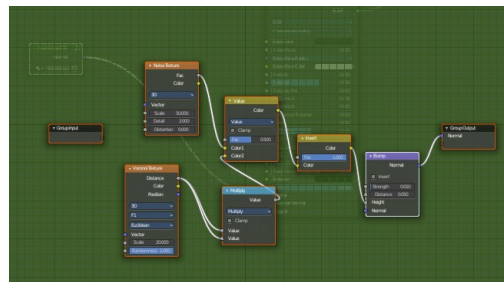

If you include a source node in your group, you will end up having the source node appearing twice: once inside the group, and once outside the group in the new material node tree.

If you include an output node in the group, there will not be an output socket available from the group!

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item in the sidebar in the Relations tab in the Group panel. That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Insert into Group

Allows you to insert a node into a node group.

Select the node, hold down Shift, then select the node group so that both are selected. Then perform the operator.

## Ungroup

Ungroups an existing group. You need to be outside of the group edit mode.

---

## Toggle Edit Group

Enters a node group for editing. Or when you are in a node group, exits the node group editing.

---

## Group Input

Adds a Group Input node. This node is usually already part of a new created group.

## Group Output

Adds a Group Output node. This node is usually already part of a new created group.

---

## List of Node Groups

Once you have created a node group it will also show up in the group menu. Groups can be inserted to other materials too.

# 12.1.46 Editors - Geometry Nodes Editor - Header - Add Menu - Layout

## Table of content

Add menu - Layout.....	1
Frame.....	1
Adding and Removing Nodes.....	2
Resizing Frame.....	2
Label and Color.....	2
Reroute.....	2
Move, Rotate, Scale.....	3

## Add menu - Layout

These nodes helps organizing the node layout.

## Frame

The Frame node allows you to drop nodes into a frame. This frame can be dragged around as a whole.

## Adding and Removing Nodes

Nodes can be added by simply dropping them onto the frame. Or with the Join in New Frame menu item in the Node menu.

To remove a node from the frame use Remove from Frame.

## Resizing Frame

When the Frame node is first placed in the node editor workspace you can resize it by dragging one of the edges.

Once a node is placed in the Frame, the Frame shrinks around the nodes. You cannot resize it anymore with handlers. Just by dragging around the nodes inside of the frame.

This behavior can be changed by disabling the *Shrink* option in the Item tab in the Properties panel. Then you can resize the frame again by dragging the edges.

## Label and Color

You can change the name of a frame in the Node panel. And you can give it a custom color by checking the Color checkbox and adjusting the color then.

## Reroute

Adds a reroute point that can be used to reroute connections. It allows just one input, but allows multiple output connections.

To quickly add a Reroute node into an existing connection, hold Shift and Right Mouse and drag the mouse to cut through the link. A new reroute node will be added.

When you exceed a specific angle amount between the reroute nodes, then the node connection becomes a sharp corner, and not longer a Bezier like soft curve.

## Move, Rotate, Scale

A normal node has a handler. The reroute dot not. You can't simply move it around with the mouse by clicking at the top area. It has none. You have to use the move, rotate and scale commands. They can be found in the View menu.

## Add menu - Hair - Deformation

Hair nodes are Node Groups found in the Essentials Library included with Bforartists. They differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

## Blend Hair Curves

Blends the shape between multiple hair curves in a certain radius together.

### Input

#### **Geometry**

The input geometry.

#### **Factor**

Factor to blend overall effect.

#### **Blend Radius**

Radius to select neighbors for blending.

#### **Blend Neighbours**

Amount of neighbors used for blending.

## ***Preserve Length***

Preserve the length of each curve during deformation.

## **Output**

### ***Geometry***

The output geometry.

## **Displace Hair Curves**

Displaces hair curves by a vector based on options.

## **Input**

### ***Geometry***

The input geometry.

### ***Factor***

Factor to blend overall effect.

### ***Shape***

Shape of the influence along curves. 0 means constant. 0.5 means linear.

### ***Object***

The object to determine the displacement space.

### ***Displace Vector***

The vector for the displacement.

### ***Surface Object***

Surface object used to sample the normal for displacement.

### ***Surface Geometry***

Surface geometry used to sample the normal for displacement.

### ***Surface UV Map***

Surface UV Map used to sample the normal for displacement.

### ***Surface Normal Displacement***

Amount of displacement along the surface normals.

## Output

### **Geometry**

The output geometry.

## Frizz Hair Curves

Deforms hair curves using a random vector per point to frizz them.

## Input

### **Geometry**

The input geometry.

### **Cumulative Offset**

Apply offset cumulatively.

### **Factor**

Factor to blend overall effect.

### **Distance**

Overall distance factor for the deformation.

### **Shape**

Shape of the influence along curves. 0 means constant. 0.5 means linear.

### **Seed**

Random seed for the operation.

### **Preserve Length**

Preserve the length of each curve during deformation.

## Output

### **Geometry**

The output geometry.

### **Offset Vector**

The vector by which each point was offset during deformation.

## Hair Curves Noise

Deforms hair curves using noise texture.

### Input

#### **Geometry**

The input geometry.

#### **Cumulative Offset**

Apply offset cumulatively.

#### **Factor**

Factor to blend overall effect.

#### **Distance**

Overall distance factor for the deformation.

#### **Shape**

Shape of the influence along curves. 0 means constant. 0.5 means linear.

#### **Scale**

Scale of the noise texture by root position.

#### **Scale along Curve**

Scale of the noise texture along the curve.

#### **Offset per curve**

#### **Seed**

Random seed for the operation.

#### **Preserve Length**

Preserve the length of each curve during deformation.

### Output

#### **Geometry**

The output geometry.

#### **Offset Vector**

The vector by which each point was offset during deformation.

## Roll Hair Curves

Rolls up hair curves, starting from their tips.

### Input

#### **Factor**

Factor to blend overall effect.

#### **Subdivision**

Subdivision level applied before deformation.

#### **Variation Level**

Level of smoothing on the roll path to include shape variation.

#### **Roll Length**

Length of each curve to be rolled

#### **Roll Radius**

Radius of the rolls.

#### **Roll Depth**

Depth offset of the rolls.

#### **Roll Taper**

Taper of the roll.

#### **Retain Overall Shape**

Offset the roll along the original curve to retain shape.

#### **Roll Direction**

The axis around each curve is rolled.

#### **Random Orientation**

Amount of randomization of the direction of the roll.

#### **Seed**

Random seed for the operation.

#### **Preserve Length**

Preserve the length of each curve during deformation.

## Output

### **Geometry**

The output geometry.

## Rotate Hair Curves

Rotates each hair curve around an axis.

## Input

### **Geometry**

The input geometry.

### **Factor**

Factor to blend overall effect.

### **Axis**

Rotation Axis. The default is tangent at root.

### **Angle**

Angle of rotation

### **Random Off**

Random offset to the rotation angle per curve.

### **Lock Ends**

Lock rotation to the axis between the curve ends.

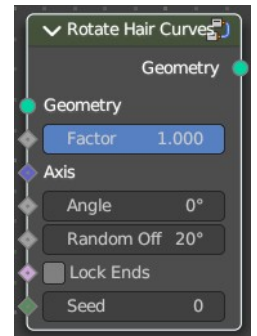

### **Seed**

Random seed for the operation.

## Output

### **Geometry**

The output geometry.

## Shrinkwrap Hair Curves

Shrinkwrap hair curves to a mesh surface from below and optionally from above.

### Input

#### **Geometry**

The input geometry.

#### **Surface**

Surface geometry used for shrinkwrap.

#### **Surface Object**

A surface object used for shrinkwrap.

#### **Factor**

Factor to blend overall effect.

#### **Offset Distance**

Distance of the surface to shrinkwrap.

#### **Above Surface**

Blend shrinkwrap for points above the surface.

#### **Smoothing Steps**

The steps of Smoothing applied after shrinkwrap.

#### **Lock Roots**

Lock the position of root points.

### Output

#### **Geometry**

The output geometry.

## Smooth Hair Curves

Smooths the shape of hair curves.

### Input

#### **Geometry**

The input geometry.

## **Amount**

Amount of smoothing.

## **Shape**

Shape of the influence along curves. 0 means constant. 0.5 means linear.

## **Iterations**

Amount of smoothing steps.

## **Weight**

Smoothing weight.

## **Lock Tip**

Lock the position of tip points.

## **Preserve Length**

Preserve the length of each curve during deformation.

## **Output**

### **Geometry**

The output geometry.

## **Straighten Hair Curves**

Straighten hair curves between root and tip.

## **Input**

### **Geometry**

The input geometry.

## **Amount**

Amount of smoothing.

## **Shape**

Shape of the influence along curves. 0 means constant. 0.5 means linear.

## **Preserve Length**

Preserve the length of each curve during deformation.

## Output

### **Geometry**

The output geometry.

## Trim Hair Curves

Trims or scales hair curves to a certain length.

## Input

### **Geometry**

The input geometry.

### **Scale Uniform**

Scale each curve uniformly to reach the target length.

### **Length Factor**

Multiply the original length by a factor

### **Replace Length**

Use the length input to fully replace the original length.

### **Length**

Target length for the operation.

### **Mask**

Mask to blend overall effect.

### **Random Offset**

Trim hair curves randomly up to a certain amount.

### **Pin at parameter**

Pin each curve at a certain point for the operation.

### **Seed**

Random seed for the operation.

## Output

### **Geometry**

The output geometry.

## Add menu - Hair - Generation

Hair nodes are Node Groups found in the Essentials Library included with Bforartists. They differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

## Duplicate Hair Curves

Duplicates hair curves a certain amount of times in the given radius.

### Input

#### **Geometry**

The input geometry.

#### **Amount**

Amount of duplication per curve.

#### **Viewport Amount**

How much percent is used in the viewport.

#### **Radius**

The radius in which the duplicate curves are offset from the guides.

#### **Distribution Shape**

Shape of distribution from center to the edge around the guide.

#### **Tip Roundness**

Offset of the curves to round the tip.

#### **Even Thickness**

Keep an even thickness of the distribution of duplicates.

#### **Seed**

Random seed for the operation.

### Output

#### **Geometry**

The output geometry.

#### **Guide Index**

The guide index map that was used for the operation.

## Generate Hair Curves

Generates new hair curves on a surface mesh.

### Input

#### **Surface**

The surface to generate the hairs on.

#### **Surface Object**

A surface object to generate the hairs on.

#### **Surface UV map**

Surface UV map used for attachment.

#### **Surface Rest Position**

Set the surface mesh into its rest position before attachment.

#### **Hair Length**

Length of the generated hair curves.

#### **Hair Material**

The material for the hair curves.

#### **Control Points**

Amount of control points for the generated hair curves.

#### **Poisson Disk Distribution**

Use Poisson Disk distribution to keep a minimum distance between the hair curves.

#### **Density**

How dense the generated hair curves are.

#### **Density Mask**

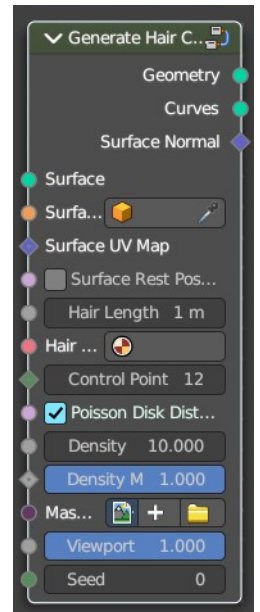

Factor for the density of generated hair curves.

#### **Mask Texture**

Discard points based on a mask texture after distribution. This mask can be loaded here.

#### **Viewport Amount**

How dense the generated hair curves are displayed in the viewport.

## **Seed**

Random seed for operation.

## **Output**

### **Geometry**

The output geometry.

### **Curves**

The output curves.

### **Surface Normal**

The surface normals.

## **Interpolate Hair Curves**

Interpolates existing guide curves on a surface.

## **Input**

### **Guide Curves**

Input guide curves.

### **Surface Geometry**

The surface geometry to generate the hairs on.

### **Surface Object**

A surface object to generate the hairs on.

### **Surface UV map**

Surface UV map used for attachment.

### **Surface Rest Position**

Set the surface mesh into its rest position before attachment.

### **Follow Surface Normal**

Align the interpolated curves to the surface normal.

### **Part by Mesh Islands**

Use mesh islands of the surface geometry for painting.

### **Interpolation Guides**

Amount of guides to be used for interpolation per curve.

### ***Distance to Guides***

Distance around each guide to spawn interpolated curves.

### ***Poisson Disk Distribution***

Use Poisson Disk distribution to keep a minimum distance between the hair curves.

### ***Density***

How dense the generated hair curves are.

### ***Density Mask***

Factor for the density of generated hair curves.

### ***Mask Texture***

Discard points based on a mask texture after distribution. This mask can be loaded here.

### ***Viewport Amount***

How dense the generated hair curves are displayed in the viewport.

### ***Seed***

Random seed for operation.

## **Output**

### ***Geometry***

The output geometry.

### ***Guide Index***

The output curves.

### ***Surface Normal***

The surface normals.

## Add menu - Hair - Guides

Hair nodes are Node Groups found in the Essentials Library included with Bforartists. They differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

### Braid Hair Curves

Deforms existing hair curves into braids.

#### Input

##### **Geometry**

The input geometry.

##### **Guide Index**

Index map input. This input has priority.

##### **Guide Distance**

Minimum distance between two guides for new guide map.

##### **Guide Mask**

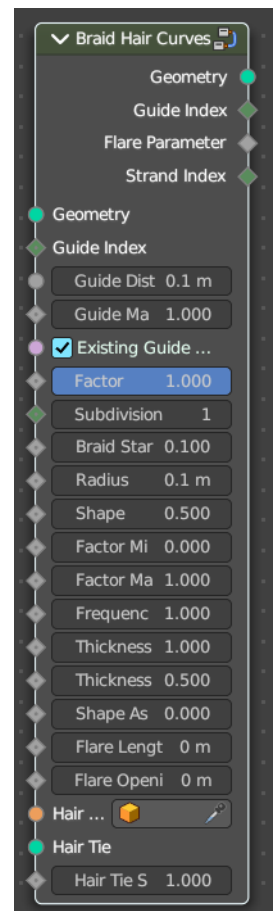

Mash for which curve are eligible to be selected as guides.

##### **Existing Guide Map**

Use the existing guide map attribute if available

##### **Factor**

Factor to blend overall effect.

### ***Subdivision***

Subdivision level applied before deformation.

### ***Braid Start***

Where to start to blend deformation in percent from the root.

### ***Radius***

Overall radius of the braids.

### ***Shape***

Shape of the braid radius along each curve.

### ***Factor Min***

Minimum radius of the braid.

### ***Factor Max***

Maximum radius of the braid.

### ***Frequency***

Frequency factor of the braids.

### ***Thickness***

Thickness of the braids.

### ***Thickness Shape***

Shape adjustment of the strand thickness for the braids.

### ***Shape Assymetry***

Asymetry of the shape adjustment of the strand thickness.

### ***Flare Length***

Length of the flare at the end of the braid.

### ***Flare Opening***

Opening radius of the flare at the tip of the braid.

### ***Hair Tie Object***

Object used for the hair tie instance.

### ***Hair Tie***

Geometry used for the hair tie instance. This has priority.

## ***Hair Tie Scale***

Scale of the hair tie instance.

## **Output**

### ***Geometry***

The output geometry.

### ***Guide Index***

The guide index map that was used for the operation.

### ***Flare Parameter***

Parameter between 0 and 1 along the flare.

### ***Strand Index***

Index of the strand within a braid that each curve belongs to.

## **Clump Hair Curves**

Clumps together existing hair curves.

## **Input**

### ***Geometry***

The input geometry.

### ***Guide Index***

Index map input. This input has priority.

### ***Guide Distance***

Minimum distance between two guides for new guide map.

### ***Guide Mask***

Mash for which curve are eligible to be selected as guides.

### ***Existing Guide Map***

Use the existing guide map attribute if available.

### ***Factor***

Factor to blend overall effect.

### ***Shape***

Shape of the influence along curves. 0 means constant. 0.5 means linear.

### **Tip Spread**

Distance of random spread at the curve tips

### **Clump Offset**

Offset of clump in a random direction.

### **Distance Falloff**

Falloff distance for the clumping effect. 0 means no falloff.

### **Distance Threshold**

Distance threshold for the clumping effect. 0 means no falloff.

### **Preserve Length**

Preserve the length of each curve during deformation.

## **Output**

### **Geometry**

The output geometry.

### **Guide Index**

The guide index map that was used for the operation.

## **Create Guide Index Map**

Creates an attribute that maps each curve to its nearest guide via index.

## **Input**

### **Geometry**

The input geometry.

### **Guides**

Index map input. This input has priority.

### **Guide Distance**

Minimum distance between two guides for new guide map.

### **Guide Mask**

Mask for which curve are eligible to be selected as guides.

### **Group ID**

The id that is used to group curves together for guide map creation.

## Output

### **Geometry**

The output geometry.

### **Guide Curves**

The output guides

### **Guide Index**

The guide index map that was used for the operation.

### **Guide Selection**

The output guide selection.

## Curl Hair Curves

Deform existing hair curves into curls.

## Input

### **Geometry**

The input geometry.

### **Guide Index**

Index map input. This input has priority.

### **Guide Distance**

Minimum distance between two guides for new guide map.

### **Guide Mask**

Mash for which curve are eligible to be selected as guides.

### **Existing Guide Map**

Use the existing guide map attribute if available.

### **Factor**

Factor to blend overall effect.

### **Subdivision**

Subdivision level applied before deformation.

### ***Curl start***

### ***Radius***

### ***Factor Start***

Form where to blend deformation in percent, starting from the root.

### ***Factor End***

Factor for the radius at the curl end.

### ***Frequency***

Frequency factor of the curls.

### ***Random Offset***

Amount of random offset per curve.

### ***Seed***

Random seed for the operation.

### **Output**

### ***Geometry***

The output geometry.

## 12.1.4 Editors - Geometry Nodes Editor - Header - Select Menu

### Table of content

Select menu.....	1
Legacy.....	1
Box select.....	1
Circle select.....	1
All.....	2

Inverse.....	2
Linked From.....	2
Linked To.....	2
Grouped.....	2
Grouped Extend.....	2
Activate same type previous.....	2
Activate same type next.....	2
Find Node.....	2

## Select menu

Here you will find the select functionality.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

### Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

### Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Inverse

Invert the current selection.

## Linked From

Select the nodes that are linked from the currently selected nodes. The nodes before in the hierarchy.

## Linked To

Select the nodes that are linked to the currently selected nodes. The nodes behind in the hierarchy.

---

## Grouped

Select grouped nodes.

## Grouped Extend

Select grouped nodes, and extend from the current selection.

## Activate same type previous

Activate same node type before the current selection, step by step.

## Activate same type next

Activate same node type after the current selection, step by step.

---

## Find Node

This button will open a search dialog where you can search for node types and select them in the current hierarchy.

## Add menu - Hair - Read

Hair nodes are Node Groups found in the Essentials Library included with Bforartists. They differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

### Curve Info

Reads information about each curve.

#### Output

##### **Curve Index**

Index of each curve.

##### **Curve ID**

ID of each curve.

##### **Length**

Length of each curve.

## ***Direction***

Direction of each curve.

## ***Random***

Random Vector of each curve.

## ***Surface UV***

Attachment surface UV coordinate of each curve.

## **Curve Root**

Reads information about the root point of each curve.

### **Output**

#### ***Root Selection***

Boolean selection of curve root points.

#### ***Root Position***

The position of a root point of a curve.

#### ***Root Direction***

Direction of the root segment of a curve.

#### ***Root Index***

Index of the root point of a curve.

## **Curve Segment**

Reads the information of the curve segment before the current point.

### **Output**

#### **Segment Length**

Length of the segment

#### **Segment Direction**

Direction of the segment

#### **Neighbor Index**

Index of the neighbouring point on segment.

## **Curve Tip**

Reads information about the tip point of each curve.

## Output

### Tip Selection

Boolean selection of the tip points.

### Tip Position

Position of the tip point of a curve.

### Tip Direction

Direction of the segment of the tip point of a curve.

### Tip Index

Index of the tip point of a curve.

## Hair Attachment Info

Reads attachment information regarding a surface mesh.

## Input

### *Surface Geometry*

Surface geometry of the curve attachment.

### *Surface UV Map*

Surface UV map used for attachment.

## Output

### *Attachment UV*

Surface attachment UV coordinate stored on each curve.

### *Attachment is Valid*

Is the attached UV coordinate valid?

### *Surface Normal*

The normal direction of the surface mesh at the attachment point.

Hair nodes are Node Groups found in the Essentials Library included with Bforartists. They differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

### Attach Hair Curves to Surface

Attaches hair curves to a surface mesh.

#### Input

##### Geometry

The input geometry.

##### Surface Object

A surface object to attach to. It needs to have matching transforms.

## **Surface**

Surface geometry to attach hair curves to.

## **Surface UV Map**

Surface UV Map used to attach hairs to.

## **Surface Rest Position**

Set the surface into rest position before attachment.

## **Sample Attachment UV**

Sample the surface UV mapp at the attachment point.

## **Snap to Surface**

Snap the root of the curve to the closest surface point.

## **Align to Surface Normal**

Align the curves to surface normals. Needs a guide as reference.

## **Blend along Curve**

Blend deformation along each curve from the root.

## **Output**

### **Geometry**

The output geometry.

### **Surface UV Coordinate**

Surface UV Coordinate at the attachment point.

### **Surface Normal**

Surface Normal at the attachment point.

## **Redistribute Curve Points**

Redistributes existing control points evenly along each curve.

## **Input**

### **Curves**

The input curve.

### **Factor**

Factor to blend overall effect.

## ***Feature Awareness***

Use simple feature awareness to keep feature definition.

## **Output**

### ***Curves***

The output curves.

## **Restore Curve Segment Length**

## **Input**

### ***Curves***

The input curve.

### ***Selection***

A selection of the input curve.

### ***Factor***

Factor to blend overall effect.

### ***Reference Position***

Reference position before deformation.

### ***Pin at Parameter***

Pin each curve at a certain point for the operation.

## **Output**

### ***Curves***

The output curves.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

## Set Hair Curve Profile

Set the radius attribute of hair curves according to a profile shape.

### Input

#### **Geometry**

The input geometry.

#### **Replace Radius**

Replace the original radius.

#### **Radius**

Base radius to be set when replace radius is enabled.

#### **Shape**

Shape of the radius along the curve.

#### **Factor Min**

Factor of the radius at the minimum.

#### **Factor Max**

Factor of the radius at the maximum.

### Output

#### **Geometry**

The output geometry.

## Add menu - Normals

The Normals node Smooth by Angle is a Node Group. Node groups differ from the other nodes in the add menu due to being mid level node groups instead of individual low level nodes.

You can enter the node tree by clicking at the icon up right. Tab to leave the node tree. And you can of course also edit the node tree.

## Smooth by Angle

Smoothens or sharpens the mesh edges based on the angle between faces.

### Input

#### *Mesh*

The input geometry.

#### *Angle*

Maximum face angle for smooth edges.

#### *Ignore Sharpness*

Ignore the sharpness at edges that are set to sharp.

### Output

#### *Geometry*

The output geometry.

## Node menu

This menu contains further node functionality.

### Move

Moves the selected nodes.

### Rotate

You can't rotate single nodes, obviously. But when you have more than one selected then you can rotate them around their center point.

### Resize

You can't resize single nodes, obviously. But when you have more than one selected then you can scale them around their center point.

### Copy

Copies the selected node(s).

### Paste

Pastes the selected node(s).

### Duplicate Keep Input

This works at nodes that have a connected input. Duplicating will keep the input connections established in the duplicated node. The output connections will be removed.

### Duplicate

Duplicates the selected node(s). All connections will be removed in the duplicated node.

### Delete

Deletes the selected node(s).

### Delete with Reconnect

Deletes the selected node(s). When this node is in the middle of a connection, then the connections will be reconnected.

## Join new Frame

Frame node functionality. Adds the selected node to a frame.

## Remove from Frame

Frame node functionality. Removes the selected node from a frame.

## Frame Make Parent

Frame node functionality. Adds the selected node to a frame.

## Rename

Allows you to rename the selected node. A popup dialog will appear where you can change the name of the node. Press enter to make it real.

## Links

### Make Links

Tries to connect nodes where it makes sense.

### Make and Replace Links

Same as Make Links. But it will replace existing links.

### Cut Links

Mouse only tool. Cut links by moving with the mouse over the connection

### Detach Links

Removes all connections from the selected node, but tries to reconnect the remaining nodes.

### Detach Links Move

Removes all connections from the selected node by dragging.

### Mute Links

Allows you to mute links instead of disconnecting it by painting over the link connection. To unmute, use the tool again. Hotkey only tool. Please use the hotkey.

## Separate

Node group functionality. You need to be in edit group mode.

## Copy

Copies the selected node, and pastes a copy of it outside of the node group. The node group remains unchanged.

## Move

Moves the selected to outside of the node group, and removes it from the node group.

## Hide / Toggle

Here you find hide options to make the display of nodes more compact.

Demonstration happens at an image node.

## Hide

Hides everything but input and output dots. To view the full node again perform the operator again. It's a toggle. Or click at the triangle left besides the node name.

## Toggle Node Mute

Deactivates the node.

## Toggle Node Preview

This is a compositor feature for the preview image. It does not belong here, but shares the same menu. It shows or hides the preview image.

## Toggle hidden node sockets

Toggles away the unused node sockets. In this case the vector input node socket and the alpha output node socket will be hidden.

## Toggle Node Options

Hides away the properties.

## Collapse and Hide Unused Sockets

Like Hide. Hides everything but the node sockets. But it also hides the unused node

sockets.

## 12.1.5 Editors - Geometry Node Editor - Header - Add Menu

### Table of content

Add menu.....	1
Add menu – Search.....	1
Add menu – Appending Node-groups.....	2
Add menu – Searching for Node-Groups.....	2

### Add menu

Here you will find all the nodes that you need to create your geometry node trees. A click at one of the items will create the node in the workspace at the mouse position right under the menu. It is already selected, and you can drag it around.

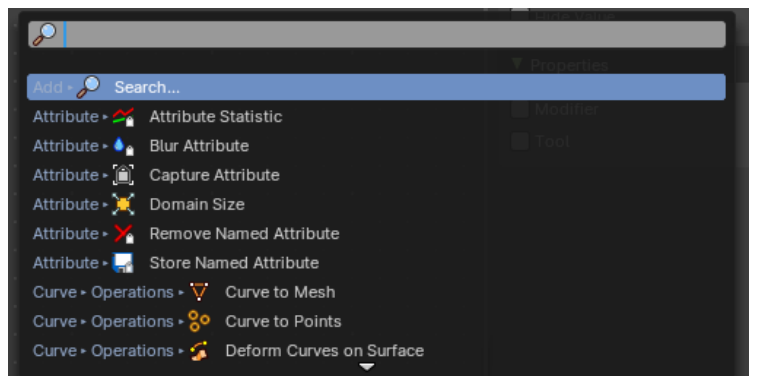

### Add menu – Search...

You can click on the search operator to bring up a Pop-up to search the Add menu where you can find specific node types in all categories.

To use, click on the operator or alternatively press spacebar or type in the term that you want to find.

**Note:** You can call the add menu then immediately start searching at any time.

## Add menu – Appending Node-groups

The add menu also dynamically loads and adds any and all node-groups listed in collective asset libraries. These are appended as new sub-menus based on the category label.

Loading these assets may take some time on first use.

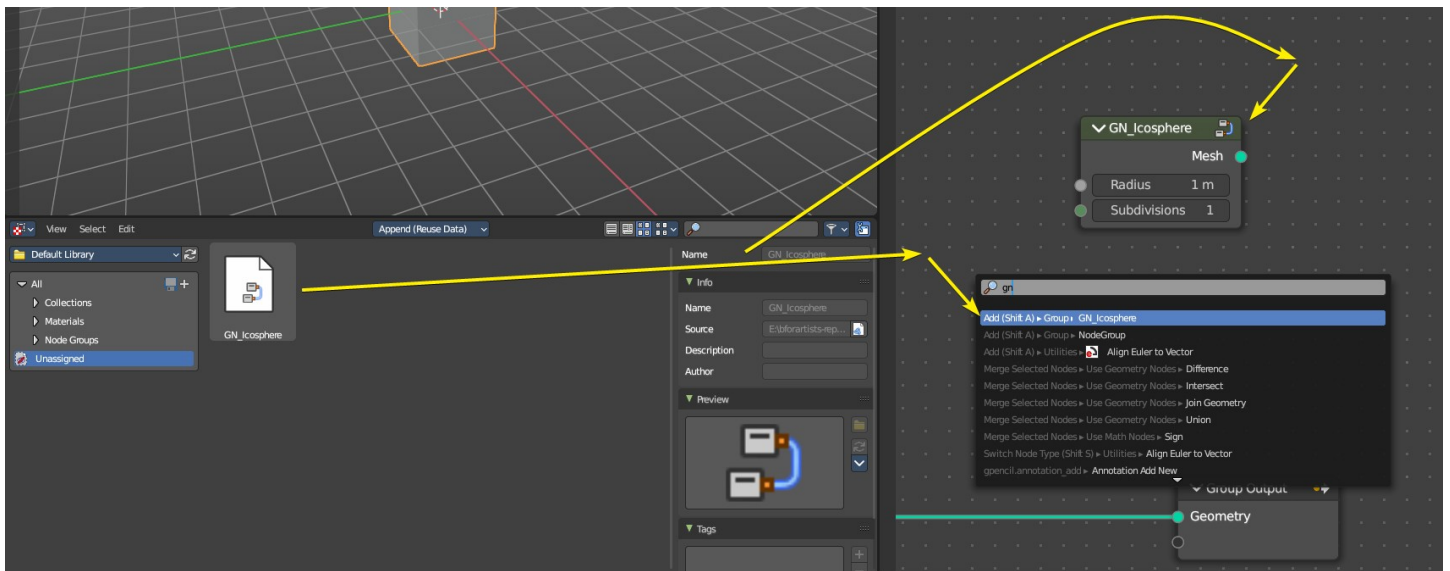

All Geometry Nodes node-groups registered in the Asset Browser are listed at the end of this menu.

**Note:** Once a node-group from an asset library has been appended to the scene, they will list as a node-group datablock and can be accessed from the Relations tab in the Node Editor Property Shelf.

## Add menu – Searching for Node-Groups

Alternatively, you can search for node-groups in the asset libraries using the search dialogue. They will also be listed in the search results.

The Attribute menu contains the attribute nodes. These nodes allows you to work with object attributes.

## Attribute Statistics

Retrieve statistic values from the input mesh.

### Inputs

#### **Geometry**

Standard geometry input.

#### **Selection**

A selection of the geometry input.

#### **Attribute**

Attribute to get the statistics from.

### Properties

#### **Domain Type**

From which domain to retrieve the data.

#### **Data Type**

What data type to use.

Float will output a single floating point value.

Vector will output a vector 3 with floating point values.

### Outputs

Outputs the statistics for the different types.

#### **Mean**

The average value of all data.

#### **Median**

The median value of all data.

## **Sum**

The sum value of all data.

## **Min**

The min value of all data.

## **Max**

The max value of all data.

## **Range**

The difference between the max and min value.

## **Standard Derivation**

How much values differ from the mean. A low standard deviation indicates that the values are grouped tightly together at the mean. A high standard deviation indicates that the values are spread out over a large range.

## **Variance**

The variance of all data, defined as the square of the standard deviation.

---

## **Blur Attribute**

The Blur Attribute mixes values of neighbour elements.

### **Inputs**

#### **Value**

Name of the attribute that is used as input. It should be a float attribute with values between zero and one.

#### **Iterations**

How many times to blur the values for all elements.

#### **Weight**

Relative mix weight of neighbouring elements.

### **Properties**

#### **Data Type**

What data type to use.

## Outputs

### Value

The output value.

## Capture Attribute

The Capture Attribute node stores the result of a field on a geometry, and outputs the data as a node socket so it can be used by other nodes.

The result is stored on the geometry just like a regular attribute with a name. But instead of referencing it with a name, it is retrieved whenever the socket is connected to the input of a node. Later on when evaluating the node tree, the attribute will be removed automatically if it is no longer used.

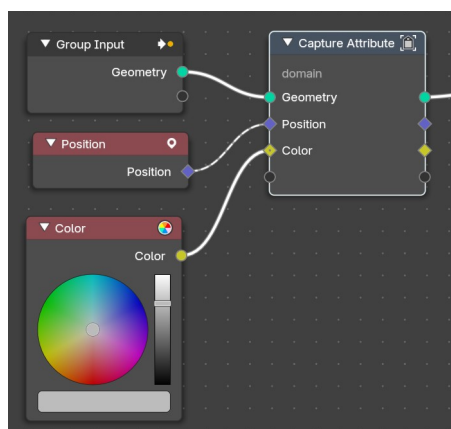

## Inputs

### Geometry

Standard geometry input.

### Empty socket

Connect a node to get its attribute. Note that adding a connection creates a new empty socket. Note also that further input and output settings depends of the input socket. For a position node you will get a vector numberfield. For a color node a color output when you disconnect the former connected socket types.

## Outputs

### Geometry

Standard geometry output.

### Attribute

Attribute output.

## Domain Size

The Domain Size node has a single geometry input and a selection for the component type. And outputs containing single values for the related domains are shown, based on this chosen component.

## Input

### Geometry

Geometry input.

## Properties

### Component

What component to calculate.

## Output

### With type mesh

#### Point Count

The point count of the mesh.

#### Edge Count

The edge count of the mesh.

#### Face Count

The face count of the mesh.

#### Face Corner Count

The face corner count of the mesh.

### With type Point Cloud

#### Point Count

The point count of the point cloud.

### With type Curve

#### Point Count

The point count of the curve.

## Spline Count

The number of splines in the curve.

## With type Instances

### Instances count

How many instances the input geometry has.

## Remove Named Attribute

### Input

#### Geometry

Geometry input.

#### Name

The attribute name that you want to remove.

### Outputs

#### Geometry

The output geometry.

## Store Named Attribute

Puts the results of a field in a named attribute.

### Input

#### Geometry

Geometry input.

#### Selection

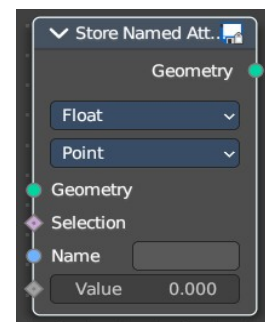

Selection input.

#### Name

The attribute name that you want to store.

#### Value

The value that is connected with the stored attribute.

## Properties

### ***Data Type***

The type for the source and result data.

### ***Domain***

What element to use.

## Outputs

### ***Geometry***

The output geometry.

## Add menu - Input - Constant

Here you find input nodes.

### Boolean

Inputs a boolean value.

### Properties

#### Value

The input boolean.

## Outputs

### **Boolean**

The boolean state.

---

### **Color**

Define a input color.

This node is a color wheel.

Clicking at the color field at the bottom will reveal the standard Blender color dialog, where you can input numeric values.

## Outputs

### **Color**

Standard color output.

---

### **Image**

Add a input image.

## Properties

### **Image**

Load or connect a image.

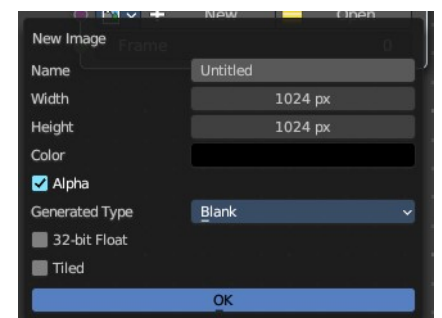

### **New**

Create a new image.

Opens a new image dialog where you can adjust the color, size and further settings.

### **Open**

Open a existing image.

## Image prop

### *Image browser*

A list of available images

### *Image name*

The name of the image

### *Fake user*

Add a fake user to this asset.

### *New*

Create a new image.

Opens a new image dialog where you can adjust the color, size and further settings.

### *Open Image*

Open an existing image.

### *Remove*

Removes the image as the active image.

### *Frame*

For videos. Which frame to use.

## Outputs

### *Image*

The output image.

---

## Integer

Inputs an integer value.

## Properties

### *Value*

The input integer.

## Outputs

### *Integer*

The integer value.

---

## Material

Retrieve a material.

## Outputs

### *Material*

The material output.

---

## Rotation

Apply a constant rotation.

## Properties

### *X, Y Z*

The rotation that you want to apply.

## Outputs

### *Rotation*

The output rotation vector.

---

## String

Input a string.

## Properties

### *String*

The string that you want to input.

## Outputs

### *Value*

The value set in the node properties.

---

## Value

Input numerical values to other nodes in the tree.

## Properties

### *Value*

Single numerical value (floating point).

## Outputs

### *Value*

The value set in the node properties.

---

## Vector

Creates a single vector of three values that can be used as an input.

Properties

### **X Y Z**

The values of the vector.

## Output

### *Vector*

Standard vector output.

## Add menu - Input - Gizmo

Here you find input nodes.

### Dial Gizmo

Displays the rotation gizmo in the 3d view.

## Inputs

### **Value**

Show or hide the widget.

### **Position**

Where to show the widget in relation to the object.

### **Up**

The up vector to define the rotation.

### **Screen Space**

Use screen space or object space values to display the widget.

### **Radius**

The radius of the widget.

## Properties

### **Color**

The widget color, defined in the theming.

### **Pin Gizmo**

Always display the gizmo.

## Outputs

### **Transform**

The output transform. No positions, no matrices, Gizmos.

---

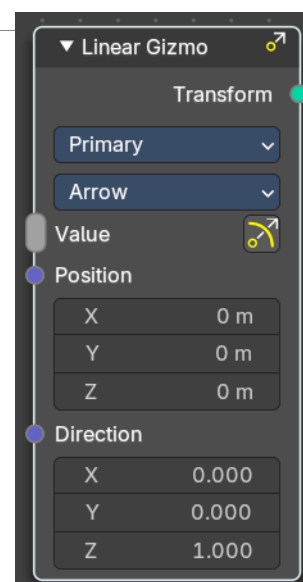

## Linear Gizmo

Displays the translation gizmo in the 3d view.

## Inputs

### **Value**

Show or hide the widget.

## ***Position***

Where to show the widget in relation to the object.

## ***Direction***

The direction vector.

## ***Screen Space***

Use screen space or object space values to display the widget.

## ***Radius***

The radius of the widget.

## **Properties**

### ***Color***

The widget color, defined in the theming.

### ***Draw Style***

How to draw the widget.

### ***Pin Gizmo***

Always display the gizmo.

## **Outputs**

### ***Transform***

The output transform. No positions, no matrices, Gizmos.

---

## **Transform Gizmo**

Displays the transform gizmo in the 3d view.

## **Inputs**

### ***Value***

Show or hide the widget.

### ***Position***

Where to show the widget in relation to the object.

### ***Rotation***

The rotation vector.

### ***Screen Space***

Use screen space or object space values to display the widget.

### ***Radius***

The radius of the widget.

## **Properties**

### ***Pin Gizmo***

Always display the gizmo.

## **Outputs**

### ***Transform***

The output transform. No positions, no matrices, Gizmos.

## Add menu - Input - Scene

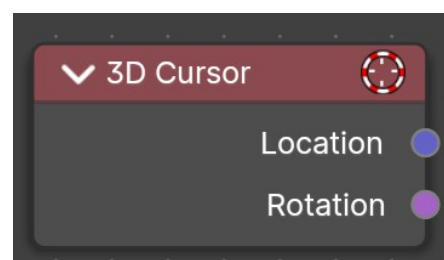

Here you find input nodes.

### Cursor

The Cursor Geometry node gets the 3D Cursor location and rotation, for tool execution. Useful for creating tools with the 3D Cursor input from user.

Note that this node just shows with geometry nodes type Tool.

### Outputs

#### Location

The location of the scene's 3D cursor, in the local space of the modified object.

#### Rotation

The rotation of the scene's 3D cursor, in the local space of the modified object.

### Active Camera

The node outputs the the scene's current active camera.

Typical usage would be to connect this node to an Object Info node to obtain its transform.

### Outputs

#### Active Camera

The active camera.

### Collection Info

The Collection Info node retrieves information from collections. This can be useful to use

an external collection to control parameters in the geometry node tree.

## Inputs

### **Collection**

Collection to get the properties from.

## Properties

### **Transform Space**

The transformation of the geometry outputs.

### **Original**

Output the geometry relative to the collection offset.

### **Relative**

Bring the input collection geometry into the modified object, maintaining the relative position between the objects in the scene.

## Outputs

### **Geometry**

Geometry of the collection in world space with all its modifiers applied.

## Image Info

Retrieve infos from an image.

## Input

### **Image**

Load or connect a image.

### **New**

Create a new image.

Opens a new image dialog where you can adjust the color, size and further settings.

### **Open**

Open a existing image.

## Image prop

### **Image browser**

A list of available images

### **Image name**

The name of the image

### **Fake user**

Add a fake user to this asset.

## **New**

Create a new image.

Opens a new image dialog where you can adjust the color, size and further settings.

### **Open Image**

Open an existing image.

### **Remove**

Removes the image as the active image.

### **Frame**

For videos. Which frame to use.

## **Outputs**

### **Width**

The width of the image.

### **Height**

The height of the image

### **Has Alpha**

Returns true if the image has an alpha channel

### **Frame Count**

For movies. How many frames.

### **FPS**

For movies, what FPS rate.

## Is Viewport

The Is Viewport node outputs true when geometry nodes is evaluated for the viewport. For the final render the node outputs false.

## Outputs

### *Is Viewport*

A boolean that indicates if the geometry nodes is evaluated for preview.

---

## Named Layer Selection

Output a selection of a grease pencil layer by attribute name

## Inputs

### *Name*

The layer name attribute.

## Outputs

### *Selection*

The selected layer.

---

## Mouse Position

Just in Tool mode !

Retreives the mouse position.

## Outputs

### *Mouse X*

Mouse X position.

### *Mouse Y*

Mouse Y position.

### *Region Width*

The total X size of the region in pixels.

## ***Region Height***

The total Y size of the region in pixels.

---

## **Object Info**

The Object Info node retrieves information from objects. And outputs it then.

### **Inputs**

#### ***Object***

Object to get the properties from.

### **Outputs**

#### ***Transform***

Transform matrix output.

#### ***Location***

Location of the object in world space.

#### ***Rotation***

Rotation of the object in world space.

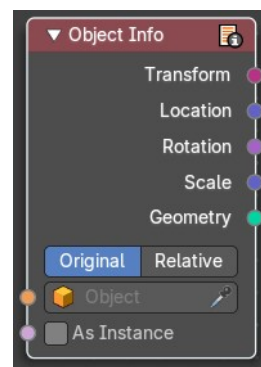

#### ***Scale***

Scale of the object in world space.

#### ***Geometry***

Geometry of the object in world space with all its modifiers applied.

---

## **Scene time**

Outputs the current scene time in seconds or in frames.

The Frame output is a float value to make subframe rendering for motion blur possible.

### **Outputs**

#### ***Seconds***

Output in seconds.

## ***Frame***

Output in Frames.

---

## **Self Object**

Retreives the parent object of the geometry nodegroup.

## **Viewport Transform**

Just in Tool mode !

Gets and retrievees the view direction and location from the 3D Viewport.

### **Outputs**

#### ***Projection***

Outputs the 3D Viewport's perspective or orthographic projection matrix as a matrix transform value.

#### ***View***

Outputs the view direction and location of the 3D Viewport as a matrix transform value.

#### ***Is Orthographic***

Outputs a boolean to show if the camera is orthographic with a true or false value.

# Tool Shelf

## Select Tools Group

Tools with a triangle down right are a group of tools. Click and hold to reveal the content. Then choose the tool that you need.

## Tweak

Allows you to select or tweak single elements by clicking at it.

## Select Box

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### *Set a new selection*

### *Extend existing selection*

### *Subtract existing selection*

## Select Circle

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### *Set a new selection*

### *Extend existing selection*

### *Subtract existing selection*

### Radius

The brush radius.

## Select Lasso

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### *Set a new selection*

### *Extend existing selection*

### *Subtract existing selection*

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar.

Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate

Draw free-hand strokes in the main window.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Stabilize Stroke

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### Radius

The radius for the stroke stabilization.

### Factor

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

## End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

---

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker where you can define the color for the annotation stroke.

---

## Annotate Eraser

Click and drag to remove annotate lines.

### Tool Settings

#### Radius

The radius of the eraser pencil.

---

## Links Cut

This tools allows you to cut connections.

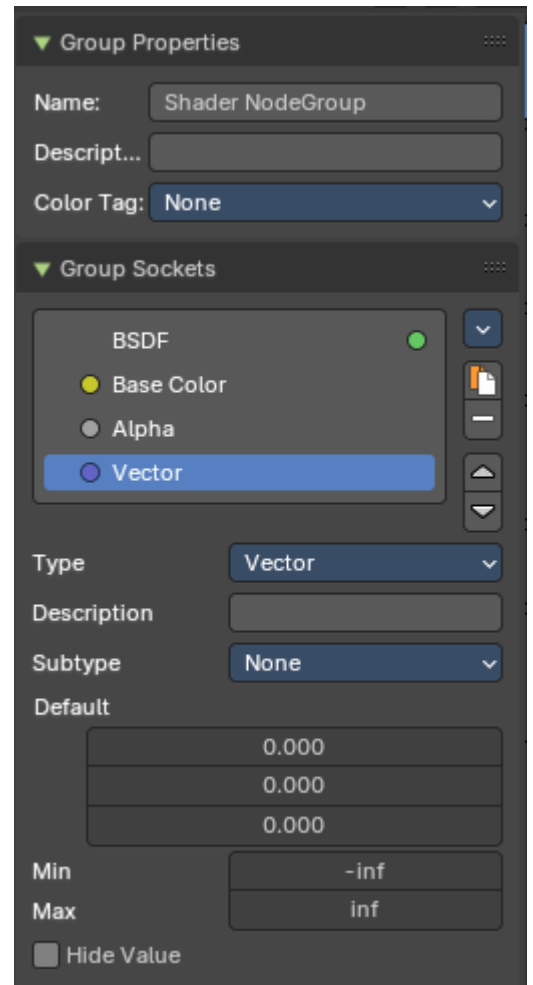

## 12.3.1 Editors - Geometry Nodes Editor - Sidebar - Group tab

Socket Type Properties.....	5
Description.....	5
Default.....	5
Min.....	5
Max.....	5
Subtype.....	6
Hide Value.....	6

## Group tab - Introduction

The Shader sidebar Group tab at the right side contains options and settings for node groups and socket input and output properties.

## Properties Panel

### Name

Change the name of the current node group. Type in a new name and hit enter.

### Description

Change the description of the current node group. Type in a new name and hit enter.

### Color Tag

Changes the header color of the current node group.

#### Color Tag Types:

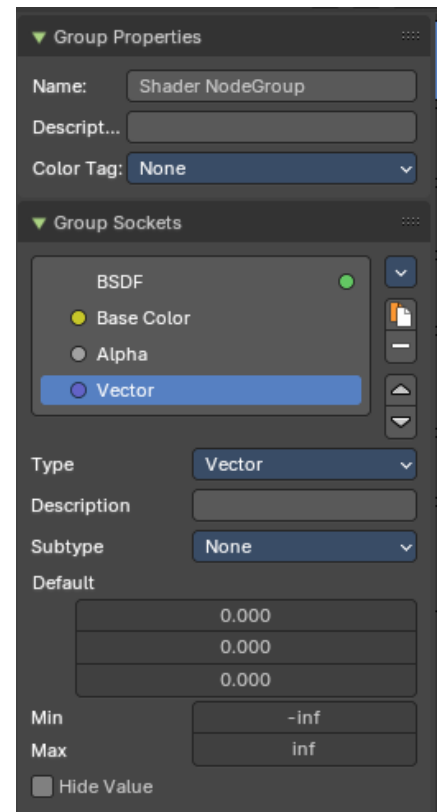

- Color
- Converter
- Input
- Output
- Script
- Shader
- Texture
- Vector

# Group Sockets Panel

Manage the input and output properties of the Group Input and Output nodes.

More than one input and output slot can be useful when you want to modify the shader in the node group in more than one way.

## Group Socket List

List of available input and output sockets.

**Note:** *The list can be sorted by dragging the items around.*

### List

The list of input and output sockets.

### Name

Change the name of the current selected input socket by double clicking on the socket in the list. Type in a new name and hit enter.

### New Item

Adds a new input sockets to the list.

### Input

Adds a new input sockets to the list.

### Output

Adds a new output socket to the list.

### Panel

Adds a new panel socket to the list.

### Duplicate Item

Duplicates the active socket.

### Remove Item

Removes the selected input socket from the list.

## Move Item Up/Down

Moves the active item to the specified direction. You can move the active item up or down the list.

**Note:** You can also alternatively drag and drop the active item to re-order.

## Inputs

Inputs are characterized by the colored dot to the left. These are manifested in the Group Input node.

## Outputs

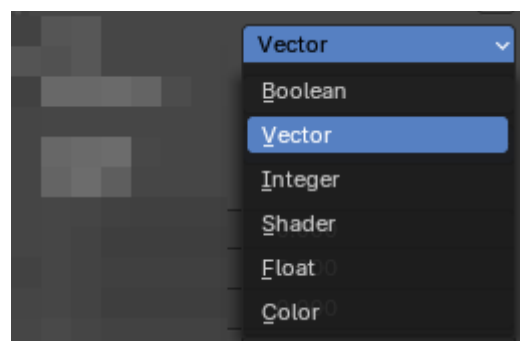

Outputs are characterized by the colored dot to the right. These are manifested in the Group Output node.

## Type

What kind of node group input or output type it is. To know more about the properties of the socket types, refer to the next section.

- Boolean
- Vector
- Integer
- Shader
- Float
- Color

# Socket Type Properties

## Description

Add a tooltip to the socket description.

## Default

The default value for the socket.

## Min

The minimum value for the socket.

**Note:** This is only available for vector, float and integer types.

## Max

The maximum value for the socket.

**Note:** This is only available for vector, float and integer types.

## **Subtype**

Some node types have a subtype dropdown menu, such as the vector or float. The subtype menu allows you to define the socket type sliders and read-out.

## **Hide Value**

Hide the input value even when the socket is not connected.

## 12.3.2 Editors - Geometry Nodes Editor - Sidebar - Node tab

### Table of content

Node panel.....	1
Name.....	1
Label.....	1
Color Subpanel.....	1
Presets.....	1
Node color specials.....	2
Copy Color.....	2
Properties panel.....	2
Repeat panel.....	2
Active Item Index.....	2

Filter Options.....	3
Filter by name.....	3
Invert.....	3
Sort by Name.....	3
Reverse.....	3
Pull handler.....	3
Socket Type.....	3
Inspection Index.....	3

## Node panel

### Name

The name of the selected node. Read only.

Despite being read only, this text can be edited. But be careful, it will not change the name in the header of the node. And it does not snap back to the original name of the node when you remove the custom text.

### Label

Allows you to define a custom name for the selected node. This text does change the name in the header of the node.

### Color Subpanel

Define a custom color for the node. A click at the color field opens a color picker.

### Presets

Add color presets.

## Node color specials

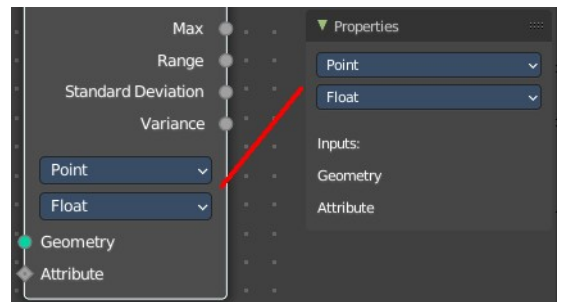

### Copy Color

Copies the color. Which doesn't help you since you cannot paste it.

## Properties panel

Lists the properties of the node in editable form. And the inputs in text form.

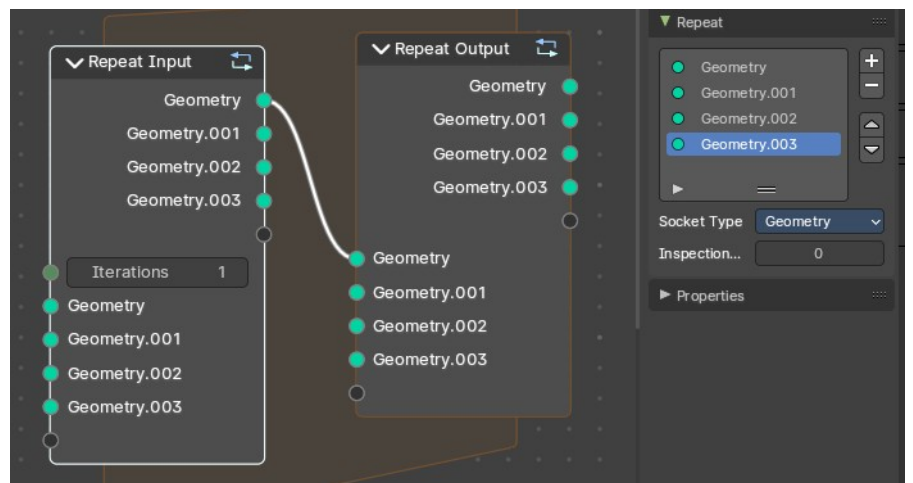

## Repeat panel

Repeat Zone node only. Repeat Zone settings.

## Active Item Index

List of active in- and output sockets.

## Add Repeat Item

Adds a new socket item.

## Remove Repeat item

Removes the selected socket item.

## Move Repeat Item up or down

Moves up or down the selected socket item.

## Filter Options

When you click at the arrow button down left then you can reveal the filter options.

### *Filter by name*

Filter the content by name by typing in the name in the field.

### **Invert**

Inverts the filtering by name.

### **Sort by Name**

Sort alphabetically. A is at the top.

### **Reverse**

Sort alphabetically in reverse order. A is at the end of the list.

## Pull handler

Resize the list.

## Socket Type

What socket type the currently selected socket is.

## Inspection Index

Iteration index that is used by inspection features like the viewer node or socket inspection. This value specifies which iteration should be used by the inspection features.

## 12.3.3 Editors - Geometry Nodes Editor - Sidebar - Node Tab

### Table of content

Node Tab - Node Panel.....	1
Name.....	1
Label.....	1
Color sub menu.....	1
Color checkbox.....	1
Presets.....	1
Color.....	1
Node color specials.....	2
Copy Color.....	2
Node Tab - Properties Panel.....	2

## Node Tab - Node Panel

In this panel you can give nodes and node groups a name and a label, and change its color.

### Name

The type of the node.

### Label

The label name of the node.

### Color sub menu

### Color checkbox

The Color checkbox turns custom color on or off.

### Presets

Store some color presets and reuse them. They are stored globally, and transfers to other blend files.

### Color

Choose a custom color. A click at the color field will open a color picker.

## Node color specials

### *Copy Color*

Allows you to copy the color.

## Node Tab - Properties Panel

This panel shows usually the same properties than the properties at the node. These properties are already explained in the Add menu chapters. So we won't repeat them here.

## 12.3.4 Editors - Geometry Nodes Editor - Sidebar - Tool Tab

### Table of content

Tool Tab..... 1

### Tool Tab

Contains the settings of the currently active tool in the tool shelf.

In the node editor we don't have something special here. The tool related settings are explained in the tool shelf chapter.

## 12.3.5 Editors - Geometry Nodes Editor- Sidebar - View Tab

### Table of content

View Tab - Annotation Panel.....	1
Annotations prop.....	1
Drop down box.....	1
Edit Box.....	1
Fake User.....	1
Add Annotation.....	2
Delete Annotation.....	2
List of Annotation Strokes.....	2
Thickness.....	2
Frame Locked/Unlocked.....	2
Onion Skin.....	2

## View Tab - Annotation Panel

View related settings. Which is in the node editor just the Annotations panel where you can manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

### Annotations prop

Add, remove and rename new annotations.

### Drop down box

A list of the available annotation layers.

### Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

### Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

---

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

---

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

---

## Onion Skin

Enable Onion Skinning.

Onion Skinning allows to show ghosts of the keyframes before and after the current frame. In this sub panel you can adjust the color of the onion skin frames.

With the numbers below the colors you can define how many frames before or after are displayed that way.

## 12.3.6 Editors - Geometry Nodes Editor - Sidebar - Add

### Table of content

Add Tab.....	1
Usage.....	1
Add tab - Display Panel.....	1
Icon Buttons.....	1

### Add Tab

Here you can find the same nodes than in the Add menu. Panels are more convenient to use. They stay open for example. It's your decision with what system you want to work.

We won't explain the content of the panels again. The single nodes are explained in the add menu chapter.

### Usage

Click at one of the node buttons, then move the mouse into the viewport. The created node sticks at the mouse. Click again to release it.

### Add tab - Display Panel

#### Icon Buttons

You can display the nodes in the panels either as text buttons or as pure icon buttons.

## 12.3.7 Editors - Geometry Nodes Editor - Sidebar - Relations tab

### Table of content

Relations tab - Display Panel.....	1
Icon Buttons.....	1
Relations tab - Group Panel.....	1
Make Group.....	2
Group Insert.....	3
Usage.....	3
Group Input.....	3
Group Output.....	3
Toggle Edit Group.....	3

Relations tab - Node Group Panel.....	3
Relations tab - Layout Panel.....	3
Frame.....	3
Adding and Removing Nodes.....	4
Resizing Frame.....	4
Label and Color.....	4
Reroute.....	4
Move, Rotate, Scale.....	5

## Relations tab - Display Panel

### Icon Buttons

You can display the nodes in the panels either as text buttons or as pure icon buttons.

## Relations tab - Group Panel

Node groups allows you to group different nodes of the material together to reduce the visual complexity. A node group acts like any other node.

Material node groups should not include Input nodes, like Image nodes, or Output nodes.

If you include a source node in your group, you will end up having the source node appearing twice: once inside the group, and once outside the group in the new material node tree.

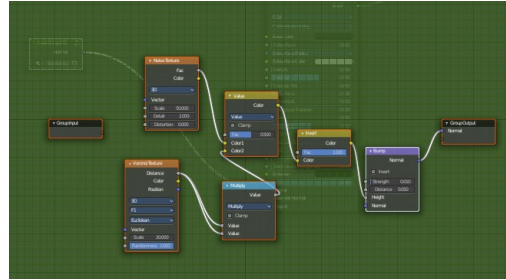

If you include an output node in the group, there will not be an output socket available from the group!

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item . That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Group Insert

Inserts the selected node into the selected group.

### Usage

Select the node.

Hold down shift, and select the group.

Click the Group Insert button. The node will now be part of the group, and you will land in group edit mode. Press tab to exit the group edit mode.

## Group Input

Adds a group input node.

## Group Output

Adds a group output node.

## Toggle Edit Group

Enter or exit the edit group mode.

## Ungroup

Ungroups an existing group. You need to be outside of the group edit mode.

## Relations tab - Node Group Panel

When you create a node group, then this node group is listed here. And can be dragged from there for reuse too.

## Relations tab - Layout Panel

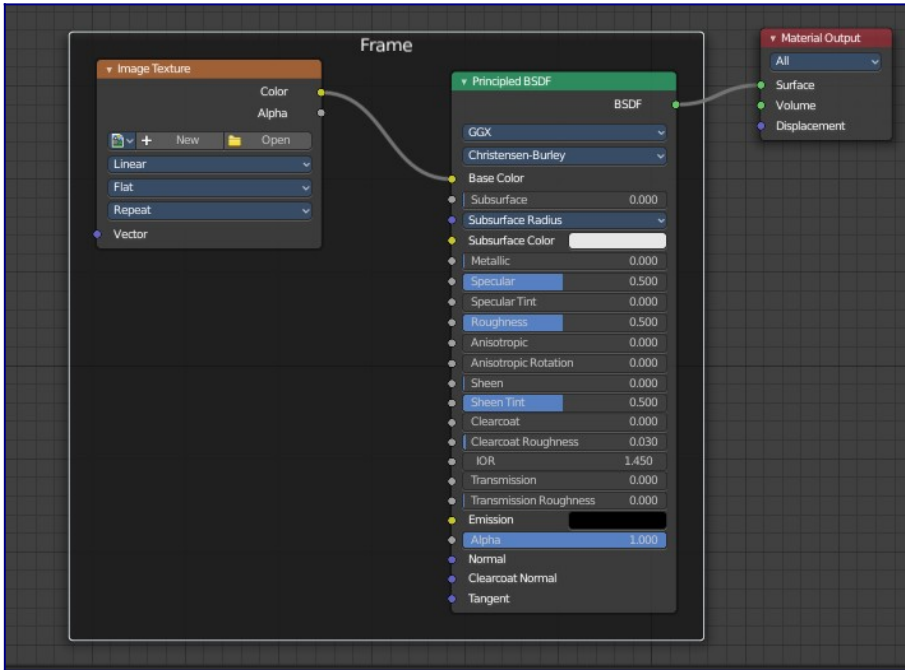

These nodes help organizing the node layout.

## Frame

The Frame node allows you to drop nodes into a frame. This frame can be dragged around as a whole.

## Adding and Removing Nodes

Nodes can be added by simply dropping them onto the frame. Or with the Join in New Frame menu item in the Node menu.

To remove a node from the frame use Remove from Frame.

## Resizing Frame

When the Frame node is first placed in the node editor workspace you can resize it by dragging one of the edges.

Once a node is placed in the Frame, the Frame shrinks around the nodes. You cannot resize it anymore with handlers. Just by dragging around the nodes inside of the frame.

This behavior can be changed by disabling the *Shrink* option in the Item tab in the Properties panel. Then you can resize the frame again by dragging the edges.

## Label and Color

You can change the name of a frame in the Node panel. And you can give it a custom color by checking the Color checkbox and adjusting the color then.

## Reroute

Adds a reroute point that can be used to reroute connections. It allows just one input, but allows multiple output connections.

To quickly add a Reroute node into an existing connection, hold Shift and Right Mouse and drag the mouse to

cut through the link. A new reroute node will be added.

When you exceed a specific angle amount between the reroute nodes, then the node connection becomes a sharp corner, and not longer a Bezier like soft curve.

### Move, Rotate, Scale

A normal node has a handler. The reroute dot not. You can't simply move it around with the mouse by clicking at the top area. It has none. You have to use the move, rotate and scale commands. They can be found in the View menu.

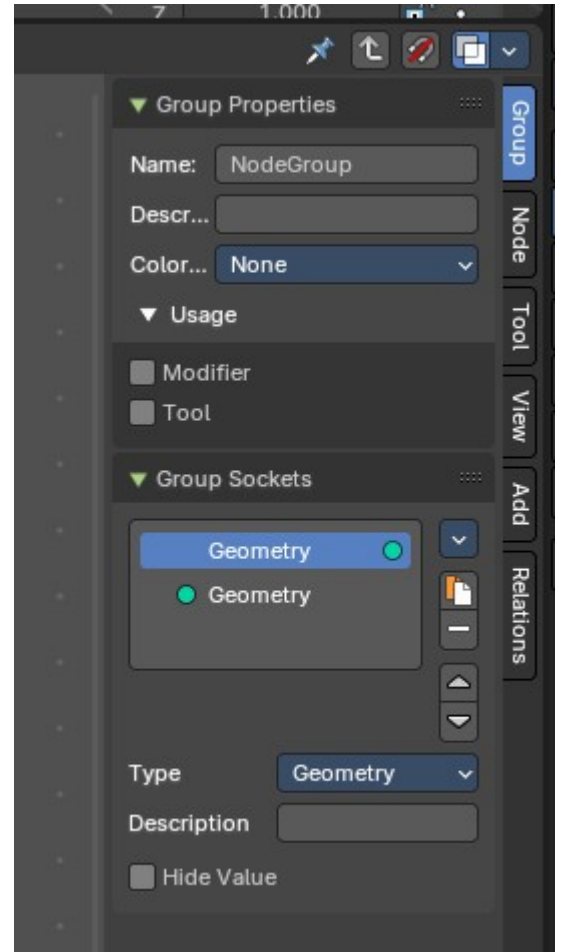

## 12.3 Editors - Geometry Node Editor - Sidebar

### Table of content

Introduction.....	1
Right Click menus.....	1

### Introduction

The Geometry Node Editor is made of several areas. At the right side you will find the sidebar. Here you will find further options and settings for the Geometry Node Editor nodes and its tools.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

# Geometry Nodes Editor

The Geometry Node Editor is an editor where you can modify the geometry of objects procedurally by nodes.

You can also create Node Group Tools for act-once operators using Geometry Node Group Tools.

When you add a node group, then a modifier is added to the Modifier Stack in the Properties Editor. Geometry nodes are tied to this modifier.

The editor is divided into several areas has several tool areas.

- Yellow – Header
- Blue - Tool Shelf
- Pink - Sidebar

Note that the shader editor does not have a tool area above the header. All tool settings are in the sidebar in the Tool tab.

The node editor displays a breadcrumb at the upper left when a geometry node tree exists. It is just a visual hint, and has no further functionality.

## Navigating in the Geometry Nodes Editor viewport

### Hotkeys

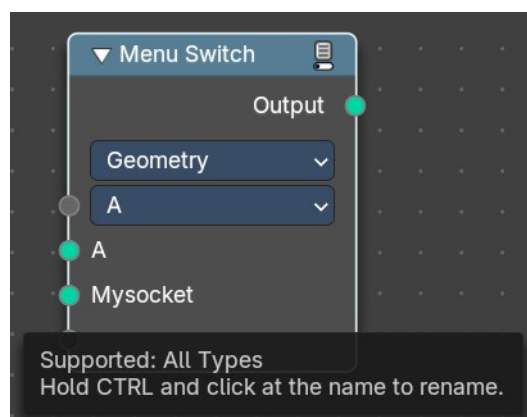

Pan the view - MMB

Zoom - Mouse Wheel, MMB+CTRL, Numpad + / -

View All - Home

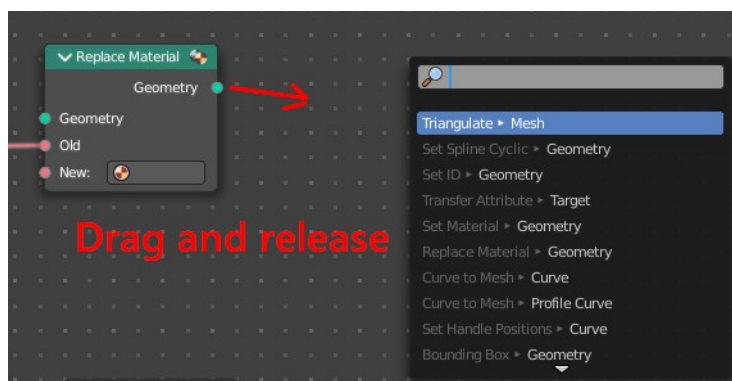

## Rename Socket names

In some nodes you can rename the socket names by holding down CTRL and click at the name.

## Node drag search

When you grab a node input or output, drag it around, and release it in the empty space, then you will get a search menu with the available nodes that fits to this input or output.

## Node context menu

When you double right click into the viewport, then you will open a menu. The UV Context menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual. It does though show different content under different circumstances.

## Add

The whole add menu from the header.

## Find

Search for nodes, and hilight them. When you are in a node group then it lists the content of the node group.

## Cut Links

Calls a cut tool with which you can cut links between nodes

## Mute Links

Calls a cut tool with which you mute cut links between nodes. To unmute the links use the same tool again.

## Exit Group

Same as Edit Group. When you are in a group then you can end editing with this operator.

## Link to Viewer

Adds a viewer node to the selected node.

## Copy

Copies the selected nodes.

## Paste

Pastes the copied nodes.

## Duplicate

Duplicates the selected nodes.

## Rename

Allows you to rename the current active node. A popup opens up where you can type in another name.

## Delete

Deletes the selected nodes. All Connections gets removed.

## Delete with Reconnect

Deletes the selected nodes. Existing connections gets bypassed as if the node would not have existed.

---

## Make Links

Shows when you have at least two nodes connected.

Tries to connect nodes where it makes sense. For example, the BSDF output of a Principled shader with the Surface input of the Material Output node.

## Make and Replace Links

Shows when you have at least two nodes connected.

Same as Make Links. But it will replace existing links.

## Detach Links

Shows when you have at least two nodes connected.

Removes all connections from the selected node, but tries to reconnect the remaining nodes.

---

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item in the sidebar in the Relations tab in the Group panel. That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Insert into Group

Allows you to insert a node into a node group.

Select the node, hold down Shift, then select the node group so that both are selected. Then perform the

operator.

## Toggle Edit Group

Enters a node group for editing. Or when you are in a node group, exits the node group editing.

## Ungroup

Removes the selected nodes from a group.

## Join new Frame

Frame node functionality. Adds the selected node to a frame.

## Remove from Frame

Frame node functionality. Removes the selected node from a frame.

## Rename

Allows you to rename a node.

## Select submenu

## Grouped

Select grouped nodes.

## Linked From

Select the nodes that are linked from the currently selected nodes. The nodes before in the hierarchy.

## Linked To

Select the nodes that are linked to the currently selected nodes. The nodes behind in the hierarchy.

## Activate same type previous

Activate same node type before the current selection, step by step.

## Activate same type next

Activate same node type after the current selection, step by step.

## Show/Hide submenu

Here you find hide options to make the display of nodes more compact.

Demonstration happens at an image node.

## Hide

Hides everything but input and output dots. To view the full node again perform the operator again. It's a toggle. Or click at the triangle left besides the node name.

## Toggle Node Mute

Deactivates the node.

## Toggle Node Preview

This is a compositor feature for the preview image. It does not belong here, but shares the same menu. It shows or hides the preview image.

## Toggle hidden node sockets

Toggles away the unused node sockets. In this case the vector input node socket and the alpha output node socket will be hidden.

## Toggle Node Options

Hides away the properties.

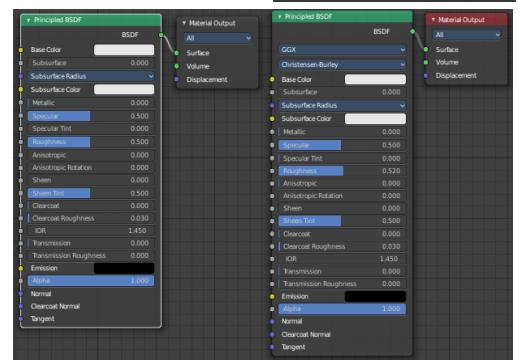

## Collapse and Hide Unused Sockets

Like Hide. Hides everything but the node sockets. But it also hides the unused node sockets.

## Toggle Node Options

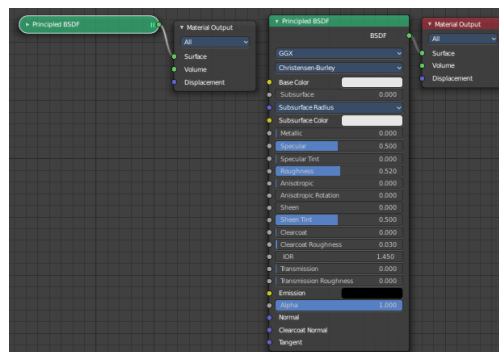

Shows or hides the node options.

## Collapse and Hide Unused Sockets

Shows or hides unused sockets.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Favorites Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Image Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Add menu - Color

This sub menu contains color related nodes.

## Bright/Contrast

### Inputs

#### *Color*

Standard input.

#### *Brightness*

An additive-type factor by which to increase the overall brightness of the image. Use a negative number to darken an image.

#### *Contrast*

A scaling type factor by which to make brighter pixels brighter, but keeping the darker pixels dark. Higher values make details stand out. Use a negative number to decrease the overall contrast in the image.

## Outputs

### Color

Standard output.

Note. It is possible that this node will put out a value set that has values beyond the normal range, i.e. values greater than one and less than zero. If you will be using the output to mix with other images in the normal range, you should clamp the values using the Map Value node (with the Min and Max enabled), or put through a Color Ramp node (with all normal defaults).

## Gamma

Use this node to apply a gamma correction.

### Inputs

#### *Color*

Standard image input.

## ***Gamma***

An exponential brightness factor.

## **Outputs**

### ***Color***

Standard output.

## **Hue Saturation Value**

The Hue Saturation Node applies a color transformation in the HSV color space. Called “Hue Saturation Value” in shader and texture context.

## **Inputs / Properties**

The inputs also works as properties when nothing is connected.

### ***Hue***

Specifies the hue rotation of the image. 360° are mapped to (0 to 1). The hue shifts of 0 (-180°) and 1 (+180°) have the same result.

### ***Saturation***

A saturation of 0 removes hues from the image, resulting in a greyscale image. A shift greater than 1.0 increases saturation.

### ***Value***

Value is the overall brightness of the image. De/Increasing values shift an image darker/lighter.

### ***Factor***

Controls the amount of influence the node exerts on the output image.

### ***Color***

Standard input.

## **Outputs**

### ***Color***

Standard output.

### Hue/Saturation Tips

Some things to keep in mind that might help you use this node better:

Hues are vice versa

A blue image, with a Hue setting at either end of the spectrum (0 or 1), is output as yellow (recall that white,

minus blue, equals yellow). A yellow image, with a Hue setting at 0 or 1, is blue.

Hue and Saturation work together.

So, a Hue of 0.5 keeps the blues the same shade of blue, but Saturation can deepen or lighten the intensity of that color.

Gray & White are neutral hues

A gray image, where the RGB values are equal, has no hue. Therefore, this node can only affect it with Value. This applies to all shades of gray, from black to white; wherever the values are equal.

Changing the effect over time

The Hue and Saturation values can be animated with a Time Node or by animating the property.

---

## Invert Color

The Invert Node inverts the colors in the input image, producing a negative.

### Inputs

#### **Factor**

Controls the amount of influence the node exerts on the output image.

#### **Color**

Standard input.

### Outputs

#### **Color**

Standard image output.

---

## Light Falloff

### Cycles Only

The Light Falloff node allows you to manipulate how light intensity decreases over distance. In reality light will always fall off quadratically; however, it can be useful to manipulate as a non-physically-based lighting trick. Note that using Linear or Constant falloff may cause more light to be introduced with every global illumination bounce, making the resulting image extremely bright if many bounces are used.

## Inputs

### **Strength**

Light strength before applying falloff modification.

### **Smooth**

Smooth intensity of light near light sources. This can avoid harsh highlights, and reduce global illumination noise. 0.0 corresponds to no smoothing; higher values smooth more. The maximum light strength will be strength/smooth.

## Outputs

### **Quadratic**

Quadratic light falloff; this will leave strength unmodified if smooth is 0.0 and corresponds to reality.

### **Linear**

Linear light falloff, giving a slower decrease in intensity over distance.

### **Constant**

Constant light falloff, where the distance to the light has no influence on its intensity.

## Mix Color

The mix Color node is in real the Mix node in Color mode. It is shared across editors.

The Mix node is meant to mix values. This can be colors, or also a vector or a single value.

Note that the Mix Color node does not start in Color mode when you insert it from the sidebar due a technical limitation in the Blender Python api. Here you have to manually switch to the color mode.

## Data Type

The mode in which the node works.

### **Color**

The Mix Node in color mode mixes images by working on the individual and corresponding pixels of the two input images. Called “MixRGB” in the shader and texture context.

## Inputs

### **Factor**

Controls the amount of influence the node exerts on the output image.

## Color 1

Usually the background image. The image size and resolution sets the dimensions of the output image.

## Color 2

Usually the foreground image.

## Properties

### Mix

Choose the different blending modes.

Add, Subtract, Multiply, Screen, Divide, Difference, Darken, Lighten, Overlay, Color Dodge, Color Burn, Hue, Saturation, Value, Color, Soft Light, Linear Light.

### Clamp Result

Clamp the result to 0, 1 range.

### Clamp Factor

Clamp the factor to 0, 1 range.

## Outputs

### Result

Standard output.

### Vector

The vector mode allows you to mix vectors.

## Inputs

### Factor

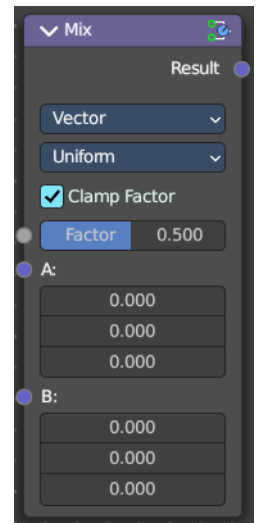

Controls the amount of influence.

### A

The input vector.

### B

The output vector.

## Properties

### Factor Mode

Use a single factor for all values, or a factor per value.

### Clamp Factor

Clamp the factor to 0, 1 range.

## Outputs

### Result

Standard output.

## Float

The vector mode allows you to mix vectors.

### Inputs

#### Factor

Controls the amount of influence.

#### A

The input value.

#### B

The output value.

### Properties

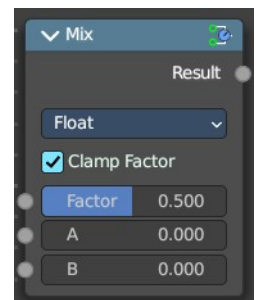

#### Clamp Factor

Clamp the factor to 0, 1 range.

### Outputs

#### Result

Standard output.

---

## RGB Curves

The RGB Curves Node allows color corrections for each color channel and levels adjustments in the compositing context.

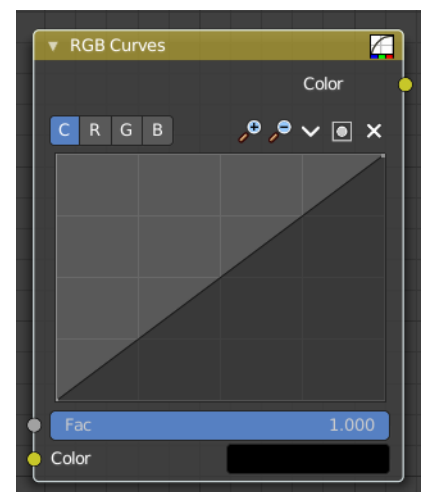

### Inputs

#### Factor

Controls the amount of influence the node exerts on the output image.

#### Color

Standard image input.

---

### Properties

#### Curve Field

#### Channel buttons

Clicking on one of the channels displays the curve for each.

C (Combined RGB), R (Red), G (Green), B (Blue).

## Navigation elements

They are described from left to right.

### **Zoom in and out**

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Tools

Tools is a menu where you can find some curve related tools.

### **Reset View**

Resets the curve windows zoom.

### **Extend horizontal**

Extends the curve before the first curve point and behind the last curve point horizontally.

### **Extend extrapolated**

Extends the curve before the first curve point and behind the last curve point extrapolated.

### **Reset Curve**

Resets the curve to the initial shape.

## Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

### **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

### **Adding Points**

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

### ***Curve point settings***

When you have a point selected then you will reveal further settings at the bottom.

### **Vector Handle**

Set handle type to Vector.

### **Auto Handle**

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

---

## **Outputs**

### ***Color***

Standard output.

## Add menu - Vector

This menu contains nodes that deals with vector data.

### Bump

The Bump node generates a perturbed normal from a height texture, for bump mapping. The height value will be sampled at the shading point and two nearby points on the surface to determine the local direction of the normal.

### Inputs

#### **Strength**

Strength of the bump mapping effect, interpolating between no bump mapping and full bump mapping.

#### **Distance**

Multiplier for the height value to control the overall distance for bump mapping.

## ***Height***

Scalar value giving the height offset from the surface at the shading point; this is where you plug in textures.

## ***Normal***

Standard normal input.

## **Properties**

### ***Invert***

Invert the bump mapping, to displace into the surface instead of out.

## **Outputs**

### ***Normal***

Standard normal output.

---

## **Displacement**

The Displacement node is used to displace the surface along all the surface normal, to add more detail to the geometry. Both procedural textures and baked displacement maps may be used.

For best results the mesh must be subdivided finely to bring out the detail in the displacement texture.

It is also possible to use the displacement as bump mapping only by changing the material settings, so that no high resolution mesh is needed.

## **Inputs**

### ***Height***

Distance to displace the surface along the normal. This is where a texture node can be connected.

### **Mid level**

Neutral displacement value that causes no displacement. With the default 0.5, any lower values will cause the surfaces to be pushed inwards, and any higher values will push them outwards.

### ***Scale***

Increase or decrease the amount of displacement.

### ***Normal***

Standard normal input.

## Properties

### Space

Object Space means the displacement scales along with the object. When using World Space the object scale is ignored.

## Outputs

### Displacement

Displacement offset to be connected into the Material Output.

## Mapping

The Mapping node transforms the input vector by applying translation, rotation, and scaling.

### Inputs

The inputs of the node are dynamic. In particular, the Location input is only available in the Texture and Point vector types.

### Vector

The vector to be transformed.

### Location

The amount of translation along each axis.

### Rotation

The amount of rotation along each axis. XYZ order.

### Scale

The amount of scaling along each axis.

## Properties

### Vector type

The node applies the transformation differently depending on the semantic type of the input vector.

### Point

For this vector type, the node performs a straightforward transformation.

Transforming a texture coordinates is analogous to transforming a UV map. For instance, translating the texture coordinates along the positive X axis would result in the evaluated texture to move in the negative X axis, much

like if one translated a UV map. Similarly, scaling the texture coordinates up would result in the evaluated texture to scale down. So transforming the texture coordinates would appear to have the opposite effect on the evaluated texture.

The order of transformation is: Scale → Rotate → Translate, which means:

Translation moves the input along the local rotation axis.

Rotation rotates the input around the origin of the space.

Scaling scales the input along the global axis.

## Texture

For this vector type, the node performs an inverse transformation.

Inverse transforming a texture coordinates would, as opposed to the Point type, transform the evaluated texture itself. For instance, translating the texture coordinates along the positive X axis would result in the evaluated texture to move in the positive X axis, as one would expect. Similarly, scaling the texture coordinates up would result in the evaluated texture to scale up, as one would expect.

The order of transformation is: Translate → Rotate → Scale, which means:

Translation moves the input along the global axis.

Rotation rotates the input around the translation vector.

Scaling scales the input along the local rotation axis.

## Vector

For this vector type, a Point transformation is performed, but with zero translation.

## Normal

For this vector type, the node performs the inverse transpose of the transformation and normalize the result. Such transformation ensures correct normals after non-uniform scaling. So this type should be used when transforming normals.

## Outputs

### *Vector*

The input vector after transformation.

---

## Normal

The Normal node generates a normal vector and a dot product.

## Inputs

### *Normal*

Normal vector input.

## Properties

### **Normal Direction**

To manually set a fixed normal direction vector. LMB click and drag on the sphere to set the direction of the normal. Holding Ctrl while dragging snaps to 45 degree rotation increments.

## Outputs

### **Normal**

Normal vector output.

### **Dot**

Dot product output. The dot product is a scalar value.

If two normals are pointing in the same direction the dot product is 1.

If they are perpendicular the dot product is zero (0).

If they are anti parallel (facing directly away from each other) the dot product is -1.

## Normal Map

The Normal Map node generates a perturbed normal from an RGB normal map image. This is usually chained with an Image Texture node in the color input, to specify the normal map image. For tangent space normal maps, the UV coordinates for the image must match, and the image texture should be set to Non-Color mode to give correct results.

## Inputs

### **Strength**

Strength of the normal mapping effect.

### **Color**

RGB color that encodes the normal in the specified space.

## Properties

### **Space**

The input RGB color can be in one of three spaces: Tangent, Object and World space. Tangent space normal maps are the most common, as they support object transformation and mesh deformations. Object space normal maps keep sticking to the surface under object transformations, while World normal maps do not.

## UV Map

Name of the UV map to derive normal mapping tangents from. When chained with an Image Texture node, this UV map should be the same as the UV map used to map the texture.

## Outputs

### Normal

Normal that can be used as an input to BSDF nodes.

## Vector Curves

The Vector Curves node maps an input vector components to a curve.

## Inputs

In the shader context the node also has an additional Factor property.

### Factor

Controls the amount of influence the node exerts on the output vector.

### Vector

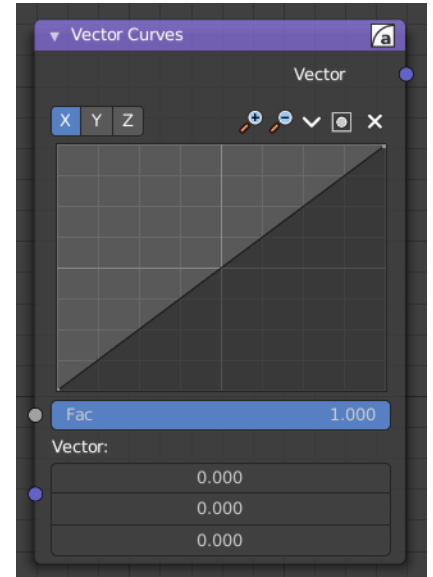

Standard vector input.

Properties

Channel

### Channel buttons

X, Y, Z. Clicking on one of the channels displays the curve for each.

### Curve edit field

Create and tweak a Bezier curve that varies the input levels (X axis) to produce an output level (Y axis).

#### Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

#### Adding Points

You can add new curve points by simply left clicking at the curve. Move the mouse to position them where you need it.

## Navigation elements

The navigation elements at the top are described from left to right.

### ***Zoom in and out***

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***Extend horizontal***

Extends the curve before the first curve point and behind the last curve point horizontally.

### ***Extend extrapolated***

Extends the curve before the first curve point and behind the last curve point extrapolated.

### ***Reset Curve***

Resets the curve to the initial shape.

## Use Clipping

Clipping options. Set up clipping for the stroke.

## Delete Points

Deletes selected curve points.

## Outputs

### ***Vector***

Standard vector output.

## Vector Displacement

The Vector Displacement node is used to displace the surface along arbitrary directions, unlike the regular Displacement node which only displaces along the surface normal.

It is typically used to apply vector displacement maps created by other sculpting software. Vector displacement maps can fully represent the high resolution detail to be applied on a smooth base mesh, unlike regular displacement maps.

For best results the mesh must be subdivided finely to bring out the detail in the displacement texture.

### Inputs

#### **Vector**

Vector specifying the displacement along three axes. This is where a texture node can be connected.

Typically a baked vector displacement image texture is used. For Object Space, RGB colors in the image are interpreted as an XYZ offset in object space. For Tangent Space, R is an offset along the tangent, G along the normal and B along the bi tangent.

#### **Mid level**

Neutral displacement value that causes no displacement. With the default 0.0, any lower values will cause the surfaces to be pushed inwards, and any higher values will push them outwards.

#### **Scale**

Increase or decrease the amount of displacement.

### Properties

#### **Space**

Object Space maps work for static meshes, and will render slightly faster with less memory usage. Tangent Space maps can be used for meshes that will be deformed, like animated characters, so the displacement follows the deformation.

### Outputs

#### **Displacement**

Displacement offset to be connected into the Material Output.

## Vector Rotate

This node provides the ability to rotate a vector around a center point using either Axis Angle, Single Axis or Euler methods.

### Inputs

#### **Vector**

The input vector.

#### **Center**

The center for the rotation.

#### **Axis**

The axis angles.

#### **Angle**

The rotation angle.

### Properties

#### **Type**

The rotation type.

#### **Invert**

Invert the angle

### Outputs

#### **Vector**

The output vector

## Vector Transform

The Vector Transform node allows converting a vector, point, or normal between world and camera and object coordinate space.

### Inputs

#### **Vector Input**

Standard vector input.

## Properties

### **Type**

Specifies the input/output type.

Vector, Point, Normal.

### **Convert From**

Coordinate Space to convert from World, Object or Camera.

### **Convert To**

Coordinate Space to convert to World, Object or Camera.

## Outputs

### **Vector Output**

The transformed output vector.

## Add menu - Converter

Here you find mainly nodes to convert data to another data.

### Blackbody

The Blackbody node converts a blackbody temperature to RGB value. This can be useful for materials that emit light at natural occurring frequencies.

### Inputs

#### *Temperature*

The temperature in Kelvin.

### Outputs

#### *Color*

RGB color output.

### Clamp

The Clamp node clamps a value between a minimum and a maximum.

### Inputs

#### *Value*

The input value to be clamped.

#### *Min*

The minimum value.

## Max

The maximum value.

## Properties

### Clamp Type

#### Min Max

Clamp values using Min and Max values.

#### Range

Clamp values between Min and Max range.

## Outputs

### Result

The input value after clamping.

## Color Ramp

The Color Ramp Node is used for mapping values to colors with the use of a gradient.

## Inputs

### Factor

The Factor input is used as an index for the color ramp.

## Properties

### Color Ramp

Color Ramps enables the user to specify a range of colors based on color stops. The color between the color stops gets interpolated.

## Controls

+

Add a stop to your color ramp. The stop will be added after the selected one, in the middle to the next one.

-

Deletes the selected color stop from the list.

### Tools menu

#### Flip Color Ramp

Flips the gradient, inverting the values of the color ramp.

### **Distribute Stops from Left**

Rearrange the stops so that every step has the same space to the right.

### **Distribute Stops Evenly**

Space between all neighboring stops becomes equal.

### **Eyedropper (pipette icon) E**

An Eyedropper to sample a color or gradient from the interface to be used in the color ramp.

### **Reset Color Ramp**

Resets the color ramp to its default state.

### **Color Mode**

#### **RGB**

Blends color by mixing each color channel and combining.

#### **HSV/HSL**

Blends colors by first converting to HSV or HSL, mixing, then combining again. This has the advantage of maintaining saturation between different hues, where RGB would de-saturate, this allows for a richer gradient.

### **Interpolation**

#### **Ease**

Uses an Ease Interpolation for the color stops.

#### **Cardinal**

Uses a Cardinal Interpolation for the color stops.

#### **Linear**

Uses a Linear Interpolation for the color stops.

#### **B-Spline**

Uses a B-Spline Interpolation for the color stops.

#### **Constant**

Uses a Constant Interpolation for the color stops.

### **Color Ramp**

The color band. A click at one of the color stops makes it the active one. You can move the color stops by clicking at them and dragging them around.

### **Active Color Stop elements**

Adjust the active color stop.

### **Choose active color stop**

Choose the color stop by index.

### **Pos**

The position of the active color stop. The range goes from 0.000 to 1.000

## Outputs

### *Image*

Standard image output.

### *Alpha*

---

## Combine Color

Combine the single RGB channels into a single image.

### Input

#### *Mode*

- **RGB** colour processing
- **HSV** colour processing
- **HSL** colour processing

#### *R, G and B*

The red, green and blue channels of an image.

### Input – RGB mode

#### *R, G and B*

The red, green and blue channels of an image.

### Input – HSV mode

#### *H, S and V*

The Hue, Saturation and Value channels of an image.

### Input – HSL mode

#### *H, S and L*

The Hue, Saturation and Luminescence channels of an image.

---

## Combine XYZ

Same as with Combine RGB node. It combines color values. But instead combining rgb values, which are in the range of 0 to 255, it uses values in the range from 0 to 1.

## Input

### *X Y and Z*

X, Y and Z values.

## Output

### *Color*

Color output.

## Float Curve

Generates a curve. This curve can then be used for profiles for example.

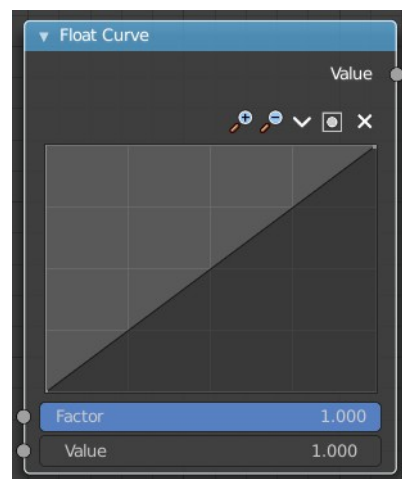

## Inputs

### *Factor*

The input factor.

### *Attribute*

The input value.

## Properties

### *Curve Widget*

#### Navigation elements

The navigation elements at the top are described from left to right.

#### *Zoom in and out*

The two buttons with the magnifying glass at it zooms in and out in the curve window.

#### *Tools*

Tools is a menu where you can find some curve related tools.

#### *Reset View*

Resets the curve windows zoom.

#### *Vector Handle*

Set handle type to Vector.

#### *Auto Handle*

Set handle type to Auto.

### **Auto Clamped Handle**

Set handle type to Auto Clamped.

### **Extend Horizontal**

Extends the curve before the last point and after the last point horizontally.

### **Extend Extrapolation**

Extends the curve before the last point and after the last point extrapolated.

### **Reset Curve**

Resets the curve to the initial shape.

---

## **Map Range**

The Map Range node remaps a value from a range to a target range.

### **Inputs**

#### **Value**

The input value to be remapped.

#### **From Min**

The lower bound of the range to remap from.

#### **From Max**

The higher bound of the range to remap from.

#### **To Min**

The lower bound of the target range.

#### **To Max**

The higher bound of the target range.

### **Properties**

#### **Interpolation Type**

##### **Linear**

Linear interpolation between From Min and From Max values.

##### **Stepped Linear**

Stepped linear interpolation between From Min and From Max values.

##### **Smooth Step**

Smooth Hermite edge interpolation between From Min and From Max values.

## Smoother Step

Smoother Hermite edge interpolation between From Min and From Max values.

## Clamp

If enabled, the output is clamped to the target range.

## Outputs

### Result

The input value after remapping.

## Math

The Math Node performs math operations.

## Inputs

### Value

First numerical value. The trigonometric functions accept values in radians.

### Value

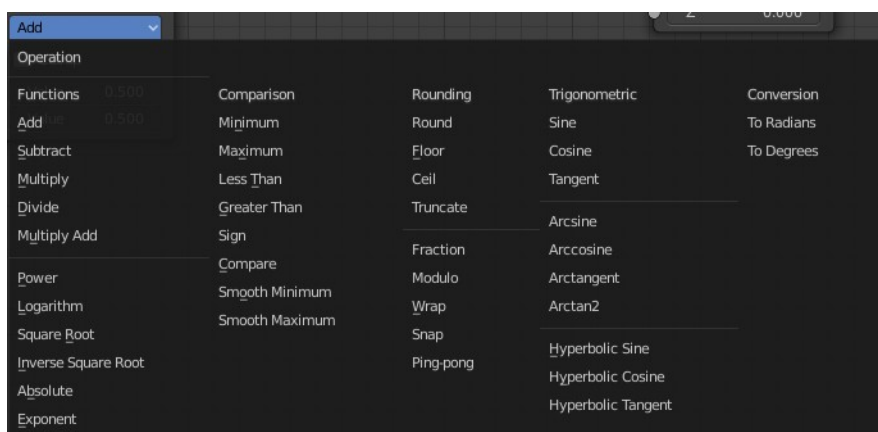

Second numerical value. This value is not used in functions that accept only one parameter like the trigonometric functions, Round and Absolute.

## Properties

### Operation

Here you can choose what mathematical operation to perform.

## Clamp

Limits the output to the range (0 to 1). See clamp.

## Outputs

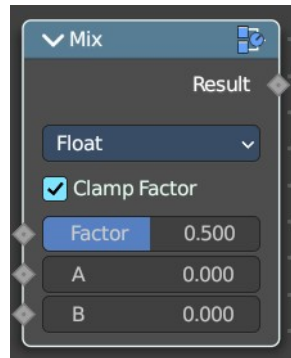

### Value

Numerical value output.

---

## Mix

Allows to mix values and vectors in various ways. The node has three different modes. Float, Vector and Color

## Input

### Float

#### Factor

The mix factor.

#### A

Float value A input.

#### B

Float value B input.

### Vector

#### Factor mode Uniform

##### Factor

The mix factor.

##### A

Vector A input.

##### B

Vector B input.

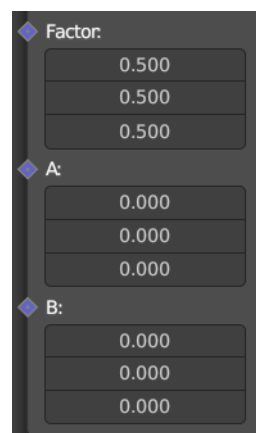

#### Factor mode Non Uniform

##### Factor

The vector mix factor.

##### A

Vector A input.

## **B**

Vector B input.

## **Color**

### **Factor**

The mix factor.

### **A**

Color A input.

### **B**

Color B input.

## **Properties**

### **Data Type**

Which mode to use.

### **Float mode**

#### **Clamp Factor**

Clamp the factor to 0-1 range.

### **Vector mode**

### **Factor mode**

Uniform or non uniform factor.

#### **Clamp Factor**

Clamp the factor to 0-1 range.

### **Color mode**

### **Blending mode**

What blending mode to use for the color.

### **Clamp Result**

Clamp the result to 0-1 range.

### **Clamp Factor**

Clamp the input factor to 0-1 range.

## **Output**

### **Result**

The output value or vector.

---

## **RGB to BW**

The RGB to BW Node converts an RGB color image to a gray-scale image based at its luminance.

## **Inputs**

### **Image**

Color image input.

## **Outputs**

### **Value**

Gray-scale value output.

---

## **Separate Color**

Separates the single RGB channels from a single image.

## **Input**

### **Mode**

- **RGB** colour processing
- **HSV** colour processing
- **HSL** colour processing

### **R, G and B**

### **Image**

The image input.

## Output – RGB mode

### *R, G and B*

The red, green and blue channels of an image.

## Output – HSV mode

### *H, S and V*

The Hue, Saturation and Value channels of an image.

## Output – HSL mode

### *H, S and L*

The Hue, Saturation and Luminescence channels of an image.

---

## Separate XYZ

Same as with Separate RGB node. It separates color values. But instead separating rgb values, which are in the range of 0 to 255, it uses a vector with the values in the range from 0 to 1.

### Input

#### *Vector*

The Input vector.

### Output

#### *X, Y and Z*

The output vectors for X, Y and Z

---

## Shader To RGB

### *Eevee Only*

Converts a shader input to rgba values.

The Shader to RGB node is typically used for non-photo realistic rendering, to apply additional effects on the output of BSDFs. For example, a color ramp on the output of a diffuse BSDF can be used to create a flexible toon shader.

Using this conversion breaks the PBR pipeline and thus makes the result unpredictable when used in combination with effects such as ambient occlusion, contact shadows, soft shadows and screen space refraction.

Some effects require multiple samples to converge, and applying arbitrary changes to noisy input may not

convert to a smooth result.

Warning! If a Shader to RGB node is used, any upstream BSDF will be invisible to the following effects:  
Screen Space Reflection, Subsurface Scattering

## Inputs

### *Shader*

Any shader such as a BSDF or Emission node can be linked here.

## Outputs

### *Color*

Surface color computed from BSDFs and lighting.

### *Alpha*

Alpha transparency from any Transparent BSDFs in the input.

---

## Vector Math

The Vector Math node performs the selected math operation on the input vectors.

### Inputs

The inputs of the node are dynamic. Some inputs are only available in certain operations. For instance, the Scale input is only available in the Scale operator.

### *Vector*

Input vector A.

### *Vector*

Input vector B.

### *Scale*

Input Scale.

## Properties

### Operation

The vector math operator to be applied on the input vectors.

### Outputs

The output of the node is dynamic. It is either a vector or a scalar depending on the operator. For instance, the Length operator have a scalar output while the Add operator have a vector output.

### Vector

Output vector.

### Value

Output value.

## Wavelength

### Cycles Only

The Wavelength node converts a wavelength value to an RGB value. This can be used to achieve a specific color on the light spectrum.

### Inputs

#### Wavelength

The color wavelength from 380 to 780 nanometers.

### Outputs

#### Color

RGB color output.

## 13.1.13 Editors - Shader Editor - Header - Add Menu - Script

### Table of content

Add menu - Script.....	1
Script.....	1
Properties.....	1
Internal / External.....	1
OSL.....	1

### Add menu - Script

The Script menu contains actually just one menu item. A script node.

### Script

In this node you can load OSL shaders.

### Properties

#### Internal / External

Use an internal OSL script from the script editor. Or use an external OSL script.

With internal you will see a drop down list with the opened scripts in the text editor.

With external the dialog below turns into a string box with a file browser button with which you can load your script then.

This node has no inputs and no outputs. The input is the script. And OSL scripts outputs directly.

### OSL

OSL was designed for node-based shading, and each OSL shader corresponds to one node in a node setup. To add an OSL shader, add a script node and link it to a text or an external file. Input and output sockets will be created from the shader parameters on clicking the update button in the Node or the Text editor.

OSL shaders can be linked to the node in a few different ways. With the Internal mode, a text data-block is used to store the OSL shader, and the OSO byte code is stored in the node itself. This is useful for distributing a blend-file with everything packed into it.

The External mode can be used to specify a .osl file from a drive, and this will then be automatically compiled into a .oso file in the same directory. It is also possible to specify a path to a .oso file, which will then be used directly, with compilation done manually by the user. The third option is to specify just the module name, which will be looked up in the shader search path.

The shader search path is located in the same place as the scripts or configuration path, under:

## **Linux**

`$HOME/.config/blender/2.79/shaders/`

## **MS-Windows**

`C:\Users\%user\AppData\Roaming\Blender Foundation\Blender\2.79\shaders\`

## **macOS**

`/Users/$USER/Library/Application Support/Blender/2.79/shaders/`

Tip. For use in production, we suggest to use a node group to wrap shader script nodes, and link that into other blend-files. This makes it easier to make changes to the node afterwards as sockets are added or removed, without having to update the script nodes in all files.

# 13.1.14 Editors - Shader Editor - Header - Add Menu - Group

## Table of content

Add menu - Group.....	1
Make Group.....	1
Insert into Group.....	2
Ungroup.....	2
Toggle Edit Group.....	3
Group Input.....	3
Group Output.....	3
List of Node Groups.....	3

## Add menu - Group

Node groups allows you to group different nodes of the material together to reduce the visual complexity. A node group acts like any other node.

Material node groups should not include Input nodes, like Image nodes, or Output nodes.

If you include a source node in your group, you will end up having the source node appearing twice: once inside the group, and once outside the group in the new material node tree.

If you include an output node in the group, there will not be an output socket available from the group!

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item in the sidebar in the Relations tab in the Group panel. That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Insert into Group

Allows you to insert a node into a node group.

Select the node, hold down Shift, then select the node group so that both are selected. Then perform the operator.

## Ungroup

Ungroups an existing group. You need to be outside of the group edit mode.

## Toggle Edit Group

Enters a node group for editing. Or when you are in a node group, exits the node group editing.

---

## Group Input

Adds a Group Input node. This node is usually already part of a new created group.

## Group Output

Adds a Group Output node. This node is usually already part of a new created group.

---

## List of Node Groups

Once you have created a node group it will also show up in the group menu. Groups can be inserted to other materials too.

# 13.1.15 Editors - Shader Editor - Header - Add Menu - Layout

## Table of content

- Add menu - Layout..... 1
- Frame..... 1
  - Adding and Removing Nodes..... 1
  - Resizing Frame..... 2
  - Label and Color..... 2
- Reroute..... 2
  - Move, Rotate, Scale..... 2

## Add menu - Layout

These nodes helps organizing the node layout.

## Frame

The Frame node allows you to drop nodes into a frame. This frame can be dragged around as a whole.

## Adding and Removing Nodes

Nodes can be added by simply dropping them onto the frame. Or with the Join in New Frame menu item in the Node menu.

To remove a node from the frame use Remove from Frame.

## Resizing Frame

When the Frame node is first placed in the node editor workspace you can resize it by dragging one of the edges.

Once a node is placed in the Frame, the Frame shrinks around the nodes. You cannot resize it anymore with handlers. Just by dragging around the nodes inside of the frame.

This behavior can be changed by disabling the *Shrink* option in the Item tab in the Properties panel. Then you can resize the frame again by dragging the edges.

## Label and Color

You can change the name of a frame in the Node panel. And you can give it a custom color by checking the Color checkbox and adjusting the color then.

## Reroute

Adds a reroute point that can be used to reroute connections. It allows just one input, but allows multiple output connections.

To quickly add a Reroute node into an existing connection, hold Shift and Right Mouse and drag the mouse to cut through the link. A new reroute node will be added.

When you exceed a specific angle amount between the reroute nodes, then the node connection becomes a sharp corner, and not longer a Bezier like soft curve.

## Move, Rotate, Scale

A normal node has a handler. The reroute dot not. You can't simply move it around with the mouse by clicking at the top area. It has none. You have to use the move, rotate and scale commands. They can be found in the View menu.

## 13.1.16 Editors - Shader Editor - Header - Node menu

Hide.....	3
Toggle Node Mute.....	4
Toggle Node Preview.....	4
Toggle hidden node sockets.....	4
Toggle Node Options.....	4
Collapse and Hide Unused Sockets.....	4

## Node menu

This menu contains further node functionality.

### Move

Moves the selected nodes.

### Rotate

You can't rotate single nodes, obviously. But when you have more than one selected then you can rotate them around their center point.

### Resize

You can't resize single nodes, obviously. But when you have more than one selected

then you can scale them around their center point.

---

## **Copy**

Copies the selected node(s).

## **Paste**

Pastes the selected node(s).

---

## **Duplicate Keep Input**

This works at nodes that have a connected input. Duplicating will keep the input connections established in the duplicated node. The output connections will be removed.

## **Duplicate**

Duplicates the selected node(s). All connections will be removed in the duplicated node.

## **Delete**

Deletes the selected node(s).

## **Delete with Reconnect**

Deletes the selected node(s). When this node is in the middle of a connection, then the connections will be reconnected.

---

## **Join new Frame**

Frame node functionality. Adds the selected node to a frame.

## **Remove from Frame**

Frame node functionality. Removes the selected node from a frame.

## **Frame Make Parent**

Frame node functionality. Adds the selected node to a frame.

---

## Links

### Make Links

Tries to connect nodes where it makes sense. For example, the BSDF output of a Principled shader with the Surface input of the Material Output node.

### Make and Replace Links

Same as Make Links. But it will replace existing links.

### Detach Links

Removes all connections from the selected node, but tries to reconnect the remaining nodes.

### Detach Links Move

Removes all connections from the selected node by dragging.

## Separate

Node group functionality. You need to be in edit group mode.

## Copy

Copies the selected node, and pastes a copy of it outside of the node group. The node group remains unchanged.

## Move

Moves the selected to outside of the node group, and removes it from the node group.

## Hide / Toggle

Here you find hide options to make the display of nodes more compact.

Demonstration happens at an image node.

## Hide

Hides everything but input and output dots. To view the full node again perform the operator again. It's a toggle. Or click at the triangle left besides the node name.

## Toggle Node Mute

Deactivates the node.

## Toggle Node Preview

This is a compositor feature for the preview image. It does not belong here, but shares the same menu. It shows or hides the preview image.

## Toggle hidden node sockets

Toggles away the unused node sockets. In this case the vector input node socket and the alpha output node socket will be hidden.

## Toggle Node Options

Hides away the properties.

## Collapse and Hide Unused Sockets

Like Hide. Hides everything but the node sockets. But it also hides the unused node sockets.

# Introduction

The header in the Shader editor contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

The text menus are covered in a own chapter each. They vary too much, dependent of mode and object type.

# Shader Type Drop-down Box

The Mode drop-down box allows you to switch between the different shader type modes. An object has a different set of available shaders than the world or a line style shading.

## Object

In this mode you work with the scene objects and its materials.

## World

In this mode you work with the world settings. HDRI's for example.

## Line Style

In this mode you work with Freestyle renderer materials.

## Object Context menu

When you right click at the dropdown box then you will reveal the Object context menu.

# Slot

This element just exists in Object mode.

The Slot menu displays the assigned material(s) at the current active mesh. It can be used to select the active material on the active object. And to select or assign materials to different mesh parts of the same object.

When you add a material by clicking at the new button in the material prop, or by choosing another material from the materials browser, then it is usually also added or changed in the slot system in the current position.

## List of materials

The list of materials in the slot list.

## Add Material Slot

Adds a new material slot. When you do this manually then this slot will be empty.

## Remove Material Slot

Remove the selected material slot. The removed material will not longer be part of the currently active mesh.

## Copy and Paste menu

Copy and paste materials. But just at the current active mesh. Means in Edit Mode.

## Copy Material

Copies the currently selected material

## Copy Material to Selected

Copies the currently selected material, and pastes it to the selection

## Paste Material

Pastes the material.

## Remove unused Slots

Clean up unused slots.

---

## Move Material Up / Down

Moves the selected material up or down in the list.

## Assign

This button appears when you are in Edit mode in the 3D view. Assign the selected material to the selected geometry.

## Select

This button appears when you are in Edit mode in the 3D view. Select the geometry where this material is assigned to.

## Deselect

This button appears when you are in Edit mode in the 3D view. Deselects the geometry where this material is assigned to.

## Search Field

When you click at the little triangle button below the list then you can reveal a search element. The buttons should be self explaining. So we won't go into detail here.

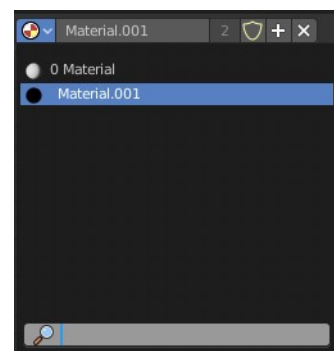

# Material Prop

Create a new material, and see a list of the available materials in the scene.

## Material Browser

The list of available materials in the scene.

## New

Creates a new material.

## Material edit box

The name of the current active material. Here you can also rename the material.

Note that the name and available materials differs, dependent in which mode you are. In Object mode you will see the object materials. In World mode the world materials. And in Line Style mode the materials for Freestyle rendering.

## Number of Users

Number of users that this material has. See Fake user.

## Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Clear Asset

When you have marked the material as asset, then the fake user button is replaced by a Clear Asset button. It allows you to clear the asset.

## New

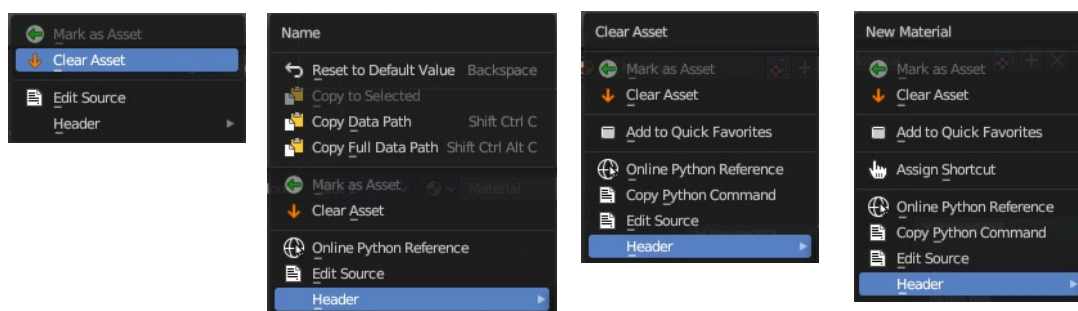

Creates a new material.

## Remove

Removes the material. To delete it completely you need to purge it. See Fake user.

## Right Click menus

When you right click at the material property then you will reveal context menus with different content, dependant of where you click. Most of the content is explained in chapter 6, the general right click menu functionality. The rest should be self explaining.

## Options

At the right side you will see some options.

## Use Nodes

The Use Nodes setting is mostly a legacy setting and should always be checked for materials.

## Pin (pin icon)

The pin button will keep the current material selection fixed. When a material is pinned, it will remain visible in the shader editor even when another object or material is selected elsewhere.

## Parent Node Tree

Grouping nodes can simplify a node tree by allowing instancing and hiding parts of the tree. Both material and composite nodes can be grouped. This button becomes active when you work with such grouped nodes, and you are in a child group. it allows you to switch to the parent group.

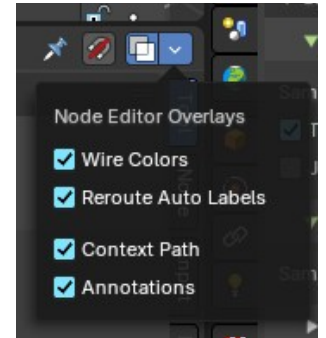

## Snap

Activates snapping. When the tool is activated, then you will also reveal the snap settings where you can choose different snap methods.

## Node Editor Overlays

Activates the node editor overlays. When the tool is activated, then you will also overlays settings in the editor. The drop down arrow to the right shows different overlay types.

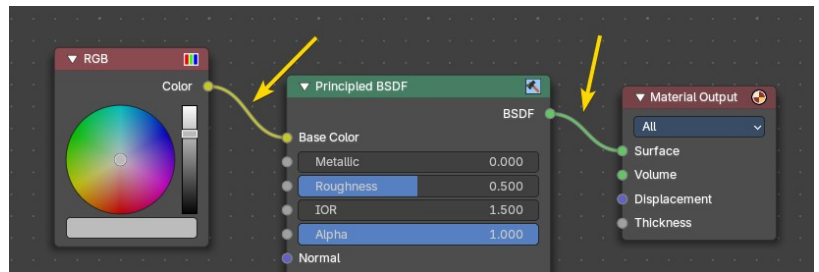

## Show Overlays

Show or hide the overlays.

## Wire Colors

Color node links based on their connected sockets.

**Example:** The color RGB socket is yellow that makes a yellow line, and the Shader BSDF socket is green that makes a green line.

## Reroute Auto Labels

Label reroute nodes based on the label of connected reroute nodes.

**Example:** The first reroute label to the right has concurring reroute labels down the line. If you toggle this off, the concurring reroute labels down the line won't contain labels.

## Context Path

Display breadcrumbs for the editor's context.

## Annotations

Shows annotations for this editor view that have been drawn by the annotation tool.

## 13.1.2 Editors - Shader Editor - Header - Quick Menu

### Table of content

- Quick Menu..... 1
  - Adding an operator to the Quick menu..... 1
  - Adding a menu to the Quick menu..... 1
  - Order..... 2
  - Removing an operator from the Quick menu..... 2
  - Context and mode dependent content..... 2

### Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 13.1.3 Editors - Shader Editor - Header - View Menu

### Table of content

View Menu.....	1
Toolbar.....	1
Sidebar.....	1
Zoom In.....	2
Zoom Out.....	2
Zoom Border.....	2
Frame Selected.....	2
Frame All.....	2
Pie menus.....	2
Area.....	2
Horizontal Split.....	2
Vertical Split.....	2
Duplicate Area into New Window.....	2
Toggle Maximize Area.....	3
Toggle Full screen Area.....	3
Close Area.....	3

## View Menu

The View menu contains all View related tools.

The content is the same in all sub modes.

### Toolbar

Shows or hides the toolbar at the left.

### Sidebar

Shows or hides the sidebar at the right in the viewport.

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Frame Selected

Zooms to the selection.

## Frame All

View all zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

### **Toggle Maximize Area**

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

### **Toggle Full screen Area**

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

### **Close Area**

Closes the editor.

## 13.1.4 Editors - Shader Editor - Header - Select Menu

### Table of content

Select menu.....	1
Legacy.....	1
Box select.....	1
Circle select.....	1
Lasso Select.....	2
All.....	2
None.....	2
Inverse.....	2
Linked From.....	2
Linked To.....	2
Grouped.....	2
Grouped Extend.....	2
Activate same type previous.....	2
Activate same type next.....	2
Find Node.....	3

### Select menu

Here you will find the select functionality.

### Legacy

The legacy sub menu contains tools that exists in the tool shelf already. It's the old way to do things. Different to the tools in the tool shelf, these tools are usually modal. And performs once. You have to call them again in case you want to repeat the tool.

### Box select

Draw a rectangle to select everything inside of the rectangle.

It automatically adds to the current selection. Holding down shift subtracts from the selection.

## Circle select

Brush select content. The radius of the brush can be adjusted by holding down left mouse button and using the scroll wheel or the + or - button at the numpad.

It automatically adds to the current selection. Holding down shift subtracts from the selection. To exit the circle select tool click with the right mouse button.

## Lasso Select

A sub menu with the available lasso select modes.

## All

Select everything.

## None

Select nothing.

## Inverse

Invert the current selection.

## Linked From

Select the nodes that are linked from the currently selected nodes. The nodes before in the hierarchy.

## Linked To

Select the nodes that are linked to the currently selected nodes. The nodes behind in the hierarchy.

---

## Grouped

Select grouped nodes.

## Grouped Extend

Select grouped nodes, and extend from the current selection.

## Activate same type previous

Activate same node type before the current selection, step by step.

## Activate same type next

Activate same node type after the current selection, step by step.

---

## Find Node

This button will open a search dialog where you can search for node types and select them in the current hierarchy.

## 13.1.5 Editors - Shader Editor - Header - Add Menu

### Table of content

Add menu..... 1  
 Add menu – Search..... 1

### Add menu

Here you will find all the nodes that you need to create your materials. A click at one of the items will create the node in the workspace at the mouse position right under the menu. It is already selected, and you can drag it around.

Note that the content of the sub menus differs, dependent in which sub mode you are. Objects have different nodes than World or Line Style.

And it differs dependent of which renderer you use. Some nodes just works with specific renderers. They will be marked as such.

Note that you need to have a material selected to activate this content.

Note also that some shaders are real resource hogs, and can slow down rendering times significantly.

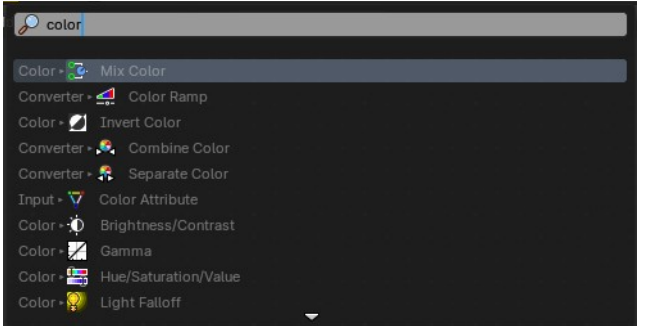

### Add menu – Search...

You can click on the search operator to bring up a Pop-up to search the Add menu where you can find specific node types in all categories.

To use, click on the operator or alternatively press spacebar or type in the term that you want to find.

**Note:** You can call the add menu then immediately start searching at any time.

## Add menu - Input

The Input menu contains Input node types.

The content is the same for all three sub modes. Note that you need to tick Use Nodes to activate the menu items when you are in Line Style sub mode.

## Ambient Occlusion

Ambient Occlusion is a technique to self shadow the geometry of objects. Corners are usually darker than flat areas.

Hint, you should either use Ambient Occlusion or Global Illumination, since GI includes AO techniques.

### Inputs

#### **Color**

Tint for AO output color.

#### **Distance Cycles Only**

Distance up to which other objects are considered to occlude the shading point.

#### **Normal**

Normal used for ambient occlusion. If nothing is connected the default shading normal is used.

### Properties

#### **Samples Cycles Only**

Number of samples to use for ray traced ambient occlusion sampling. Keep as low as possible for an optimal performance.

#### **Inside Cycles Only**

Detect convex rather than concave shapes, by computing occlusion inside mesh.

#### **Only Local Cycles Only**

Only detect occlusion from the object itself, and not others.

## Outputs

### **Color**

Ambient occlusion with color tint.

### **AO**

Ambient occlusion factor without color tint.

---

## Attribute

The Attribute node allows you to retrieve attributes attached to an object or mesh.

## Properties

### **Name**

Name of the attribute that you want to use.

Most attributes are easily available. Some not. Examples of not so obvious ones:

Vertex Color Layers can be retrieved this by their names.

Density gives a scalar defining the density of any smoke inside the Fluid Domain.

Color gives the color of the smoke inside the Fluid Domain. The color and vector outputs are the same. The Factor output is an average of the channels.

Temperature gives a scalar defining the temperature of the volume. Values in the range 0 - 1 map to 0 - 1000 kelvin. This may be used to render physically-based fire with the Blackbody or Principled Volume shaders. All three outputs are the same.

Flame gives a scalar defining the density of any fire inside the Fluid Domain. All three outputs are the same.

Ocean Foam gives a scalar defining where foam might appear when using an Ocean Modifier. This depends on the name you give this property.

## Outputs

### **Color**

RGB color interpolated from the attribute.

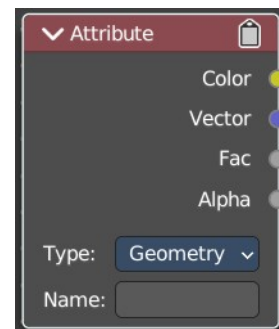

### **Vector**

XYZ vector interpolated from the attribute.

### **Factor**

Scalar value interpolated from the attribute.

---

## Bevel

### Cycles Only

The Bevel shader node can be used for rendering rounded corners to capture specular highlights. The geometry is not modified. The modification happens at shader level.

### Inputs

#### *Radius*

Width of the bevel effect on edges.

#### *Normal*

Normal to apply bevel on top of, to be combined with a Bump node for example.

### Properties

#### *Samples*

Number of samples to take for each shader evaluation. More samples give more accurate results, but are also slower to render. The default value of 4 works well for most cases, with any noise resolved by using more AA samples.

### Outputs

#### *Normal*

Standard normal output.

## Camera Data

With the Camera Data node you can get information about the position of the object relative to the camera. This could be used for example to change the shading of objects further away from the camera, or make custom fog effects.

### Inputs

This node has no inputs.

### Properties

This node has no properties.

### Outputs

#### *View Vector*

A camera space vector from the camera to the shading point.

## ***View Z Depth***

The distance each pixel is away from the camera.

## ***View Distance***

Distance from the camera to the shading point.

---

## **Fresnel**

The Fresnel effect says that the more a face goes towards 180 degrees, the more it is reflecting. With 180 degrees every object in real life is 100% reflective, no matter how the material is.

## **Inputs**

### ***IOR***

Index of refraction (IOR) of the material being entered.

### ***Normal***

Input meant for plugging in bump or normal maps which will affect the output.

## **Outputs**

### ***Factor***

Fresnel weight, indicating the probability with which light will reflect off the layer rather than passing through.

---

## **Color Attribute**

Provides vertex colors as well as their alpha value.

## **Properties**

### ***Vertex Color***

The target vertex color. The listed vertex colors are those of the mesh of the active object.

If the active object has no mesh, a warning will be displayed. If the property is marked in red, it means the vertex color is not available in the mesh of the active object, but it may be available in other meshes of objects that share this material.

## **Outputs**

### ***Color***

The vertex color.

## **Alpha**

The alpha value.

---

## **Geometry**

The Geometry node gives geometric information about the current shading point. All vector coordinates are in World Space. For volume shaders, only the position and incoming vector are available.

### **Outputs**

#### **Position**

Position of the shading point.

#### **Normal**

Shading normal at the surface (includes smooth normals and bump mapping).

#### **Tangent**

Tangent at the surface.

#### **True Normal**

Geometry or flat normal of the surface.

#### **Incoming**

Vector pointing towards the point the shading point is being viewed from.

#### **Parametric**

Parametric coordinates of the shading point on the surface. To area lights it outputs its UV coordinates in planar mapping and in spherical coordinates to point lights.

#### **Backfacing**

1.0 if the face is being viewed from the back side, 0.0 for the front side.

#### **Pointiness Cycles Only**

An approximation of the curvature of the mesh per vertex. Lighter values indicate convex angles, darker values indicate concave angles. It allows you to do effects like dirt maps and wear-off effects.

#### **Random Per Island Cycles Only**

A random value for each connected component (island) of the mesh. It is useful to add variations to meshes composed of separated units like tree leaves, wood planks, or curves of multiple splines.

---

## Curves Info

The Hair Info node gives access to Hair information.

### Outputs

#### *Is Strand*

Returns 1 when the shader is acting on a strand, otherwise 0.

#### *Intercept*

The point along the strand where the ray hits the strand (1 at the tip and 0 at the root).

#### *Length*

Returns the length of the hair curve.

#### *Thickness*

The thickness of the strand at the point where the ray hits the strand.

#### *Tangent Normal*

Tangent normal of the strand.

#### *Random*

A random per-hair value in the range from 0 to 1. It can for example be used in combination with a color ramp, to randomize the hair color.

## Layer Weight

The Layer Weight node outputs a weight typically used for layering shaders with the Mix Shader node.

### Inputs

#### *Blend*

Bias the output towards all 0 or all 1. Useful for uneven mixing of shaders.

#### *Normal*

Input meant for plugging in bump or normal maps which will affect the output.

### Outputs

#### *Fresnel*

Dielectric Fresnel weight, useful for example for layering diffuse and glossy shaders to create a plastic material. This is like the Fresnel node, except that the input of this node is in the often more convenient 0.0 to 1.0 range.

## Facing

Weight that blends from the first to the second shader as the surface goes from facing the viewer to viewing it at a grazing angle.

## Light Path

The Light Path node is used to find out for which kind of incoming ray the shader is being executed. This is useful for non-physically-based tricks.

### Outputs

#### *Is Camera Ray*

1.0 if shading is executed for a camera ray, 0.0 otherwise.

#### *Is Shadow Ray*

1.0 if shading is executed for a shadow ray, 0.0 otherwise.

#### *Is Diffuse Ray*

1.0 if shading is executed for a diffuse ray, 0.0 otherwise.

#### *Is Glossy Ray*

1.0 if shading is executed for a glossy ray, 0.0 otherwise.

#### *Is Singular Ray Cycles Only*

1.0 if shading is executed for a singular ray, 0.0 otherwise.

#### *Is Reflection Ray Cycles Only*

1.0 if shading is executed for a reflection ray, 0.0 otherwise.

#### *Is Transmission Ray Cycles Only*

1.0 if shading is executed for a transmission ray, 0.0 otherwise.

#### *Ray Length Cycles Only*

Distance traveled by the light ray from the last bounce or camera.

#### *Ray Depth*

Number of times the ray been reflected or transmitted on interaction with a surface.

Note. Passing through a transparent shader does not count as a normal “bounce”.

#### *Diffuse Depth Cycles Only*

Number of times the ray has gone through diffuse reflection or transmission.

## ***Glossy Depth Cycles Only***

Number of times the ray has gone through glossy reflection or transmission.

## ***Transparent Depth Cycles Only***

Returns the number of transparent surfaces passed through.

## ***Transmission Depth Cycles Only***

Replace a Transmission light path after X bounces with another shader, e.g. a Diffuse one. This can be used to avoid black surfaces, due to low amount of max bounces.

---

## **Object Info**

The Object Info node gives information about the object instance.

Note that this node only works for material shading nodes; it does nothing for light and world shading nodes.

### **Outputs**

#### ***Location***

Location of the object in world space.

#### ***Color***

Object color, same as Color in the Properties Editor > Object > Viewport Display.

#### ***Alpha***

Alpha color for the Object Color, if existing.

#### ***Object Index***

Object pass index, same as Pass Index in the Properties Editor > Object > Relations.

#### ***Material Index***

Material pass index, same as Pass Index in the Properties Editor > Material > Settings.

#### ***Random***

Random number unique to a single object instance.

---

## **Particle Info**

### **Cycles Only**

This node gives access to the data of the particle that spawned the object instance.

Note that this node currently only supports parent particles. Info from child particles is not available.

## Outputs

### ***Index***

Index number of the particle (from 0 to number of particles).

### ***Random***

A random per-particle value in the range from 0 to 1. It can for example be used in combination with a color ramp, to randomize the particle color.

### ***Age***

Age of the particle in frames.

### ***Lifetime***

Total lifespan of the particle in frames.

### ***Location***

Location of the particle.

### ***Size***

Size of the particle.

### ***Velocity***

Velocity of the particle.

### ***Angular Velocity***

Angular velocity of the particle.

---

## Point Info

Retrieve info from a point cloud. Just cycles. Eevee is not yet supported.

## Outputs

### ***Position***

The position of the point cloud.

### ***Radius***

The radius of the point cloud.

### ***Random***

A random point in the point cloud.

## RGB

Set a color.

### Properties

The RGB node uses the color picker widget.

### Outputs

#### *Color / RGBA*

A single RGBA color value.

## Tangent

The Tangent node generates a tangent direction for the Anisotropic BSDF.

### Properties

#### *Direction Type*

The tangent direction can be derived from a cylindrical projection around the X, Y, or Z axis (radial), or from a manually created UV Map for full control.

### Outputs

#### *Tangent*

The tangent direction vector.

## Texture Coordinate

Define some texture coordinate types. The types are pretty self explaining.

### Properties

#### *Object*

Specific object to use for object space coordinates. This only affects the Object output.

#### *From Instancer*

#### *Cycles Only!*

If the object is generated by instancing from vertices or faces, use texture coordinates from instancer. This only affects the Generated and UV outputs.

## Output

### **Generated**

Uses automatically generated texture coordinates, calculated from the bounding box.

### **Normal**

Uses the normals for the texture coordinates.

### **UV**

Uses the UV mapping for the texture coordinates.

### **Object**

Uses the Object for the texture coordinates.

### **Camera**

Uses the position coordinate in camera space for texture coordinates.

### **Window**

Uses the location of shading point on the screen.

### **Reflection**

Uses the direction of the reflection vector as texture coordinates.

## UV Along Stroke

### **Line Style Mode Only**

The UV Along Stroke input node maps textures along the stroke length, making it possible to mimic pencil, paintbrush, and other art medium marks.

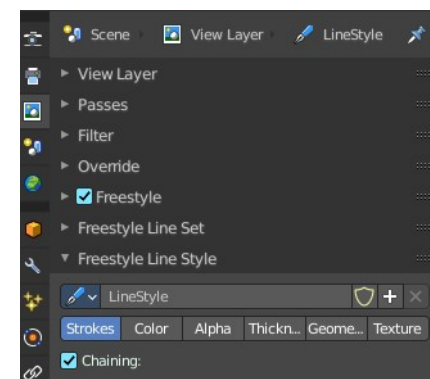

The pattern type can be set up in the properties editor in the Freestyle Line Style panel in the View Layer Properties tab. Don't forget to turn on Line Style in the Render Properties first. Or the Freestyle panels will not show.

Note! These UV maps become available only during the Freestyle rendering process. This means that the UV Along Stroke node cannot be replaced by the conventional UV Map input node. Since it takes an existing UV map already defined as part of mesh data.

## Properties

### **Use Tips**

Allows to use lower quarters of a texture image for the head and tail tips of a stroke, while the upper half for the stroke body.

## Outputs

### UV

UV maps defined along strokes.

---

## UV Map

The UV Map node is used to retrieve specific UV maps. This node can retrieve any UV map that belongs to the object with this material.

## Properties

### *From Instancer Cycles Only*

See the From Instancer option of the Texture Coordinate Node.

### *UV Map edit box*

UV map to use.

## Outputs

### UV

UV mapping coordinates from the specified UV map.

---

## Value

The Value Node is a simple node to input numerical values to other nodes in the tree.

## Properties

### *Default Value*

Type in a single numerical value (floating point).

## Outputs

### Value

The value set in the options.

---

## Volume Info

The Volume Info node provides information about Smoke Domains.

## Outputs

### ***Color***

Smoke color.

### ***Density***

Smoke density.

### ***Flame***

Fire density.

### ***Temperature***

Temperature of the fire. Values in the range [0, 1] linearly maps to temperatures in the range [0, 1000] in Kelvin.

---

## Wireframe

The Wireframe node is used to retrieve and render the wireframe of the object. This happens as the edges of the object appears to Cycles.

Meshes are triangulated before being processed by Cycles. So the topology will always appear triangulated when viewed with the Wire frame node.

## Inputs

### ***Size***

The input value used for unconnected socket.

## Properties

### ***Pixel Size***

When enabled, the size of edge lines is set in screen space.

## Outputs

### ***Factor***

Black-and-white mask showing white lines representing edges according to the object's topology.

## Add menu - Output

The output section contains the different output nodes. The content is different for the sub modes Object, World and Line Style. And also for the different renderers

### Material Output

The Material Output node is used to output surface material information to a surface object. It is what goes to the render engine then.

#### Inputs

##### **Surface**

Shading for the surface of the object.

##### **Volume**

Shading for the volume inside the object.

The types of volume shaders are:

Emission shader.

Volume Absorption shader.

Volume Scatter shader.

##### **Displacement**

Used to create bump mapping or actual subdivided displacement.

## Thickness

Used to give a geometry a thickness by shader.

## Properties

### Target

Choose which renderer the output should go to.

## Light Output

### Cycles Only

Outputs light information to a light object.

## Inputs

### Surface

The shading for the surface of the light object.

## Properties

### Target

What render engine to use. By default shaders are shared between Cycles and Eevee. By using multiple output nodes specialized shader setups can be created for each.

## AOV Output

Shader AOVs (Arbitrary Output Variables) provide custom render passes for arbitrary shader node components. As an artist this can be a good way to debug or tweak very fine details of a scene in post processing. To use shader AOVs create the pass in the Shader AOV panel then reference that pass with the AOV Output shading node. Shader AOVs can be added or removed in the Shader AOV panel.

Tip! The AOV Output node can be used in Material and World shader nodes.

## Inputs

### Color

Output a color variable; as the name suggest can be used for a color but also a normal value.

## Value

Output a single numerical value.

## Properties

### Name

The name of the render pass to assign the input value to. This property is the same Name that is specified in the Shader AOV panel.

---

## World Output

Shader type World. The World Output node is used to output light and color information to the scene's World.

## Inputs

### Surface

The appearance of the environment, usually preceded by a Background shader.

### Volume

Used to add volumetric effects to the world. See the shaders Volume Absorption and Volume Scatter for more information.

### Note

It is not possible to have an HDR and volumetric due to the fact that HDR's are assumed to be an infinite distance from the camera.

---

## Line Style Output

Shader Type Line Style

## Inputs

### Color

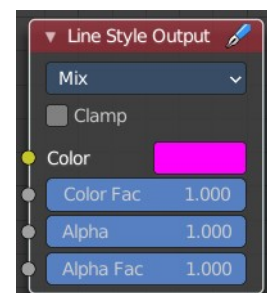

The input color.

### Color factor

The factor for the color.

### Alpha

Alpha channel information.

### ***Alpha Factor***

The factor for the alpha channel.

### **Properties**

#### ***Blending Mode***

Choose the Blending mode.

#### ***Clamp***

Clamp the result to the range between 0 and 1.

## Add menu - Shader

The shader section contains the different shader nodes. The content is different for the sub modes Object, World and Line Style. And it is dependant of the chosen render engine.

Left Eevee, right Cycles:

World / Line Art :

## Add Shader

The Add node is used to add two Shaders together.

### Inputs

### Shaders

Standard shader inputs.

## Outputs

### Shader

Standard shader output.

## Anisotropic BSDF

### Cycles Only

Adds a glossy reflection. The U and V direction roughness can be controlled separately. The tangents used for shading are derived from the active UV map. If no UV map is available, they are automatically generated using a sphere mapping based on the mesh bounding box.

### Inputs

#### Color

Color of the surface, or physically speaking, the probability that light is reflected for each wavelength.

#### Roughness

Sharpness of the reflection; perfectly sharp at 0.0 and smoother with higher values.

#### Anisotropy

Amount of anisotropy in the reflection; 0.0 gives a round highlight. Higher values give elongated highlights orthogonal to the tangent direction; negative values give highlights shaped along the tangent direction.

#### Rotation

Rotation of the anisotropic tangent direction. Value 0.0 equals 0° rotation, 0.25 equals 90° and 1.0 equals 360° = 0°. This can be used to texture the tangent direction.

#### Normal

Normal used for shading; if nothing is connected the default shading normal is used.

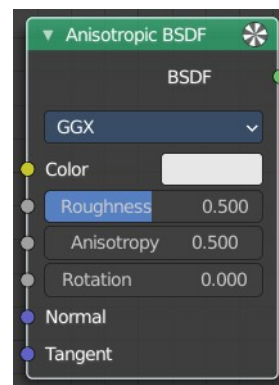

#### Tangent

Tangent used for shading; if nothing is connected the default shading tangent is used.

### Properties

#### Distribution

The available Microfacet distribution methods. Beckmann, GGX and Ashikhmin-Shirley can use the Roughness input for blurry reflections.

## Outputs

### ***BSDF***

Standard shader output.

---

## Background

### Shader Type World

The Background shader node is used to add background light emission.

## Inputs

### ***Color***

Color of the emitted light.

### ***Strength***

Strength of the emitted light.

## Outputs

### ***Background***

Standard shader output.

---

## Diffuse BSDF

### Shader Type Object

The Diffuse BSDF node is used to add Lambertian and Oren-Nayar diffuse reflection.

## Inputs

### ***Color***

Color of the surface, or physically speaking, the probability that light is reflected or transmitted for each wavelength.

### ***Roughness Cycles Only***

Surface roughness; 0.0 gives standard Lambertian reflection, higher values activate the Oren-Nayar BSDF.

### ***Normal***

Normal used for shading; if nothing is connected the default shading normal is used.

## Outputs

### ***BSDF***

Standard shader output.

---

## Emission

The Emission node emits light.

### Inputs

#### *Color*

Color of the emitted light.

#### *Strength*

Strength of the emitted light. For point and area lights, the unit is Watts. For materials, a value of 1.0 will ensure that the object in the image has the exact same color as the Color input, i.e. make it 'shadeless'.

### Outputs

#### *Emission*

The Emission shader output can both be plugged into the Surface Input as well as the Volume Input of the Material Output node.

## Glass BSDF

A glass shader.

### Inputs

#### *Color*

Color of the surface, or physically speaking, the probability that light is transmitted for each wavelength.

#### *Roughness*

Influences sharpness of the refraction; perfectly sharp at 0.0 and smoother with higher values.

#### *IOR*

Index of refraction (IOR) defining how much the ray changes direction. At 1.0 rays pass straight through like transparent; higher values give more refraction.

#### *Normal*

Normal used for shading.

### Properties

#### *Distribution*

The micro facet distribution method to use.

#### **Sharp**

Results in perfectly sharp reflections like a mirror. The Roughness value is not used.

#### **GGX**

GGX micro facet distribution.

## Multiple-scattering GGX

### Cycles Only

Takes multiple bounce (scattering) events between micro facets into account. This gives a more energy conserving results, which would otherwise be visible as excessive darkening.

### Beckmann

#### Cycles Only

Beckmann micro facet distribution.

### Ashikhmin-Shirley

#### Cycles Only

Ashikhmin-Shirley micro facet distribution.

## Outputs

### **BSDF**

Standard shader output.

## Glossy BSDF

### Object sub mode only

The Glossy BSDF node is used to add reflection with micro facet distribution, used for materials such as metal or mirrors.

## Inputs

### **Color**

Color of the surface, or physically speaking, the probability that light is reflected for each wavelength.

### **Roughness**

Input for the surface roughness resulting in sharp to blurry reflections.

### **Normal**

Normal used for shading.

## Properties

### **Distribution**

Micro facet distribution to use.

#### **Sharp**

Results in perfectly sharp reflections like a mirror. The Roughness value is not used.

#### **Beckmann**

#### **Cycles Only**

Beckmann micro facet distribution.

## **GGX**

GGX micro facet distribution.

## **Ashikhmin-Shirley**

Cycles Only

Ashikhmin-Shirley micro facet distribution.

## **Multiple-scattering GGX**

Cycles Only

Takes multiple bounce (scattering) events between micro facets into account. This gives a more energy conserving results, which would otherwise be visible as excessive darkening.

## **Outputs**

### ***BSDF***

Standard shader output.

---

## **Hair BSDF**

Cycles Only

The Hair BSDF node is used to add shading for Hair.

## **Inputs**

### ***Color***

Color of the hair.

### ***Offset***

Controls the way the light is rotated (angular shift) for the reflection/transmission.

### ***Roughness U/V***

Controls the roughness in the direction light is skewed, and perpendicular to it.

### ***Tangent***

Input tangent.

## **Properties**

### ***Component***

There are two components that can be used to control the look of the hair. Usually you are going to want each of these and use a Mix Node.

## Reflection

The light that bounces off the surface of the hair.

## Transmission

The light that passes through the hair and comes out the other side.

## Outputs

### BSDF

Standard shader output.

## Holdout

The Holdout shader node is used to create a “hole” in the image with zero alpha transparency, which is useful for compositing (see alpha channel).

Note that the holdout shader can only create alpha when Transparent is enabled. This can be found in the render settings. Properties > Render > Film > Transparent is enabled. If it is disabled, the holdout shader will be black.

## Outputs

### Holdout

Standard shader output.

## Mix Shader

The Mix node is used to mix two shaders together. Mixing can be used for material layering, where the Factor input may, for example, be connected to a Blend Weight node.

## Inputs

### Shader

Shaders to mix, such that incoming rays hit either with the specified probability in the Factor socket.

### Factor

Blend weight to use for mixing two shaders; at zero it uses the first shader entirely and at one the second shader.

## Outputs

### Shader

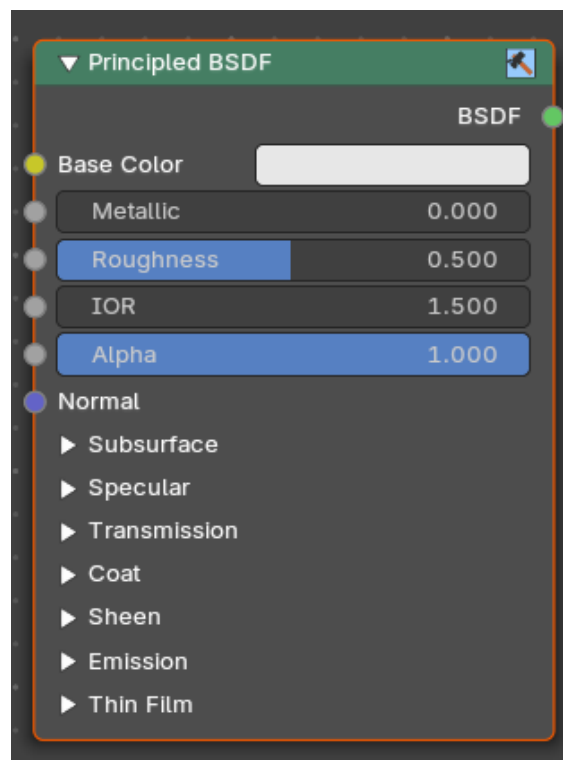

Standard shader output.

## Principled BSDF

The Principled BSDF that combines multiple shader layers into a single easy to use node. It is based on the Disney principled model also known as the “PBR” shader, making it compatible with other software such as Pixar’s Renderman® and Unreal Engine®. Image textures painted or baked from software like Substance Painter® may be directly linked to the corresponding parameters in this shader.

This “Uber” shader includes multiple layers to create a wide variety of materials. The base layer is a user controlled mix between diffuse, metal, subsurface scattering and transmission. On top of that there is a specular layer, sheen layer and clear coat layer.

Note! The emphasis on compatibility with other software means that it interprets certain input parameters differently from older Blender nodes.

## Inputs

### **Base Color**

Diffuse or metal surface color.

### **Metallic**

Blends between a non-metallic and metallic material model. A value of 1.0 gives a fully specular reflection tinted with the base color, without diffuse reflection or transmission. At 0.0 the material consists of a diffuse or transmissive base layer, with a specular reflection layer on top.

### **Roughness**

Specifies micro facet roughness of the surface for diffuse and specular reflection.

Hint. When converting from the older Glossy BSDF node, use the square root of the original value.

### **IOR**

Index of refraction for transmission.

## Alpha

Controls the transparency of the surface, with 1.0 fully opaque. Usually linked to the Alpha output of an Image Texture node.

## Normal

Controls the normals of the base layers.

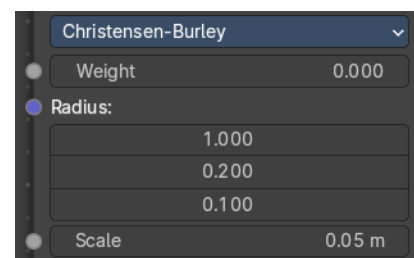

## Subsurface Subtab

### Mode Christensen-Burley

Christensen-Burley is an approximation to physically-based volume scattering. Gives less blurry results than Cubic and Gaussian functions.

### Weight

Mix between diffuse and subsurface scattering. Rather than being a simple mix between Diffuse and Subsurface Scattering, it acts as a multiplier for the Subsurface Radius.

### Subsurface Radius

Average distance that light scatters below the surface. Higher radius gives a softer appearance, as light bleeds into shadows and through the object. The scattering distance is specified separately for the RGB channels, to render materials such as skin where red light scatters deeper. The X, Y and Z values are mapped to the R, G and B values, respectively.

### Scale

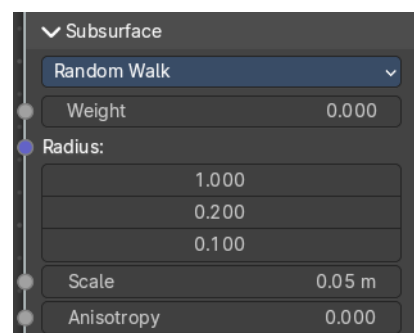

Scale of the subsurf scattering ( multiplied with radius).

### Mode Random Walk

Random Walk Provides the most accurate results for thin and curved objects. This comes at the cost of increased render time or noise for more dense media like skin, but also better geometry detail preservation. Random Walk uses true volumetric scattering inside the mesh, which means that it works best for closed meshes. Overlapping faces and holes in the mesh can cause problems.

### Weight

Mix between diffuse and subsurface scattering. Rather than being a simple mix between Diffuse and Subsurface Scattering, it acts as a multiplier for the Subsurface Radius.

### Subsurface Radius

Average distance that light scatters below the surface. Higher radius gives a softer appearance, as light bleeds into shadows and through the object. The scattering distance is specified separately for the RGB channels, to render materials such as skin where red light scatters deeper. The X, Y and Z values are mapped to the R, G and B values, respectively.

## Scale

Scale of the subsurf scattering ( multiplied with radius).

## Anisotropy

Adds some random directional light scattering.

## Mode Random Walk (Skin)

Random Walk Provides the most accurate results for thin and curved objects. This comes at the cost of increased render time or noise for more dense media like skin, but also better geometry detail preservation. Random Walk uses true volumetric scattering inside the mesh, which means that it works best for closed meshes. Overlapping faces and holes in the mesh can cause problems.

## Weight

Mix between diffuse and subsurface scattering. Rather than being a simple mix between Diffuse and Subsurface Scattering, it acts as a multiplier for the Subsurface Radius.

## Subsurface Radius

Average distance that light scatters below the surface. Higher radius gives a softer appearance, as light bleeds into shadows and through the object. The scattering distance is specified separately for the RGB channels, to render materials such as skin where red light scatters deeper. The X, Y and Z values are mapped to the R, G and B values, respectively.

## Scale

Scale of the subsurf scattering ( multiplied with radius).

## IOR

Adds a refraction for more realistic results.

## Anisotropy

Adds some random directional light scattering.

## Specular Subtab

### Specular Mode

#### GGX

A method that is faster than Multiple-scattering GGX but is less physically accurate. Selecting it enables the Transmission Roughness input.

#### Multiple-scattering GGX

Takes multiple bounce (scattering) events between micro facets into account. This gives a more energy conserving results, which would otherwise be visible as excessive darkening.

#### IOR Level

Amount of dielectric specular reflection. Specifies facing (along normal) reflectivity in the most common 0 -

8% range.

Hint. To compute this value for a realistic material with a known index of refraction, you may use this special case of the Fresnel formula:  $\text{specular} = ((\text{ior} - 1) / (\text{ior} + 1))^2 / 0.08$

For example:

water: ior = 1.33, specular = 0.25

glass: ior = 1.5, specular = 0.5

diamond: ior = 2.417, specular = 2.15

Since materials with reflectivity above 8% do exist, the field allows values above 1.

## ***Tint***

Tints the facing specular reflection using the base color, while glancing reflection remains white.

Normal dielectrics have colorless reflection, so this parameter is not technically physically correct and is provided for faking the appearance of materials with complex surface structure.

## ***Anisotropic***

Amount of anisotropy for specular reflection. Higher values give elongated highlights along the tangent direction; negative values give highlights shaped perpendicular to the tangent direction.

## ***Anisotropic Rotation***

Rotates the direction of anisotropy, with 1.0 going full circle.

Hint. Compared to the Anisotropic BSDF node, the direction of highlight elongation is rotated by 90°. Add 0.25 to the value to correct.

## ***Tangent***

Controls the tangent for the Anisotropic layer.

## ***Transmission Subpanel***

### **Weight**

Blend between transmission and other base layers.

## ***Coat subpanel***

Extra white specular layer on top of others. This is useful for materials like car paint and the like.

### **Weight**

Controls the intensity of the coat layer. Both, the reflection and the tinting. For physically based materials this value should be zero.

## ***Roughness***

Roughness of clear coat specular.

## ***IOR***

The index of refraction of the coat layer. It affects the reflectivity and the falloff of coat tinting.

## ***Tint***

The coat color. Saturation increases at shallower angles as the light travels farther through the medium.

## ***Normal***

Controls the normals of the coat layer.

---

## ***Sheen subpanel***

### **Weight**

Controls the intensity of the layer.

### **Roughness**

Controls the roughness of the layer.

### **Tint**

Mix between white and using base color for sheen reflection.

---

## ***Emission subpanel***

Light emission from the surface, like the Emission shader.

### **Color**

The emission color.

### **Emission Strength**

The strength of the light emission.

---

## ***Thin Film subpanel***

A thin film coating of a material with a normal angle of incidence.

**Note:** *Useful for bubbles, oil floating on water and other similar effects.*

### **Thickness**

The thickness of the thin film

## IOR

The index of refraction of the thin film layer. It affects the reflectivity and the falloff of thin film.

## Outputs

### BSDF

Standard shader output.

## Principled Hair BSDF

### Cycles Only

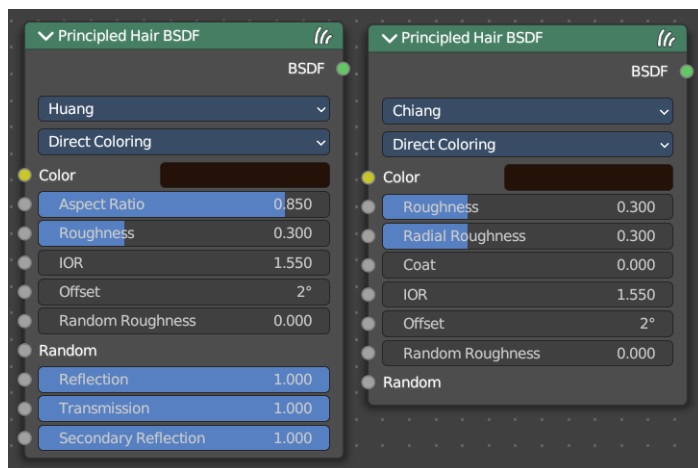

The Principled Hair BSDF is a physically-based, easy-to-use shader for rendering hair and fur.

## Properties

### Scattering Mode

#### Chiang Model versus Huang Model

There are two scattering models available. Chiang is the older model, with a less accurate result. Huang the newer model. The available options differs from model to model.

### Color Parametrization

The shader provides three different ways, or parametrizations, to color the hair strands. Direct coloring, Melanin concentration and Absorption coefficient. They have some different settings and inputs.

## Inputs

## Huang - Absorption coefficient

Specifies the attenuation coefficient  $s_a$ , as applied by the Beer-Lambert law. This mode is intended mainly for technical users who want to use coefficients from the literature without any sort of conversion.

### Absorption Coefficient

Specifies the light absorption per unit length as the light passes through the value. A higher value leads to a darker color. The absorption coefficient is a vector  $\mathbf{3}$ .

### Aspect Ratio

For elliptical hair cross-section the aspect ratio is the ratio of the minor axis to the major axis. The major axis is aligned with the curve normal.

Recommended values are 0.8 to 1 for asian hair, 0.654 to 0.9 for caucasian hair and 0.5 to 0.65 for african hair. Set it to 1 for a circular cross section.

### Roughness

The hair roughness. A lower value leads to a metallic look.

### IOR

Refraction coefficient. The default value of 1.550 is the refraction coefficient of melanin.

### Offset

The tilt angle of the cuticle scales. That'st the outermost part of the hair. They are always tilted towards the hair root. Human hair has a value between 2 and 4.

### Random Roughness

Adds a random roughness to each strand.

### Random

Add a random input value.

### Reflection

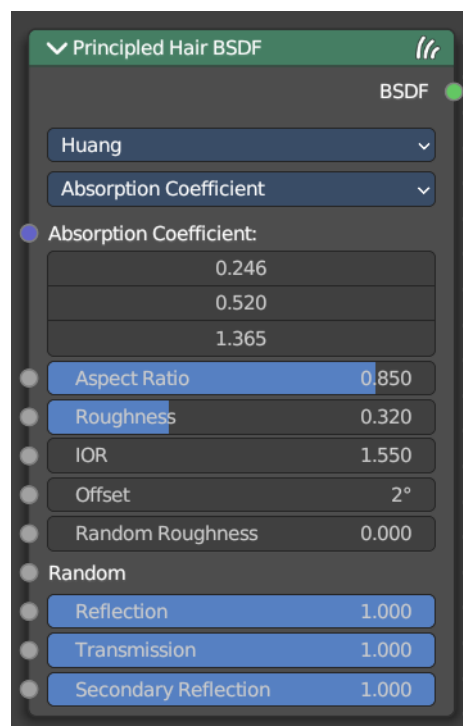

Optional factor for modulating the first light bounce off the hair surface. The color of this component is always white. Keep it 1.0 for physical correctness.

### Transmission

Optional factor for modulating the transmission component. The color of this component is always white. Keep it 1.0 for physical correctness.

### Secondary Reflection

Optional factor for modulating the component which is transmitted into the hair, reflected off the backside of the hair and then transmitted out of the hair. This component is oriented approximately around the incoming direction, and picks up the color of the pigment inside the hair. Keep this 1.0 for physical correctness.

## Huang - Melanin concentration

This mode defines the color as the quantity and ratio of the pigments which are commonly found in hair and fur, eumelanin (prevalent in brown-black hair) and pheomelanin (red hair). The quantity is specified in the Melanin input, and the ratio between them in Melanin Redness. Increasing concentrations darken the hair (the following are with Melanin Redness 1):

White (Melanin 0), Blonde (Melanin 0.25), Reddish (Melanin 0.5), Brown (Melanin 0.75), Black (Melanin 1)

Additionally, the Tint inputs allows to dye the hair with the desired color.

### Melanin

Absolute quantity of pigment. Range [0,1] equivalent to [0%,100%].

Hint. This is a linear mapping to the underlying exponential function:  
 $\text{melanin\_qty} = -\ln(\max(1.0 - \text{Melanin}, 0.0001))$

### Melanin Redness

Ratio of pheomelanin to eumelanin. Range [0,1] equivalent to [0%,100%].

Hint. The ratio formula is:  $\text{eumelanin} = \text{Melanin} * (1.0 - \text{MelaninRedness})$ ,  
 $\text{pheomelanin} = \text{Melanin} * \text{MelaninRedness}$ .

The resulting quantities are converted (after randomization, if specified) to absorption concentration via the following formula (section 6.1 of [EFHLA11], adjusted for the range [0,1]):  
 $\text{sa} = \text{eumelanin} * (0.5060.8411.653 + \text{pheomelanin} * (0.3430.7331.924))$

### Tint

Color used for dyeing the hair after applying the melanin pigment. It is not subject to randomization. It can be disabled by setting the color to white.

Hint. This is converted via the Color mapping above and added to the absorption coefficient of the melanin concentration.

### IOR

Refraction coefficient. The default value of 1.550 is the refraction coefficient of melanin.

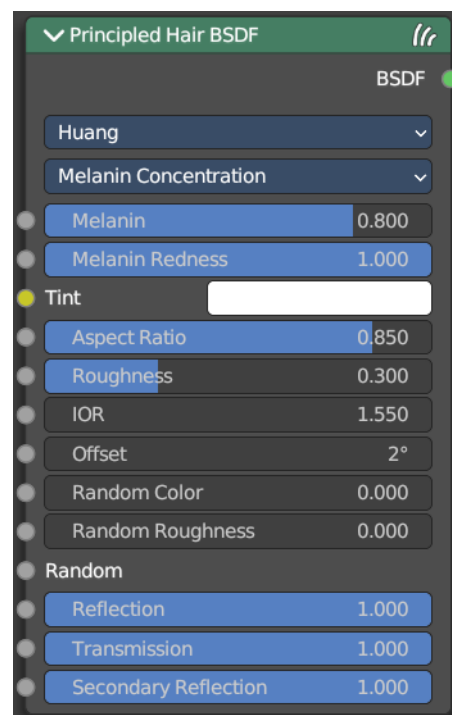

### Offset

The tilt angle of the cuticle scales. That'st the outermost part of the hair. They are always tilted towards the hair root. Human hair has a value between 2 and 4.

### Random Color

For each strand, vary the melanin concentration by RandomFactor. Range [0,1] equivalent to [0%,100%] of the initial melanin concentration.

Hint. The melanin concentration is multiplied by randomFactor, where  $\text{randomFactor} = 1.0 + 2.0 * (\text{Random} - 0.5) * \text{RandomColor}$ .

## Random Roughness

Adds a random roughness to each strand.

## Reflection

Optional factor for modulating the first light bounce off the hair surface. The color of this component is always white. Keep it 1.0 for physical correctness.

## Transmission

Optional factor for modulating the transmission component. The color of this component is always white. Keep it 1.0 for physical correctness.

## Secondary Reflection

Optional factor for modulating the component which is transmitted into the hair, reflected off the backside of the hair and then transmitted out of the hair. This component is oriented approximately around the incoming direction, and picks up the color of the pigment inside the hair. Keep this 1.0 for physical correctness.

## Huang - Direct Coloring

Choose the desired RGB color and the shader will approximate the necessary absorption coefficient (below).

## Aspect Ratio

For elliptical hair cross-section the aspect ratio is the ratio of the minor axis to the major axis. The major axis is aligned with the curve normal.

Recommended values are 0.8 to 1 for asian hair, 0.654 to 0.9 for caucasian hair and 0.5 to 0.65 for african hair. Set it to 1 for a circular cross section.

## Roughness

The hair roughness. A lower value leads to a metallic look.

## IOR

Refraction coefficient. The default value of 1.550 is the refraction coefficient of melanin.

## Offset

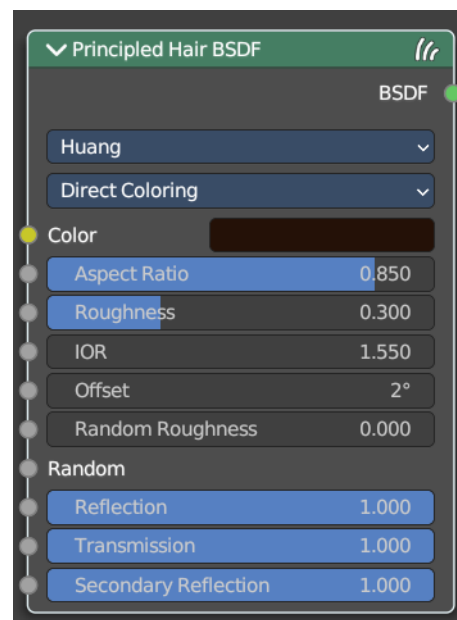

The tilt angle of the cuticle scales. That'st the outermost part of the hair. They are always tilted towards the hair root. Human hair has a value between 2 and 4.

## Random Roughness

Adds a random roughness to each strand.

## Reflection

Optional factor for modulating the first light bounce off the hair surface. The color of this component is always white. Keep it 1.0 for physical correctness.

## Transmission

Optional factor for modulating the transmission component. The color of this component is always white. Keep it 1.0 for physical correctness.

## Secondary Reflection

Optional factor for modulating the component which is transmitted into the hair, reflected off the backside of the hair and then transmitted out of the hair. This component is oriented approximately around the incoming direction, and picks up the color of the pigment inside the hair. Keep this 1.0 for physical correctness.

## *Chiang* - Absorption coefficient

Specifies the attenuation coefficient  $s_a$ , as applied by the Beer-Lambert law. This mode is intended mainly for technical users who want to use coefficients from the literature without any sort of conversion.

## Absorption Coefficient

Specifies the light absorption per unit length as the light passes through the value. A higher value leads to a darker color. The absorption coefficient is a vector  $\vec{s}$ .

## Roughness

The hair roughness. A lower value leads to a metallic look.

## Radial Roughness

Specify how much the glints are smoothed in the direction of the hair tangent. Too low values will concentrate the glint; while setting it too high will spread the light across the width of the strand.

Hint. Mathematically, this parameter is mapped to the logistic distribution's scale factor  $s$  (section 4.1 of [CBTB16]).

## Coat

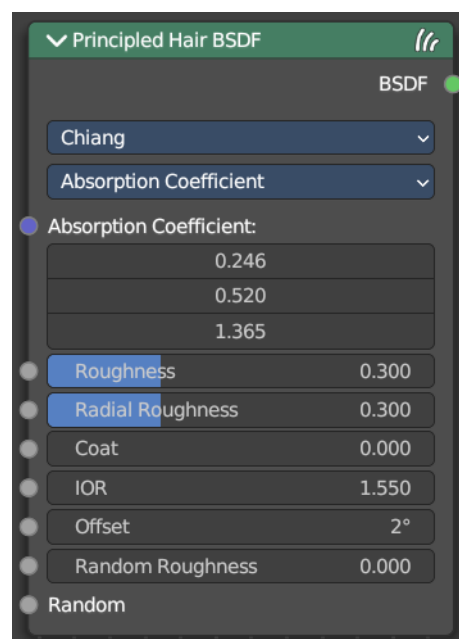

Simulate a shiny coat by reducing the roughness to the given factor only for the first light bounce (diffuse). Range  $[0, 1]$  is equivalent to a reduction of  $[0\%, 100\%]$  of the original roughness."

## IOR

Refraction coefficient. The default value of 1.550 is the refraction coefficient of melanin.

## Offset

The tilt angle of the cuticle scales. That'st the outermost part of the hair. They are always tilted towards the hair root. Human hair has a value between 2 and 4.

## Random Roughness

Adds a random roughness to each strand.

## Random

Add a random value.

## Chiang - Melanin concentration

This mode defines the color as the quantity and ratio of the pigments which are commonly found in hair and fur, eumelanin (prevalent in brown-black hair) and pheomelanin (red hair). The quantity is specified in the Melanin input, and the ratio between them in Melanin Redness. Increasing concentrations darken the hair (the following are with Melanin Redness 1):

White (Melanin 0), Blonde (Melanin 0.25), Reddish (Melanin 0.5), Brown (Melanin 0.75), Black (Melanin 1)

Additionally, the Tint inputs allows to dye the hair with the desired color.

## Melanin

Absolute quantity of pigment. Range [0,1] equivalent to [0%,100%].

Hint. This is a linear mapping to the underlying exponential function:  
 $\text{melanin\_qty} = -\ln(\max(1.0 - \text{Melanin}, 0.0001))$

## Melanin Redness

Ratio of pheomelanin to eumelanin. Range [0,1] equivalent to [0%,100%].

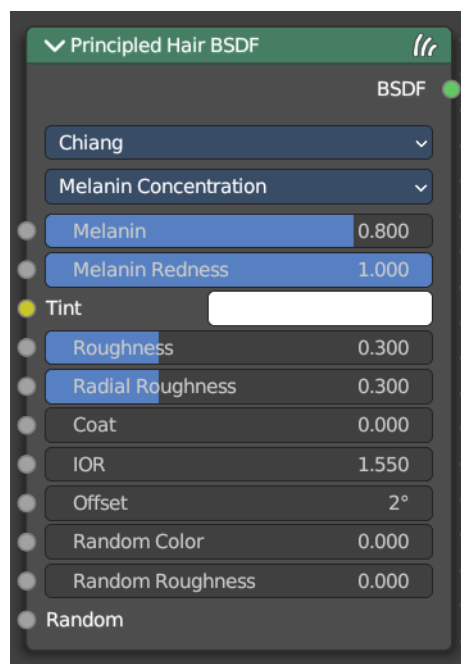

Hint. The ratio formula is:  $\text{eumelanin} = \text{Melanin} * (1.0 - \text{MelaninRedness})$ ,  
 $\text{pheomelanin} = \text{Melanin} * \text{MelaninRedness}$ .

The resulting quantities are converted (after randomization, if specified) to absorption concentration via the following formula (section 6.1 of [EFHLA11], adjusted for the range [0,1]):  
 $\text{sa} = \text{eumelanin} * 0.5060.8411.653 + \text{pheomelanin} * 0.3430.7331.924$

## Tint

Color used for dyeing the hair after applying the melanin pigment. It is not subject to randomization. It can be disabled by setting the color to white.

Hint. This is converted via the Color mapping above and added to the absorption coefficient of the melanin concentration.

## Roughness

The hair roughness. A lower value leads to a metallic look.

## Radial Roughness

Specify how much the glints are smoothed in the direction of the hair tangent. Too low values will concentrate the glint; while setting it too high will spread the light across the width of the strand.

Hint. Mathematically, this parameter is mapped to the logistic distribution's scale factor  $s$  (section 4.1 of [CBTB16]).

## Coat

Simulate a shiny coat by reducing the roughness to the given factor only for the first light bounce (diffuse). Range [0, 1] is equivalent to a reduction of [0%, 100%] of the original roughness."

## IOR

Refraction coefficient. The default value of 1.550 is the refraction coefficient of melanin.

## Offset

The tilt angle of the cuticle scales. That'st the outermost part of the hair. They are always tilted towards the hair root. Human hair has a value between 2 and 4.

## Random Color

For each strand, vary the melanin concentration by RandomFactor. Range [0,1] equivalent to [0%,100%] of the initial melanin concentration.

Hint. The melanin concentration is multiplied by randomFactor, where  $\text{randomFactor} = 1.0 + 2.0 * (\text{Random} - 0.5) * \text{RandomColor}$ .

## Random Roughness

Adds a random roughness to each strand.

## Chiang - Direct Coloring

Choose the desired RGB color and the shader will approximate the necessary absorption coefficient (below).

### Color

The RGB color of the strand. Only used in Direct coloring.

Hint. The chosen color is converted to an absorption coefficient with the following formula (section 4.2 of [CBTB16]):

$$s_a = \ln(\text{Color}) (5.969 - 0.215\beta_N + 2.532\beta_N^2 - 10.73\beta_N^3 + 5.574\beta_N^4 + 0.245\beta_N^5)^2$$

where  $\beta_N$  is the radial roughness of the hair after applying randomization (if specified).

## Roughness

The hair roughness. A lower value leads to a metallic look.

## Radial Roughness

Add an extra radial roughness.

## Coat

Simulate a shiny coat of fur, by reducing the Roughness to the given factor only for the first light bounce (diffuse). Range [0,1] equivalent to a reduction of [0%,100%] of the original Roughness.

## IOR

Index of refraction (IOR) defining how much the ray changes direction. At 1.0 rays pass straight through like in a transparent material; higher values give more refraction. Default value is 1.55.

## Offset

Tilts the glint of the hair by increasing the angle of the scales of the hair's cuticle with respect to the hair shaft. Human hair usually has low values.

## Random Roughness

For each strand, vary both Roughness values by RandomFactor. Range [0,1] equivalent to [0%,100%] of the initial roughness values.

Hint. The applied formula is the same one as for Random Color.

## Outputs

### *BSDF*

Standard shader output.

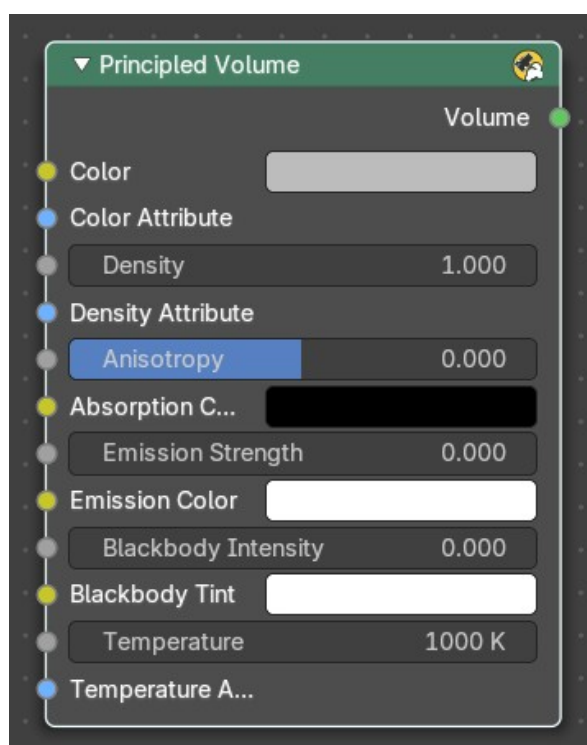

## Principled Volume

The Principled Volume shader combines all volume shading components into a single easy to use node. Volumes like smoke and fire can be rendered with a single shader node, which includes scattering, absorption and blackbody emission.

## Inputs

### *Color*

Volume scattering color.

## ***Color Attribute***

Volume grid for coloring the volume. Use “color” for smoke simulations.

## ***Density***

Density of the volume.

## ***Density Attribute***

Volume grid to define the density, typically “density”.

## ***Anisotropy***

Backward or forward scattering direction.

## ***Absorption Color***

Volume shadow color tint.

## ***Emission Strength***

Amount of light to emit.

## ***Emission Color***

Emission color tint.

## ***Blackbody Intensity***

Blackbody emission for fire. Set to 1 for physically accurate intensity.

## ***Blackbody Tint***

Color tint for blackbody emission.

## ***Temperature***

Temperature in kelvin for blackbody emission, higher values emit more.

## ***Temperature Attribute***

Volume grid attribute to define the temperature.

## **Outputs**

### ***Volume***

Standard shader output.

---

## **Refraction BSDF**

The Refraction BSDF is used to add glossy refraction with sharp or micro facet

distribution, used for materials that transmit light. For best results this node should be considered as a building block and not be used on its own, but rather mixed with a glossy node using a Fresnel factor. Otherwise it will give quite dark results at the edges for glossy refraction.

## Inputs

### **Color**

Color of the surface, or physically speaking, the probability that light is refracted for each wavelength.

### **Roughness**

Influences sharpness of the refraction; perfectly sharp at 0.0 and smoother with higher values.

### **Normal**

Normal used for shading; if nothing is connected the default shading normal is used.

## Properties

### **Distribution**

Micro facet distribution to use. Sharp results in perfectly sharp refraction, while Beckmann and GGX can use the Roughness input for blurry refraction.

## Outputs

### **BSDF**

Standard shader output.

## Specular BSDF

### **Eevee Only**

The Specular BSDF combines multiple shader layers into a single easy to use node.

It is similar to the Principled BSDF node but uses the specular workflow instead of the metallic. It has far fewer parameters and supports less features. Both might be merged into one node in the future.

The specular workflow functions by specifying the facing (along normal) reflection color. The result may not be physically plausible because there is no energy conservation.

## Inputs

### **Base Color**

Diffuse surface color. For conductor materials (metals) it should be black.

## ***Specular Color***

Amount of specular reflection. Specifies facing (along normal) reflectivity. Conductor materials (metals) can have colored specular reflection.

Hint. To compute this value for a realistic material with a known index of refraction, you may use this special case of the Fresnel formula:  $\text{specular} = ((\text{ior}-1)/(\text{ior}+1))^2$

For example:

water: ior = 1.33, specular = 0.25

glass: ior = 1.5, specular = 0.5

diamond: ior = 2.417, specular = 2.15

## ***Roughness***

Specifies micro facet roughness of the surface for diffuse and specular reflection.

Hint. When converting from the older Glossy BSDF node, use the square root of the original value.

## ***Emissive Color***

Color of the emitted light. This light is added to the BSDF result.

## ***Transparency***

Transparency factor. This is the inverse of the alpha channel (1 - alpha) you find in an image. Use an Invert node to convert alpha to transparency. This will only have an effect if the material uses a blend mode other than opaque.

## ***Normal***

Controls the normals of the base layers.

## ***Clear coat***

Extra white specular layer on top of others. This is useful for materials like car paint and the like.

## ***Clear coat Roughness***

Roughness of clear coat specular.

## ***Clear coat Normal***

Controls the normals of the Clear coat layer.

## ***Ambient Occlusion***

Amount of occlusion to apply to indirect lighting. Usually a bake ambient occlusion map. The final occlusion factor is the minimum of this input and the runtime ambient occlusion effect.

## Outputs

### ***BSDF***

Standard shader output.

## Subsurface Scattering

The Subsurface Scattering node is used to add simple subsurface multiple scattering, for materials such as skin, wax, marble, milk and others. For these materials, rather than light being reflect directly off the surface, it will penetrate the surface and bounce around internally before getting absorbed or leaving the surface at a nearby point.

How far the color scatters on average can be configured per RGB color channel. For example, for skin, red colors scatter further, which gives distinctive red-colored shadows, and a soft appearance.

## Inputs

### ***Color***

Color of the surface, or physically speaking, the probability that light is reflected for each wavelength.

### ***Scale***

Global scale factor for the scattering radius.

### ***Radius***

Average distance that light scatters below the surface. Higher radius gives a softer appearance, as light bleeds into shadows and through the object. The scattering distance is specified separately for the RGB channels, to render materials such as skin where red light scatters deeper. The X, Y and Z values are mapped to the R, G and B values, respectively.

### ***Sharpness***

Used only with Cubic falloff. Values increasing from 0 to 1 prevents softening of sharp edges and reduces unwanted darkening.

### ***Normal***

Normal used for shading; if nothing is connected the default shading normal is used.

### ***Texture Blur***

How much of the texture will be blurred along with the lighting, mixing the texture at the incoming and outgoing points on the surface. Note that the right choice depends on the texture. Consider for example a texture created from a photograph of skin, in this case the colors will already be pre-blurred and texture blur could be set to 0. Even for hand-painted textures, no blurring or minimal blurring might be appropriate, as a texture artist would likely paint in softening already. One would usually not even know what an unblurred skin

texture looks like; we always see it blurred. For a procedural texture on the other hand this option would likely have a higher value.

## Properties

### ***Falloff Method***

Rendering method to simulate subsurface scattering.

### **Christensen-Burley**

Is an approximation to physically-based volume scattering. Gives less blurry results than Cubic and Gaussian functions.

### **Random Walk**

#### **Cycles Only**

Provides the most accurate results for thin and curved objects. This comes at the cost of increased render time or noise for more dense media like skin, but also better geometry detail preservation. Random Walk uses true volumetric scattering inside the mesh, which means that it works best for closed meshes. Overlapping faces and holes in the mesh can cause problems.

### **Cubic**

Is a sharp falloff useful for many simple materials. The function is  $(\text{radius}-x)^3$ .

### **Gaussian**

Gives a smoother falloff following a normal distribution, which is particularly useful for more advanced materials that use measured data that was fitted to one or more such Gaussian functions. The function is  $e^{-8x^2/\text{radius}^2}$ , such that the radius roughly matches the maximum falloff distance. To match a given measured variance  $v$ , set  $\text{radius}=\sqrt{16 \times v}$ .

## Outputs

### **BSSRDF**

BSSRDF shader output.

## Toon BSDF

### **Cycles Only**

The Toon BSDF is used to create Diffuse and Glossy materials with cartoon light effects.

### Inputs

#### **Color**

Color of the surface, or physically speaking, the probability that light is reflected for each wavelength.

## **Size**

Parameter between 0.0 and 1.0 that gives an angle of reflection between 0° and 90°.

## **Smooth**

This value specifies an angle over which a smooth transition from full to no reflection happens.

## **Normal**

Normal used for shading; if nothing is connected the default shading normal is used.

## **Properties**

### **Component**

#### **Diffuse**

Use shading based on the Diffuse BSDF.

#### **Glossy**

Use shading based on the Glossy BSDF for specular reflection.

## **Outputs**

### **BSDF**

Standard shader output.

---

## **Translucent BSDF**

The Translucent BSDF is used to add Lambertian diffuse transmission.

## **Inputs**

### **Color**

Color of the surface, or physically speaking, the probability that light is transmitted for each wavelength.

### **Normal**

Normal used for shading; if nothing is connected the default shading normal is used.

## **Outputs**

### **BSDF output**

Standard shader output.

---

## Transparent BSDF

The Transparent BSDF is used to add transparency without refraction, passing straight through the surface, as if there were no geometry there. Useful with alpha maps, for example. This shader affects light paths somewhat differently than other BSDFs. Note that only pure white transparent shaders are completely transparent.

### Inputs

#### *Color*

Color of the surface, or physically speaking, the probability for each wavelength that light is blocked or passes straight through the surface.

### Outputs

#### *BSDF*

Standard shader output.

## Sheen BSDF

### Cycles Only

The Sheen BSDF is used to add reflection to materials such as cloth. It is meant to be used together with other shaders (such as a Diffuse Shader) and is not particularly useful on its own.

### Inputs

#### *Color*

Color of the surface, or physically speaking, the probability that light is reflected for each wavelength.

#### *Sigma*

Variance of the normal distribution, controlling the sharpness of the peak. It can be thought of as a kind of roughness.

#### *Normal*

Normal used for shading; if nothing is connected the default shading normal is used.

### Properties

#### *Distribution*

The distribution algorithm. Akishikmin is the legacy model. Microfiber the modern approach.

## Outputs

### ***BSDF***

Standard shader output.

---

## Volume Absorption

The Volume Absorption node allows light to be absorbed as it passes through the volume. Typical usage for this node would be water and colored glass.

## Inputs

### ***Color***

Color of the volume.

### ***Density***

The density of the absorption effect.

## Outputs

### ***Volume***

The Volume Shader.

---

## Volume Scatter

The Volume Scatter node allows light to be scattered as it passes through the volume. Typical usage would be to add fog to a scene. It can also be used with the Volume Absorption node to create smoke.

## Inputs

### ***Color***

Color of the volume.

### ***Density***

The density of the scatter effect.

### ***Anisotropy***

Controls the look of the scatter effect depending on the direction of the light passing through it.

## **Output**

### ***Volume***

The Volume Shader output must be plugged into the Volume Input of the Material or World Output node.

## Add menu - Texture

Here are the texture nodes. They allow you to add different texture types to the scene. The content is the same for the sub modes and the different renderers. However, a environment texture just makes sense for the world sub mode.

### Brick Texture

The Brick Texture node is used to add a procedural brick texture.

#### Inputs

##### ***Color 1, Color 2 and Mortar***

Color of the bricks and mortar.

##### ***Scale***

Overall texture scale.

##### ***Mortar Size***

The size of the filling between the bricks known as “mortar”; 0 means no mortar.

##### ***Mortar Smooth***

Blurs/softens the edge between the mortar and the bricks. This can be useful with a texture and displacement textures.

##### ***Bias***

The color variation between Color 1/2. Values of -1 and 1 only use one of the two colors; values in between mix the colors.

##### ***Brick Width***

The width of the bricks.

##### ***Row Height***

The height of the brick rows.

## Properties

### **Offset**

Determines the brick offset of the various rows.

### **Frequency**

Determines the offset frequency. A value of 2 gives an even/uneven pattern of rows.

### **Squash**

Amount of brick squashing.

### **Frequency**

Brick squashing frequency.

## Outputs

### **Color**

Texture color output.

### **Factor**

Mortar mask (1 = mortar).

## Checker Texture

The Checker Texture node adds a procedural checkerboard texture.

## Inputs

### **Vector**

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

### **Color1, Color 2**

Color of the checkers.

### **Scale**

Overall texture scale. The scale is a factor of the bounding box of the face divided by the scale. For example, a scale of 15 will result in 15 alternate patterns over the overall UV bounding box. Different patterns could be achieved using other nodes to give different input patterns to this socket. For example, using the Math Node.

## Outputs

### **Color**

Texture color output.

### **Factor**

Checker 1 mask (1 = Checker 1).

## Environment Texture

Load an environment texture to light your scene.

## Inputs

### **Vector**

Texture coordinate for texture look-up. If this socket is left unconnected, the image is mapped as environment with the Z axis as up.

## Properties

### **Image**

Image data-block used as the image source. Additional settings can be found in Sidebar > Item > Properties: These include options to control the alpha channel along with addition options for the color space. These addition options are documented with the rest of Common Image Settings.

### **Color Space**

Type of data that the image contains, either Color or Non-Color Data. For most color textures the default of Color should be used, but in case of e.g. a bump or alpha map, the pixel values should be interpreted as Non-Color Data, to avoid doing any unwanted color space conversions.

### **Texture Interpolation**

Interpolation method used for the environment texture.

#### **Linear**

Regular quality interpolation.

#### **Closest**

No interpolation, use closest pixel.

#### **Cubic**

Smoother, better quality interpolation.

#### **Smart**

Bicubic when magnifying, otherwise Bilinear is used. This is only available for OSL.

## Projection Method

Allows you to use different types of environmental maps.

### Equirectangular

Projection from an Equirectangular photo.

### Mirror Ball

Projection from an orthographic photo or mirror ball.

## Outputs

### Color

RGB color from the image.

## Gabor Texture

The Gabor Texture is a special directional noise texture from the OSL Shading language.

### Inputs

#### Vector

Texture coordinate to sample texture at defaults to Generated texture coordinates if the socket is left unconnected.

#### Scale

The scale of the Gabor noise.

#### Frequency

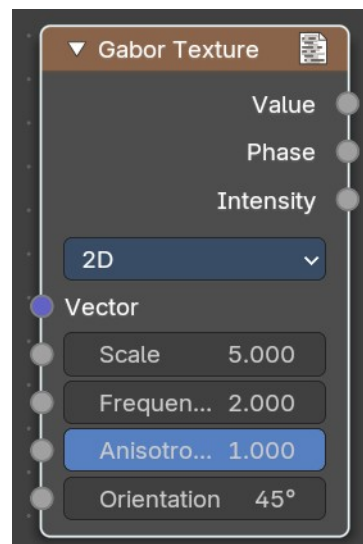

The rate at which the Gabor noise changes across space. It differs from the input scale in that it only scales perpendicular to the gabor noise direction.

#### Anisotropic

The directionality of the Gabor noise. 1 means the noise is completely directional. With a value of 0 the noise goes in all directions.

#### Orientation

The direction of the anisotropic Gabor noise. With the 2ds method you have a orientation value. With the 3d method you will have a trackball to adjust the orientation.

## Properties

### Type

2D ignores the Z input. 3D goes in all 3 directions.

### Outputs

#### *Value*

The Gabor noise value with both, random phase and random intensity.

#### *Phase*

The phase of the Gabor noise, without random intensity.

#### *Intensity*

The intensity of the Gabor noise, without random phase.

## Gradient Texture

The Gradient Texture node generates interpolated color and intensity values based on the input vector.

### Inputs

#### *Vector*

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

## Properties

### *Gradient Type*

Controls the type of gradient generated.

#### **Linear**

Directly returns the input X coordinate.

#### **Quadratic**

Interpolates the input X coordinate quadratically.

#### **Easing**

Uses a combination of quadratic and linear interpolation to return a smooth gradient from the input X coordinate.

#### **Diagonal**

Averages the input X and Y coordinates.

## Spherical

Creates an inverse gradient using the length of the input vector; the maximum value is at (0, 0, 0).

## Quadratic Sphere

The same as Spherical, except interpolated quadratically.

## Radial

Returns a value based on the angle of the input around the Z axis.

## Outputs

### *Color*

Texture color output.

### *Factor*

Texture intensity output.

## IES Texture

The IES Texture is used to match real world lights based on IES files. IES files store the directional intensity distribution of light sources.

## Inputs

### *Vector*

Texture coordinate for lookup in the light distribution. Defaults to the normal.

### *Strength*

Light strength multiplier.

## Properties

### *Mode*

#### Internal

Use IES profile from a file embedded in a text data-block in the blend-file, for easy distribution.

#### External

Load IES profile from a file on the drive.

## Outputs

### *Factor*

Light intensity, typically plugged into the Strength input of an Emission node.

# Image Texture

The Image Texture is used to add an image file as a texture.

## Inputs

### Vector

Texture coordinate for texture look-up. If this socket is left unconnected, UV coordinates from the active UV render layer are used.

## Properties

### Image

Open an image, choose an existing image, or generate a new image.

When you click at Open then a file browser opens up. When you click at New then a popup dialog opens. up where you can create a new image.

The image browser at the left allows you to pick an already existing texture from the scene.

More image settings can be found in the Sidebar in the Items tab. Usually you find in the Item tab the very same settings like in the selected node. But the Image texture node is an exception. It shows here the usual image related settings too. This will be explained in the sidebar chapter.

## Interpolation

Method to scale images up or down for rendering.

### Linear

Regular quality interpolation.

## **Cubic**

Smoother, better quality interpolation. For bump maps this should be used to get best results.

## **Closest**

No interpolation, use only closest pixel for rendering pixel art.

## **Smart**

### **Cycles Only**

Only for Open Shading Language. Use cubic interpolation when scaling up and linear when scaling down, for a better performance and sharpness.

## ***Projection***

Projection to use for mapping the textures.

## **Flat**

Uses the XY coordinates for mapping.

## **Box**

Maps the image to the six sides of a virtual box, based on the normal, using XY, YZ and XYZ coordinates depending on the side.

## **Blend**

For Box mapping, the amount to blend between sides of the box, to get rid of sharp transitions between the different sides. Blending is useful to map a procedural-like image texture pattern seamlessly on a model. 0.0 gives no blending; higher values give a smoother transition.

## **Sphere**

Sphere mapping is the best type for mapping a sphere, and it is perfect for making planets and similar objects. It is often very useful for creating organic objects.

## **Tube**

Maps the texture around an object like a label on a bottle. The texture is therefore more stretched on the cylinder. This mapping is of course very good for making the label on a bottle, or assigning stickers to rounded objects. However, this is not a cylindrical mapping so the ends of the cylinder are undefined.

## ***Extension***

Extension defines how the image is extrapolated past the original bounds:

### **Repeat**

Will repeat the image horizontally and vertically giving tiled-looking result.

### **Extend**

Will extend the image by repeating pixels on its edges.

## Clip

Clip to the original image size and set all the exterior pixels values to transparent black.

## Source

What kind of image it is. The terms should be self explaining.

## Color Space

What color space is used for the image.

## Alpha

What alpha mode is used for the image.

## Outputs

### Color

RGB color from image. If the image has alpha, the color is premultiplied with alpha if the Alpha output is used, and unpremultiplied or straight if the Alpha output is not used.

### Alpha

Alpha channel from image.

---

## Magic Texture

The Magic Texture node is used to add a procedural psychedelic color texture.

### Inputs

#### Vector

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

## Scale

Scale of the texture.

## Distortion

Amount of distortion.

## Properties

### Depth

Number of iterations.

## Outputs

### Color

Texture color output.

### Factor

Texture intensity output.

---

## Noise Texture

The Noise Texture node evaluates a fractal Perlin noise at the input texture coordinates. This nodes allows great control over how noise octaves are combined.

## Inputs

The inputs are dynamic, they become available if needed depending on the node properties.

## **Vector**

Texture coordinate to evaluate the noise at; defaults to Generated texture coordinates if the socket is left unconnected.

## **Normalize**

Normalize the output to the 0 - 1 range.

## **W**

Texture coordinate to evaluate the noise at. Appears with 4 dimensions.

## **Scale**

Scale of the base noise octave.

## **Detail**

Number of noise octaves. The fractional part of the input is multiplied by the magnitude of the highest octave. Higher number of octaves corresponds to a higher render time.

## **Roughness**

Adds a roughness noise.

## **Lacunarity**

The scale of a perlin noise octave relative to the perlin noise octave from the previous octave.

## **Offset**

An added offset to each octave, determines the level where the highest octave will appear.

## **Gain**

An extra multiplier to tune the magnitude of octaves.

## **Distortion**

Amount of distortion.

## **Properties**

### **Dimensions**

The dimensions of the space to evaluate the noise in.

#### **1D**

Evaluate the noise in 1D space at the input W.

#### **2D**

Evaluate the noise in 2D space at the input Vector. The Z component is ignored.

#### **3D**

Evaluate the noise in 3D space at the input Vector.

## 4D

Evaluate the noise in 4D space at the input Vector and the input W as the fourth dimension.

### Type

Type of the perlin noise texture.

#### Multifractal

The result is more uneven (varies with location), more similar to a real terrain. Uses a multiplicative cascade.

#### Ridged Multifractal

Creates sharp peaks. Calculates the absolute value of the noise, creating “canyons”, and then flips the surface upside down.

#### Hybrid Multifractal

Creates peaks and valleys with different roughness values, like real mountains rise out of flat plains. Combines the additive cascade with a multiplicative cascade.

#### fBM (fractal Brownian Motion)

Produces an unnatural homogeneous and isotropic result. Uses an additive cascade, the values are simply added together.

#### Hetero Terrain (Heterogeneous Terrain)

Similar to Hybrid Multifractal creates a heterogeneous terrain, but with the likeness of river channels.

## Outputs

### Factor

Value of fractal noise.

### Color

Color with different fractal noise in each component.

---

## Point Density

The Point Density node is used to add volumetric points for each particle or vertex of another object.

## Inputs

### **Vector**

Texture coordinate to sample texture at; defaults to global position (Position output of Geometry node) if the socket is left unconnected.

## Properties

### **Point Data**

Where to get points from.

### **Particle System**

Use each particle position from the specified particle system.

### **Object Vertices**

Use each vertex position from the specified object.

### **Object**

Which object's vertices or particle system will be used.

### **Particle System**

Particle positions from this system will be used.

### **Space**

The coordinate system for mapping points.

### **World Space**

Map each point exactly where the source particle/vertex is.

### **Object Space**

Fit the points from the source particles/vertices inside the bounding box of the object with the point density texture.

### **Radius**

Size of the points.

### **Interpolation**

Texel filtering type.

### **Closest**

No interpolation, use nearest texel. Produces blocky looking points.

### **Linear**

Interpolate linearly between texels, producing soft, round points.

## Cubic

Use cubic falloff, producing very soft points. Useful when points are very densely packed.

## Resolution

The dimensions of the texture holding the point data.

## Color Source

Which attribute of the particle system or mesh is used to color the output. Switch to Object vertices to show the Vertex color sources.

## Particle Color Sources

### Particle Age

Lifetime mapped as (0.0 - 1.0) intensity.

### Particle Speed

Particle speed (absolute magnitude of velocity) mapped as (0.0 - 1.0) intensity.

### Particle Velocity

XYZ velocity mapped to RGB colors.

## Vertex Color Sources

### Vertex Color

Use a vertex color layer for coloring the point density texture.

Note. Vertex colors are defined per face corner. A single vertex can have as many different colors as faces it is part of. The actual color of the point density texture is averaged from all vertex corners.

### Vertex Weight

Use weights from a vertex group as intensity values.

### Vertex Normals

Use object-space vertex normals as RGB values.

## Outputs

### Color

Texture color output.

### Density

Density of volume.

## Sky Texture

The Sky Texture node adds a procedural Sky texture.

### Inputs

#### Vector

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

### Properties

#### Sky Type

Sky model to use. You have the choice between three methods. Nishita, Preetham and Hosek/Wilkie

#### Sun Direction

Sun direction vector. Click at the image and drag to change the sun direction.

#### Turbidity

Atmospheric turbidity. Some reference values:

2: Arctic like

3: clear sky

6: warm/moist day

10: hazy day

#### Ground Albedo

Amount of light reflected from the planet surface back into the atmosphere. (RGB(0, 0, 0) is black, RGB(1, 1, 1) is white.)

### Outputs

#### Color

Texture color output.

## Voronoi Texture

The Voronoi Texture node evaluates a Worley Noise at the input texture coordinates.

### Inputs

The inputs are dynamic, they become available if needed depending on the node properties.

#### **Vector**

Texture coordinate to evaluate the noise at; defaults to Generated texture coordinates if the socket is left unconnected.

#### **W**

Texture coordinate to evaluate the noise at.

#### **Scale**

Scale of the noise.

#### **Randomness**

The randomness of the noise.

### Properties

#### **Dimensions**

The dimensions of the space to evaluate the noise in.

#### **1D**

Evaluate the noise in 1D space at the input W.

#### **2D**

Evaluate the noise in 2D space at the input Vector. The Z component is ignored.

#### **3D**

Evaluate the noise in 3D space at the input Vector.

#### **4D**

Evaluate the noise in 4D space at the input Vector and the input W as the fourth dimension.

#### **Feature**

The Voronoi feature that the node will compute and return.

#### **F1**

Compute and return the distance to the closest feature point as well as its position and color.

## Smooth F1

Compute and return a smooth version of F1.

## Distance To Edge

Compute and return the distance to the edges of the Voronoi cells.

## N-Sphere Radius

Compute and return the radius of the n-sphere inscribed in the Voronoi cells. In other words, it is half the distance between the closest feature point and the feature point closest to it.

## Distance Metric

The distance metric used to compute the texture.

### Euclidean

Use the Euclidean distance metric.

### Manhattan

Use the Manhattan distance metric.

### Chebychev

Use the Chebychev distance metric.

### Minkowski

Use the Minkowski distance metric. The Minkowski distance is a generalization of the aforementioned metrics with an Exponent as a parameter. Minkowski with an exponent of one is equivalent to the Manhattan distance metric. Minkowski with an exponent of two is equivalent to the Euclidean distance metric. Minkowski with an infinite exponent is equivalent to the Chebychev distance metric.

## Outputs

### *Distance*

The Distance.

### *Color*

Cell color. The color is arbitrary.

### *Position*

Position of feature point.

### *W*

Position of feature point.

### *Radius*

N-Sphere radius.

Note. In some configurations of the node, especially for low values of Randomness, rendering artifacts may occur. This happens due to the same reasons described in the Notes section in the White Noise Texture page and can be fixed in a similar manner as described there.

## Wave Texture

The Wave Texture node adds procedural bands or rings with noise distortion.

### Inputs

#### **Vector**

Texture coordinate to sample texture at; defaults to Generated texture coordinates if the socket is left unconnected.

#### **Scale**

Overall texture scale.

#### **Distortion**

Amount of distortion of the wave (similar to the Marble texture in Blender Internal).

#### **Detail**

Amount of distortion noise detail.

#### **Detail Scale**

Scale of distortion noise.

#### **Detail Roughness**

Adds a roughness noise.

#### **Phase Offset**

Set an offset for the phase.

### Properties

#### **Wave Type**

Bands or Rings shaped waves.

## ***Bands direction***

In which direction the bands should point.

## **Wave Profile**

Controls the shape and look of the wave type.

### **Saw**

Uses a saw tooth profile.

### **Sine**

Uses the standard sine profile.

### **Triangle**

Uses a triangle shape.

## **Outputs**

### ***Color***

Texture color output.

### ***Factor***

Texture intensity output.

---

## **White Noise Texture**

This node adds noise.

### **Inputs**

The inputs are dynamic, they become available if needed depending on the node properties.

### ***Vector***

Vector used as seed in 2D, 3D, and 4D dimensions.

### ***W***

Value used as seed in 1D and 4D dimensions.

## Properties

### ***Dimensions***

The dimensions of the space to evaluate the noise in.

#### **1D**

The *W* input is used as seed.

#### **2D**

The *X* and *Y* components of the *Vector* input are used as seed.

#### **3D**

The *Vector* input is used as seed.

#### **4D**

Both the *Vector* input and the *W* input are used as seed.

## Outputs

### ***Value***

Output random value.

Note! The slightest difference in seed values would result in completely different outputs. Consequently, bad precision may have significant impact on the output. Usually, we can mitigate this issue by:

Eliminating the problematic seed value. If the problematic seed value is constant, it should be eliminated by choosing a lower dimension or multiplying it by zero.

Adding an arbitrary value to the seed. The issue might only happen at certain boundaries, like unit boundaries, so simply adding an arbitrary value might solve the issue.

Taking the absolute value of the seed. In computing, zero may be positive or negative, so taking the absolute values unifies the zero into a single value.

## 13.1 Editors - Shader Editor - Header

### Table of content

Shader Editor - Header.....	1
Header Tabs.....	1
Header right click menus.....	1
Editor type Menu.....	2
Sub Modes.....	2
Object.....	2
World.....	2
Line Style.....	2

## Shader Editor - Header

The Header contains various menus, navigation elements, settings and tools for the viewport. This content differs, dependent of the sub mode. And the content of the menus may differ too, dependent of the chosen renderer.

The header is divided into two areas. Left mode and menus. Right settings.

## Header Tabs

The tabs at the very left allows you to switch between the most important node editor types by one click. Compositor Editor, Geometry Nodes Editor and Shader Editor.

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

# Editor type Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

# Sub Modes

The Shader Editor has three shader type sub modes. Every sub mode has some different set of shaders for its own purpose.

## Object

The Object mode is for the scene objects. It shows materials and shader for the scene objects.

## World

In the World mode you can change the shaders and materials for the world settings. It shows the world shaders and materials.

## Line Style

The Line Style mode allows you to set up materials for the Freestyle renderer. Freestyle rendering must be active for this. It shows the Freestyle materials and shaders.

# Tool Shelf

## Select Tools Group

Tools with a triangle down right are a group of tools. Click and hold to reveal the content. Then choose the tool that you need.

## Tweak

Allows you to select or tweak single elements by clicking at it.

## Select Box

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### *Set a new selection*

### *Extend existing selection*

### *Subtract existing selection*

## Select Circle

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### Set a new selection

### Extend existing selection

### Subtract existing selection

### Radius

The brush radius.

## Select Lasso

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### Set a new selection

### Extend existing selection

### Subtract existing selection

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar.

Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate

Draw free-hand strokes in the main window.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Stabilize Stroke

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### Radius

The radius for the stroke stabilization.

### Factor

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Color

Clicking at the left color field reveals a color picker. Define the color for the annotation stroke.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

## End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

---

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for Annotate.

### Color

Clicking at the left color field reveals a color picker where you can define the color for the annotation stroke.

---

## Annotate Eraser

Click and drag to remove annotate lines.

### Tool Settings

#### Radius

The radius of the eraser pencil.

---

## Links Cut

This tools allows you to cut connections.

## Item Tab - Node Panel

In this panel you can give nodes and node groups a name and a label, and change its color.

### Name

The type of the node.

### Label

The label name of the node.

### Color sub menu

### Color checkbox

The Color checkbox turns custom color on or off.

### Presets

Store some color presets and reuse them. They are stored globally, and transfers to other blend files.

### Color

Choose a custom color. A click at the color field will open a color picker.

### Node color specials

#### Copy Color

Allows you to copy the color.

## Item Tab - Properties Panel

This panel shows usually the same properties than the properties at the node. These properties are already explained in the Add menu chapters. So we won't repeat them here.

But there are exceptions like the Image node. Here the Properties panel shows much more options than at the node. It shows all the possible image settings. We will explain the extra options here.

## Item Tab - Properties Panel with Image node

This tab contains image related settings. Size, type, and so on.

### Image Property

Load an image and / or switch to other images.

From left to right ...

### Image Browser

This is a list of the images in the scene. This list allows you to switch to other images.

## New / Open

When nothing is loaded then you will see the New / Open buttons to load a new image, or to create a new one.

## Image Edit Box

Read the name of the currently selected image. And you can rename the image here too.

## Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Open Image

Load an image

## Remove

Delete the image.

---

## Source

Choose the image type. This type gets usually automatically set. When you create a new image, then this image is generated. When you load an image then the Source switches to Single Image.

Generated images does not have a path.

---

## Source Type Generated

### *X / Y*

The image width and height.

### *Float Buffer*

Use a floating point buffer. 8 Bit images uses integers. 32 Bit works with floats.

---

## Generated Type Blank

This type displays an image with one blank color

### **Color**

The color of the blank image.

### Generated Type UV Grid

This type displays a with a black and white checker texture but colored dots.

### Generated Type Color Grid

This type displays a with a colored checker texture with numbers.

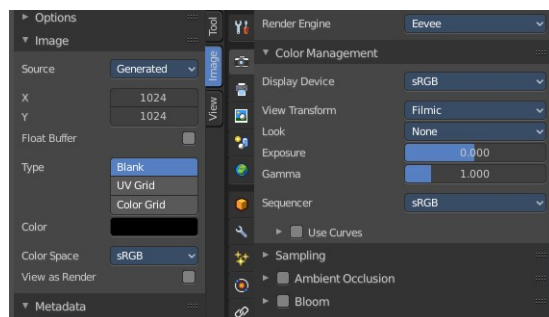

### Color Space

Choose the color space type for the image.

### View as Render

Displays the image with the color management settings.

### Source Type Movie + Image Sequence

### Path edit box

### Pack

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you

save the blend file the next time.

### **Path edit box**

See and edit the path to your movie or image sequence files.

### **Open**

Open a new movie or image sequence files. A file dialog will appear.

### **Refresh**

Reread the movie or image sequence files.

---

## ***Info string***

Some information about the currently loaded movie. Frames, resolution and color space.

---

## ***Frames***

The number of frames of the movie or image sequence.

## **Match Movie Length**

Set Users Image Length to the one of this video.

## ***Start***

The start frame of the movie or image sequence

## ***Offset***

Offset the number of the frame to use in the animation. -1 means off.

## ***Cyclic***

Cycle the images in the movie.

## ***Auto Refresh***

Always refresh image on frame changes.

## ***Deinterlace***

Deinterlace the movie file on load.

---

## ***Color Space***

Choose the color space type for the movie or image sequence files.

## Alpha

Choose the alpha channel mode. Straight or Premultiplied.

## View as Render

Display the image with using the color management settings.

## Source Type Single Image

### Path edit box

### Pack

With this button you can pack the movie or the image sequence into the blend file. It gets packed when you save the blend file the next time.

### Path edit box

See and edit the path to your movie or image sequence files.

### Open

Open a new movie or image sequence files. A file dialog will appear.

### Refresh

Reread the movie or image sequence files.

## Info string

Some information about the currently loaded image. Resolution and color space.

## Color Space

Choose the color space type for the movie or image sequence files.

## Alpha

Choose the alpha channel mode. Straight or Premultiplied.

## View as Render

Display the image with using the color management settings.

## Source Type Udim

UDIM is an enhancement to the UV mapping and texturing workflow. And does not belong here. But in the UV Editor. It is just in the list because it shares the same menus with the UV Editor.

## 13.3.2 Editors - Shader Editor - Sidebar - Tool Tab

### Table of content

Tool Tab..... 1

### Tool Tab

Contains the settings of the currently active tool in the tool shelf.

In the node editor we don't have something special here. The tool related settings are explained in the tool shelf chapter.

## 13.3.3 Editors - Shader Editor - Sidebar - View Tab

### Table of content

View Tab - Annotation Panel.....	1
Annotations prop.....	1
Drop down box.....	1
Edit Box.....	1
Fake User.....	1
Add Annotation.....	2
Delete Annotation.....	2
List of Annotation Strokes.....	2
Thickness.....	2
Frame Locked/Unlocked.....	2
Onion Skin.....	2

### View Tab - Annotation Panel

Contains view related settings. Which is in the node editor just the Annotations panel where you can manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

### Annotations prop

Add, remove and rename new annotations.

### Drop down box

A list of the available annotation layers.

### Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

### Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

## Onion Skin

Enable Onion Skinning.

Onion Skinning allows to show ghosts of the keyframes before and after the current frame. In this sub panel you can adjust the color of the onion skin frames.

With the numbers below the colors you can define how many frames before or after are displayed that way.

## 13.3.4 Editors - Shader Editor - Sidebar - Options Tab

## Options Tab - Settings panel

In the Options tab you will find general shading options for the current material for the render engines Eevee and Cycles. The Workbench renderer does not have any extra shading options.

The options tab moves around, dependent of what render engine you have chosen. With cycles the tab is at the end of the list.

The Settings panel appears with a mesh object selected.

## Settings panel with Eevee

### Backface Culling

Hide the back sides of the geometry when rendering.

### Blend Mode

The blend mode for transparent faces.

### ***Opaque***

Render the surface without transparency.

### ***Alpha Clip***

Use the alpha threshold to clip the visibility.

### ***Alpha Hashed***

Use noise to dither the binary visibility

### ***Alpha Blend***

Render polygon transparent, depending of the alpha channel of the texture.

### Shadow Mode

The shadow mapping method.

## ***None***

The material will cast no shadow.

## ***Opaque***

The material will cast shadow without transparency.

## ***Alpha Clip***

Use the alpha threshold to clip the visibility.

## ***Alpha Hashed***

Use noise to dither the binary visibility and use filtering to reduce the noise.

## **Screen Space Refraction**

Use ray-traced screen space refraction's.

## **Subsurface Translucency**

Add translucency effect to subsurface.

---

## **Settings panel with Cycles**

### **Pass Index**

Index number for the material render index pass

### ***Surface sub panel***

#### **Multiple Importance**

Use multiple Importance sampling for this material.

#### **Transparent Shadows**

Use transparent shadows for this material if it contains a Transparent BSDF

#### **Displacement**

Adjust the displacement method. Bump mapping is an old image based shader technique to fake displacement. Displacement deforms the geometry.

### ***Volume Sub panel***

#### **Sampling**

The volume sampling method.

## Interpolation

The volume interpolation method. Linear or cubic

## Homogeneous

Use the same density for volume rendering.

# Options Tab - Light panel

The Light panel appears with a light object selected.

## With Eevee

### Type

The light type. The light settings changes, dependent of what light type you have chosen.

### Animate Property

This property can be animated.

## Point light

### Color

The light color.

### Animate Property

This property can be animated.

### Power

The strength of the light in Watt.

### Animate Property

This property can be animated.

### Specular

Adjust the specular reflection multiplier.

### Animate Property

This property can be animated.

### Radius

The size of the point light.

## Animate Property

This property can be animated.

---

## Sun light

### **Color**

The light color.

### **Animate Property**

This property can be animated.

### **Strength**

The strength of the light. This value is not in Watt.

### **Animate Property**

This property can be animated.

### **Specular**

Adjust the specular reflection multiplier.

### **Animate Property**

This property can be animated.

### **Angle**

The angular diameter for the sun as seen from the earth.

### **Animate Property**

This property can be animated.

---

## Spot light

### **Color**

The light color.

### **Animate Property**

This property can be animated.

### **Power**

The strength of the light in Watt.

### **Animate Property**

This property can be animated.

## ***Specular***

Adjust the specular reflection multiplier.

### **Animate Property**

This property can be animated.

## ***Radius***

The size of the point light.

### **Animate Property**

This property can be animated.

---

## **Area light**

### ***Color***

The light color.

### **Animate Property**

This property can be animated.

### ***Power***

The strength of the light in Watt.

### **Animate Property**

This property can be animated.

### ***Specular***

Adjust the specular reflection multiplier.

### **Animate Property**

This property can be animated.

### ***Shape***

The shape of the light emitting area of the light.

Size X / Y

The size of the light emitting area of the light.

### **Animate Property**

This property can be animated.

## With Workbench

### **Type**

The light type. The light settings changes, dependent of what light type you have chosen.

## With Cycles

### **Type**

The light type. The light settings changes, dependent of what light type you have chosen.

## Point light

### **Color**

The light color.

### **Power**

The strength of the light in Watt.

### **Size**

The size of the point light

### **Max Bounces**

The maximum numbers of the bounces that this light will contribute to the render.

### **Cast Shadow**

The light casts a shadow.

### **Multiple Importance**

Use Multiple Importance sampling for this light.

## Sun light

### **Color**

The light color.

### **Strength**

The strength of the light. This value is not in Watt.

### **Angle**

The angular diameter for the sun as seen from the earth

### **Max Bounces**

The maximum numbers of the bounces that this light will contribute to the render.

### **Cast Shadow**

The light casts a shadow.

### **Multiple Importance**

Use Multiple Importance sampling for this light.

## Spot light

### **Color**

The light color.

### **Power**

The strength of the light in Watt.

### **Size**

The size of the point light

### **Max Bounces**

The maximum numbers of the bounces that this light will contribute to the render.

### **Cast Shadow**

The light casts a shadow.

### **Multiple Importance**

Use Multiple Importance sampling for this light.

## Area light

### **Color**

The light color.

### **Power**

The strength of the light in Watt.

### **Shape**

The shape of the light emitting area of the light.

Size X / Y

The size of the light emitting area of the light.

### **Max Bounces**

The maximum numbers of the bounces that this light will contribute to the render.

### **Cast Shadow**

The light casts a shadow.

### **Multiple Importance**

Use Multiple Importance sampling for this light.

### **Portal**

Use this light to guide sampling of the background. This will make the light invisible.

## Options Tab - Viewport Display panel

Adjust how the mesh object is displayed in the viewport when the viewport shading in the 3D view is in solid mode.

The content is the same for all three render engines.

### **Color**

The color.

### **Animate Property**

This property can be animated.

### **Metallic**

Metallic look.

## **Animate Property**

This property can be animated.

## **Roughness**

The roughness.

## **Animate Property**

This property can be animated.

# 13.3.5 Editors - Shader Editor - Sidebar - Add Tab

## Table of content

- Add Tab..... 1
- Usage..... 1
- Add tab - Display Panel..... 1
- Icon Buttons..... 1
- Common..... 2

## Add Tab

Here you can find the same nodes than in the Add menu. Panels are more convenient to use. They stay open for example. It's your decision with what system you want to work.

We won't explain the content of the panels again. The single nodes are explained in the add menu chapter.

### Usage

Click at one of the node buttons, then move the mouse into the viewport. The created node sticks at the mouse. Click again to release it.

## Add tab - Display Panel

### Icon Buttons

You can display the nodes in the panels either as text buttons or as pure icon buttons.

## Common

This checkbox allows you to display just the most common nodes for quicker search and find.

## 13.3.6 Editors - Shader Editor - Sidebar - Relations tab

Move, Rotate, Scale.....	5

## Relations tab - Display Panel

### Icon Buttons

You can display the nodes in the panels either as text buttons or as pure icon buttons.

## Relations tab - Group Panel

Node groups allows you to group different nodes of the material together to reduce the visual complexity. A node group acts like any other node.

Material node groups should not include Input nodes, like Image nodes, or Output nodes.

If you include a source node in your group, you will end up having the source node appearing twice: once inside the group, and once outside the group in the new material node tree.

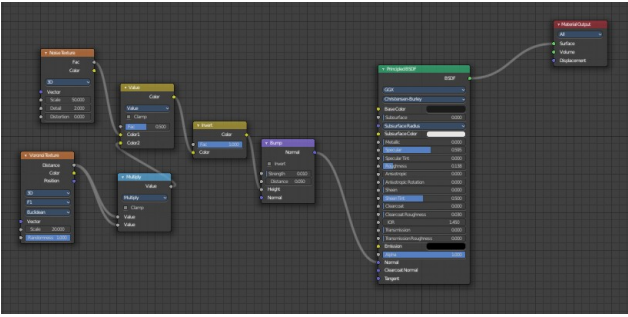

If you include an output node in the group, there will not be an output socket available from the group!

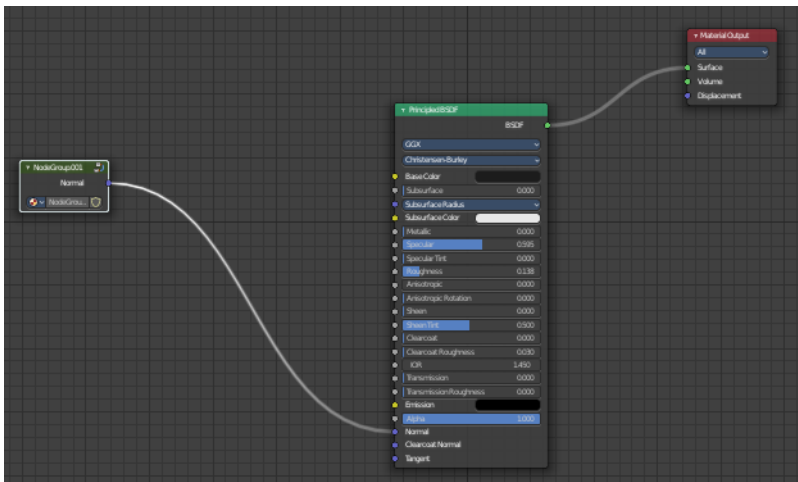

# Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item . That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Group Insert

Inserts the selected node into the selected group.

## Usage

Select the node.

Hold down shift, and select the group.

Click the Group Insert button. The node will now be part of the group, and you will land in group edit mode.

Press tab to exit the group edit mode.

## Group Input

Adds a group input node.

**Note:** When at a top level, this node is unavailable. These are only available when inside a node group.

## Group Output

Adds a group output node.

**Note:** When at a top level, this node is unavailable. These are only available when inside a node group.

## Toggle Edit Group

Enter or exit the edit group mode.

## Ungroup

Ungroups an existing group. You need to be outside of the group edit mode.

## Relations tab - Node Group Panel

When you create a node group, then this node group is listed here. And can be dragged from there for reuse too.

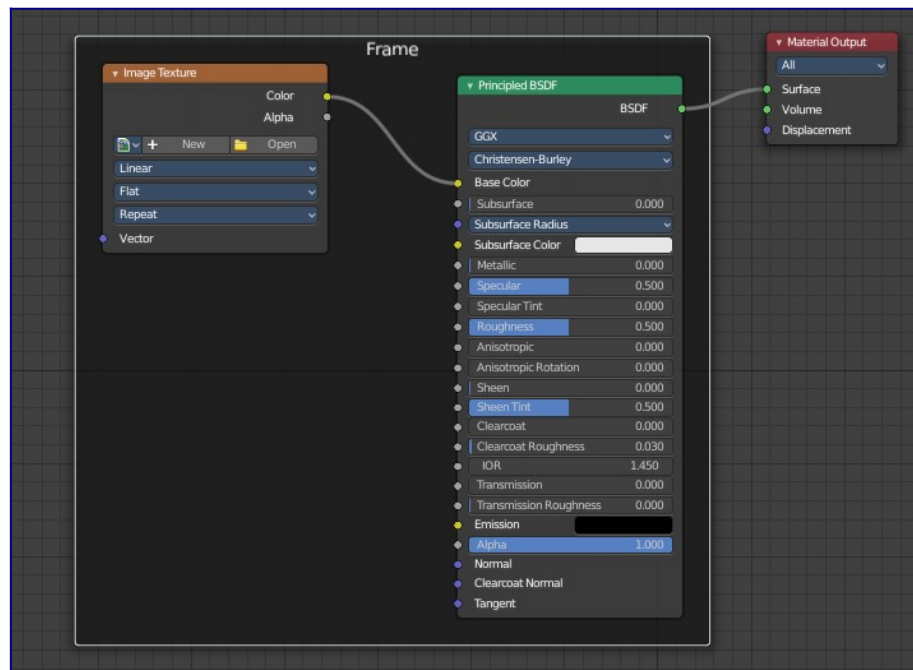

## Relations tab - Layout Panel

These nodes help organizing the node layout.

## Frame

The Frame node allows you to drop nodes into a frame. This frame can be dragged around as a whole.

## Adding and Removing Nodes

Nodes can be added by simply dropping them onto the frame. Or with the Join in New Frame menu item in the Node menu.

To remove a node from the frame use Remove from Frame.

## Resizing Frame

When the Frame node is first placed in the node editor workspace you can resize it by dragging one of the edges.

Once a node is placed in the Frame, the Frame shrinks around the nodes. You cannot resize it anymore with handlers. Just by dragging around the nodes inside of the frame.

This behavior can be changed by disabling the *Shrink* option in the Item tab in the Properties panel. Then you can resize the frame again by dragging the edges.

## Label and Color

You can change the name of a frame in the Node panel. And you can give it a custom color by checking the Color checkbox and adjusting the color then.

## Reroute

Adds a reroute point that can be used to reroute connections. It allows just one input, but allows multiple output connections.

To quickly add a Reroute node into an existing connection, hold Shift and Right Mouse and drag the mouse to cut through the link. A new reroute node will be added.

When you exceed a specific angle amount between the reroute nodes, then the node connection becomes a sharp corner, and not longer a Bezier like soft curve.

## Move, Rotate, Scale

A normal node has a handler. The reroute dot not. You can't simply move it around with the mouse by clicking at the top area. It has none. You have to use the move, rotate and scale commands. They can be found in the View menu.

## Group tab - Introduction

The Geometry Node sidebar Group tab at the right side contains options and settings for node groups nodes and socket input and output properties.

# Properties Panel

## Name

Change the name of the current node group. Type in a new name and hit enter.

## Description

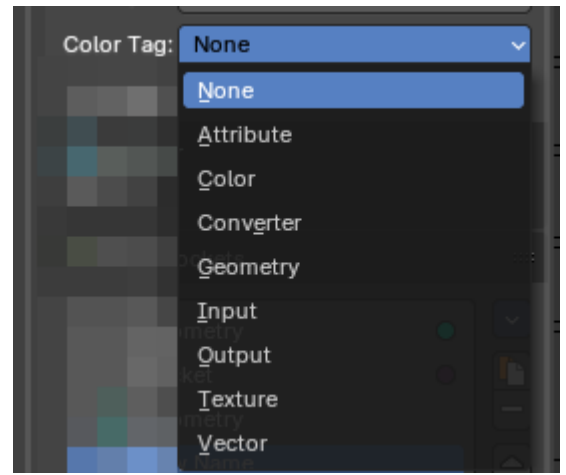

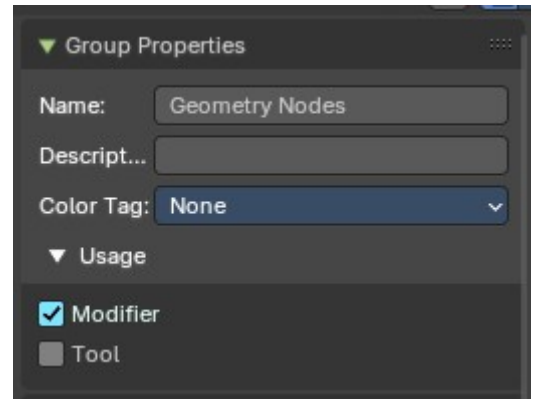

Change the description of the current node group. Type in a new name and hit enter.

## Color Tag

Changes the header color of the current node group.

### Color Tag Types:

- Attribute
- Color
- Converter
- Geometry
- Input
- Output
- Texture
- Vector

## Usage

This defines if the node group will be listed as a Modifier in the Properties editor Modifier Stack and/or an act-once Tool operator in the 3D View editor. These are only relevant when you have marked the node group as an Asset.

## Modifier

Expose the Node Group marked asset as a Modifier Asset in the

## Tool

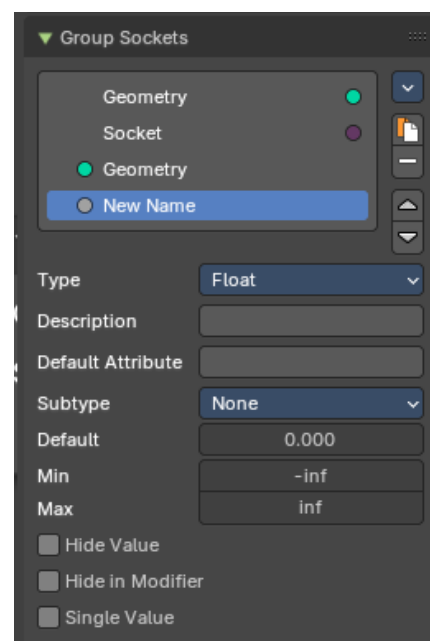

Expose the Node Group marked asset as an act-once tool in the 3D View header menus.

## Group Sockets Panel

Manage the input and output properties of the Group Input and Output nodes.

More than one input and output slot can be useful when you want to modify the geometry in the node group in more than one way.

### Group Socket List

List of available input and output sockets.

**Note:** *The list can be sorted by dragging the items around.*

#### List

The list of input and output sockets.

#### Name

Change the name of the current selected input socket by double clicking on the socket in the list. Type in a new name and hit enter.

#### New Item

Adds a new input sockets to the list.

#### Input

Adds a new input sockets to the list.

#### Output

Adds a new output socket to the list.

#### Panel

Adds a new panel socket to the list.

#### Duplicate Item

Duplicates the active socket.

#### Remove Item

Removes the selected input socket from the list.

## Move Item Up/Down

Moves the active item to the specified direction. You can move the active item up or down the list.

**Note:** You can also alternatively drag and drop the active item to re-order.

## Inputs

Inputs are characterized by the colored dot to the left. These are manifested in the Group Input node.

## Outputs

Outputs are characterized by the colored dot to the right. These are manifested in the Group Output node.

## Type

What kind of node group input or output type it is. To know more about the properties of the socket types, refer to the next section.

- String
- Boolean
- Material
- Vector
- Integer
- Menu
- Geometry
- Collection
- Texture
- Float
- Color
- Object
- Rotation
- Matrix
- Image

# Socket Type Properties

## Common

Both input and output sockets have these properties.

## Description

Add a tooltip to the socket description.

## Default

The default value for the socket.

## Min

The minimum value for the socket.

**Note:** *This is only available for vector, float and integer types.*

## Max

The maximum value for the socket.

**Note:** *This is only available for vector, float and integer types.*

## Attribute Domain

Attribute Domain that is used by the geometry nodes modifier to create an attribute output.

## Default Attribute

The default attribute name that is used when the node group is used by a geometry nodes modifier.

## Subtype

Some node types have a subtype dropdown menu, such as the vector or float. The subtype menu allows you to define the socket type sliders and read-out.

### Socket Sub-Types:

- None
- Percentage
- Factor
- Angle
- Time (Scene Relative)
- Time (Absolute)
- Distance
- Wavelength

## Hide Value

Hide the input value even when the socket is not connected.

## Input

Properties that are input socket exclusive.

## Hide in Modifier

Don't show the input value in the geometry nodes modifier interface.

## **Single Value**

Only allow single value input, and not fields.

## **Layer Selection**

Take a Grease Pencil Layer or Layer Group as a selection field.

## 13.3 Editors - Shader Editor - Sidebar

### Table of content

Introduction.....	1
Right Click menus.....	1

### Introduction

The Shader Editor is made of several areas. At the right side you will find the sidebar. Here you will find further options and settings for the Shader Editor nodes and its tools.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

# Shader Editor

The shader editor is the editor where you can create and edit your materials for your objects in the scene. It is a node editor. The materials are made of nodes. And you connect them to achieve the desired result.

The editor is divided into several areas has several tool areas.

Yellow – Header

Blue - Tool Shelf

Pink - Sidebar

Note that the shader editor does not have a tool area above the header. All tool settings are in the sidebar in the Tool tab.

## Navigating in the Shader Editor viewport

### Hotkeys

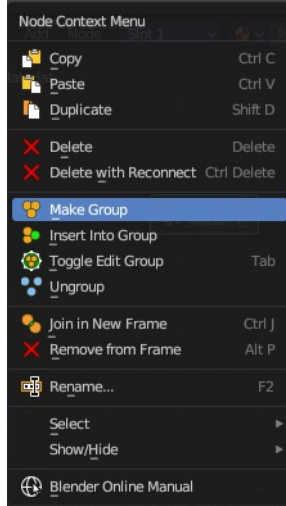

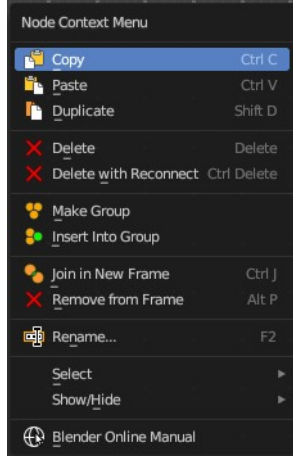

Pan the view - MMB

Zoom - Mouse Wheel, MMB+CTRL, Numpad + / -

View All - Home

# Node context menu

When you double right click into the viewport, then you will open a menu. The UV Context menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual. It does though show different content under different circumstances.

## Add

The whole add menu from the header.

## Find

Search for nodes, and hilight them. When you are in a node group then it lists the content of the node group.

## Cut Links

Calls a cut tool with which you can cut links between nodes

## Mute Links

Calls a cut tool with which you mute cut links between nodes. To unmute the links use the same tool again.

## Exit Group

Same as Edit Group. When you are in a group then you can end editing with this operator.

## Copy

Copies the selected nodes.

## Paste

Pastes the copied nodes.

## Duplicate

Duplicates the selected nodes.

## Rename

Allows you to rename the current active node. A popup opens up where you can type in another name.

## Delete

Deletes the selected nodes. All Connections gets removed.

## Delete with Reconnect

Deletes the selected nodes. Existing connections gets bypassed as if the node would not have existed.

---

## Make Links

Shows when you have at least two nodes connected.

Tries to connect nodes where it makes sense. For example, the BSDF output of a Principled shader with the Surface input of the Material Output node.

## Make and Replace Links

Shows when you have at least two nodes connected.

Same as Make Links. But it will replace existing links.

## Detach Links

Shows when you have at least two nodes connected.

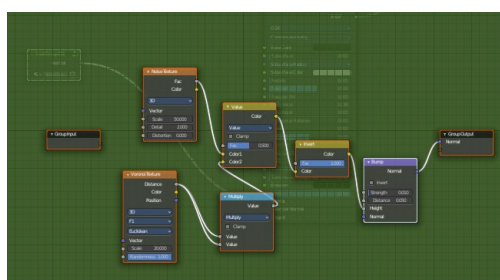

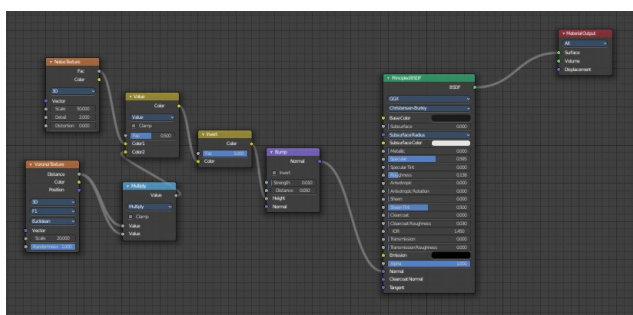

Removes all connections from the selected node, but tries to reconnect the remaining nodes.

---

## Make Group

Groups the selected nodes together.

Select the nodes that you want to group together. Choose Make Group. You will now see a green background. This indicates that the group is created, and that you are in edit mode for the group now.

To exit the group edit mode press Tab key, or choose Toggle Edit Group menu item in the sidebar in the Relations tab in the Group panel. That way you can also enter the Group Edit mode again.

There is a third way to enter the group edit mode. Click at the right upper icon of the group node.

A group can be further collapsed by clicking at the triangle button in the upper left corner.

The group can be renamed in the sidebar in the Item tab and in the Properties tab in the Node panel.

## Insert into Group

Allows you to insert a node into a node group.

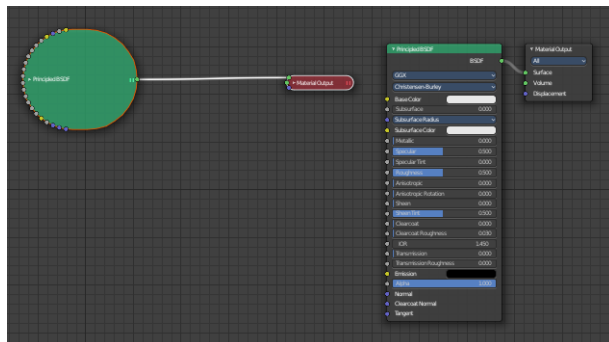

Select the node, hold down Shift, then select the node group so that both are selected. Then perform the

operator.

## Toggle Edit Group

Enters a node group for editing. Or when you are in a node group, exits the node group editing.

## Ungroup

Removes the selected nodes from a group.

## Join new Frame

Frame node functionality. Adds the selected node to a frame.

## Remove from Frame

Frame node functionality. Removes the selected node from a frame.

## Rename

Allows you to rename a node.

## Select submenu

## Grouped

Select grouped nodes.

## Linked From

Select the nodes that are linked from the currently selected nodes. The nodes before in the hierarchy.

## Linked To

Select the nodes that are linked to the currently selected nodes. The nodes behind in the hierarchy.

## Activate same type previous

Activate same node type before the current selection, step by step.

## Activate same type next

Activate same node type after the current selection, step by step.

## Show/Hide submenu

Here you find hide options to make the display of nodes more compact.

Demonstration happens at an image node.

## Hide

Hides everything but input and output dots. To view the full node again perform the operator again. It's a toggle. Or click at the triangle left besides the node name.

## Toggle Node Mute

Deactivates the node.

## Toggle hidden node sockets

Toggles away the unused node sockets. In this case the vector input node socket and the alpha output node socket will be hidden.

## Toggle Node Options

Hides away the properties.

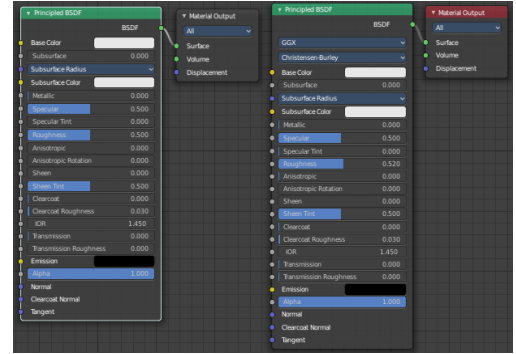

## Collapse and Hide Unused Sockets

Like Hide. Hides everything but the node sockets. But it also hides the unused node sockets.

## Toggle Node Options

Shows or hides the node options.

## Collapse and Hide Unused Sockets

Shows or hides unused sockets.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Favorites Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Image Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

## 14.1.10 Editors - Video Sequence Editor - Header - Image Menu

### Table of content

Clear.....	1
Position.....	1
Scale.....	1
Rotation.....	1
All Transforms.....	1
Apply.....	1
Scale to Fit.....	1
Scale to Fill.....	1
Stretch to Fill.....	2

## Image menu

The Image menu contains strip related functionality. The images of the strips can be transformed in the preview window.

### Clear

### Position

Resets the position of the image.

### Scale

Resets the scale of the image.

### Rotation

Resets the rotation of the image.

### All Transforms

Resets all transformations of the image.

### Apply

Apply does NOT apply, it scales the images in various ways.

### Scale to Fit

Scales the image to fit in the preview window in at least one direction.

### Scale to Fill

Scales the image so that the whole preview window is covered.

## **Stretch to Fill**

Stretches the image so that the whole preview window is covered.

## Header tools and options - Preview view

### Timeline

The timeline drop down “pins” a selected scene to the Sequencer. This overrides the scene selection of the Sequencer timeline.

**Note:** This is useful with the Bforartists 3D Sequencer addon to synchronize the Sequencer Scene Strips with the 3D View.

### Pivot Point

The Pivot Point is the center of your object or your selection. The names should be self explaining.

### Snap

Snap to elements.

### Snapping Settings

#### Preview Snapping

#### Snap to

##### **Borders**

Snap to borders.

##### **Center**

Snap to center.

##### **Other Strips**

Snap to other strips.

### Display Mode

How to display the preview video.

### Image Preview

Displays the image material.

## Luma Waveform

Displays the luma waveform of the image.

## Chroma Vectorscope

Displays the chroma vectorscope of the image.

## Histogram

Displays a histogram of the image.

## Display Channels

What channels of the video to display.

## Color and Alpha

Display the color channels and alpha channel.

## Color

Display just the color channels.

## Show Gizmo

Show or hide the viewport gizmos.

## Viewport Gizmos

What kind of gizmos to show.

## Show Overlay

Turn on or off all overlays.

## Preview Overlays

### Image Outline

Outline the selected image element.

### Frame Overlay

Show the frame overlays.

## Metadata

Show the Metadata overlay.

## 2D Cursor

Show the 2d cursor.

## Safe Areas

Show the safe area overlays.

## Annotations

Show the annotations.

## Options

### Show Metadata

Show metadata of first visible strip in the viewport.

### Zoom to Fit

Automatically zoom preview image to fully fit into the preview window. Note that zooming in or out turns off the feature then.

## Header tools and options - Sequencer View

### Timeline

The timeline drop down “pins” a selected scene to the Sequencer. This overrides the scene selection of the Sequencer timeline.

**Note:** This is useful with the Bforartists 3D Sequencer addon to synchronize the Sequencer Scene Strips with the 3D View.

### Overlap Mode

How to resolve overlap after transformation.

### Expand

Move strips until there is no overlap anymore.

### Overwrite

Trim or split strips to resolve overlap.

## Shuffle

Move transformed strip to nearest free space to resolve overlap.

## Snap

Snap to strip edges or current frame.

## Snapping Settings

### *Sequence Snapping*

#### Snap to

##### *Current Frame*

Snap to the current frame

##### *Hold Offset*

Snap to strip Hold offsets.

##### *Markers*

Snap to Markers.

#### Ignore

##### *Muted Strips*

Ignores muted strips.

##### *Sound Strips*

Ignores sound strips.

#### Current Frame

##### *Snap to Strips*

Sets the current frame to the start or end point of the selected clip.

## Show Overlay

Turn on or off all overlays.

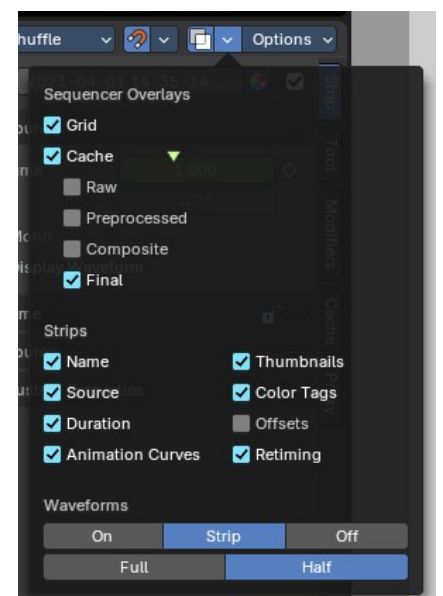

## Sequencer Overlays

### *Grid*

Show the grid in the sequencer timeline.

### *Cache*

Cache settings. Toggle to visualize cached images in the timeline.

## **Raw**

Show the raw images. This is a Developers extra.

## **Preprocessed**

Show the preprocessed images. This is a Developers extra.

## **Composite**

Show the composite images. This is a Developers extra.

## **Final**

Show the final images.

## **Strips**

### ***Name***

Show the name of the clip.

### ***Source***

Show the source of the clip.

### ***Duration***

Display the duration of the clip.

### ***Animation Curves***

Display the strip opacity/volume curves.

### ***Thumbnails***

Draw thumbnails as strip overlay. This works for movie and image strips. To draw thumbnails, this overlay has to be enabled and strips must be tall enough.

### ***Color Tags***

Display the strip color tags in the sequencer.

### ***Offset***

What offset frame to use, relative to the current frame position.

### ***Retiming***

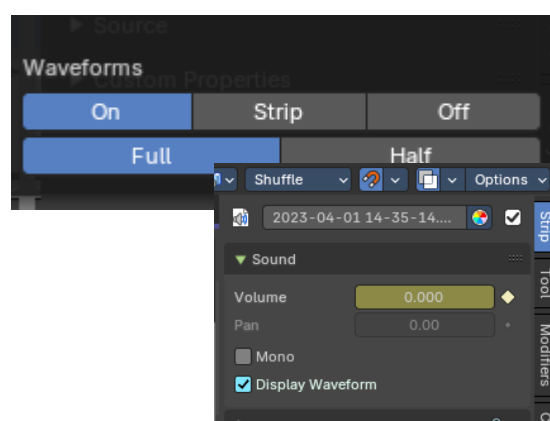

Display the retiming keys on top of the strips.

### ***Waveforms***

How waveforms are displayed.

#### **On**

Shows waveforms

## Strip

Shows strip settings per strip in the Sound panel Display Waveform settings.

## Off

Hides all waveforms.

## Waveform Style

What waveform style to use.

## Full

Shows a bidirectional wave form.

## Half

Shows a one-sided wave form.

## Options

## Preview as Backdrop

Display the result as a backdrop under the strips.

When you turn on Preview as Backdrop, then you will activate the View Settings, Frame Overlay and Scene Strip Display panels from the Preview mode. Please have a look there for the descriptions.

## Preview during translation

Show a preview of the transformed frames.

## Cache

Cache settings. Toggle to visualize cached images in the timeline.

## Raw

Show the raw images. This is a Developers extra.

## Preprocessed

Show the preprocessed images. This is a Developers extra.

## Composite

Show the composite images. This is a Developers extra.

## Final

Show the final images.

## Show Seconds

Show the timing in the timeline area in seconds instead of frames.

## Sync visible range

Synchronize the visible timeline range with other visible time based editors.

## Show Markers

Display the markers menu and the markers at the bottom in the timeline.

## Lock Markers

Prevent marker editing.

## Sync Markers

Transform markers with the strips.

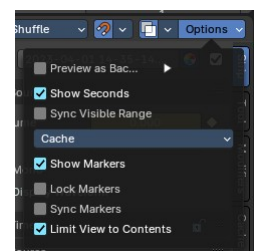

## Limit View to Content

Limit timeline height to maximum used channel slots.

## Header tools and options - Sequencer & Preview view

The tools in the Sequencer & Preview view mode are usually the same than in the single modes. Both showing at the same time. With one exception in the options panel. Preview as backdrop is not showing in this mode.

And snapping.

## Snap

Snap to elements.

##### ***Sound Strips***

Ignores sound strips.

#### **Current Frame**

##### ***Snap to Strips***

Sets the current frame to the start or end point of the selected clip.

# 14.1.2 Editors - Video Sequence Editor - Header - Quick Menu

## Table of content

- Quick Menu..... 1
  - Adding an operator to the Quick menu..... 1
  - Adding a menu to the Quick menu..... 1
  - Order..... 2
  - Removing an operator from the Quick menu..... 2
  - Context and mode dependent content..... 2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## Type of Sequencer View

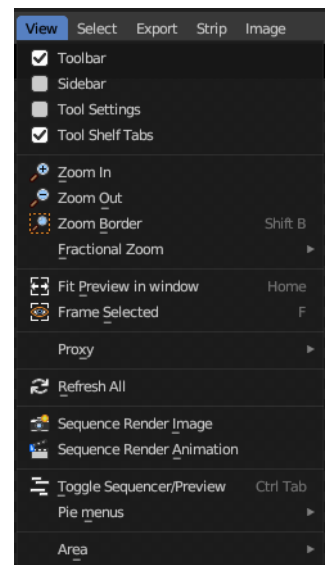

The Video Sequence Editor is two editors in one. The Preview sequencer view is a preview window. Here plays the video. The Sequencer sequencer view is the view that contains the video and audio strips.

The view menu for Sequencer/Preview contains the same menu items than in the other two views. So we won't explicitly list it here again.

## View Menu in Preview window

The View menu contains all View related tools.

## Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Tool Settings

Show or hide the tool settings at the top.

## Tool shelf tabs

Show or hide the tool shelf tabs in the tool shelf.

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet.

**Note:** *These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.*

### ***Draw Annotation***

Starts the annotation free hand draw tool in the editor.

### ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

### ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

### ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

### ***Add Annotation Layer***

Starts a new annotation layer.

### ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

## Zoom In

Zooms in.

## Zoom Out

Zooms out.

## Fit Preview in Window

Zooms in or out until the video displays fitting in the viewport.

## Frame Selected

Centers the selection and zooms to fit.

## Zoom Border

Draw a rectangle around the target area to zoom in or out.

Left mouse button zooms in. Middle mouse button zooms out.

## Fractional Zoom

A set of predefined zoom factors.

## Proxy

Proxy works just with movie or image strips. What it does is to create a smaller set of preview images. This speeds up the calculation while you are at editing the video. The final result uses the final images again then.

## Setup

Calls a panel where you can choose the resolution of the proxy images. Clicking OK starts the creation process.

## Rebuild

Recreates the proxy images

## Scene Render Size

What render size the display should choose.

---

## Refresh All

Refresh the sequence editor.

## Sequence render Image

Renders an image of the current frame.

## Sequence render Animation

Renders the animation in the preview range.

## Toggle Sequencer/Preview

Toggles the type of sequencer view between Sequencer or Preview.

## Pie Menu

The available pie menus for the sequencer in View mode.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Toggle Quad view

Displays the 3D View divided into four split screen parts. Note that the orthographic views cannot be switched in this mode. They remain orthographic, you cannot rotate them.

To return to single view reuse the menu item in the View menu.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + space bar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + space bar.

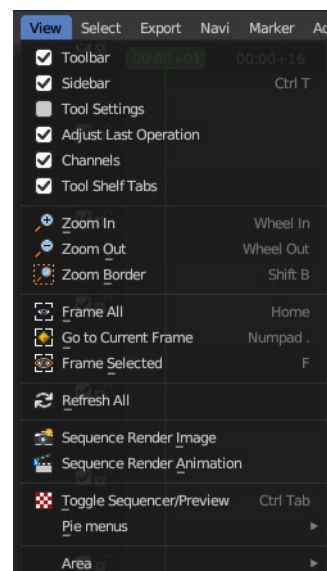

## Close Area

Closes the area window.

# View Menu in Sequencer window

The View menu contains all View related tools.

## Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Tool Settings

Show or hide the tool settings at the top.

## Adjust Last Operation

Displays the Adjust last operation panel down left.

## Channels

Display the channels in front of the timeline

## Tool Shelf Tabs

Show or hide the tool shelf tabs in the tool shelf.

---

## Zoom In

Zooms in.

## Zoom Out

Zooms out.

## Zoom Border

Zooms to the selection.

## Frame all

Zooms in or out to display all elements fitting into the view.

## Go to current frame

Centers the view at the current frame.

## Frame selected

Zooms in or out to display the currently selected element fitting into the view.

## Refresh all

Refreshes the sequence editor.

## Sequence render Image

Renders an image of the current frame.

## Sequence render Animation

Renders the animation in the preview range.

## Toggle Sequencer/Preview

Toggles the type of sequencer view between Sequencer or Preview.

---

## Pie Menu

The available pie menus for the sequencer in Sequencer mode.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Toggle Quad view

Displays the 3D View divided into four split screen parts. Note that the orthographic views cannot be switched in this mode. They remain orthographic, you cannot rotate them.

To return to single view reuse the menu item in the View menu.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + space bar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + space bar.

## Close Area

Closes the area window.

## 14.1.4 Editors - Video Sequence Editor - Header - Export Menu

### Table of content

Export menu.....	1
Export Subtitles.....	1

## Export menu

This menu exists in both view types. It currently has just one entry.

### Export Subtitles

Exports the subtitles of a video in stl format. You need to have a subtitle text strip in the video.

### Navi menu

This menu exists in Sequencer view type.

#### Play Animation

Plays the movie.

#### Jump to Previous Strip

Jumps to the start of the previous strip.

#### Jump to Next Strip

Jumps to the start of the next strip.

#### Jump to Previous Strip(Center)

Jumps to the center of the previous strip.

#### Jump to Next Strip(Center)

Jumps to the center of the next strip.

#### Range

Play range related functionality. Most of it can also be adjusted in the play elements in the timeline editor.

## Set Preview Range

Calls a border select tool that allows you to set the range of the preview.

## Set Preview Range to Strips

Sets the width of the preview range to the length of the strips.

## Clear Preview Range

Removes the preview range.

## Set Start Frame

Sets the current frame as the start frame for playback.

## Set End Frame

Sets the current frame as the end frame for playback.

## Set Frame Range to Strips

Sets the start and end frame to the start and end frames of the strips in the sequencer.

### Select menu in Sequencer window

## All

Select everything.

## None

Select nothing.

## Inverse

Invert the current selection.

## Box Select

Draw a rectangle to box select strips.

It adds to selection by default. To subtract from selection hold down Shift key.

## Box Select (Include Handles)

Draw a rectangle to box select the handles of the strips. A strip has a resize handle at the start and the end of the strip.

It adds to selection by default. To subtract from selection hold down Shift key.

## Side of Frame

### Left

Select the strips left from the current frame.

### Right

Select the strips right from the current frame.

## Handle

### Both

Select all handles of the selected strips.

### Left

Select the left handles of the selected strips.

### Right

Select the right handles of the selected strips.

## Both Neighbours

Select all handles of the selected strips. Plus the handles from the neighbour strips that touches this strip.

## Left Neighbours

Select the left handles of the selected strips. Plus the handle from the neighbour strips that touches the left handle of the strip.

## Right Neighbours

Select the right handles of the selected strips. Plus the handle from the neighbour strips that touches the right handle of the strip.

## Last operator Select Handles

### Side

Which side to select.

## Channel

### Left

Select the strips left from the current frame that are in the same channel.

### Right

Select the strips right from the current frame that are in the same channel.

### Both sides

Select all strips in the channel of the currently selected strip.

## Linked

### All

Select all strips that are adjacent to the current selected strip.

### Less

Decrease the selection of strips that are adjacent to the current selected strip.

### More

Increase the selection of strips that are adjacent to the current selected strip.

## Grouped

Select all strips that are equal to the current selected strip by the chosen method. The menu items should be self explaining.

## Last operator Select Grouped

### *Type*

The selection method.

### *Extend*

Extend the selection

### *Same Channel*

Select just strips that are in the same channel.

## Select menu in Preview window

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Box Select

Draw a rectangle to box select strips.

It adds to selection by default. To subtract from selection hold down Shift key.

### Grouped

Select all strips that are equal to the current selected strip by the chosen method. The menu items should be self explaining.

## Last operator Select Grouped

### *Type*

The selection method.

***Extend***

Extend the selection

***Same Channel***

Select just strips that are in the same channel.

## 14.1.7 Editors - Video Sequence Editor - Header - Marker Menu

### Table of content

Dopesheet Editor - Marker Menu.....	1
Add Marker.....	1
Duplicate Marker.....	1
Duplicate Marker to Scene.....	1
Delete Marker.....	2
Bind Camera to Markers.....	2
Rename Marker.....	2
Grab/Move Marker.....	2
Jump to Next Marker.....	2
Jump to Previous Marker.....	2

### Dopesheet Editor - Marker Menu

Markers are visual landmarks. They can mark a start of a specific animation sequence, the end of a camera movement, and so on.

When you add one then a marker area appears at the bottom of the timeline.

Markers can be pulled around by clicking at them and dragging them left or right. The active marker is yellow.

By holding down shift you can select more than one marker.

### Add Marker

Adds a marker at the current frame position.

### Duplicate Marker

Duplicates the selected marker(s). The duplicate(s) sticks at the mouse until you click to give it the target destination.

### Duplicate Marker to Scene

Duplicate markers to other scenes. A blend file can contain more than one scene. See Scene Properties in the Properties editor.

### Delete Marker

Deletes the selected marker(s).

## Bind Camera to Markers

This feature is of interest when you work with scene strips. Bind camera to markers turns an object into a camera object. This can be any object in the scene. Not just camera objects.

When the current frame position does not have a marker yet, then it creates a marker at the current frame position.

By binding different objects or cameras at different marker locations you can switch cameras automatically.

The marker with a bind camera attached will show a camera icon.

## Rename Marker

A menu will open up where you can rename the active marker.

## Grab/Move Marker

Hotkey only functionality! This menu item exists to show the hotkey to move the marker.

## Jump to Next Marker

Sets the frame position to the next marker.

## Jump to Previous Marker

Sets the frame position to the previous marker.

## Add menu

The sequencer does not only display video and audio strips. There are several strip types available. You can in the Add menu load image sequences, single images, masks, and even whole scenes.

Different strip types have different colors. You can customize them further in the sidebar in the strip tab.

Note that some strip types can also be loaded by drag n drop. When you load the strips by the file selector then you will see some import options there. These import settings are mentioned here.

## Search

A way to search the menu by typing. Press spacebar to also start searching.

## Scene Strips

Scene strips are a way to insert the render output of another scene into your sequence. Instead of rendering out a video, then inserting the video file, you can insert the scene directly.

The strip length will be determined based on the animation settings in that scene.

Note! You can't use the same scene than the one where you have the Video Sequence Editor open. You need to have a second scene with the content. Scenes can be managed in the Scene tab in the Properties Editor.

Scenes must exist in the current file. Available scenes appears in the Scene menu.

You can also create a strip directly from this Add Scene Strips operator using the New Scene entry.

## Clip Strips

Clips comes from the Movie Clip Editor. The Movie Clip Editor is

part of the motion tracking workspace, and primarily used for motion tracking.

Clips must exist in the current file. Available clips appears in the Clip menu.

## Mask Strips

The Mask strip generates a mask image from the selected mask data-block generated in the Movie Clip Editor. This works similar to the Mask Node but without the options available for finer control. The mask image is always generated at the render resolution, scaling along with different proxy levels.

Masks must exist in the current file. Available masks appears in the Mask menu.

## Movie Strips

Import a video.

### Import settings

#### ***Relative Path***

Use a relative path to the blend file.

#### ***Start Frame***

Start frame of the strip.

#### ***Channel***

In which channel to insert.

#### ***Replace Selection***

Replace selected strips at import.

#### ***Sound***

Import sound. A video is usually made of an image part and an audio part.

#### ***Use Movie Frame rate***

Use the frame rate of the video to keep video and audio in sync.

## Sound

Import an audio file.

### Import settings

#### ***Relative Path***

Use a relative path to the blend file.

### ***Start Frame***

Start frame of the strip.

### ***Channel***

In which channel to insert.

### ***Replace Selection***

Replace selected strips at import.

### ***Cache***

Cache the sound in memory.

### ***Mono***

Import the audio file as mono.

## **Image/Sequence**

Adds a single image or a sequence of images.

When you add a single image then a strip with the length of one second gets created.

When you want to import an image sequence you have to select all the images of the sequence.

## **Import settings**

### ***Relative Path***

Use a relative path to the blend file.

### ***Start Frame***

Start frame of the strip.

### ***End Frame***

End frame of the strip.

### ***Replace Selection***

Replace selected strips at import.

### ***Use Placeholders***

Use placeholder images in an image sequence with missing images.

Image sequences can use placeholder files. This works by enabling Use placeholders checkbox when adding an image strip. The option detects the frame range of opened images using Blender's frame naming scheme (filename + frame number + ..extension) and makes an image sequence with all files in between even if they are missing. This allows you to render an image sequence with a few frames missing and still the image strip will have the correct range to account for the missing frames displayed as black. When the missing frames are

rendered or placed in the same folder, you can refresh the Sequencer and get the missing frames in the strip. The option is also available when using the Change Data/File operator and allows you to add more images to the range.

## Color

Adds a strip with a plain color. Color is one of many effect strips.

### Last Operator Add Effect Strip

#### Type

Effect strip type.

#### Start Frame

Start frame of the strip.

#### End Frame

End frame of the strip.

#### Channel

In which channel to insert.

#### Replace Selection

Replace selected strips.

#### Color

The color of the color effect strip.

## Text Strip

A Text strip allows you to display text in the Sequence.

### Last Operator Add Effect Strip

#### Type

Effect strip type.

#### Start Frame

Start frame of the strip.

#### End Frame

End frame of the strip.

## **Channel**

In which channel to insert.

## **Replace Selection**

Replace selected strips.

## **Adjustment Layer**

The Adjustment Layer strip works like a regular input file strip except for the fact, that it considers all strips below it as its input.

Real-world use cases, you want to add some last finishing color correction on top of parts of your final sequence, timeline without messing with meta strips around. Just add an adjustment layer on top and activate the color balance.

Or you can stack a primary color correction and several secondary color corrections on top of each other (probably using the new mask input for area selection).

## **Last Operator Add Effect Strip**

### **Type**

Effect strip type.

### **Start Frame**

Start frame of the strip.

### **End Frame**

End frame of the strip.

### **Channel**

In which channel to insert.

### **Replace Selection**

Replace selected strips.

## **Effect strip**

Effect strips that adds effects to the image part of the strips.

The color related strips that are greyed out here requires to have two strips selected. The one controls the other strip then.

The last operator panel is mostly similar for all types.

### **Add**

The Add Effect adds the colors of two strips together. Use this effect with a

base image strip, and a modifier strip. The modifier strip can be either a solid color or a black-and-white mask, or another image.

You can use this effect to increase the brightness of an image, or if you use a BW mask, selectively increase the brightness of certain areas of the image. The Mix node, in Add mode, does exactly the same thing as the Add SFX strip here, and is controlled the same way by feeding the Factor input.

## Subtract Effect

This effect takes away one strip's color from the second.

Make a negative of an image using this effect, or switch the order of the strips and just darken the strip. Subtracting a hue of blue from a white image will make it yellow, since red and green make yellow.

## Multiply

The Multiply effect multiplies two colors. Blender uses values between (0.0 to 1.0) for the colors. This operation does not have to be normalized, the multiplication of two terms between (0.0 to 1.0) always gives a result between (0.0 to 1.0).

With the “traditional” representation of three bytes, like RGB(124, 255, 56), the multiplications give far too high results, like RGB(7316, 46410, 1848), that have to be normalized (brought back) by dividing them by 256 to fit in the range of (0 to 255)...

Multiply can be used with a Mask. Or with Uniform Colors.

Multiplying a color with a “normal” image allows you to soften some hues of this one (and so – symmetrically – to enhance the others).

For example, if you have a brown pixel RGB(0.50, 0.29, 0.05), and you multiply it with a cyan filter (uniform color RGB(0.0, 1.0, 1.0)), you will get a color RGB(0.0, 0.29, 0.5). Visually, the result is to zero the reds and bring up (by “symmetry” – the real values remain unchanged!) the blues and greens. Physically, it is the same effect as shining a cyan light onto a chocolate bar. Emotionally, vegetation becomes more lush, water becomes more Caribbean and inviting, skies become friendlier.

Note! This effect reduces the global luminosity of the picture (the result will always be smaller than the smallest operand). If one of the images is all white, the result is the other picture; if one of the images is all black, the result is all black!

## Over Drop

Alpha channel effect. With Over Drop the first strip selected is the foreground. But as with Alpha Over, the Opacity controls the transparency of this foreground.

Warning! By clicking the Premultiply Alpha button in the Sidebar of the foreground strip, the alpha values of the two strips are not multiplied or added together.

## Alpha Over

Alpha channel effect. With Alpha Over the first strip selected is the background, and the second one goes over the first one selected. The Opacity controls the transparency of the foreground.

## Alpha Under

Alpha channel effect. With Alpha Under the first strip selected is the foreground, and the second one, the background. The Opacity controls the transparency of the background.

## Color Mix

The Color Mix effect strip mixes two strips by working on the individual and corresponding pixels of the two input strips. This effect can do the exact same operation as the Add, Subtract, or Multiply effect strips but also other color blending modes.

## Multicam Selector

The Multicam Selector strip is used for multi-camera editing. Multi-camera editing is when a scene is recorded using multiple cameras from different angles and then edited together afterwards. This process can be rather easy in the VSE if you properly setup every to improve your workflow.

## Workflow

Add your video strips.

Sync all your cameras by either using Audio Wave forms or by the movement of objects.

Tip! To make syncing strips easier you can group cameras, their audio, and their effects together using Meta Strips.

Add a viewer region for every input channel and to improve the performance use proxies.

Add a Multicam Selector strip above all the channel tracks.

After completing these steps you should get something similar to the image below:

Select the Multicam strip.

When you select the Multicam strip, the keys 1 to 9 are mapped to the cut buttons. So, select the Multicam strip and start playback and press the keys for the correct input while watching the individual cameras.

You will now have a small Multicam Selector strip for every cut.

---

## Transform

Moves, rotates or scales the images within a strip.

---

## Speed Control

Speed Control time-warps the strip, making it play faster or slower than it normally would. A Global Speed less than 1.0 makes the strip play slower; greater than 1.0 makes it play faster.

Playing faster means that some frames are skipped, and the strip will run out of frames before the end frame. When the strip runs out of frames to display, it will just keep repeating the last one; action will appear to freeze. To avoid this, position the next strip under the original at a point where you want the motion to continue.

## Glow

This effect makes parts of an image glow brighter.

To “animate” the glow effect, mix it with the base image using the Gamma Cross effect, crossing from the base image to the glowing one.

## Gaussian Blur

Blurs the input strip in a defined direction.

## Last Operator Add Effect Strip

### *Type*

Effect strip type.

### *Channel*

In which channel to insert.

### *Replace Selection*

Replace selected strips.

## Transition

Adds transitions between two selected strips.

These strips are effect strips. And will have similar adjust last operation panels therefore.

## Sound Crossfade

Adds a cross fade between two selected audio strips.

## Cross

The Cross transition adds a cross fade transition. Strips can be overlapping or have a gap between them, But when strips contain a gap the last and first frame of each strip is extend which can cause a pause if any of the strips are a sequence.

## Gamma Cross

Similar to the Cross transition. It adds a cross fade transition. But uses color correction while transitioning between the two strips. This results in a smoother transition.

## Wipe

Adds a transition from one strip to the next strip. The duration of the wipe is the intersection of the two source strips and cannot be adjusted. To adjust the start and end of the wipe you must adjust the temporal bounds of the source strips in a way that alters their intersection.

## Fade

Adds a fade effect to the selected strip(s). The menu items should be self explaining.

## Clear Fade

Removes all fade effects from the selected strips.

## Strip menu in Sequencer window

The strip menu contains strip related functionality. The content differs, dependent of the selected strip.

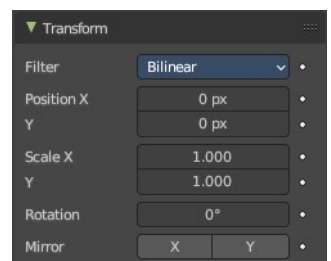

### Transform - Submenu

This sub-menu contains transform operators that you can use on strips.

### Move

Moves the selected strip(s).

## ***Last operator Sequence Slide***

### ***Offset X***

The horizontal frame offset from the starting position.

### ***Y***

The vertical offset from the starting channel.

## **Move/Extend from Frame**

Extends the selected strips relative to the frame indicator and the mouse position. All selected strip handles to the mouse side of the current frame indicator will transform together.

## ***Last operator Transform***

### ***Values X, Y, Z, W***

The transform values, relative to the starting point.

### **Axis**

The transform axis orientation. This axis value box has no meaning here.

### **Orientation**

Choose the type of orientation for the transform action.

## ***Proportional editing***

The tool has no proportional editing. The checkbox cannot be activated.

## **Slip strip content**

Change the position of the contents of a strip without moving the strip itself.

## **Snap Strips to the current frame**

Snaps the selected strips to the current frame.

## **Clear Strip Offset**

Clear strip offset from the start and end frames.

## **Swap Strip Left**

Swap the active strip with the strip to the left.

## **Swap Strip Right**

Swap the active strip with the strip to the right.

## Remove Gaps

Removes gaps at the frame indicator position in the current channel. Strips after the indicator will move to the left to close the gap.

### *Last operator Remove Gaps*

#### All Gaps

Remove all gaps between all clips at the right side.

## Insert Gaps

Inserts a gap at the frame indicator position. Strips after the indicator will move to the right by the amount of gap frames.

### *Last operator Remove Gaps*

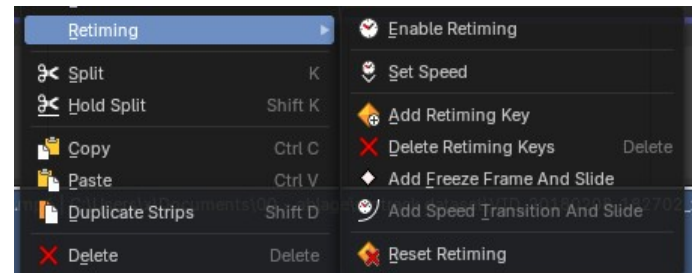

#### Frames

The size of the gap in frames.

## Retiming - Submenu

This submenu contains retiming operators to help change the speed of movie strips. This menu is context sensitive. If you select a retiming keyframe, you will see a new set of operators.

**Note:** *These operators only work on movie strips, and you must have one selected to see the operators.*

## Enable/Disable Retiming

Enables and Disables the retiming keys of a strip. When you enable retiming, you will be able to set keyframes to retime at difference speeds, to set freeze frames, and or set gradient time changes between keyframes.

## Set Speed

Sets the speed of a retimed segment. If there is no segment, it will create a new segment. To edit the segment, Enable Retiming.

**Note:** *The speed is a percentage of total, where 100% is original speed, 110% of the movie playback is 10% faster, and at 90% the movie playback is*

10% slower.

## Speed

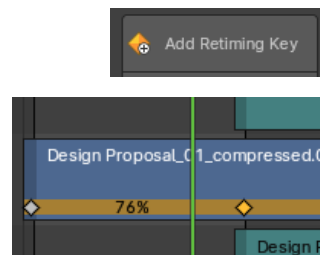

The new speed value.

## Preserve Current Retiming

With preserve current retiming the strip changes length instead of changing next segment speed.

## Add Retiming Key

Adds a retiming key. Here you can change strip speeds in various locations within the strip to squash and stretch time dynamically. To edit a retiming key, click on it in the bottom row of the movie strip and drag left or right. A percentage overlay will show the amount of time change is happening between the keyframes.

## Last operator Add Retiming Key

### Timeline Frame

Defines which frame the new retiming keyframe is placed.

## Delete Retiming Key

Removes the selected retiming keys.

## Add FreezeFrame

Adds a freeze frame by creating two retiming keyframes with 0% time change between them. You can then later adjust the length of the freeze frame by adjusting either of the retiming keyframes.

## Last operator Add Freeze Frame

### Duration

Defines the duration of the freeze frame.

## Reset Timing

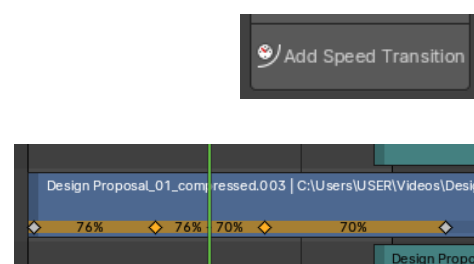

Resets the movie strip to original playback speed.

## Add Speed Transition

Add a smooth time transition between two retimed segments.

To do this, create 3 retiming keyframes, select the middle one, then use the operator. This will create two new keyframes with a beginning percentage and an ending percentage. The distance between these two retiming keyframes will be the duration of the transition.

**Note:** This operator only shows when you have a retiming keyframe selected.

## Last operator Add Speed Transition

### Duration

Defines the duration of the Speed Transition between the two new retiming keyframes.

## Split

Split the selected strip into two parts at the current frame.

## Last operator Split Strips

### Frame

The frame at which the cut happens.

### Channel

The channel of the strip.

### Type

How to cut. Soft or hard.

### Use Cursor Position

Split at the position of the cursor instead of the current frame. Note! This setting makes no sense. You can't adjust the cursor position afterwards.

### Side

The side that remains selected after the split.

---

## Hold Split

Like Split, it splits a strip in two strips. But you will not be able to drag the endpoints to show the frames past the split of each resulting strip. You can adjust the Hold Offset number fields in the Strip Info panel.

## Last operator Split Strips

### Frame

The frame at which the cut happens.

## Channel

The channel of the strip.

## Type

How to cut. Soft or hard.

## Use Cursor Position

Split at the position of the cursor instead of the current frame. Note! This setting makes no sense. You can't adjust the cursor position afterwards.

## Side

The side that remains selected after the split.

## Copy

Copies the selected strip(s).

## Paste

Pastes copied strip(s).

## Duplicate Strips

Duplicates the selected strip(s).

## Last operator Duplicate Strips

### Offset X

The horizontal frame offset from the starting position.

### Y

The vertical offset from the starting channel.

---

## Delete

Deletes the selected strip(s).

---

## Delete Strip & Data

Deletes the selected scene strip types and associated scene data.

This will then convert the associated scene to an orphan data block which will be permanently removed upon save and re-load of the \*.blend file.

## Change Operators

These operators show and hide depending on the strip selection context.

If a strip cannot be changed, it will advise you to selected a changeable strip, which are Scene, Effect and Data strips.

### Change Scene

Changes a scene strip with another scene. Only shows when a scene strip is selected. If there are fewer than 14 scenes, it will list all scenes you could change to. If more than 14 scenes, it will call a search dialogue.

### Change Effect Input

Changes a selected existing effect strip input order. Only shows when an effect strip is selected.

### Change Effect Type

Changes a selected existing effect strip effect type. Only shows when an effect strip is selected.

### Path/Files

Changes a selected existing strip path/file. Only shows when a data strip is selected. Audio, Movie and Image/Sequence strip are data strips.

### Add Modifier – Submenu

All strip types. Adds a strip modifier. Strip modifiers are explained in the sidebar chapters.

Sound strips has different content in the modifier menu.

## Copy modifiers to selection

Copies the modifiers from the source strip to the target strip by given method. It opens a popup where you can choose the method.

First select the source strip. Hold down shift, select the second strip. Perform the tool.

---

## Movie Strip - Submenu

Strip type Movie.

### Set Render Size

Set the render size and aspect from the active strip. Attention, there is no feedback if the operation was successful. It simply sets it.

### Deinterlace Movies

Deinterlaces the selected movie strips.

## Effect Strip

Strip type Effects.

### Reassign Inputs

Reassigns the input of the strips.

Unfortunately not to find out how this works.

### Swap Inputs

Swaps the inputs of the selected strips.

Unfortunately not to find out how this works.

---

## Set Render Size

Strip type Image. Set the render size and aspect from the active image strip. Attention, there is no feedback if the operation was successful. It simply sets it.

## Separate Images

Strip type Image. Create a strip for every image in the image sequence strip.

## Last Operator Separate Images

The length of each frame of the new created strips.

## Make Meta Strip

Creates a meta strip out of the selected strips. A Meta Strip is a strip which contain multiple strips treated as if it was one strip. It allows you to reduce the vertical space used in the Sequencer. You can edit it the same way as any other strips.

Note! The default blend mode for a Meta strip is Replace. There are many cases where this alters the results of the animation so be sure to check the results and adjust the blend mode if necessary.

## UnMeta Strip

Separating (ungrouping) the Meta strip restores the strips to their relative positions and channels.

## Toggle Meta

Toggles between the meta and unmeta state. You need to have a meta strip in the sequencer timeline already.

## Set Color Tag

Set the display color of the strips.

## Lock/Mute - Submenu

### Lock Strips

Locks the strip from editing. They can't be moved or edited anymore.

Locked strips appears hatched.

### Unlock Strips

Unlock locked strips.

### Mute Strips

Mutes the selected strips. They do not play anymore, and they appear greyed out.

## ***Last operator Mute Strips***

### **Unselected**

Mute unselected strips.

## **Unmute Strips**

Unmutes selected muted strip.

## ***Last operator Unmute Strips***

### **Unselected**

Unmute unselected strips.

## **Mute unselected strips**

Mute the unselected strips.

## ***Last operator Mute Strips***

### **Unselected**

Mute unselected strips.

## **Unmute deselected Strips**

Unmute all deselected strips.

## ***Last operator Unmute Strips***

### **Unselected**

Unmute unselected strips.

---

## **Inputs - Submenu**

### **Reload Strips**

Reloads the strips in the sequencer.

### **Reload Strips and Adjust Length**

Reloads the strips in the sequencer.

### **Change Paths/Files**

Undocumented Operator. Opens a file selector.

### **Swap Data**

Swaps the data between two selected strips. The strips must be compatible.

## Strip menu in Preview window

The strip menu contains strip related functionality.

### Transform - Submenu

#### Move

Move the selected item.

#### Rotate

Rotate the selected item.

#### Scale

Scale the selected item.

#### Delete

Delete the selected item.

#### Delete Strip & Data

Deletes the selected item and all of its data.

#### Update Scene Frame Range

Shows with a scene strip. Update the frame range of the scene strip.

### Change - Submenu

Allows you to change things like the source scene. Or the effect of a effect strip.

# 14.1 Editors - Video Sequence Editor - Header

## Table of content

Video Sequence Editor - Header..... 1  
 Header right click menus..... 1  
 Editortype Menu..... 1

## Video Sequence Editor - Header

The Header contains some menus and settings.

The header is divided into two areas.

Left Type of sequencer view with additional menus.

Right contains tools and options, including the timeline, editing, snapping, overlay and settings.

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

## Editortype Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

## Tool shelf in Preview view

The strip menu contains strip related functionality.

### Select Tools Group

Tools with a triangle down right are a group of tools. Click and hold to reveal the content. Then choose the tool that you need.

#### Select

Allows you to select single elements by clicking at it.

#### Select Box

Draws a box to select several elements at once. Click at the start point, then drag.

## Tool Settings

### Mode

The available selection modes. The mode titles are pretty self explaining. So i won't go into detail here.

### Set a new selection

### Extend existing selection

### Subtract existing selection

## Move

Activates the move tool. Activating the move tool also reveals a move widget at the object. This widget allows you to move the object around, by using the corresponding axis.

Clicking and dragging at one of the axis moves the object along this axis. By clicking into the white square in the middle you can move the object freely.

## Snapping

Holding down Ctrl activates temporary global snapping.

### Precision movement

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

D: 0.1529 m (0.1529 m) along global Z

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

D: 0.7057 m D: -0.2678 m (0.7548 m) global

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you move the object, and hold down the mouse and type in a value, like 20, then the movement will be performed by the value that you have typed in. In this case by 20 units in direction of the selected axis.

### Limit Axis

When you have accidentally grabbed the middle of the widget, and want to move

D: 0.1529 m (0.1529 m) along global Z

along a specific axis, then press X or Y to limit to this axis. The widget orientation remains at global orientation.

## Tool Settings

### *Drag*

What to do when you click in the off.

### **Active Tool**

Use the transform tool.

### **Tweak**

Deselect the current element and/or select another element.

### **Select Box**

Deselect the current element and/or box select another element.

### **Select mode**

The select mode for the select methods.

---

## Rotate

Activating the rotate tool reveals a rotate widget at the object. This widget allows you to rotate the object.

## Snapping

Snapping while rotation is by default on. It snaps in 5 degree steps.

Holding down Ctrl deactivates temporary global snapping.

## *Precision movement*

When you hold down shift, then you will have a much slower but also much preciser movement.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the

direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in. In this case by 20 degrees clockwise.

## Tool Settings

### Drag

What to do when you click in the off.

### Active Tool

Use the transform tool.

### Tweak

Deselect the current element and/or select another element.

### Select Box

Deselect the current element and/or box select another element.

### Select mode

The select mode for the select methods.

## Scale

Activates the Scale tool. Activating the scale tool also reveals a traditional scale widget at the object. This widget allows you to scale the object, by using the corresponding axis. When you click at the outer white circle and drag, then you can scale the object uniformly.

## Snapping

Snapping while rotation is by default on. It snaps in 0.1 unit steps.

Holding down Ctrl deactivates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser transformation.

## Header Values

When you move your object then you will see some values in the header, which

defines the current position of the object.

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

D: 0.7057 m D: -0.2678 m (0.7548 m) global

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in. In this case by 20 degrees clockwise.

## Limit Axis

When you have accidentally grabbed the middle of the widget, and want to move along a specific axis, then press X or Y to limit to this axis. The widget orientation remains at global orientation.

D: 0.1529 m (0.1529 m) along global Z

## Tool Settings

### Drag

What to do when you click in the off.

### Active Tool

Use the transform tool.

### Tweak

Deselect the current element and/or select another element.

### Select Box

Deselect the current element and/or box select another element.

### Select mode

The select mode for the select methods.

## Transform

Activates the Transform tool. The transform tool allows you to move, rotate and scale the object. You can also select more than one object and move it. To rotate or to scale more than one object simultaneously is currently not possible.

## Snapping

Snapping while rotation is by default on. It snaps in 0.1 unit steps.

Holding down Ctrl deactivates temporary global snapping.

## Precision movement

When you hold down shift, then you will have a much slower but also much preciser transformation.

## Header Values

When you move your object then you will see some values in the header, which defines the current position of the object.

The value m stands for the default metric system. Meters. You can change the units in the Properties editor in the Scene properties in the Units panel. When you choose kilometers here then you will see a km instead m.

The value D stands for the distance of the current selected axis. This can also be two axis. Then you have two d values. The value in the brackets is then the direct distance to the starting point.

These values are always relative to the starting point. You always start with zero, regardless of the real world position.

## Numerical Input

When you rotate the object, and hold down the mouse and type in a value, like 20, then the rotation will be performed by the value that you have typed in. In this case by 20 degrees clockwise.

## Limit Axis

When you have accidentally grabbed the middle of the widget, and want to move along a specific axis, then press X or Y to limit to this axis. The widget orientation remains at global orientation.

## Tool Settings

### Drag

What to do when you click in the off.

### Active Tool

Use the transform tool.

### Tweak

Deselect the current element and/or select another element.

### Select Box

Deselect the current element and/or box select another element.

## Select mode

The select mode for the select methods.

## Sample

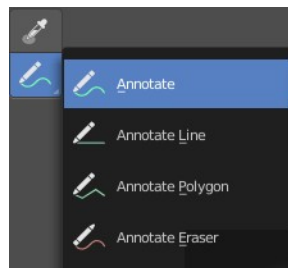

Samples colors under the mouse position when you left click at the position. The result is displayed at the bottom of the view.

## Annotate Tools group

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil objects.

Further settings for annotate can be found in the sidebar. Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Annotate

Draw free-hand strokes in the main window.

### Tool Settings

The tool settings for Annotate.

## Color

Clicking at the color field reveals a color picker. Define the color for the annotation stroke.

## Stabilize Stroke

Helper to draw smooth and clean lines. Pressing shift inverts the effect.

### Radius

The radius for the stroke stabilization.

### Factor

Stabilizer stroke factor. Higher values gives a smoother stroke.

## Annotate Line

Click and drag to create a line.

### Tool Settings

The tool settings for the Annotate tool.

### Color

Clicking at the color field reveals a color picker. Define the color for the annotation stroke.

### Style Start

The stroke start style. With an arrow for example you place an arrow at the start of the stroke.

### End

The stroke end style. With an arrow for example you place an arrow at the end of the stroke.

## Annotate Polygon

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed.

### Tool Settings

The tool settings for Annotate.

## Color

Clicking at the color field reveals a color picker where you can define the color for the annotation stroke.

## Annotate Eraser

Click and drag to remove annotate lines.

### Tool Settings

#### Radius

The radius of the eraser pencil.

## Tool shelf in Sequencer view

## Tool shelf area

### Select

Select strips. This default mode allows you to select strips and move them around.

### Blade

Cut the selected strips at mouse position.

### Active Tool settings

Create a soft split or a hard split.

### Last operator Split Strips

#### Frame

The frame at which the cut happens.

#### Channel

The channel of the strip.

#### Type

How to cut. Soft or hard.

## Use Cursor Position

Split at the position of the cursor instead of the current frame. Note! This setting makes no sense. You can't adjust the cursor position afterwards.

## Side

The side that remains selected after the split.

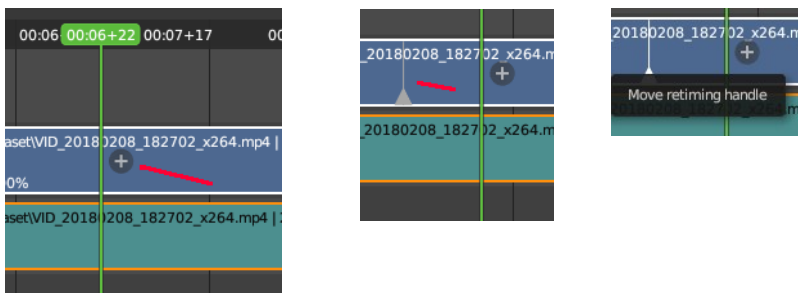

## Retime

The retime tool lets you trim the playback speed of your clip by dragging around retime markers. The markers gets added at the clip. And just shows when the retime tool is activated.

## Adding Marker

When you activate the Retime tool then you will notice a plus sign besides the playhead cursor. Clicking at it will add a retime marker. Which is a handle that can be moved around. And by draggin around the handler you will stretch or compress the clip towards the handler position.

The retiming happens from marker to marker per section. The new playspeed of the marker section can be seen at the clip then.

## Remove Retime Marker

Markers can be removed by moving the mouse over the triangle area of the handler and a left click.

## Last Operator Add Retiming Handle

### Timeline Frame

The position at which the handler is added.

## Channel header

The channel headers allows you to activate and to lock the current channel. The channel names can be renamed by double clicking at it.

This header can be hidden away by dragging at the border. To reveal it, click at the little triangle button up left.

### View Settings Tab

In the View Settings tab you will find the display related settings.

Note that not all content is available in all submodes. The Preview submode shows other content than the Sequencer submode.

## View Settings Panel

### Proxy Render Size

Size to display proxies at in the preview region. Using a smaller preview size will increase speed.

Proxies is a simplified data set to speed up workflow.

### Use Proxies

Use proxy images instead of the real material to speed up workflow.

### Prefetch Frames

Render frames ahead of current frame in the background for faster playback.

### Channel

Which channel number to show in the image preview. The value 0 is the result of all strips combined.

### Show Overexposed

Shows overexposed (bright white) areas using a zebra pattern. The threshold can be adjust with the slider.

### Show Missing Media

Render missing images or movies with a solit magenta color

## Frame Overlay Panel

Display an overlay on top of the sequencer with a frame offset of the content.

When the feature is active then you will see a green dashed line in the sequencer timeline.

## Set Overlay Region

Box select a portion of the viewport to display the overlay content.

## Frame offset

What offset frame to use, relative to the current frame position.

## Overlay Type

The overlay draw type.

## Overlay Lock

Locks the overlay frame to the current frame. It will not go ahead when you play the video.

## Save Areas panel

Modern LCD or plasma monitors usually doesn't have over scan areas anymore.

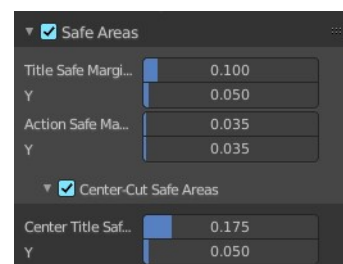

But especially older TV screens still may have varying amounts of over scan.

And cuts quite a bit content away at the border. And so not all content is shown at all monitors. Safe areas is the area that is always visible at all hardware.

Safe areas are guides to ensure that the most important parts of the content can be seen across all screens. The lines are unfortunately a bit hard to see when you are in camera view. They mark the safe areas.

Safe areas can be set from the Camera and Sequencer views.

Tip! Each country sets a legal standard for broadcasting. These include also specific values for safe areas. Bforartists defaults for safe areas follow the EBU (European Union) standard. Make sure you are using the correct values when working for broadcast to avoid any trouble.

## Title Safe Margins X/Y

Also known as Graphics Safe. Information (graphics or text) inside this area can be seen by the majority of viewers.

## Action Safe Margins X/Y

An extra “margin” for the screen, which can be used to keep elements from piling up against the edges.

## Center-Cut Safe Areas

Center-cuts are a second set of safe areas to ensure content is seen correctly on screens with a different aspect ratio. Old TV sets receiving 16:9 or 21:9 video

will cut off the sides. Position content inside the center-cut areas to make sure the most important elements of your composition can still be visible in these screens.

## Center Title Safe Margins X/Y

Information (graphics or text) inside this area can be seen by the majority of viewers.

## Scene Strip Display panel

Settings for the strip type Scene Strip.

### Shading

How to display the scene content in the preview window.

### Override scene settings

Use the workbench render settings from the sequencer scene instead of the settings instead of each individual scene used in the strip.

## Annotations panel

Manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

### Annotations prop

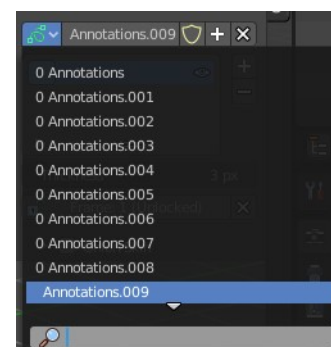

Add, remove and rename new annotations.

### Drop down box

A list of the available annotation layers.

### Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

## Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

---

## List of Annotation Strokes

Here you see your Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

---

## Thickness

The thickness of the annotation stroke.

## Frame Locked/Unlocked

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

## Onion Skin subpanel

Enable Onion Skinning

Onion Skinning allows to show ghosts of the keyframes before and after the current frame. In this sub panel you can adjust the color of the onion skin frames. With the numbers below the colors you can define how many frames before or after are displayed that way.

## Metadata panel

Display existing meta data of the selected strip(s).

## Strip Tab

The strip tab contains all the strip type related settings. For the different strip types see the Add menu.

Some panels have the same content for all strip types. Some not. Some strip types have their own panels.

### Strip tab header

In the strip tab header you will see an icon for the current strip type. The name of the strip. And a checkbox to set this strip active.

The strip can be renamed by double clicking left into the edit box.

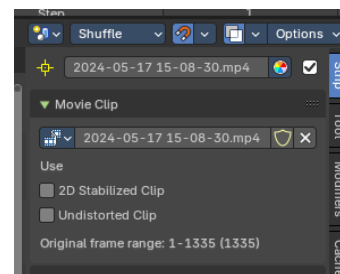

## Movie Clip Panel

### 2D Stabilized Clip

Use the 2D stabilized version of the clip.

### Undistorted Clip

Use the undistorted version of the clip.

## Compositing Panel

### Blend

The blend method to control how the strip combines with other strips.

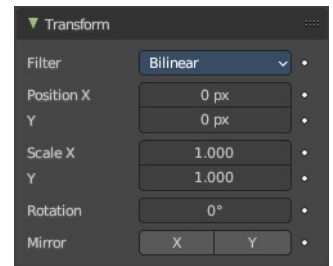

### Opacity

How much the strip color affects other strips.

## Transform Panel

## Filter

Filter type to use for transformations.

### Auto

Automatically choose filter based on scaling factor.

### Nearest

Use nearest sample.

### Bilinear

Interpolate between 2x2 Samples

### Cubic Mitchell

Cubic Mitchell filter on 4x4 Samples.

### Cubic B-Spline

Cubic B-Spline Filter on 4x4 Samples. Blurry, but not ringing.

### Box

Averages source image samples that fall under destination pixel.

## Position X

The X offset.

## Y

The Y offset.

## Rotation

The rotation around the image center.

## Mirror

Flip on the X and/or Y axis.

## Video Panel

### Strobe

Don't display every frame, but just every nth frame.

### Reverse Frames

Reverse the frame order.

## Color Panel

### Saturation

The intensity of the input color.

### Multiply

Multiply colors by this factor.

### Multiply Alpha

Multiply Alpha along with color channels.

### Convert to Float

Convert input to float data.

## Sound Panel

This panel shows with an audio clip selected.

### Volume

The volume of the audio clip.

### Pitch

The pitch of the audio clip.

### Pan

When mono, the pan of the audio clip.

## Mono

Set the audio clip to mono.

## Display Waveform

Display the waveform in the clip.

## Time Panel

Time related settings.

### Lock

Lock strip so that it cannot be transformed.

### Show Retiming Keys

This toggles the overlay and retiming state of a Movie or Image Sequence strip. For more information, refer to chapter **Editors - Video Sequence Editor - Header - Strip Menu** retiming section.

**Note:** To retime a strip, select a Movie or Image Sequence strip.

### Channel

The channel of the strip.

### Start

The start frame of the strip.

### Duration

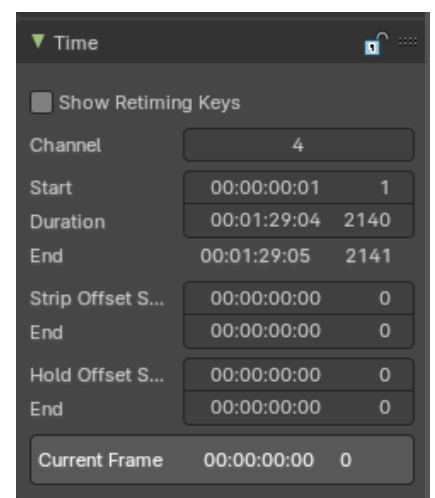

The duration of the strip.

### End

The end frame of the strip.

### Strip Offset Start

The strip offset start. This offsets the beginning of the strip in the timeline.

## End

The strip offset end. This offsets the end of the strip in the timeline.

## Hold Offset Start

Animation start offset (trim start)

## End

Animation end offset (trim end)

## Current Frame

Info box that displays the position of the frame cursor at the current frame.

# Scene Panel

This panel just shows with strip type scene.

## Scene Property

## Scene Browser

A scene browser that contains the available scenes in the file.

## Scene edit box

The name of the scene. It can be renamed by double clicking into the edit box.

## Add

Add a new scene. This button calls a menu where you can choose with what method you want to create the new scene.

## New

Adds a new empty scene.

## Copy Settings

Adds a new empty scene. And copies the settings from the current scene.

## Linked Copy

Link in the collections from the current scene. (Shadow Copy)

## Full Copy

Make a full copy of the current scene.

## Remove

Remove the scene as the active one. Note that the scene is still available in the scene browser.

## Input

Type of input to use. The camera of the scene. Or a file from the sequencer in this scene.

## Input Type Camera

### Volume

The audio volume.

### Camera

Which camera of the scene to use.

### Show Grease Pencil

Show grease pencil strokes in OpenGL previews.

### Transparent

Use a transparent background.

## Input type Sequencer

### Volume

The audio volume.

## Mask Panel

This panel just shows with strip type Mask.

## Mask Property

## Mask Browser

A mask browser that contains the available masks in the file.

## Mask edit box

The name of the scene. It can be renamed by double clicking into the edit box.

## Fake User

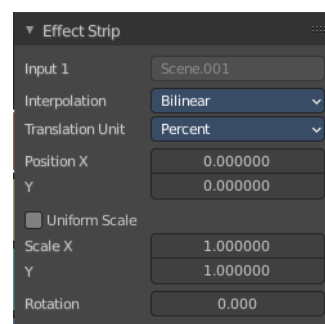

Assign a fake user to this mask. Fake users is a odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Remove

Remove the scene as the active one. Note that the scene is still available in the scene browser.

# Effect Strip Panel

Settings for the single effect strip types.

## Effect strip type Color Mix

### Input 1

The first strip.

### Input 2

The second strip.

### Swap Strips

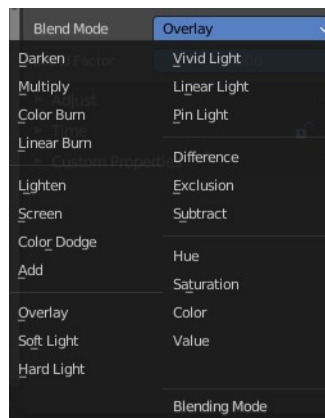

Swap the strips.

### Blend Mode

The color blend mode to use.

### Blend Factor

The blend factor. 1.000 means 100%.

## Effect strip type Text

### Text

The text to displayed.

### Wrap Width

World wrap width as factor. Zero disables the wrap.

### Style sub panel

### Font property

When no font is loaded then the internal font is used.

### Font browser

The list of loaded fonts. This list is empty by default. It displays the fonts that you load.

### Open

Load a font.

### Font Edit Box

Display the current active font. You can rename the font by double clicking in the edit box.

### Fake User

Assign a fake user to this font. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### Open Font

Load a font.

### Remove

Remove the selected font as the active one. Note that the font is still in the list then.

## **Bold**

Display the font bold.

## **Italic**

Display the font italic.

## **Size**

Size of the text.

## **Color**

The text color.

## **Shadow**

Creates a shadow of the specified color under the text.

### **Shadow color**

The color of the shadow. Clicking at the color field opens a color dialog.

### **Angle**

The shadow angle. In which direction the shadow shall point.

### **Offset**

Add an offset to the shadow in pixels

### **Blur**

Blur the shadow by a pixel amount.

## **Outline**

### **Color**

The outline color.

### **Width**

The outline width.

## **Box**

Display colored box behind text.

### **Box Color**

The color of the box.

### **Margin**

The margin of the box. Based at the image width.

## Layout sub panel

### Location X/Y

Positions the text on the X, Y axis.

### Anchor X/Y

Horizontal (X) or vertical (Y) anchor point of the text relative to the location.

## Effect strip type Gaussian Blur

### Input 1

The strip to blur. This strip cannot be changed. You need to apply the effect with the correct strip selected.

### Size X

The size of the blur along X axis.

### Y

The size of the blur along Y axis.

## Effect strip type Multicam

### Source Channel

The channel which the Multicam Selector gets its input from.

### Cut to

Cuts the Multicam strip at the current frame and changes the Source Channel automatically to the selected channels.

## Effect strip type Speed Control

### Input

The video where the speed control is applied to. This is read only.

### Speed Control

### Stretch

Adjust input playback so that the input duration fits the strip length

## Multiply

Multiply with the speed factor.

## Multiply factor

The speed factor.

## Frame Number

Frame Number of the Input strip.

## Frame number

The frame number.

## Length

## Interpolation

Do crossfade blending between current and previous frame.

## Effect strip type Color

### Color Picker

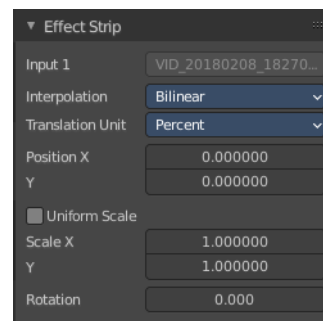

Adjust the color of the color strip.

## Effect strip type Transform

### Input 1

The strip to transform. This strip cannot be changed. You need to apply the effect with the correct strip selected.

## Interpolation

The interpolation type for the transform.

## Translation Unit

The measure unit to use for the transform.

## Position X

Amount to move the input in the X axis.

## Y

Amount to move the input in the Y axis.

## Uniform scale

Scale uniformly, preserve the aspect ratio.

## Scale X

Amount to scale the input in the X axis.

## Y

Amount to scale the input in the Y axis.

## Rotation

Degrees to rotate the input.

## Effect strip type Glow

### Input 1

The strip to use. This strip cannot be changed. You need to apply the effect with the correct strip selected.

### Threshold

Minimum intensity to trigger a glow.

### Clamp

The brightness limit of intensity.

### Boost Factor

Brightness multiplier.

### Blur Distance

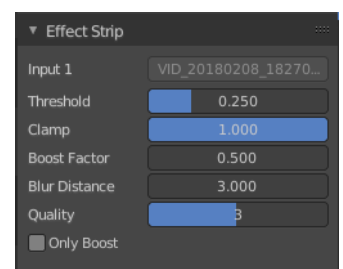

The radius of the glow effect.

### Quality

The accuracy of the blur effect.

### Only Boost

Show the glow buffer only.

## Effect strip type Wipe

### Input 1

The first strip.

## Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Transition type

The wipe effect type.

## Direction

The direction of the wipe.

## Blur width

The width of the blur edge, relative to the image size.

## Angle

The edge angle.

## Default Fade

Use the builtin default effect time, which is as long as the fade clip. Or adjust the effect time.

## Effect strip type Alpha over Drop

### Input 1

The first strip.

### Input 2

The second strip.

### Swap Inputs

Swap the two strips.

### Default Fade

Use the builtin default effect time, which is as long as the fade clip. Or adjust the effect time.

## Effect strip type Multiply

### Input 1

The first strip.

## Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Effect strip type Gamma Cross

### Input 1

The first strip.

### Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Default Fade

Use the builtin default effect time, which is as long as the fade clip. Or adjust the effect time.

## Effect strip type Alpha Under

### Input 1

The first strip.

### Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Default Fade

Use the builtin default effect time, which is as long as the fade clip. Or adjust the effect time.

## Effect strip type Alpha Over

### Input 1

The first strip.

## Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Default Fade

Use the builtin default effect time, which is as long as the fade clip. Or adjust the effect time.

## Effect strip type Subtract

### Input 1

The first strip.

### Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Effect strip type Add

### Input 1

The first strip.

### Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Effect strip type Crossfade

### Input 1

The first strip.

### Input 2

The second strip.

## Swap Inputs

Swap the two strips.

## Default Fade

Use the builtin default effect time, which is as long as the fade clip. Or adjust the effect time.

# Custom Properties Panel

Here you can define custom properties that can be used for scripting.

Here you might also find custom properties from addons or scripts.

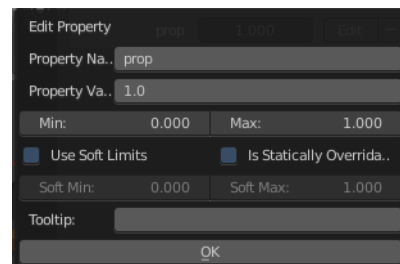

## Add

Adds a new property.

## Edit

Opens a panel where you can adjust the settings for the custom property.

## Remove

Removes the property.

## 14.3.4 Editors - Video Sequence Editor - Sidebar - Sequencer - Tool tab

### Table of content

Tool Tab.....	1
Tool Tab and Top Bar.....	1

## Tool Tab

In the tool tab you will find the tool related settings for the tools in the tool shelf. These settings are explained for the single tools in the tool shelf chapter.

## Tool Tab and Top Bar

The content in the Tool Tab is besides one panel the same than in the Topbar.

Different from the 3D view, he top bar cannot be hidden.

## Modifier Tab

In the Modifier tab you will find strip modifiers to manipulate image content. Modifiers is a non destructive way to manipulate the data.

Note that these modifiers cannot be applied.

## General functionality

### Add

To add a modifier to an object, simply open the drop down menu, and choose the type of modifier that you want to add.

This will add the modifier to the list of modifiers. Also called the modifier stack.

### Header elements

Elements are explained from left to right.

### Collapse panel

The whole modifier panel can be collapsed. Click at the arrow button up left in the header.

### Modifier Icon

This icon shows the type of the modifier. And has no further functionality.

### Modifier Name

The name of the modifier. You can rename modifiers by clicking into the edit field and change the text.

### Mute

Don't use this modifier.

### Move Strip Modifier

Move the modifier upwards or downwards in the list.

### Remove Strip Modifier

Removes the modifier from the list.

## Modifiers Panel

### Use Linear Modifiers

Calculate modifiers in linear space instead of sequencer space.

### Add Strip Modifiers

The list of available modifiers. Clicking will insert it into the modifier stack.

### Copy to selected Strips

Copies the modifiers from one strip to another strip.

### Workflow

Select the strip without modifier. Hold down shift, select the strip with the modifiers. Click the copy to selected button, choose the method in the popup. And the modifier should now be at the first strip.

### Replace

Replace the modifiers in the modifier stack of the target strip.

### Append

Append the modifiers to the modifier stack of the target strip.

## Color Balance Modifier

Color balance adjustments, through Lift, Gamma, and Gain.

### Mask Input Type

Type of input data used for mask.

## Mask Input Type type Strip

### Mask

The strip used as mask input for the modifier.

## Mask Input Type type Mask

### Mask

The mask used as mask input for the modifier.

### Mask Time

Time to use for the mask animation.

### Relative

Mask animation is offset to start of strip.

### Absolute

Mask animation is in sync with scene frame.

## Multiply Colors

Multiply the intensity of each pixel by this factor.

## Lift

Color picker for the lift color. The panel content should be self explaining.

## Gamma

Color picker for the Gamma color. The panel content should be self explaining.

## Gain

Color picker for the Gain color. The panel content should be self explaining.

## Curves Modifier

Color and RGB curves.

## Mask Input Type

Type of input data used for mask.

## Mask

The strip used as mask input for the modifier.

## Tone

Tone mapping of the curve. Standard or film like.

## C R G B

What color channels to affect. C stands for color, for all channels.

## Selecting Points

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse button down and move them to a new location.

## Adding Points

## Navigation elements

The navigation elements at the top are described from left to right.

## Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

## ***Extend horizontal***

Extends the curve horizontal before the first curve point and after the last curve point.

## ***Extend vertical***

Extends the curve vertical before the first curve point and after the last curve point.

## ***Reset Curve***

Resets the curve to the initial shape.

## **Use Clipping**

Clipping options. Set up clipping for the stroke. The blue button at the top turns clipping on or off.

## **Delete Points**

Deletes the selected curve point.

# Hue Correct Modifier

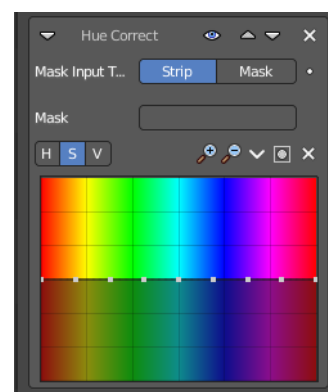

HSV multi points curves.

## **Mask Input Type**

Type of input data used for mask.

## **Mask**

The strip used as mask input for the modifier.

## **H S V**

What color channels to affect. Hue, saturation, value.

## **Selecting Points**

You can select curve points. This reveals two edit boxes for the x and y coordinate of this point.

Selected points can be moved around. Left click at them, hold the mouse

button down and move them to a new location.

## Adding Points

## Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

---

## Tools

Tools is a menu where you can find some curve related tools.

### ***Reset View***

Resets the curve windows zoom.

### ***Vector Handle***

Set handle type to Vector.

### ***Auto Handle***

Set handle type to Auto.

### ***Auto Clamped Handle***

Set handle type to Auto Clamped.

### ***Extend horizontal***

Extends the curve horizontal before the first curve point and after the last curve point.

### ***Extend vertical***

Extends the curve vertical before the first curve point and after the last curve point.

### ***Reset Curve***

Resets the curve to the initial shape.

## Use Clipping

Clipping options. Set up clipping for the stroke. The blue button at the top turns clipping on or off.

## Delete Points

Deletes the selected curve point.

## Bright / Contrast modifier

Adjusts the brightness and contrast of the modifier input.

### Mask Input Type

Type of input data used for mask.

### Mask

The strip used as mask input for the modifier.

### Bright

Adjust the luminosity of the colors.

### Contrast

Adjust the contrast of the colors.

## Mask modifier

Use it for masking the other modifiers in the stack which are below.

### Mask Input Type

Type of input data used for mask.

### Mask

The strip used as mask input for the modifier.

## White Balance modifier

Use it to adjust the white balance by choosing the color that should be white.

## Mask Input Type

Type of input data used for mask.

## Mask

The strip used as mask input for the modifier.

## White Value

The color that defines white in the strip.

# Tone map modifier

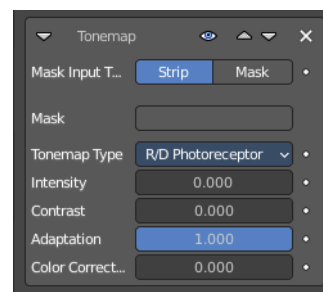

Used to map one set of colors to another in order to approximate the appearance of high dynamic range images in a medium that has a more limited dynamic range.

## Mask Input Type

Type of input data used for mask.

## Mask

The strip used as mask input for the modifier.

## Tone map Type

What tone mapping algorithm to use.

## Intensity

A value less than zero darkens the image. A value higher than zero brightens the image.

## Contrast

Adjust the contrast. A value of 0 uses the input value.

## Adaption

The color adaption. If 0 global, if 1 based on pixel intensity.

## Color Correction

The color correction. If 0 same for all channels. If 1 each independent.

## Equalizer modifier

An audio equalizer for audio clips. The range goes from 30 hz to 20.000 hz

### Adding Points

### Navigation elements

The navigation elements at the top are described from left to right.

### Zoom in and out

The two buttons with the magnifying glass at it zooms in and out in the curve window.

### Clipping Options

Clips the values.

### Tools

#### ***Reset View***

Resets the view.

#### ***Reset Curve***

Resets the curve.

## **Footer**

The footer contains further tools to modify the selected point

## ***Handles***

### **Auto Handle**

Set the handle type to auto

### **Vector Handle**

Set the handle type to vector

### **Auto Clamped**

Set the handle type to auto clamped.

### ***X / Y Values***

The position of the selected point.

### ***Delete Points***

Removes the selected point.

## 14.3.6 Editors - Video Sequence Editor - Sidebar - Sequencer - Proxy&Cache tab

### Table of content

Cache Settings panel.....	1
Cache Raw.....	1
Cache Preprocessed.....	1
Cache Composite.....	2
Cache Final.....	2
Strip Cache panel.....	2
Enable Strip Cache.....	2
Cache Raw.....	2

Strip Proxy & Time code panel.....	3
Custom Proxy.....	3
Proxy Custom Directory.....	3
Proxy Custom File.....	3
Resolutions.....	3
Overwrite.....	3
Build Jpeg Quality.....	3
Time code Index.....	3

### Cache Settings panel

The Cache is used to save frames in memory for preview, so they can be later displayed much faster than rendered from scratch. Cache capacity can be set in System tab of the Preferences.

In this panel you can set up types of images that will be cached for all strips.

### Cache Raw

Cache raw images read from drive, for faster tweaking of strip parameters at the cost of memory usage.

### Cache Preprocessed

Cache preprocessed images, for faster tweaking of effects at the cost of memory usage.

## Cache Composite

Cache intermediate composited images, for faster tweaking of stacked strips at the cost of memory usage.

## Cache Final

Cache final image for each frame.

## Strip Cache panel

Similar to Cache Settings Panel, this panel sets the types of images that will be cached for the active strip.

## Enable Strip Cache

Enable overriding the cache defaults. When disabled, Cache Settings will be used.

## Cache Raw

Cache raw images read from drive, for faster tweaking of strip parameters at the cost of memory usage.

## Cache Preprocessed

Cache preprocessed images, for faster tweaking of effects at the cost of memory usage.

## Cache Composite

Cache intermediate composited images, for faster tweaking of stacked strips at the cost of memory usage.

## Proxy Settings Panel

### Storage

Defines whether the proxies are for individual strips or the entire sequence.

### Per Strip

Proxies are stored in the directory of the input.

### Project

All proxies are stored in one directory.

### Proxy Directory

The location to store the proxies for the project.

## Set Selected Strip Proxies

Set proxy size and overwrite flag for all selected strips.

## Rebuild Proxy and Time code Indices

Generates Proxies and Time codes for all selected strips, same as doing Strip ? Rebuild Proxy and Time code indices.

# Strip Proxy & Time code panel

## Custom Proxy

## Proxy Custom Directory

Use a custom directory to store data. Activating the tool reveals a directory picker.

## Proxy Custom File

Use a custom file to read proxy data from. Activating the tool reveals a directory picker.

You can either show the directory or the custom file path directory picker.

## Resolutions

Buttons to control how big the proxies are. The available options are 25%, 50%, 75%, 100 percent of original strip size.

## Overwrite

Saves over any existing proxies in the proxy storage directory.

## Build Jpeg Quality

Defines the quality of the JPEG images used for proxies.

## Time code Index

When you are working with footage directly copied from a camera without pre-processing it, there might be bunch of artifacts, mostly due to seeking a given frame in sequence. This happens because such footage usually

does not have correct frame rate values in their headers. This issue can still arise when the source clip has the same frame rate as the scene settings. In order for Blender to correctly calculate frames and frame rate there are two possible solutions:

Preprocess your video with e.g. MEncoder to repair the file header and insert the correct keyframes.

Use Proxy/Time code option in Blender.

The following time codes are supported:

No TC in use – do not use any time code

Record Run

Free Run

Free Run (rec date)

Record Run No Gaps

Note! Record Run is the time code which usually is best to use, but if the clip's file is totally damaged, Record Run No Gaps will be the only chance of getting acceptable result.

## 14.3.7 Editors - Video Sequence Editor - Sidebar - Sequencer - View tab

### Table of content

View Settings Panel.....	1
Proxy Render Size.....	1
Use Proxies.....	1
Prefetch Frames.....	1
Channel.....	1
Show Overexposed.....	2
Frame Overlay Panel.....	2
Set Overlay Region.....	2
Frame offset.....	2
Overlay Type.....	2
Overlay Lock.....	2
Scene Strip Display panel.....	2
Shading.....	2
Override scene settings.....	3

## View Settings Panel

Note that this panel just shows when Preview As Backdrop is activated.

### Proxy Render Size

Size to display proxies at in the preview region. Using a smaller preview size will increase speed.

Proxies is a simplified data set to speed up workflow.

### Use Proxies

Use proxy images instead of the real material to speed up workflow.

### Prefetch Frames

Render frames ahead of current frame in the background for faster playback.

### Channel

Which channel number to show in the image preview. The value 0 is the result of all strips combined.

## Show Overexposed

Shows overexposed (bright white) areas using a zebra pattern. The threshold can be adjust with the slider.

## Frame Overlay Panel

Note that this panel just shows when Preview As Backdrop is activated.

Display an overlay on top of the sequencer with a frame offset of the content.

When the feature is active then you will see a green dashed line in the sequencer timeline.

## Set Overlay Region

Box select a portion of the viewport to display the overlay content.

## Frame offset

What offset frame to use, relative to the current frame position.

## Overlay Type

The overlay draw type.

## Overlay Lock

Locks the overlay frame to the current frame. It will not go ahead when you play the video.

## Scene Strip Display panel

Note that this panel just shows when Preview As Backdrop is activated.

Settings for the strip type Scene Strip.

## Shading

How to display the scene content in the preview window.

## **Override scene settings**

Use the workbench render settings from the sequencer scene instead of the settings instead of each individual scene used in the strip.

## 14.3 Editors - Video Sequence Editor - Sidebar

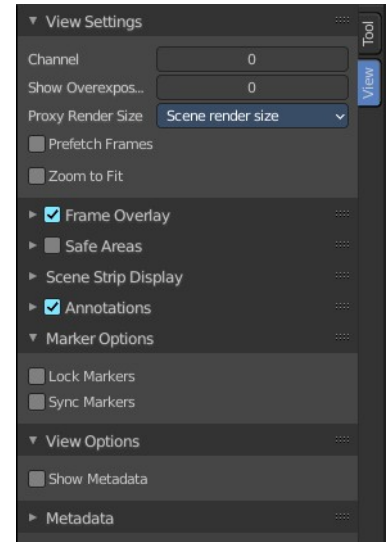

### Table of content

Introduction.....	1
Right Click menus.....	1

### Introduction

The Video Sequence Editor is made of several areas. And it is made of two editor types. Preview and Sequence.

At the right side you will find the sidebar with further options and settings for the VSE and its tools.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

# Video Sequence Editor

The Video Sequence Editor is a complete video editing system. It allows you to cut videos and add effects and audio.

## Type of Sequencer View

The Video Sequence Editor is two editors in one. The Preview sequencer view is a preview window. Here plays the video. The Sequencer sequencer view is the view that contains the the video and audio strips. The third method is both editor view types in one editor.

Both editor view types are divided into several areas.

Green - Tool area. Note that, different from the 3D view, the tool area cannot be hidden away.

Yellow – Header

Blue - Tool Shelf

Pink - Sidebar

## Drag n Drop

You can drag n drop several elements like movie and audio clips into the Sequencer timeline. In this case you get the import options from the file browser displayed in the adjust last operator panel. The settings are pretty similar.

### Last operator Add Movie / Image etc. Strip

When you drop a strip then you will get a last operator panel down left.

#### **Relative Path**

Select the file relative to the blend file.

#### **Start Frame**

The start frame of the strip.

#### **End Frame**

The end frame of the strip

#### **Channel**

The channel to place this strip into.

#### **Replace Selection**

Replace the current selection.

#### **Sound**

Load the audio of the movie.

#### **Use Movie Frame rate**

Use the frame rate from the movie to keep sound and video in sync.

## Navigating in the viewport

### Hotkeys

Pan the view - MMB

Zoom - Mouse Wheel, MMB+CTRL, Numpad + / -

View All - Home

Deselect - left click into the off.

Select - left click

Add to selection - Shift + left click

# Strips

An element in the sequencer timeline is called strip. Strips are represented as bars.

Every strip displays the name of the strip up left.

## Strip Types

Videos can also contain audio. When you import a video with audio, then you will have two strips in the timeline. A video strip that contains the image material. And an audio strip that contains the sound.

But the sequencer does not only display video and audio strips. There are several more strip types available. You can in the Add menu load image sequences, single images, masks, and even whole scenes.

## Move Strips

To move strips in the sequencer timeline select the strip and drag it. Upwards will put it into another channel. Sideways will move it in the timeline.

## Resizing strips

A strip has a drag handler at the left and a drag handler at the right. This handler allows you to resize the strip.

When the handlers are active you will see the frame numbers at the start and/or end of the clip. You can't move the strip as a whole while one of the handlers is active. Click in the off to deactivate the handlers. Then you can move the whole clip again.

## Last operator Sequence Slide

This adjust last operator shows for both, move strips and resize strips.

### Offset X

The modified frame position, relative to the start position of the strip.

### Y

The modified channel position, relative to the start position of the strip.

## Strip States

### Active Strip

Highlighted in White. When you copy properties and modifiers copy to selected

### Selected Strip

Highlighted in Orange

### Unselected Strip

Un highlighted with a thin black border.

### Muted Strip

Highlighted by a faded effect to show that strip that has been muted, no-longer influencing the timeline.

### Locked strip

Highlighted with diagonal lines to show that the strip is locked and can no-longer be edited in the timeline.

### Missing Data

Highlighted in Dark red

## Preview - Sequencer Preview context menu

When you right click into the preview window then you will call a menu.

Allows you to rename the active sequence strip.

# Sequencer - Sequencer context menu

When you double right click into the Sequencer view, then you will open a menu. The Sequencer Context menu. Its content is to 100% double content to already existing menu entries. And it is despite the name not contextual.

The menu content differs, dependant of which sort of strip is selected

## Split

Splits the selected strips at the chosen mouse position.

## Last operator Split Strips

### Frame

The frame at which the split happens.

### Channel

The channel

### Type

Split type. Soft or hard.

### Use Cursor Position

Split the strip at the cursor position instead of the current frame.

This feature is pretty useless since you adjust this setting afterwards, after you have already cut at the current frame. There is no cursor position available anymore.

### Side

The side that remains selected after splitting.

## Last operator Remove Gaps

### All Gaps

Snaps all strips to the ends of the previous strips to close all gaps.

## Insert Gaps

Insert a gap of frames before the selected strip.

## Last operator Insert Gaps

### Frames

The number of frames to insert.

## Cross fade Sounds

Audio Strips only. And you need to have two strips selected. Cross fade two selected audio strips.

## Add Strip Modifier

All strip types but Sound. Adds a strip modifier. Strip modifiers are explained in the sidebar chapters.

## Fade

Fade effects for strips. The names should be self explaining.

## Last operator

### Fade Duration

The duration of the fade.

### Fade Type

The fade type to choose.

## Clear Fade

Clears the fade effects at the selected strips.

## Movie Strip

### Set Render Size

Sets the render resolution and aspect to match the strip's resolution.

### Deinterlace Movies

Converts interlaced video into progressive video.

## Effect Strip

Strip type Effects.

### Change Effect Input

Changes the effect input of two selected effect strips.

Unfortunately not to find out how this works.

### Change Effect Type

Sets the effect type to a new chosen type.

### Reassign Inputs

Reassigns the input of the strips.

Unfortunately not to find out how this works.

### Swap Inputs

Swaps the inputs of the selected strips.

Unfortunately not to find out how this works.

## Make Meta Strip

Creates a meta strip out of the selected strips. A Meta Strip is a strip which contain multiple strips treated as if it was one strip. It allows you to reduce the vertical

space used in the Sequencer. You can edit it the same way as any other strips.

Note! The default blend mode for a Meta strip is Replace. There are many cases where this alters the results of the animation so be sure to check the results and adjust the blend mode if necessary.

## UnMeta Strip

Separating (ungrouping) the Meta strip restores the strips to their relative positions and channels.

## Toggle Meta

Toggles between the meta and unmeta state. You need to have a meta strip in the sequencer timeline already.

## Set Color Tag

Changes the header or the body color of the selected strip. This depends of the strip type.

## Lock/Mute

### Lock Strips

Locks the strip from editing. They can't be moved or edited anymore.

Locked strips appears hatched.

### Unlock Strips

Unlock locked strips.

### Mute Strips

Mutes the selected strips. They do not play anymore, and they appear greyed out.

### Last operator Mute Strips

#### Unselected

Mute unselected strips.

### Unmute Strips

Unmutes selected muted strip.

## Last operator Unmute Strips

### Unselected

Unmute unselected strips.

## Mute unselected strips

Mute the unselected strips.

## Last operator Mute Strips

### Unselected

Mute unselected strips.

## Unmute deselected Strips

Unmute all deselected strips.

## Last operator Unmute Strips

### Unselected

Unmute unselected strips.

---

## With retiming keyframes selected

### Set Speed

Sets the speed of a retimed segment. If there is no segment, it will create a new segment. To edit the segment, Enable Retiming.

**Note:** The speed is a percentage of total, where 100% is original speed, 110% of the movie playback is 10% faster, and at 90% the movie playback is 10% slower.

### Speed

The new speed value.

### Preserve Current Retiming

With preserve current retiming the strip changes length instead of changing next segment speed.

### Add Retiming Key

Adds a retiming key. Here you can change strip speeds in various locations within the strip to squash and stretch time dynamically. To edit a retiming key, click on it in the bottom row of the movie strip and drag left or right. A percentage overlay

will show the amount of time change is happening between the keyframes.

### ***Last operator Add Retiming Key***

#### ***Timeline Frame***

Defines which frame the new retiming keyframe is placed.

### **Delete Retiming Key**

Removes the selected retiming keys.

### **Add FreezeFrame**

Adds a freeze frame by creating two retiming keyframes with 0% time change between them. You can then later adjust the length of the freeze frame by adjusting either of the retiming keyframes.

### ***Last operator Add Freeze Frame***

#### ***Duration***

Defines the duration of the freeze frame.

### **Reset Timing**

Resets the movie strip to original playback speed.

### **Add Speed Transition**

Add a smooth time transition between two retimed segments.

To do this, create 3 retiming keyframes, select the middle one, then use the operator. This will create two new keyframes with a beginning percentage and an ending percentage. The distance between these two retiming keyframes will be the duration of the transition.

**Note:** This operator only shows when you have a retiming keyframe selected.

### ***Last operator Add Speed Transition***

#### ***Duration***

Defines the duration of the Speed Transition between the two new retiming keyframes.

## **Quick Favorites menu**

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Favorites Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Image Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

## Context Set - O

Preview view. Context Set for overlay frame. Calls a box select tool.

## Masking preface

Masks have many purposes. They can be used in a motion tracking workflow to mask out, or influence a particular object in the footage. They can be used for manual rotoscoping to pull a particular object out of the footage. Or as a rough matte for green screen keying. This is done in the Node editor in compositing mode by a mask node.

Masks are independent from a particular image of movie clip. And so they can just as well be used for creating motion graphics or other effects in the compositor.

Masks are defined by splines. Means you work with splines, and you have a bunch of spline tools available.

## S-Curves

The curve type used for creating mask splines is almost a Bezier curve. But there are some differences. Smooth edges of the mask are defined by feathering. These are called S-Curves.

Besides the handles, every control point also has points that define the feather between the current point and the next point on the spline. Each feather point is stored in UV space, where U means position across spline segment, and V means distance between main spline and feather points.

This allows for deforming the main spline in almost any way, and the feather will be updated automatically to reflect that change.

For example if there is just rotation of the spline, feather would stay completely unchanged. If one point's feather is moved, the other feathers will be automatically stretched uniformly along that segment and the overall shape will be almost the same as artists would want it to be.

# Mask Menu

## Transform

### Move

Move the selected curve spline or points.

### Last Operator Move

### Values

Adjust the move amount.

X, Y and Z defines the position.

### Axis Ortho

Along which axis to move.

### Orientation

Orientation is a drop-down box where you can choose the type of orientation for the transform action.

### Proportional Editing

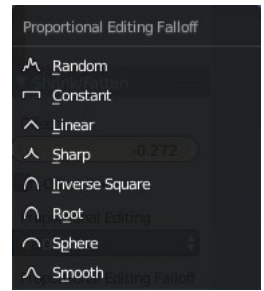

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

### **Proportional Editing Falloff**

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

### **Proportional size**

Proportional size is an edit box to Adjust the strength of the Proportional falloff.

### **Connected**

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

### **Projected ( 2D)**

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## **Rotate**

Rotate the selected curve spline or points.

### **Last Operator Rotate**

#### **Angle**

Adjust the angle.

#### **Axis**

Along which axis to rotate

#### **Orientation**

Orientation is a drop-down box where you can choose the type of orientation for the transform action.

### **Proportional Editing**

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

### **Proportional Editing Falloff**

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

### **Proportional size**

Proportional size is an edit box to adjust the strength of the Proportional falloff.

## Connected

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

## Projected ( 2D)

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## Scale

Scale the selected curve spline or points.

## Last Operator Resize

### Scale X Y Z

Adjust the scaling.

### Orientation

Orientation is a drop-down box where you can choose the type of orientation for the transform action.

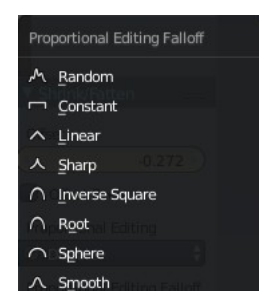

### Proportional Editing

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

### Proportional Editing Falloff

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

### Proportional size

Proportional size is an edit box to adjust the strength of the Proportional falloff.

## Connected

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

## Projected ( 2D)

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## To Sphere

Shapes a selection of objects into the shape of a sphere. The calculation happens with the object origins.

In Object mode this tool requires to have more than one object selected.

### Usage

Select the objects, activate the tool, then drag the mouse in the 3D viewport. In the header you will read the current factor then. Which tells you how close you are towards the sphere shape.

### Last Operator To Sphere

#### Factor

The factor to transform the selection into a sphere form.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### Proportional Falloff

Adjust the falloff methods.

#### Proportional Size

See and adjust the falloff radius.

#### Connected

The proportional falloff gets calculated for connected parts only.

#### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Shear

Shear shears the selection.

In Object mode this tool requires to have more than one object selected.

### Last Operator Shear

#### Offset

Adjust an offset.

#### Shear Axis

The shear tool works along a imaginary 2d plane. The shear axis controls if the items are sheared along the x or the y axes of this plane. This is the plane along which the transformation happens. You can shear along the x or the y axis of this plane.

To make things even more complicated, the orientation of this imaginary plane is defined by the Axis and Axis Ortho items below.

### Axis

Defines one axis of the imaginary shear axis plane.

### Axis Ortho

Defines the other axis of the imaginary shear axis plane.

### Orientation

Choose the orientation for the shear action.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Push/Pull

It pushes or pulls the object positions relative to the center of the selection.

In Object mode this tool requires to have more than one object selected.

### Last Operator Push/Pull

### Factor

Adjust the strength of influence of the tool.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

## Proportional Falloff

Adjust the falloff methods.

## Proportional Size

See and adjust the falloff radius.

## Connected

The proportional falloff gets calculated for connected parts only.

## Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Scale Feather

Scale feather weight for the selected points.

The curve type that is used to create mask splines is almost a Bezier curve. But it has some differences. Smooth edges of the mask are defined by feathering. The curve needed to support feathering in a way that stuck to the curve as you edited it, for ease of editing an animation. These are called S-Curves.

Besides the handles, every control point also has points that define the feather between the current point and the next point on the spline. Each feather point is stored in UV space, where U means position across spline segment, and V means distance between main spline and feather points.

## Last Operator Transform

### Values

Adjust the scale amount.

X, Y and Z defines the position. W defines the rotation.

### Axis

Around which axis to rotate. X, Y or Z.

### Orientation

Orientation is a drop-down box where you can choose the type of orientation for the transform action.

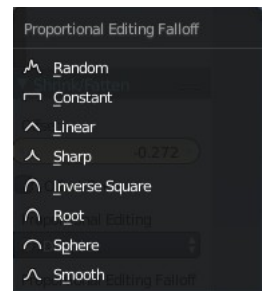

## Proportional Editing

Proportional Editing is a drop-down box where you can choose to use proportional editing. When you choose one of the active methods then the neighbor geometry gets influenced too in a proportional way.

## **Proportional Editing Falloff**

Proportional Editing Falloff is a drop-down box where you can choose a method for the falloff for the proportional editing.

## **Proportional size**

Proportional size is an edit box to adjust the strength of the Proportional falloff.

## **Connected**

Just edit geometry that is directly connected with the current selection. 4 Bforartists 2 Reference Manual - 7.1.4 Editors - 3D View - Header - Navigation Menu

## **Projected ( 2D)**

Edit geometry that is in 2d space aligned with the current selection. This one goes from the current view in depth direction.

## **Clear Feather Weight**

Reset the feather weight to zero.

---

## **Duplicate**

Duplicates the selected curve and moves it.

## **Delete**

Deletes the selected mask curve point.

## **Copy Splines**

Copies the currently selected spline.

## **Paste Splines**

Pastes a copied spline.

## **Make Parent**

Set the mask's parenting.

## **Clear Parent**

Clears the mask's parenting.

## **Toggle Cyclic**

Make the spline closed or open.

## **Switch Direction**

Switch the direction in which the spline points. A spline has a direction. A starting point and an endpoint. By switching the starting point becomes the end point, the end point becomes the starting point.

## Recalc Normals

Recalculate the direction of the selected spline handlers.

## Set Handle Type

In this sub menu you can set the handle type for the currently selected spline points.

## Animation

### Insert Shape Key

Inserts a shape key keyframe.

The inserted keyframes can then be found in the dope sheet editor in mask mode.

### Clear Shape Key

Clears an existing shape key keyframe.

### Reset Feather Animation

Resets the feather offset across all animated frames.

### Re-key Shape points

Recalculate animation data on selected points for frames selected in the dope sheet.

## Show / Hide

### Show Hidden

Reveals all hidden curves

### Hide Selected

Hides the selected curve.

### Hide Unselected

Hides the unselected curves.

### Last operator Hide Layer

#### Unselected

Hide selected or unselected curves.

## Movie Clip Editor - Header

The Movie Clip Editor has two modes, and is three editors in one. So we have to explain the single header tools and options at a one by one base.

## Movie Clip prop

Available in Tracking in Clip mode and Mask mode.

This property contains the list of loaded movie clips. When no movie clip is loaded or active, then it displays the Open Buttons. When a movie clip is loaded and active, then it displays the name of the currently active movie clip.

From left to right ...

### List of clips in the scene

This is a list of the movie clips in the scene. Allows you to witch to other images.

### Search form

Search for specific clips.

### Clip Edit Box

The name of the currently selected movie clip. You can rename the movie clip here too.

### Number of Fake Users

In case this file has a fake user assigned, then this number displays the number of fake users.

### Fake User

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Open

Open a new movie clip.

## Remove

Removes the movie clip. Note that it will not be removed when it has a fake user assigned. Then the clip becomes simply inactive. You can still use it from the list again.

## Info String

Available in Tracking in Clip mode.

A string, giving you some informations about the scene. In this case the number of solve errors for the current tracking.

## Pivot Point

Available in Tracking in Clip mode and Mask mode.

Adjust the pivot point for transform operations. The names should be self explaining.

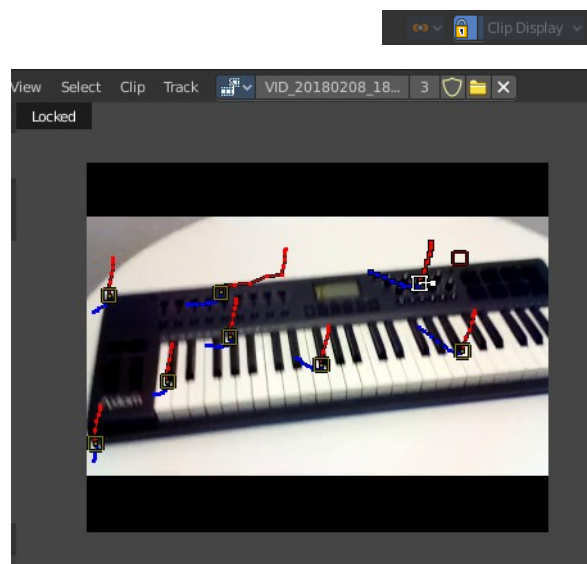

## Lock to Selection

Available in Tracking in Clip mode.

With lock to selection disabled the viewport stands still and the markers moves. With lock to selection enabled the view is centered at the current selected marker, and the video moves around.

Available in Tracking in Clip mode and Mask mode.

## Mask Display

Available in Mask mode.

These are display options for mask overlays.

### Mask Display

#### Spline

Display spline overlays.

#### Edge Display

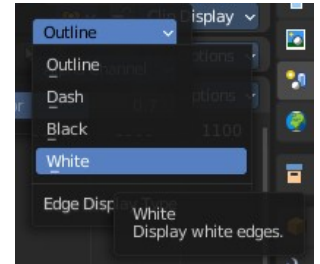

Changes the spline overlay to outline, dash, black or white edges.

#### Overlay

Displays an overlay overlays.

#### Overlay Mode

Show combined color channels or alpha channel. When using combined, the Blending Factor slider can be changed.

## Clip Display

Available in Tracking in Clip mode and Mask mode.

Display options for the tracking footage.

### Clip Display

#### R G B

Display the red green and blue channels of the footage

#### BW

Display the footage in black and white.

#### Mute Footage

Hide the footage.

#### Render Undistorted

Render Preview undistorted.

## **Show Metadata**

Shows the metadata of the clip if available.

## **Show Stable**

Show stable footage in editor. Stabilization needs to be enabled.

## **Grid**

Displays a red grid over the footage that displays the lens distortion.

## **Calibration**

Use manual calibration helpers.

## **Display Aspect Ratio X Y**

The aspect ratio to display the footage.

## **Marker Display**

### **Pattern**

Displays the rectangles around the markers.

### **Search**

Shows a search bound box around the currently selected marker.

### **Path**

Shows the paths for the markers.

### ***Length***

How much of the path is displayed before and after the current position in the movie clip.

### **Show Disabled**

Show also disabled markers.

### **Info**

Displays an information string at the currently selected markers.

### **3D Markers**

Displays a green dot at the center of the marker.

### **Display Thin**

Displays the markers, marker widgets and marker lines with thin lines.

## Mask Display

Available in Tracking in the Mask mode.

### Mask Display

#### Spline

Show splines in as a mask overlay

#### Edge Display Type

A drop down that shows the different spline mask overlay types.

#### Outline

Display white edges with a black outline.

#### Dash

Display dashed black-white edges.

#### Black

Display black edges.

#### White

Display white edges.

#### Overlay

Show mask overlays.

#### Overlay Mode

A drop down that shows different mask overlay types.

#### Alpha Channel

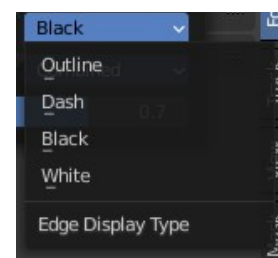

Show the alpha channel of the mask.

#### Combined

Show the combined space background of the image in the mask

#### Blending Factor

When combined is activated, you can control the overlay blending factor of rasterized masks.

## Marker Tools

Available in Tracking mode in Graph and Dope sheet mode.

Tools to refine and modify the markers.

### Refine Markers Backwards

Refine selected markers position by running the tracker from tracks reference to current frame.

### Clear Track Path Backwards

Clear tracks before the current position.

### Track Markers Backwards

Track selected markers backwards.

### Track Markers Sequence Backwards

Track selected marker sequence backwards.

### Track Markers Sequence Forwards

Track selected marker sequence forwards.

### Track Markers Forwards

Track selected markers forwards.

### Clear Track Path Forwards

Clear tracks after the current position.

### Refine Markers Forwards

Refine selected markers position by running the tracker from tracks reference to current frame.

## Graph editor Options

### Only selected

Only display channels relating to the current objects and data.

### Display Hidden

Display also channels from objects/bones that are not visible.

## Show Frames

Show curve for per frame average error. Camera motion should be solved first.

## Show Track Motion

Display the speed curves for the selected tracks. Red is X direction. Green is Y direction.

## Show Tracks Error

Display the reprojection error curve for the selected tracks.

## Options panel

### Show Seconds

Option. Display the timeline numbering in seconds instead of frames.

### Sync Visible Range

Option. Synchronize the visible timeline range with other time based editors.

## Dopesheet editor Options

### Only selected

Only display channels relating to the current objects and data.

### Display Hidden

Display also channels from objects/bones that are not visible.

### Dope sheet Sort Field

Sort the list of the tracks by chosen method.

### Invert

Invert the sort order of dope sheet channels.

## Options panel

### Show Seconds

Option. Display the timeline numbering in seconds instead of frames.

0+16 1+08 2+00 2+16 3+08 3+23 4+

## Sync Visible Range

Option. Synchronize the visible timeline range with other time based editors.

## Proportional Editing

### Proportional Editing

Enables proportional editing.

Proportional Editing is a way of transforming selected elements (such as vertices, or in this case the handlers for the mask spline curves) while having that transformation affect other nearby elements with a falloff. For example, moving a single vertex will move unselected vertices within a given range. And the falloff means that selected vertices that are closer to the selected vertex will move more than those farther from it.

### Settings

Choose between different falloff methods for the proportional editing. The settings are hidden when you have proportional editing off.

## Mask Prop

### Mask Prop

When you are in Mask mode then you can create a new mask, and work with this mask then.

Masks have many purposes. They can be used to mask out, or influence a particular object in the footage in Motion tracking. They can be used for manual rotoscoping to pull a particular object out of the footage. They can be used as a rough matte for green-screen keying.

Masks are independent from a particular image of movie clip, and so they can also be used for creating motion graphics or other effects in the compositor.

Masks can be driven over the time so that they follow some object from the footage. For example a running actor. This can be achieved with shape keys or parenting the mask to tracking markers.

### List of Masks

This is a list of the masks in the scene. Allows you to switch to other masks.

## Mask Edit Box

The name of the currently selected mask. And you can rename the image mask too.

## Fake User

With this button you assign a fake user to this selected mask. Masks get created with a fake user already. Means when you save the scene and reopen it, then this mask will still be there.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

## Search form

Search for specific masks.

# Mask Display

## Mask Display

In Mask mode and with a Render result. Adjust the display of the mask.

## Smooth

Smoothens the outline of the mask curve.

## Overlay

When it's a closed curve then this closed area gets displayed as filled where it covers the image. When you tick Overlay then a second drop down box becomes active.

## Edge Display Type

The mask curve can be displayed in different styles.

# Gizmo

## Show Gizmo

Show or hide all gizmos in the editor.

## Viewport Gizmos

### Navigate

Show or hide the Navigate Gizmo.

# 15.1.2 Editors - Movie Clip Editor - Header - Quick Menu

## Table of content

- Quick Menu..... 1
  - Adding an operator to the Quick menu..... 1
  - Adding a menu to the Quick menu..... 1
  - Order..... 2
  - Removing an operator from the Quick menu..... 2
  - Context and mode dependent content..... 2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## Movie Clip Editor Modes

The Movie Clip Editor is three editors in one. And the Clip editor in mask mode looks also different. So we need to explain the content for all three editor types plus the Mask mode.

## View Menu in Tracking mode in Clip sub mode

The View menu contains all View related tools.

## Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Adjust Last Operation

Shows the adjust last operation panel down left.

## Frame Selected

Zooms to the selection.

## View All

View all zooms in or out in the viewport until all selected objects are displayed fitting in the viewport.

## View Fit

View all zooms in or out in the viewport to fit the current selection into the viewport.

## Center View to Cursor

Center Cursor centers the view to the 2D cursor.

## Annotations (Legacy)

This group of operators is useful to take notes without changing tool-shelf operators. These notes can be colored in the View tab of the Property Shelf. Each layer is a single color. You can also animate the notes with keyframes, editable in the dopesheet.

**Note:** These are legacy operators, meaning they are equally available in the Toolshelf as a modal operator.

## ***Draw Annotation***

Starts the annotation free hand draw tool in the editor.

## ***Draw Line Annotation***

Starts the annotation line draw tool to draw straight lines in the editor.

## ***Draw Polyline Annotation***

Starts the annotation Polyline draw tool in the editor which allows to draw multiple connected straight lines in the editor.

## ***Erase Annotation***

Starts the annotation erase tool in the editor which erases any strokes in the editor.

## ***Add Annotation Layer***

Starts a new annotation layer.

## ***Erase Annotation Active Keyframe***

Erases the active keyframe of the annotation.

---

## **Zoom In**

Zooms into the view.

## **Zoom Out**

Zooms out of the view.

## **Fractional Zoom**

A set of predefined zoom factors.

---

## **Pie menus**

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Close the area window.

# View Menu in in Tracking mode in Graph sub mode

The View menu contains all View related tools.

## Frame Selected

Centers the view at the current frame(s).

## Frame All

Views all content, zoomed in to fit into the viewport.

## Zoom In + Zoom Out

Zoom in and out in the viewport.

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Close the area window.

## View Menu in in Tracking mode in Dopesheet sub mode

The View menu contains all View related tools.

## Frame All

Show all content, zoomed to fit into the viewport.

## Zoom In + Zoom Out

Zooms in and out in the viewport.

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

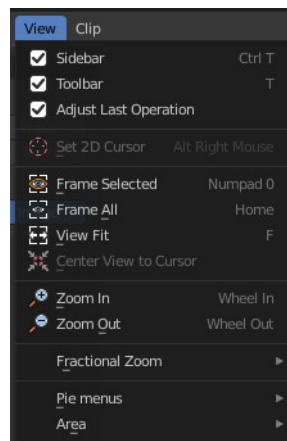

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Close the area window.

# View Menu in Mask mode

The View menu contains all View related tools.

## Toolbar

Shows or hides the toolbar at the left.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Adjust Last Operation

Shows the adjust last operation panel down left.

## Set 2D Cursor

The 2D cursor is the center for mask creation and modification. Hotkey only tool! Please use the hotkey!

## Frame Selected

Zooms to the selection.

## View All

View all zooms in or out in the viewport until all selected objects are displayed fitting in the viewport.

## View Fit

View all zooms in or out in the viewport to fit the current selection into the viewport.

## Center View to Cursor

Center Cursor centers the view to the 2D cursor.

## Zoom In

Zooms into the view.

## Zoom Out

Zooms out of the view.

## Fractional Zoom

A set of predefined zoom factors.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Close the area window.

## 15.1.4 Editors - Movie Clip Editor - Header - Select Menu

# Movie Clip Editor Modes

The Movie Clip Editor is three editors in one. And the Clip editor in mask mode looks also different. So we need to explain the content for all editor types plus the Mask mode that has a Select menu.

The Dope sheet mode has no Select menu.

## Select Menu in Tracking mode in Clip sub mode

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Box Select

Draw a rectangle to box select markers.

It adds to selection by default. To subtract from selection hold down Shift key.

### Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

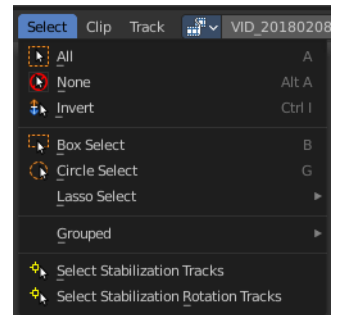

### Lasso Select

A sub menu with the available lasso select modes.

### Grouped

Here you can select objects that are in the same group by the chosen method. The items should be self explaining.

## Select Stabilization tracks

Select the tracks that are used for translation stabilization.

## Select Stabilization Rotation tracks

Select the tracks that are used for rotation stabilization.

# Select Menu in Tracking mode in Graph sub mode

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Box Select

Draw a rectangle to box select markers.

It adds to selection by default. To subtract from selection hold down Shift key.

# Select Menu in Mask mode

Note that you need to have a mask so that the content becomes active.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Box Select

Draw a rectangle to box select markers.

It adds to selection by default. To subtract from selection hold down Shift key.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Lasso Select

A sub menu with the available lasso select modes.

## Linked

Select all curve points that are linked to the already selected points.

## More

Increase the selection by one point.

## Less

Decrease the selection by one point.

## 15.1.5 Editors - Movie Clip Editor - Header - Tracking Mode - Clip Submode - Clip Menu

### Table of content

Clip Menu.....	1
Open Clip.....	1
Set Scene Frames.....	1
Prefetch Frames.....	1
Reload Clip.....	1
Set as Background.....	1
Setup Tracking Scene.....	1

## Clip Menu

### Open Clip

Opens an Image Sequence or a movie clip.

### Set Scene Frames

Set the start and end frame of the frames to match the start and end frame of the clips.

### Prefetch Frames

Prefetch frames from disk for faster playback and/or tracking.

### Reload Clip

Reloads the movie clip.

### Set as Background

Set the current movie clip as the camera background in the 3d view.

### Setup Tracking Scene

Prepare the scene fro compositing 3d objects into this footage.

# Track Menu

Contains tracking functionality. Note that lots of this content is currently a double entry to the content in the tool shelf. The tool shelf content will most probably vanish in the future, in favour of a tool shelf with buttons like in the 3d view.

## Transform

Track navigation.

## Move

Move the selected track(s).

### *Last Operator Move Last*

#### Move X Y Z

The transform values. Set x and y position of the track. Z value has no influence.

#### Axis Ortho

Defines the other axis of an imaginary shear axis plane.

#### Orientation

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Resize

Resize the selected track(s).

### **Last Operator Resize Last**

#### **Resize X Y Z**

The transform values. Set x and y position of the track. Z value has no influence.

#### **Orientation**

Choose the orientation for the shear action.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

## ***Proportional Size***

See and adjust the falloff radius.

## ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Reconstruction**

This menu once contained nothing but double menu entries that can be found in the panels. It is part of the Blender menu structure. And a add-on may add an entry here. So it remains for compatibility reasons.

---

## **Track Motion**

### **Backwards**

Track backwards the whole range.

### **Frame Backwards**

Track backwards frame wise.

### **Forwards**

Track forwards the whole range.

### **Frame Forwards**

Track forwards frame wise.

---

## **Clear**

### **Before**

Clears track paths before the current position.

### **After**

Clears track paths after the current position.

## Track Path

Clears the currently active Track Path.

## Solution

Clears all calculated data.

---

## Refine

### Backwards

Refine selectet marker positions forwards.

### Backwards

Refine selectet marker positions forwards.

---

## Add Marker

Add a marker. The marker will appear under the mouse, and stick until you click.

## Detect Features

Adds automatically markers at the current movie position, and tries to detect marcant areas in the current frame that are useful for tracking. It also sets keyframes at this position.

When enough marcant areas are available then it adds up to eight markers that way.

## Last Operator Detect Features

### Placement

Placement is a drop down box where you can limit the placement of the markers.

## Whole frame

The markers can be at every position of the current frame image.

## Inside Grease Pencil

The markers have to be inside the Grease Pencil.

## Outside Grease Pencil

The markers have to be outside Grease Pencil.

## Margin

Gives a margin to the border of the frame image. Markers have to stay away from the border by the given amount.

## Threshold

The threshold level to consider the current position of the marker as good enough for tracking.

## Distance

The minimum distance between two markers.

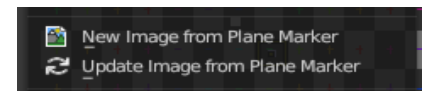

## Create Plane Track

Creates a plane track. A plane track can be used to map an image or a movie at an area in your clip. The Plane track.

---

## New Image from Plane Marker

Create new image from the content of the plane marker from the pixels of the movie clip that the plane marker “sees” at the current frame. This allows you to create and impose an un-warped texture of any flat surface in the footage.

To use, create and select four tracking points then create a Plane Marker. Once you’ve selected the Plane Marker, create the new image - then edit the image in the Image Editor.

## Update Image from Plane Marker

Update current image used by plane marker from the content of the plane marker. This updates the pixels of the active Plane Track’s image.

Allows you to update the texture of any flat surface in the footage.

---

## Solve Camera Motion

Starts the calculation for the camera motion to match the track motion.

There should be at least eight common tracks on the both of the selected keyframes.

There should be noticeable parallax effects between these two keyframes.

The average re-projection error is reported to the information space and to the clip editor header. Re-projection error means the average distance between reconstructed 3D position of tracks projected back to footage and original position of tracks. Re-projection error below 0.3 means accurate re-projection, (0.3 - 3.0) means quite nice solving which still can be used. Values above 3 means some tracks should be tracked more accurately, or that values for focal length or distortion coefficients were set incorrectly.

## Join Tracks

Joins selected tracks.

## Copy

Copy selected tracks to clipboard.

## Paste

Pastes selected tracks from clipboard.

## Copy Settings to Defaults

Copies track settings from active track to default settings.

## Apply default settings

Copy tracking settings from active tracks to selected tracks. You need to select the source track first, then hold down shift, then select the target track. Then perform copy track settings.

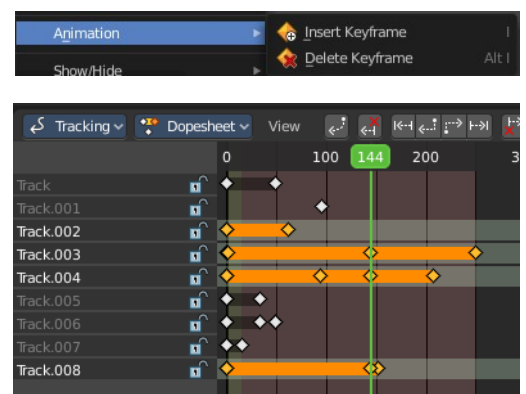

## Animation

### Insert Keyframe

Inserts a keyframe at current position in spreadsheet sub mode panel.

### Delete Keyframe

Deletes keyframes at current position in dope sheet sub mode panel.

## Show/Hide

Show or hide tracks.

### Show Hidden

Show all hidden tracks.

## Hide Selected

Hide the selected tracks.

## Hide Unselected

Hide the unselected tracks.

## Last operator Hide Tracks

### *Unselected*

Hide selected or unselected tracks.

---

## Clean up

### Clean Tracks

Clean tracks with high error values or few frames.

### Filter Tracks

Filter out tracks that has weird looking spikes in motion curves.

---

## Delete Track

Delete the selected track.

## Delete Marker

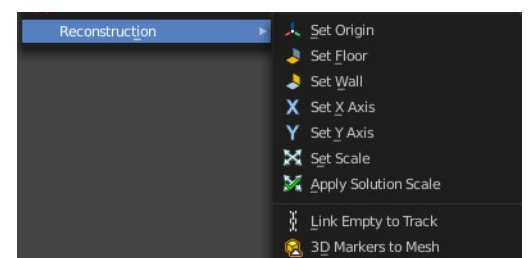

Delete the selected marker.

---

## Reconstruction

### Set Origin

Set active marker as origin in 3D space.

## ***Last Operator Set Origin***

### **Use Median**

Set Origin to Median Point of selected bundles.

---

## **Set Floor**

Set plane in the 3D space as a Floor plane, based at three selected markers. You need to have three markers selected. Or you will get an error message.

## **Set Wall**

Set plane in the 3D space as a Wall plane, based at three selected markers.

## ***Last Operator Set Plane***

### **Plane**

A drop down box to choose if you want to set the selected markers as plane or as floor.

---

## **Set X Axis**

Set X axis rotation in 3D space, based at the selected marker. You need to have one marker selected. Or you will get an error.

## **Set Y Axis**

Set X axis rotation in 3D space, based at the selected marker. You need to have one marker selected. Or you will get an error.

## ***Last Operator Set Axis***

### **Axis**

A drop down box to choose if you want to use the axis to X or to Y

---

## **Set Scale**

Set scale of scene by scaling camera, based at two selected markers. You need to have two markers selected. Or you will get an error.

## ***Last Operator Set Scale***

### **Distance**

The distance between two bundles used for scene scaling.

---

## **Apply Scale**

Apply scale to solution.

## ***Last operator Apply Solution Scale***

### **Distance**

The distance between two bundles used for scene scaling.

## **3D Markers to Mesh**

Creates a vertex cloud using the coordinates of the reconstructed tracks.

## **Link Empty to Track**

Creates an Empty which will be copying movement of active track.

# 15.1.7 Editors - Movie Clip Editor - Header - Tracking Mode - Graph Submode - Graph Menu

## Track Menu

### Delete Curve

Deletes the track that correspondent to the current curve.

### Delete Knot

Deletes the selected curve points.

### Clear Track Path Remained

Clears the track path after the current position.

### Clear Track Path Up To

Clears the track path up to the current position.

### Clear Track Path All

Clears the complete track path.

### Disable Markers

Disables the selected curve points.

## **Move**

Moves the selected curve points.

## **Rotate**

Rotates the selected curve points.

## **Resize**

Scales the selected curve points.

Last operator Add Vertex and Slide.....	2
Location X Y.....	2

## Add Menu

Masking can be done by using curves. In the Add menu you will find two spline primitives. You can choose between a circle Bezier curve object and a square Bezier curve object.

You select curve points by clicking with the left mouse button at them. Holding down Shift will add to the selection. Clicking in the off will deselect everything.

### Circle

Adds a Bezier circle that you can use for masking.

This circle element can be modified by right clicking at the handlers and pulling at the handlers until the desired result is achieved. The yellow points are handlers. The whole curve can be moved around with right mouse button. See also Transform sub menu in the Mask menu.

### Last Operator Add Circle

#### Size

The size of the circle.

## ***Location X Y***

The location of the circle.

## **Square**

Adds a Bezier circle that you can use for masking.

This circle element can be modified by right clicking at the handlers and pulling at the handlers until the desired result is achieved. The yellow points are handlers. The whole curve can be moved around with right mouse button. See also Transform sub menu in the Mask menu.

## **Last Operator Add Square**

### ***Size***

The size of the circle.

### ***Location X Y***

The location of the circle.

## **Adding more curve points**

You can add more curve points by holding down ctrl and clicking left at a curve.

You can create a spline from scratch with this method too. Simply hold down Ctrl, click into the viewport, and created your needed spline points. To close the created mask spline use Toggle Cyclic from the mask menu.

## **Last operator Add Vertex and Slide**

### ***Location X Y***

The location of the created spline point.

# 15.1 Editors - Movie Clip Editor - Header

## Table of content

Movie Clip Editor - Header..... 1  
 Header right click menus..... 1  
 Editortype Menu..... 1

## Movie Clip Editor - Header

The Header contains various menus, navigation elements, settings and tools for the viewport.

The header is divided into two areas. Left menus. Right settings.

The Movie Clip Editor is three editors in one. And the Clip editor in mask mode looks also different. So we need to explain the content for all three editor types plus the sub mode mask.

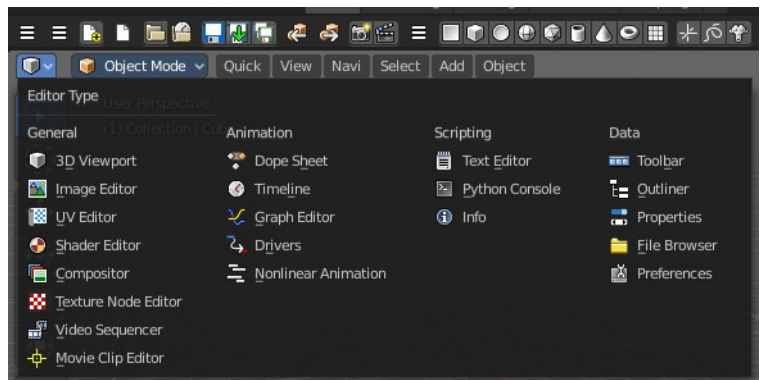

## Header right click menus

The general right click menu functionality is explained in chapter 6 Editors introduction.

## Editortype Menu

Bforartists is made of several editor types. Headers can display a menu where you can switch to other editor types.

This menu is hidden by default. It is meant to edit the layouts, and should not be necessary for regular work. You can reveal it in the header right click menu.

## Track tab - Clip Panel

The Clip panel contains movie related tools.

### Set Scene Frames

Sets the length, means start and end frame of the tracking to match the start and end frame of the active movie.

You can see the length of the active movie in the Properties sidebar in the Footage tab in the Footage Settings panel. And the tracking length and position can be seen and set in the time line.

The default range for tracking is from 1 to 250. But our movie is 295 frames long. Pressing the Set Scene Frames button makes the range going from 1 to 295 here.

## Track tab - Marker Panel

The marker panel contains marker related tools.

## Detect Features

Adds automatically markers at the current movie position, and tries to detect marcant areas in the current frame that are useful for tracking. It also sets keyframes at this position.

When enough marcant areas are available then it adds up to eight markers that way.

## Last Operator Detect Features

### Placement

Placement is a drop down box where you can limit the placement of the markers.

### Whole frame

The markers can be at every position of the current frame image.

### Inside Grease Pencil

The markers have to be inside the Grease Pencil.

### Outside Grease Pencil

The markers have to be outside Grease Pencil.

### Margin

Gives a margin to the border of the frame image. Markers have to stay away from the border by the given amount.

### Threshold

The threshold level to consider the current position of the marker as good enough for tracking.

### Distance

The minimum distance between two markers.

## Add Marker

Adds a marker by hand. First click the tool, then click at the location where you want to place it. You can reposition this marker afterwards by simply clicking at it and move it to a new position.

---

## Enable Markers

Enables the currently selected marker(s).

## Disable Markers

Disables the currently selected marker(s)

## Last operator Disable Markers

### Action

Edit box to choose if you want to enable or disable the selected marker(s).

---

## Delete Marker

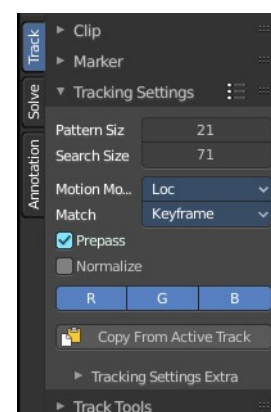

Deletes the currently selected marker(s) data. The track stays available. And the marker is still there too. But cleared.

## Delete Track

Deletes marker, marker data and track data.

## Track tab - Tracking Settings Panel

In the Tracking Settings Panel you will find some settings for Tracking.

## Tracking Presets

In the header is a drop down box to choose between some predefined tracking presets.

+ Button adds a new preset with the current settings. First give the preset a name in the edit box.

- Button removes the current tracking preset.

## Pattern Size

Size of pattern area for newly created tracks.

## Search Size

Size of search area for newly created tracks.

## Motion

Choose between different motion models for tracking.

Loc stands for location. Rot for Rotation, etc.

---

## Match

The pattern match method.

Keyframe matches the tracking from the keyframe.

Previous frame matches the tracking from the previous frame. Regardless if there is a keyframe recorded or not.

## Prepass

Use a Brute Force translation - only initialization when tracking.

## Normalize

Normalize light intensities when tracking.

## R G B

By default all three colors gets used for calculation. But you can enable or disable specific color range.

## Copy from Active Track

Copy tracking settings from active track to default settings

---

## Tracking Settings Extra

Extra settings is a sub menu that contains some not so often used settings.

### Weight

Influence of newly created track on a final solution.

### Correlation

Default minimum value of correlation between matched pattern and reference that is still treated as successful tracking.

### Frames Limit

In every tracking cycle the numbers of given frames are tracked.

### Margin

Default distance from image boundary at which markers stops tracking.

### Use Mask

Use a Grease Pencil data block as a mask.

## Track tab - Track Tools Panel

The tracking tools.

### Track

Track selected markers in chosen direction. Usually you want to play them forward. But you can also track backwards. And by one step.

The two play buttons in the center tracks the whole range. The two outer buttons tracks just frame wise.

**Tip**

To select good points for tracking, use points in the middle of the footage timeline and track backwards and forwards from there. This will provide a greater chance of the marker and point staying in the camera shot.

### Clear

The left button clears the track before the chosen position. The right button clears the track after the chosen position.

### Last Operator Clear Track Path

#### Action

Choose the direction.

Clear up to clears the track before the chosen position.

Clear remained clears the track after the chosen position.

Clear all clears the whole track.

### **Clear active**

When ticked, just the active track gets cleared.

---

## **Refine**

Refine selected marker position in given direction from the current position.

Last operator Refine Markers

### **Backwards**

Refine in backwards directory.

---

## **Merge**

### **Join Track**

Joins selected tracks.

### **Average Tracks**

Averages selected tracks into active.

### **Last Operator Average Tracks**

#### **Keep Original**

Keep the original track.

## **Solve tab - Plane Track Panel**

Create a plane track. A plane track can be used to map an image or a movie at an area in your clip. The Plane track.

A plane track can be used to replace things like billboards and screens on the footage with another image or video. It can also be used for masking.

It is also possible to have some tracks appear and disappear during the time. This required to have two neighbor frames have at least 4 common tracks.

You need to select at least four markers. And the four markers should preferably be at the corners of the area in which you want to map the image or movie.

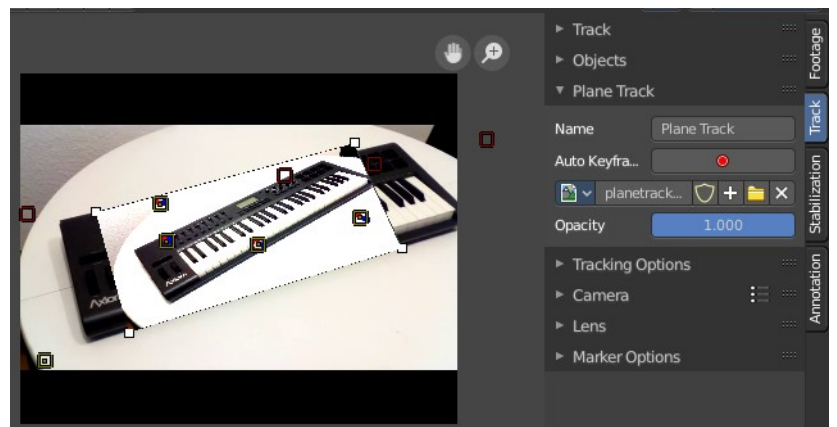

With the left mouse button and clicking at one of the corners of the cage you can move the plane track plane around in the view.

With the right mouse button and clicking at one of the corners of the cage you can move the single corners, and fit the plane into the area of the movie.

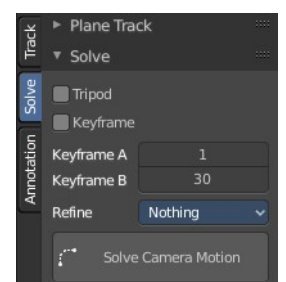

In the sidebar, open the Track tab and the Plane Track panel. Here you can now load an image or movie that gets displayed in this rectangle now, create a new image, or browse for already existing images in the project.

## Solve tab - Solve Panel

The Solve Panel contains functionality around solving the camera motion.

## Tripod

Tripod tracking is a special method to track a stable camera position, and uses special solver. Tripod Motion can be used for footage where the camera does not move and only rotates. Here you can enable Tripod camera tracking. Keyframe A and B are greyed out then.

Note that Tripod behaves different from regular solver. More tracks doesn't imply to have more accuracy. 5-10 solver is recommended.

## Keyframe

Automatically select Keyframes when solving camera / object motion

## Keyframe A

The first keyframe for camera tracking.

## Keyframe B

The last keyframe for camera tracking.

## Refine

Choose between different refine methods.

## Solve Camera Motion

Starts the calculation for the camera motion to match the track motion.

There should be at least eight common tracks on the both of the selected keyframes.

There should be noticeable parallax effects between these two keyframes.

The average re-projection error is reported to the information space and to the clip editor header. Re-projection error means the average distance between reconstructed 3D position of tracks projected back to footage and original position of tracks. Re-projection error below 0.3 means accurate re-projection, (0.3 - 3.0) means quite nice solving which still can be used. Values above 3 means some tracks should be tracked more accurately, or that values for focal length or distortion coefficients were set incorrectly.

## Solve tab - Cleanup Panel

This panel contains tools to clean up tracks.

## Clean Tracks

Cleans tracks with high error values or few frames. The tracks or segments in question can either be selected, or directly removed. Dependent of the settings.

## Last Operator Clean Tracks

### Frames

Adjust the number of "few" frames for clean track. 0 means the feature gets ignored.

### Error

Adjust the error value for Clean Tracks.

See also Last Operator Clean Tracks.

### Select

The action that should happen when you click at Clean Tracks. Default is select.

## Filter Tracks

Removes tracks with too high spikes in their motion curve.

### Last Operator Filter Tracks

#### Track Threshold

Filter threshold to select problematic tracks.

## Solve tab - Geometry Panel

### 3D Markers to Mesh

Creates a vertex cloud using the coordinates of the reconstructed tracks.

### Link Empty to Track

Creates an Empty which will be copying movement of active track.

## Solve tab - Orientation Panel

Here you will find some orientation functionality to match the geometry in the 3D view to the movie.

## Floor

Set plane in the 3D space as a Floor plane, based at three selected markers. You need to have three markers selected. Or you will get an error message.

## Wall

Set plane in the 3D space as a Wall plane, based at three selected markers.

## Last Operator Set Plane

### Plane

A drop down box to choose if you want to set the selected markers as plane or as floor.

---

## Set Origin

Set active marker as origin in 3D space.

## Last Operator Set Origin

### Use Median

Set Origin to Median Point of selected bundles.

---

## Set X Axis

Set X axis rotation in 3D space, based at the selected marker. You need to have one marker selected. Or you will get an error.

## Set Y Axis

Set X axis rotation in 3D space, based at the selected marker. You need to have one marker selected. Or you will get an error.

## Last Operator Set Axis

### Axis

A drop down box to choose if you want to use the axis to X or to Y

---

## Set Scale

Set scale of scene by scaling camera, based at two selected markers. You need to have two markers selected. Or you will get an error.

## Last Operator Set Scale

### *Distance*

The distance between two bundles used for scene scaling.

## Apply Scale

Apply scale to solution.

## Last operator Apply Solution Scale

### *Distance*

The distance between two bundles used for scene scaling.

## Distance

The distance between two bundles used for scene scaling. This setting is a pre value, and gets used for Set Scale as well as for Apply Scale when you perform those tools.

# Solve tab - Scene Setup Panel

## Set as Background

Sets the current movie as background in the 3D view. You need to be in camera view to see the movie in the background.

## Setup Tracking Scene

Prepare Scene for composing 3D objects into this footage.

This feature will create a ground plane, which is used for shadow catching in the rendering.

# Annotation tab

The annotation tool is available in multiple editors. With this tool you can write notes at the screen. The annotate tools is the little brother of the grease pencil object in the 3D view.

Further settings for annotations can be found in the sidebar. Here you can also remove an annotation when you don't longer need it. And here you can also adjust the size of the stroke.

## Draw:

### Draw

Draw free-hand strokes in the main window.

### Erase

Activate the eraser brush.

### Line

Click and drag to create a line.

### Poly

Click multiple times to create multiple connected lines. The current polygon is finished when Esc or RMB is pressed. When you hold down the right mouse button then you can activate and use the eraser tool to remove parts of the polygon again.

### Insert Blank Frame

Insert a blank animation frame at the current position.

### *Last Operator Insert Blank Frame*

#### All Layers

Create a blank frame in all annotation layers, not only in the active.

### Delete Frame(s)

Delete current animation frame.

---

## Data Source

### Clip / Track

Where the annotation stroke comes from. From the movie clip, or from the track.

### Stroke Placement

### View / Cursor

Stick stroke to the view, or to the cursor. The cursor is visible in Mask mode.

## 15.2 Editors - Movie Clip Editor - Tool shelf

### Table of content

Tool Shelf.....	1
Track Tab and Solve Tab in Tracking Mode.....	1
Annotation tab.....	1
Draw.....	1
Draw.....	1
Erase.....	2
Line.....	2
Poly.....	2
Stroke Placement.....	2
View.....	2
Cursor.....	2

## Tool Shelf

The Tool Shelf exists for the Tracking Mode in Clip submodule. And for Mask mode.

In Tracking Mode it contains the tools to do the tracking. And in Mask Mode some mask tool functionality.

The submodes Graph and Dopesheet does not have a tool shelf. Here you can find a list of the tracks instead.

The content is differing, dependant of the mode you are in. Tracking mode has other tools than the Masking mode.

### Track Tab and Solve Tab in Tracking Mode

The track tab contains the tools around the movie side of things. Markers, tracking etc.

The solve tab contains the tools around the scene side of things. Scene setup, camera motion, etc.

### Annotation tab

The Annotation tab contains the usual Annotation tools to draw and erase strokes. The tools should be self explaining

### Draw

#### *Draw*

Draw freehand strokes.

### ***Erase***

Erase strokes.

### ***Line***

Draw a line by clicking at a starting point and then at the end point.

### ***Poly***

Draw a polygon by clicking at the places where a corner should be.

## **Stroke Placement**

### ***View***

Place the strokes relative to the view.

### ***Cursor***

Place the strokes relative to the cursor.

## 15.3.1 Editors - Movie Clip Editor - Sidebar - Footage tab

### Table of content

Preface.....	1
Footage Tab - Metadata Panel.....	1
Footage Tab - Proxy/Time code Panel.....	2
Build Original.....	2
Build Undistorted.....	2
Quality.....	2
Proxy Custom Directory.....	2
Build Proxy / Time code.....	2
Delete Proxy.....	2
Time code Index.....	2
Proxy Size.....	3
Footage Tab - Footage Settings Panel.....	3
File Path.....	3
Color Space.....	3
Start Frame.....	3
Frame Offset.....	3
Footage Information string.....	3

### Preface

Note that the correct mode is Tracking Mode in Clip View. In Graph and Dopesheet View there is no sidebar.

Note also that some panels exists in both modes, tracking and masking. They have sometimes different content though.

### Footage Tab - Metadata Panel

Displays the metadata of the footage if available. The panel stays empty if there is none.

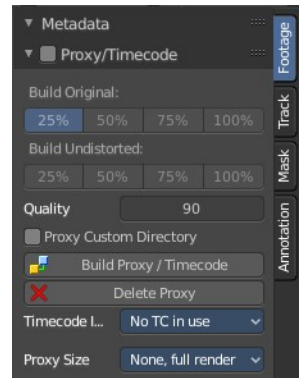

## Footage Tab - Proxy/Time code Panel

This content shows in Tracking Mode and Masking mode.

A proxy is a smaller replacement image for the main image. Think of it as a thumbnail. The creation may take some time. But once done, all other calculations happens much faster. So it can make sense to use proxies for bigger footage.

Make sure to disable the Proxy images before doing the final render!

### Build Original

Define the resolution of the proxy images.

### Build Undistorted

Builds the proxy images from the undistorted original images for the sizes set above.

### Quality

Defines the quality of the JPEG images used for proxies.

### Proxy Custom Directory

By default, all generated proxy images are storing to the <path of original footage>/BL\_proxy/<clip name> folder. Define a custom directory.

### Build Proxy / Time code

(Re)creates the proxy images and the time code.

### Delete Proxy

Deletes the proxy images and the time code.

### Time code Index

When you are working with footage directly copied from a camera without pre-processing it, then there might be a bunch of artifacts. In this case the calculation can give errant result. One way to avoid this is to use the Proxy / Time code option. Another method would be to use a external tool like Mencoder to repair the file header and insert correct keyframes.

#### Note

Record Run is recommended for most needs. But when the clip's file is totally damaged, *Record Run No Gaps* will be the only chance of getting acceptable result.

## Proxy Size

This setting defines which proxy image resolution is used for display in the viewport. If there is no generated proxies, render size is set to “No proxy, full render”.

## Footage Tab - Footage Settings Panel

This content shows in Tracking Mode and Masking mode.

The panel contains some footage related settings.

### File Path

The file path for the currently loaded and active video. Here you can also load another video, or refresh the video.

### Color Space

The color space for the currently loaded and active video.

### Start Frame

The start frame for the currently loaded and active video.

### Frame Offset

Define a frame offset.

### Footage Information string

Here you will find some information about the footage. Size, color mode, fps, current position ...

## 15.3.2 Editors - Movie Clip Editor - Sidebar - Track tab

## Preface

Note that the correct mode is Tracking Mode in Clip View. In Graph and Dopesheet View there is no sidebar.

Note also that most panels just shows in tracking mode, and not in masking mode.

## Track Tab - Track Panel

Marker settings for the currently selected marker.

### Edit Box

Read and edit the name of the currently selected marker.

### Enable

Enable the currently selected marker.

## Lock

Lock the currently selected marker.

## Track Scope

This is a preview image and fine tune window for the currently selected marker. The fade cross stays always in the center, but you can move the image with the left mouse. This automatically records the changed position, and inserts a keyframe at the current position if necessary.

You can pull it vertically bigger by pulling at the handler below the image. And horizontally bigger by pulling out the properties sidebar.

If an anchor is used (the position in the image which is tracking is different from the position which is used for parenting), a preview widget will display the area around the anchor position.

---

## Color Settings

### R, G, B

Use red, green and blue color in the preview image.

### B/W

Use a greyscale preview image.

### Alpha

Use existing alpha channel for preview image.

---

## Weight

The influence of this track to the final solution. Altering the weights of problem tracking markers can correct or greatly reduce undesirable jumps. This parameter can be animated.

## Stab Weight

Stabilization weight. The influence of this track on 2D stabilization.

---

## Average Error

The average error of this marker.

---

## Custom Color

Give the markers different colors. This also affects the list of markers in Dope sheet view.

## Color Preset

A dropdown box to choose between some predefined colors.

## Copy Color

Copy the color of the currently chosen preset.

## Color

When you tick custom color then a color field will appear below. It displays the current custom color, and allows you to change the color by clicking at it. A color picker will appear.

# Track tab - Objects Panel

This content shows in Tracking Mode and Masking mode.

A list of the tracked objects. Usually the camera. But you can track every other object too.

## Add, Remove Tracking Object

The plus and minus buttons at the right allows you to add new objects to the list, or to remove existing objects from the list.

## Search Field

The list field contains a hidden search field. Click at the little + button down left to reveal it.

# Track tab - Plane Track Panel

This content is just active and visible when you have a Plane track in your footage.

See also in the Tool shelf in the Solve tab in the Plane Track panel.

## Name

The name of the Plane track.

## Auto Keyframe

Use Auto Keyframe when moving plane track corners.

## Image prop

### Image browser

See and load images or movies that you want to display inside of the Plane track. Note that this image needs to exist already so that it gets displayed in the list. As an image node for example.

### Edit Box

The name of the current active image or movie. Click at it to change the name.

### Fake User

With this button you assign a fake user to this selected mask. Masks get created with a fake user already. Means when you save the scene and reopen it, then this mask will still be there.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behaviour. An image with a fake user is in fact linked to something. And so it is not lost when you save and reload the scene.

### New Image

Calls a file browser to choose an image or movie.

### Remove

Removes the current active image or movie. It is still in the Image browser though. To delete it completely you can use the Purge command in the File menu in the Cleanup submenu. See also Fake User.

## Opacity

The opacity of the image or movie.

# Track tab - Tracking Options Panel

This content is visible when you have at least one of the markers selected.

## Motion Model

Choose the motion model for the marker.

## Match

Choose the pattern match method.

## Prepass

Use a brute-force translation only pre-track before refinement.

## Normalize

Normalize light intensities while tracking.

## Tracking Options Extras

A sub menu that contains some not so often used settings.

## Correlation

Default minimum value of correlation between matched pattern and reference that is still treated as successful tracking.

## Margin

Default distance from image boundary at which markers stops tracking.

## Use Mask

Use a Grease Pencil data block as a mask.

## Frames Limit

In every tracking cycle the numbers of given frames are tracked.

## Speed

A drop down box to choose the tracking speed. This is just a preview feature. The tracking quality is not affected.

## Track tab - Camera Panel

The settings for the camera with which you have recorded the footage movie. Every camera has some specific settings. And this needs to be calculated too to match the footage to the 3D content.

### Presets

A drop down box to choose between different camera presets. When your camera is not listed then you need to do the settings manually.

### Add Camera Preset

This is at the end of the list. Add a new preset, and give it a name. To remove the preset click at the minus sign besides the preset in the list

### Sensor Width

The width of the CCD Sensor in your used camera. This value can be found in the camera specifications.

### Pixel Aspect

The Pixel Aspect ratio of the CCD Sensor in your used camera. This value can be found in the camera specifications.

This value can also be guessed. For example, when the footage should be 1920×1080, but the images themselves are 1280×1080, then the pixel aspect is:  $1920 / 1280 = 1.5$ .

## Track tab - Camera Panel - Lens Subpanel

This panel belongs to the Camera panel above. Type in your lens values from the camera with which you have recorded your footage movie.

### Focal length

The focal length units with which the movie was shot. You can choose between millimeter and pixel.

### Units

The units to use for the camera focal length.

## Optical center

The optical center. Usually in the middle of the movie. But some cameras also have an offset here.

In most cases it is equal to the image center, but it can be different in some special cases. Check camera/lens specifications in such cases. To set the optical center to the center of image, there is a Return button below the sliders.

## Set Center

Center the optical center.

## Lens Distortion

The lens distortion of your camera. You can choose between two distortion models. Polynomial and Divisions.

Basically, just tweak K1 until solving is most accurate for the known focal length (but also take grid and grease pencil into account to prevent “impossible” distortion).

The brown model also provides P1 and P2 values.

## Track tab - Marker Options Panel

The Marker panel contains the settings for the selected marker(s). Here you can also enable or disable the marker.

### Enabled

Enable the selected marker(s).

### Position

The position of the selected marker(s) in pixel. Zero is down left.

### Offset

You can give the marker handler an offset. So that it gets displayed besides the marker.

### Pattern Area

The handler size.

## Search Area

The size and position of the search area for this marker for tracking.

The search area can be turned on in the Clip Display options in the header up right.

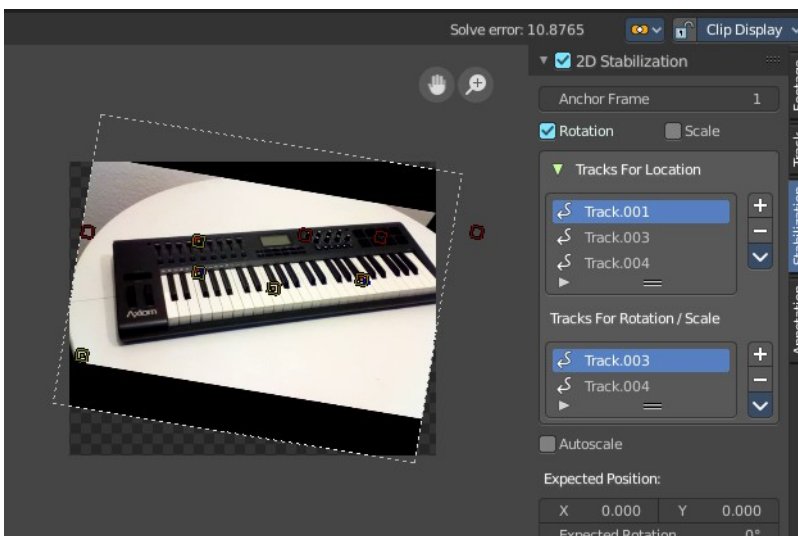

## 15.3.3 Editors - Movie Clip Editor - Sidebar - Tracking Mode - Stabilization tab

### Table of content

Tracking Mode - 2D Stabilization Panel.....	1
Anchor Frame.....	2
Rotation / Scale.....	2
Tracks for Location.....	2
Tracks for Rotation/Scale.....	2
Autoscale.....	2
Max.....	2
Expected Position.....	2
X / Y.....	2
Expected Rotation.....	2
Expected Scale.....	2
Influence.....	3
Interpolate.....	3

## Tracking Mode - 2D Stabilization Panel

The purpose of 2D Stabilization is to smooth out jerky camera handling on existing real world footage. To activate the 2D stabilizer, you need to set the toggle in the panel, and additionally you need to enable *Show Stable* in the Display panel. Then you'll need to set up some tracking points to detect the image movements. And you need to set a proper starting point, the anchor frame.

## Anchor Frame

The first frame of the stabilization.

## Rotation / Scale

Normally you just stabilize the position. Here you can stabilize rotation and scale too. Note that you can't activate scale independently here. It appears when you activate Rotation.

## Tracks for Location

The list of markers that gets used for location stabilization.

With the plus and minus button at the right you can add selected markers, or remove the markers from the list.

## Tracks for Rotation/Scale

The list of markers that gets used for rotation/scale stabilization.

With the plus and minus button at the right you can add selected markers, or remove the markers from the list.

This list is just visible when you have at least Rotation activated.

## Autoscale

The stabilization will lead to areas where the movie doesn't show at the canvas anymore. Autoscale scales the content so that the whole canvas is covered again.

## Max

The maximum value for Autoscale. This slider appears when you activate Autoscale.

## Expected Position

### X / Y

The position of the movie at the canvas.

## Expected Rotation

Rotate the movie at the canvas manually.

## Expected Scale

Scale the movie at the canvas manually. Note that this slider is not showing when you have Autoscale activated.

## Influence

The influence of stabilization algorithm. You can independently adjust location, rotation and scale. When you have rotation off, then the sliders for rotation influence and scale influence are not showing.

Location Influence	1.000
Rotation Influence	1.000
Scale Influence	1.000

## Interpolate

Adjust the interpolation mode for images. For rotation and scale the images needs to be recalculated.

## 15.3.4 Editors - Movie Clip Editor - Sidebar - View tab

### Table of content

Preface.....	1
2D Cursor Tab.....	1
Annotations Panel.....	1
Clip / Track.....	2
Annotations prop.....	2
Drop down box.....	2
Edit Box.....	2
Fake User.....	2
Add Annotation.....	2
Delete Annotation.....	2
List of Annotation Strokes.....	2
Thickness.....	2
Frame Locked/Unlocked.....	3
Delete Active Frame.....	3

### Preface

Note that the correct mode is Tracking Mode in Clip View. In Graph and Dope sheet View there is no sidebar.

Note also that some panels exists in both modes, tracking and masking.

### 2D Cursor Tab

Just shows in Mask mode. Tracking has no 2D cursor.

This panel shows the location of the 2d cursor, based at the lower left corner of the footage image. The edit boxes also allows you to set the cursor position by numeric values.

### Annotations Panel

The Annotations panel is the place to manage the Annotation layers and materials.

When you don't have drawn an annotation yet then the panel just contains a New button.

## Clip / Track

Where the Grease Pencil comes from. From the movie Clip, or from a track.

## Annotations prop

Add, remove and rename new annotations.

## Drop down box

A list of the available annotation layers.

## Edit Box

The name of the current annotation. You can rename the annotation to your needs here.

## Fake User

Assign a fake user to this annotation. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## Add Annotation

Add a new annotation.

## Delete Annotation

Delete the annotation.

---

## List of Annotation Strokes

A list of the Annotation layers for the current Annotation. Every layer can have an own color.

At the right side you find buttons to sort them and to add and remove new Annotation layers.

You can change the color by clicking at the color field. A color dialog will pop up. You can rename annotation layers by double clicking at it.

The eye icon allows you to make it invisible And it has a search field.

---

## Thickness

The thickness of the annotation stroke.

## **Frame Locked/Unlocked**

Lock frame displayed by current layer. This toggles whether the active layer is the only one that can be edited.

## **Delete Active Frame**

This feature is active when there is an animation. Delete the active frame from the active annotations layer.

## 15.3 Editors - Movie Clip Editor - Sidebar

### Table of content

Introduction.....	1
Right Click menus.....	1

### Introduction

The Movie Clip Editor is made of several areas. And it is made of several modes with different editor types.

At the right side you will find the sidebar in Tracking Mode with Clip view. And in Masking mode. In the sidebar you will find further options and settings for the Movie Clip Editor and its tools.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

# Movie Clip Editor

The Movie Clip Editor is the editor where you deal with the footage for motion tracking. Here you load your footage movies, mask them out, set the markers, and calculate the tracks.

## Areas

The Movie Clip editor is divided into several areas has several tool areas. In the Clip editor we have header, tool shelf, sidebar and viewport. In the other modes there is just the header and the viewport.

Yellow – Header

Blue - Tool Shelf

Pink - Sidebar

Note that this editor does not have a tool area above the header. All tool settings are in the sidebar in the Tool tab.

## Modes and Sub modes

The Movie Clip Editor has two modes. Tracking and Mask mode. The tracking mode has three sub modes that reveals three different sub editors.

## Clip, Graph and Dope sheet subeditors

The Movie clip editor is three editors in one. The actual Clip editor, a Graph editor, and a Dope sheet editor. You can switch to the different editor types with the View drop down box in the header.

## Tracking Mode - Clip Subeditor

The clip editor contains the footage related tools and settings. Here you deal with the footage movie. It's the main window that you see in the Motion tracking layout. The Clip Editor is used for tracking.

## Navigation elements

In the upper right corner you will find two navigation elements.

### Pan the View

Pans the view

### Zoom In/Out the View

Zooms in or out.

## Timeline

At the ground you can see a timeline. The green slider can be dragged around. You can set and show the current position in the video.

The timeline shows different colors, dependent of the state for this video area. Pink is the area where the tracking works fine. Red the area where the tracking has too much solve errors to show a useful result.

The green lines marks the Keyframe A and Keyframe B, which is the solve area.

## Tracking Mode - Graph Subeditor

The Graph editor is the place where you can see and deal with the function curves of the recorded tracks for the single markers.

The timeline slider can be moved with the right mouse button. Or with the left mouse button when you grab the handler in the timeline.

## Tracking Mode - Dope sheet Subeditor

The Dope sheet Editor is the place where you deal with the keyframes for the tracks.

## Mask Mode

In Mask mode you can mask out parts of the footage by adding splines and adjust them to cover the needed areas.

Masks have many purposes. They can be used in a motion tracking workflow to mask out, or influence a particular object in the footage. They can be used for manual rotoscoping to pull a particular object out of the footage. Or as a rough matte for green screen keying. This is done in the Node editor in compositing mode by a mask node.

Masks are independent from a particular image of movie clip. And so they can just as well be used for creating motion graphics or other effects in the compositor.

Masks are defined by splines. Means you work with splines, and you have a bunch of spline tools available.

## Navigation elements

In the upper right corner you will find two navigation elements.

### Pan the View

Pans the view

### Zoom In/Out the View

Zooms in or out.

## 2D Cursor

In Mask mode you will see a 2d cursor down left. It is for example the point at which the mask primitives are created. This 2D cursor can be set and moved by hotkey ALT + Right Mouse

### Last Operator Set 2D cursor

Location X / Y

Adjust the position of the 2D cursor.

## Add Vertex and Slide

You can create mask spline primitives from the Add menu. But you can also draw your own mask spline with hotkey Ctrl + Left Mouse.

### Last Operator Add Vertex and Slide

*Location X / Y*

The location of the latest created vertex point.

## Navigating in the viewport

This navigation is valid for all three Movie Clip Editor sub types and both, the tracking mode and the mask mode.

### Hotkeys

Pan the view - MMB

Zoom - Mouse Wheel, MMB+CTRL, Numpad + / -

View All - Home

## Tracking mode - Clip Sub mode - Context menu

When you double right click into the viewport, then you will open a menu. The Context menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual.

Graph and Dope sheet sub modes does not have a context menu.

### Copy Track Settings

Copies track settings from active to selected track. You need to select the source track first, then hold down shift, then select the target track. Then perform copy track settings.

### Copy from Active Track

Copies track settings from active to default settings.

### Copy Color

Copies color to all selected tracks. What color? Ask the Blender developers ...

### Copy Tracks

Copies the selected tracks.

### Paste Tracks

Pastes the selected tracks.

### Disable Markers

Disables the currently selected marker(s)

## Enable Markers

Enables the currently selected marker(s)

## Last operator Disable Markers

### *Action*

Edit box where you can again choose if you want to enable or disable the selected marker(s).

## Hide Tracks

Hides the selected track(s)

## Show Tracks

Shows the selected track(s)

## Last Operator Hide Tracks

### *Unselected*

Hide the unselected tracks.

## Lock Tracks

Locks the selected tracks. You will see the locks in the Dopesheet view.

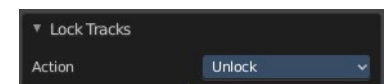

## Unlock Tracks

Unlocks the selected tracks. You will see the locks in the Dopesheet view.

## Last Operator Lock Tracks

### *Action*

Lock or unlock the selected tracks.

## Join Tracks

Joins the selected tracks.

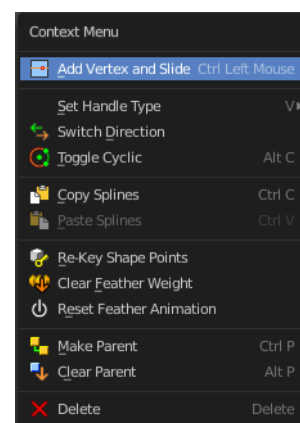

## Delete Track

Deletes the selected tracks.

## Mask mode - Context menu

When you double right click into the viewport, then you will open a menu. The Context menu. Its content is to 100% double content to already existing menus. And it is despite the name not contextual.

This functionality becomes active when you create a mask spline from the Add menu.

### Add Vertex and Slide

Add a vertex with a handle to draw a free hand polygon.

This tool is hotkey only, and should only be used with the mouse.

### Set Handle Type

In this sub menu you can set the handle type for the currently selected spline points.

### Last operator Set Handle Type

#### Type

Choose the handle type again.

### Switch Direction

Switch the direction in which the spline points. A spline has a direction. A starting point and an endpoint. By switching the starting point becomes the end point, the end point becomes the starting point.

### Toggle Cyclic

Make the spline closed or open.

### Copy Splines

Copies the currently selected spline.

### Paste Splines

Pastes a copied spline.

### Re-key Shape Points

Recalculate animation data on selected points for frames selected in the dopesheet.

## Clear Feather Weight

Reset the feather weight to zero.

The curve type that is used to create mask splines is almost a Bézier curve. But it has some differences. Smooth edges of the mask are defined by feathering. The curve needed to support feathering in a way that stuck to the curve as you edited it, for ease of editing an animation. These are called S-Curves.

Besides the handles, every control point also has points that define the feather between the current point and the next point on the spline. Each feather point is stored in UV space, where U means position across spline segment, and V means distance between main spline and feather points.

## Reset Feather Animation

Resets the feather offset across all animated frames.

## Make Parent

Set the mask's parenting.

## Clear Parent

Clears the mask's parenting.

## Delete

Deletes the selected mask curve point.

## Tracking Introduction

Match moving is a cinematic technique that allows the insertion of computer graphics into live-action footage ( a movie ) with correct position, scale, orientation, and motion relative to the objects in the shot. And this is what motion tracking does.

Bforartists motion tracker supports tools for 2D tracking and 3D motion tracking. This includes camera tracking and object tracking, as well as some special features like the plane track for compositing. Tracks can also be used to move and deform masks for rotoscoping in the Mask Editor. This is available as a special mode in the Movie Clip Editor.

## Manual Lens Calibration

All cameras record distorted video. That's how optical lenses work. For accurate camera motion you need the exact value of the focal length and the “strength” of distortion.

Focal length can only be automatically obtained from the camera's settings or from the EXIF information. Both is not necessarily available. There are some tools which can help to find approximate values to compensate for distortion. There are also fully manual tools where you can use a grid which is getting affected by distortion model and deformed cells defines straight lines in the footage.

You can also use the grease pencil for this – just draw a line which should be straight on the footage using poly line brush and adjust the distortion values to make the grease pencil match lines on the footage.

To calibrate your camera more accurately, use the grid calibration tool from OpenCV. OpenCV is using the same distortion model, so it should not be a problem.

## Camera and Object Motion Solving

Bforartists supports the solving of camera motion, including tripod shots,. It includes also the solving of object motion in relation to the motion of the camera. In addition to that there is the Plane Track, which solves the motion of all markers on one plane.

## Tools for Scene Orientation and Stabilization

After solve, you need to orient the real scene in the 3D scene for more convenient compositing. There are tools to define the floor, the scene origin, and the X/Y axes to perform scene orientation.

Sometimes, the video footage includes spurious jumps and tilting movements, like e.g. when using a hand held camera. Based on some tracked image elements, the 2D Stabilization is able to detect and compensate such movements to improve the quality of the final result.

## Marker

A marker is a tracking point in the movie. A point where the position of the pixel underneath the marker gets tracked. That's where the camera tries to follow the motion.

Each marker is represented by a rectangle. You can insert a marker by hand or automatically with the Detect feature.

When you select a marker then it will be displayed with handlers. One in each corner, and a straight line from the center of the marker. This Handlers can be manipulated with the mouse.

The handlers in the corners allows to distort the marker, to fit it to distortions in the movie.

The straight handler from the center allows you to rotate and scale the marker.

Every marker has also a search area, where the searching for the tracking happens.

The search area can be enabled in the Marker Display panel in the Properties Sidebar.

This area usually scales with the marker. To scale this search area separately you can use the handlers of this search area.

Or you can scale the marker only by pressing the scale hotkey twice.

## Track

A track is the recorded movement of a marker. The movement is recorded in keyframes and curves. Once recorded you can see the track for the markers in the Dopesheet editor in the Movie Clip Editor.

And you can see the curves for this track(s) in the Graph editor.

## Quick Favourites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favourites menu entry.

The Quick Menu is empty by default. With Add to Quick favourites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Movie Clip Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider. here the incremental snapping happens by the frame rate that you have defined. With a frame rate of 24 it will snap in steps of 24 frames when holding down ctrl.

## Short tutorial

There are too many steps involved to get Motion tracking working. You can't figure it out by your own, nothing is self explaining. So here comes a short workflow tutorial.

Note that we will just cover some of the basics here, some first steps. And we describe the setup for a ground tracking case here. I would suggest to search for a Blender tracking tutorial for more details.

## Preparing the video

Load a video.

Set the frame to the one where you want to start the tracking. The range of the movie to work with can be set in the Timeline at the bottom of the layout. I have chosen frame 90 to 120 here. Since especially the first frames of my example movie were very blurry.

Click the Detect Features button in the tool shelf in the Track tab in the Marker panel. This sets some markers automatically, and adds tracks in the movie clip editor in dopesheet mode. Every track represents one marker.

You can add a few more markers manually with the Add Marker button, and place them at marcant locations in the current image of the movie. Borders or Corners for example. To do so, click the Add Marker button, then click in the image. We need minimum eight markers to have enough stability. The Add Marker button is below the Detect Features button.

Selected markers can be moved with the left mouse. You can fine tune the position of the marker in the Track panel in the Properties sidebar. Simply move the image there to the required position.

Now choose a camera preset in the properties sidebar in the Camera Data panel. If unsure, and your camera isn't listed, select Blender. The presets can be found in the header.

Or type in the values manually. Sensor and Optical Center ...

Select all markers.

Click the Track Forward button in the Track panel. This records everything. And you get data in the Graph Editor view. Blue and red lines for every marker.

Some markers may go crazy at this point. Motion means blurry graphics. And then a marker can loose its tracking position. Or the tracking point moves out of the visible area.

You can either remove such markers after tracking when you have enough working tracks left. Remember we need eight valid tracks. You can also try to add new markers, and repeat the procedure with this new markers.

Or you can manually adjust the markers, and add a keyframe where they loose their position. Scroll to the frames where the marker is loosing its position, move it back into location, and add a keyframe for it. Adding keyframes is done in the Track menu.

## Tracking the object

This was the preparation of the movie material. Now for the tracking part. We need a camera. And something to track. A cube will do it for now.

In the 3D view, create or select the object that you want to track.

Now go into camera view, and adjust it so that it shows the content somehow in the center. Our cube for example.

Go to the solve tab into the solve panel. First adjust the range. I had tracked frame 90 to frame 120. So the default of 1 and 30 will not work since there are no keyframes for the markers at this position. And so you will get an error.

When done click at the solve camera motion button. This calculates the camera motion.

In the solve tab in the Scene Setup panel click at Set as Background. This will show our movie as background now in the 3D view in the camera view.

In the solve tab in the Geometry panel, click at 3D Markers to Mesh. You can also click Link Empty to Track. This will create an empty where you can parent things at.

Then click at Setup Tracking Scene below the Set as Background button. This will create a ground plane, which is used for shadow catching in the rendering. And now our object should already follow the motion of the movie when you play back.

## Orientation and dimensions

In the solve tab you can find the Orientation panel. This allows you to adjust the orientation of the object along marker points. Select three of your markers, and click at Floor, and the object will orient along this three points.

This may or may not lead to useful results. In our case it didn't. Even after selecting other markers. So we need to rotate our object manually.

## Reloading a project

When you save your project and reload it then you might notice that the Movie Clip editor loads empty. This is because Bforartists has by default "Load UI" unticked. The UI does not load from the previous project. And so it looks like the movie is missing and the project is empty.

There is nothing missing. You just need to select the movie again in the dropdown box at the top.

You can also tick Load UI in the file browser when you load the blend file.

When you work more often with motion tracking, then you might want to activate Load UI in the user preferences permanently.

## Introduction

The header contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

The text menus are covered in an own chapter each. They vary too much, dependent of mode and object type.

## Header Tabs

The tabs at the very left allows you to switch between the four most important editor types by one click. Dope sheet Editor, Graph Editor, Driver Editor, NLA Editor.

## Dope Sheet Modes

The Dope sheet has different modes. Each mode has its own purpose. In Mask mode you can for example see and edit the keyframes for mask animations, from the movie clip editor for example.

### Dope Sheet

Display the keyframe animation of all currently selected object in the 3d view.

## Action Editor

Display and edit the Action part of a keyframe animation of the currently active object in the 3d view. Just the data for this one object is displayed.

*Actions* are a generic containers for F-Curves. Actions can contain any number of F-Curves, and can be attached to any data block. For example, an action that modifies the 'X location' and 'Y location' properties can be shared across multiple objects, since both objects have 'X location' and 'Y location' properties available.

The Action editor allows you to edit the animation in various ways. For example also turn a keyframe animation into a clip for the NLA editor.

The animation data is build in a hierarchical way. From top to bottom.

Actions - Record and contain animation data.

Groups - Are groups of channels.

Channels - Contains record properties.

F-Curves - F-Curves are used to interpolate the difference between the keyframes.

Keyframes - Keyframes are used to set the values of properties bound to a point in time.

## Shape Key Editor

Display and and edit the keyframes for shape key animations. Shape keys is vertex animation.

## Grease Pencil

Display and and edit the keyframes for animated grease pencil strokes. This mode is for when you animate grease pencil strokes and colors at a vertex level. When you record

keyframes at an object level then those keyframes gets displayed in the Dope sheet and Action mode.

## Mask

Display and edit the keyframes for animated mask curves. Like from the movie clip editor.

## Cache File

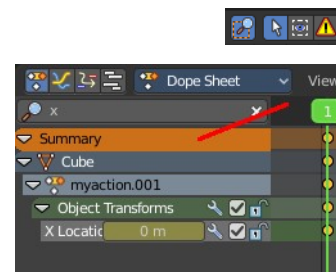

NOT DOCUMENTED BY BLENDER. NOT TO FIND OUT HOW TO USE.

From the Blender Manual: Cache File: Alembic Todo 2.78.

## Show Hide elements

### Summary

Display the Summary label above the list of elements.

### Only Show Selected

Display only the data for the selected object in the list of elements. If off it displays all available animation data of the whole scene.

### Show Hidden

Include channels from objects / bones that are not visible. This feature just works with Only Selected off.

### Only Show Errors

Only display F-Curves and Drivers that have errors or are disabled.

## Dope Sheet Mode - Filters

The show hide elements allows you to filter out the general elements. The Filters panel allows you to filter out further elements.

Note that this filter methods just exists for the dope sheet mode. In other modes the panel does not show.

## Filter by Collection

Just display the content from the chosen collection in the list of elements.

## Filter by Type

In this section you can choose what type of animation data should be displayed. The names should be self explaining.

## Options

### Sort Data Blocks

Alphabetically sort the data in the list of elements.

### Multi Word Match Search

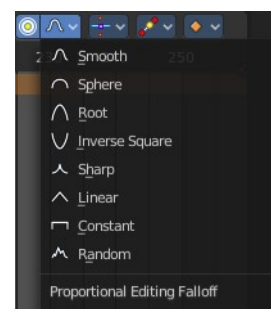

Enable Multi Word matching for the search in the list of elements.

## All Modes - Proportional Editing

Enable proportional editing.

Proportional editing allows you for example to scale two keyframes and influence the not selected neighbour keyframes in a proportional way. Or the proportional editing of fcurve points.

The dropdown menu to choose the proportional editing falloff method is just available when the proportional tool is active.

## All Modes - Keyframe Easing, Handle Type, Keyframe Interpolation, Keyframe Type

### Easing Mode

Choose between different easing modes for the selected keyframes. Easing is a method to fade in and out curves.

### Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its own handler with which you can influence the curve behaviour. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dopesheet editor

too.

## Interpolation Mode

The Interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose an easing method.

## Keyframe Type

Recolor the currently selected keyframes. Or create the next keyframe with this chosen keyframe color.

## All Modes but Grease Pencil - Auto Snap

Adjust how the selected keyframe or fcurve point snaps to other elements.

## Action & Shape Key mode tools

## Next Layer / Previous Layer

When there is more than one animated object in the scene then you have most probably more than one action in the scene too. Switch to previous or next actions to use them in the current object.

## Push Down

Adds the active action on to the NLA stack as a contributing strip. The same can be done by pressing the Push Down button in the NLA Editor.

## Stash

Stashes the active action on to the NLA stack. This means it is added as a non-contributing stack in the same way that it would if you were creating a new action instead.

### Note

Push down and Stash adds the action to the NLA stack. It is cleared / unassigned from the active action slot.

This means that the action cannot be edited anymore from the Action or Graph Editors, unless you enter “Tweak Mode” on the corresponding strips later.

## Action Data Browser prop

When there is more than one animated object in the scene then you have most probably more than one action in the scene too. The Action Data Browser allows you to display, select and rename the available actions in the scene.

## Action Data Browser

The list of available actions in the scene.

## Number of Fake Users

Displays the current number of fake users for the active action.

## Fake User

Assign a fake user to this action. Fake users is a odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## New Action

Add a new blank action.

## Unlink Action

Delete the current active action.

## Grease Pencil mode tools

### Add new Layer

Adds a new blank grease pencil layer.

### Remove Layer

Removes the currently selected grease pencil layer.

## **Layer Specials**

A menu with grease pencil functionality.

### **Duplicate layer**

Duplicates the currently selected grease pencil layer.

### **Show All**

Shows all hidden grease pencil layers.

### **Hide Others**

Hides all grease pencil layers but the selected.

### **Lock All**

Locks all grease pencil layers.

### **Unlock All**

Unlocks all grease pencil layers.

### **Autolock inactive Layers**

Lock automatically all layers except active one.

### **Merge Down**

Merge the current layer with the layer below.

### **Copy Layer to object**

Copies the grease pencil layer to another object.

### **Move Grease Pencil Layer upwards**

Moves the grease pencil layer upwards in the hierarchy.

### **Move Grease Pencil Layer downwards**

Moves the grease pencil layer downwards in the hierarchy.

### **Isolate Layer with visibility**

Locks and hides the currently active grease pencil layer.

### **Isolate Layer without visibility**

Locks the currently active grease pencil layer.

# Options

## Real-time Updates

When transforming keyframes then this transformation is also immediately visible in other editors.

## Show Seconds

Show the timing in the timeline area in seconds instead of frames.

## Sync visible range

Synchronize the visible timeline range with other visible time based editors. When you zoom in or out in the one editor, then it zooms in or out in the other editor too. Each editor to sync needs to have Sync Visible Range ticked.

## Show Sliders

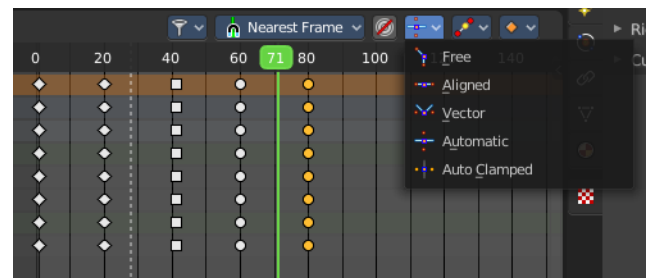

Shows the value sliders for f-curve channels in the channel list.

## Show Handles and Interpolation

With this option on the keyframes shows different shapes that depends of their handle type.

With this option off all keyframes shows as diamond shape.

## Show Curve Extremes

Shows the curve extremes at the keyframe icons.

## AutoMerge Keyframes

Automatically merge nearby keyframes.

## **Show Markers**

Display the markers row at the bottom of the view.

## **Lock Markers**

Make the markers uneditable.

## **Sync Markers**

Sync markers with keyframe edits. When you move the keyframes, then the markers will move too.

## 16.1.2 Editors - Dope Sheet - Header - Quick Menu

### Table of content

Quick Menu.....	1
Adding an operator to the Quick menu.....	1
Adding a menu to the Quick menu.....	1
Order.....	2
Removing an operator from the Quick menu.....	2
Context and mode dependent content.....	2

### Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 16.1.3 Editors - Dope Sheet - View Menu

### Table of content

Dopesheet Editor - View Menu.....	1
Channels List.....	1
Sidebar.....	2

## Dopesheet Editor - View Menu

The View menu contains all View related tools.

The content is for all modes the same.

### Channels List

Shows or hides the Channels list at the left in the viewport.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

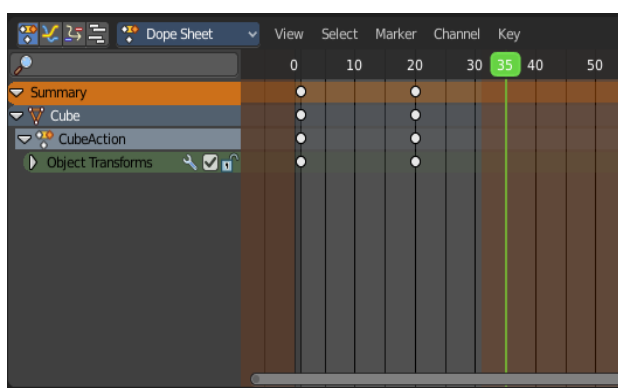

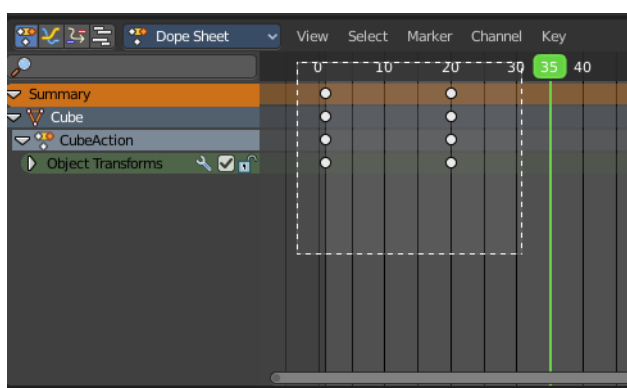

## Adjust Last Operation

Show the adjust last operation panel down left when you use a tool.

## Set Preview Range

Rectangle select an area of the timeline that gets previewed. The playback now just happens in this marked area.

## Clear Preview Range

Clears an existing preview range.

## Set Preview Range to selected

Sets the preview range to fit the first and last selected keyframe.

## Frame Scene Range

With Use Preview Range off , reset the horizontal view to the current scene frame range.

## Frame Preview Range

With Use Preview Range on , reset the horizontal view to the current preview frame range.

---

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Frame All

Zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Frame Selected

Centers the view at the currently selected keyframe(s).

## Go to current Frame

Centers the view at the frame slider.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the area window.

## Toggle Graph Editor

Switch to the Graph Editor.

Note that this is a Blender relict. In Bforartists we already have a convenient top level UI menu entry to switch between the editors. We haven't removed this Blender entry for two reasons. It can be hotkeyed. And the entry shows that this Blender functionality exists.

## 16.1.4 Editors - Dope Sheet - Select Menu

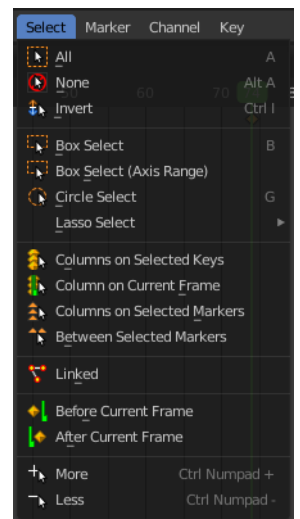

### Table of content

Dopesheet Editor - Select Menu.....	1
All.....	1
None.....	1
Inverse.....	1
Box Select.....	1
Box Select(Axis Range).....	2
Circle Select.....	2
Columns on Selected Keys.....	2
Columns on Current Frame.....	2
Columns on Selected Markers.....	2
Between Selected Markers.....	2
Linked.....	2
Before current Frame.....	2
After current Frame.....	2
More.....	3
Less.....	3

### Dopesheet Editor - Select Menu

The Select menu contains various tools to select elements.

The content is the same in all modes. With one exception. Grease Pencil mode is missing the More / Less menu items.

#### All

Select everything.

#### None

Select nothing.

#### Inverse

Invert the current selection.

#### Box Select

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. Just what's inside of the rectangle gets selected then.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the

mouse.

## Box Select(Axis Range)

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. And what's inside the horizontal range of the rectangle gets selected then. Even when the keyframes are outside of the rectangle.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Lasso Select

A sub menu with the available lasso select modes.

## Columns on Selected Keys

Select the keyframes in the columns of the currently selected keyframe.

## Columns on Current Frame

Select the keyframes in the columns of the current frame.

## Columns on Selected Markers

Select the keyframes in the columns of the selected markers.

## Between Selected Markers

Select the keyframes between the selected markers. You need to have markers in the view for this feature.

## Linked

Select all UV vertices linked to the active UV map. The previous selection gets cleared.

## Before current Frame

Select the keyframes before the current frame.

## **After current Frame**

Select the keyframes after the current frame.

## **More**

Grow the selection.

## **Less**

Shrink the selection.

## 16.1.5 Editors - Dope Sheet - Marker Menu

### Table of content

Dopesheet Editor - Marker Menu.....	1
Add Marker.....	1
Duplicate Marker.....	1
Duplicate Marker to Scene.....	1
Delete Marker.....	2
Bind Camera to Markers.....	2
Rename Marker.....	2
Grab/Move Marker.....	2
Jump to Next Marker.....	2
Jump to Previous Marker.....	2

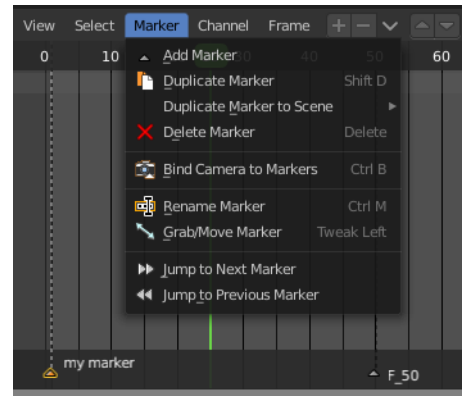

## Dopesheet Editor - Marker Menu

Markers are visual landmarks. They can mark a start of a specific animation sequence, the end of a camera movement, and so on.

When you add one then a marker area appears at the bottom of the timeline.

Markers can be pulled around by clicking at them and dragging them left or right. The active marker is yellow.

By holding down shift you can select more than one marker.

### Add Marker

Adds a marker at the current frame position

### Duplicate Marker

Duplicates the selected marker(s). The duplicate(s) sticks at the mouse until you click to give it the target destination.

### Duplicate Marker to Scene

Duplicate markers to other scenes. A blend file can contain more than one scene. See Scene Properties in the Properties editor.

## Delete Marker

Deletes the selected marker(s).

## Bind Camera to Markers

Bind camera to markers turns an object into a camera object. This can be any object in the scene. Not just camera objects.

When the current frame position does not have a marker yet, then it creates a marker at the current frame position.

By binding different objects or cameras at different marker locations you can switch cameras automatically.

The marker with a bind camera attached will show a camera icon.

## Rename Marker

A menu will open up where you can rename the active marker.

## Grab/Move Marker

Hotkey only functionality! This menu item exists to show the hotkey to move the marker.

## Jump to Next Marker

Sets the frame position to the next marker.

## Jump to Previous Marker

Sets the frame position to the previous marker.

## 16.1.6 Editors - Dope Sheet - Channel Menu

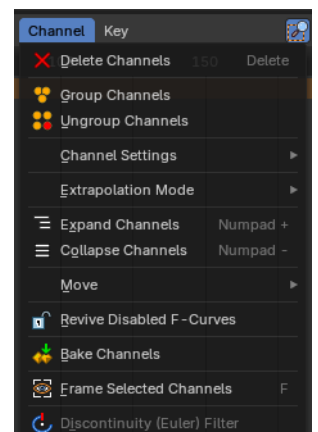

### Table of content

### Dopesheet Editor - Channel Menu

This menu contains functionality to manage the channels in the channels list at the left.

The menu doesn't exist in all modes. It exists in Dope sheet, Action Editor and Grease Pencil mode. And has different content.

## Channel Menu - Dope sheet + Action Editor mode

### Delete Channels

Deletes the selected channels and all its keyframes.

### Group Channels

Creates a custom group from the selected channels.

### Ungroup Channels

Removes the selected channels from the group, and adds them back to the original hierarchy.

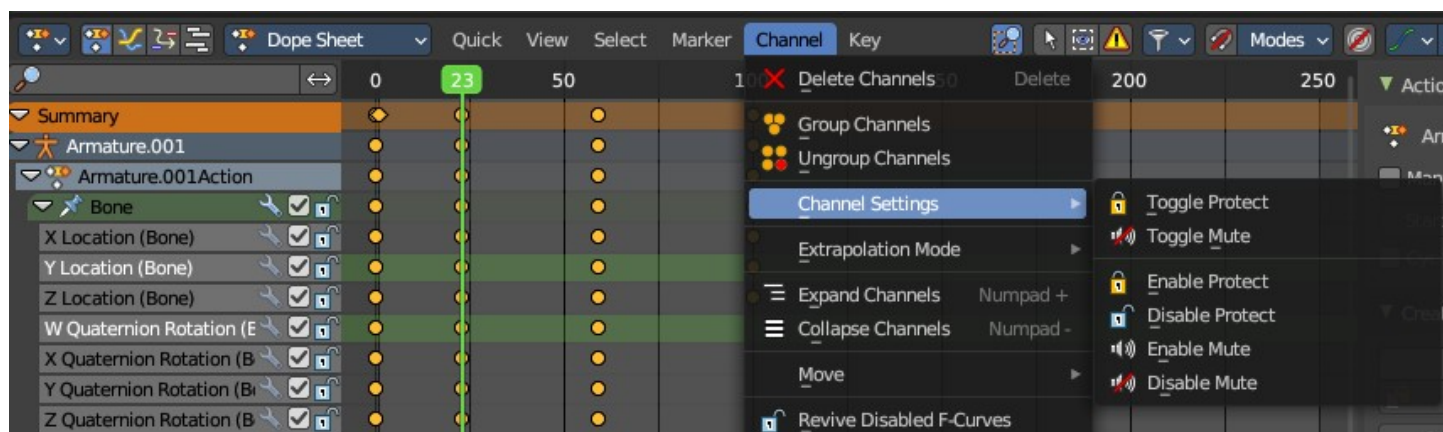

### Channel Settings

Adjusts the locks and check boxes in the channels list from outside of the channels list for all selected elements at once. With Toggle Mute you could, for example, disable all selected channels at once.

The menu items should be self explaining.

These are also accessible from the Dopesheet Channel Context Menu.

## Toggle Channel Editability

Toggles the locks in the channel list from their previous state to locked and back.

## Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

### Constant Extrapolation

The animation curve continues straight at the end.

### Linear Extrapolation

The animation curve continues the last direction.

### Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

### Clear Cyclic

Removes the cyclic extrapolation.

## Expand Channels

Expands all channels in the channel list.

## Collapse Channels

Collapses all channels in the channels list.

## Move

Sort the items in the channels list.

## Revive Disabled F-Curves

Clears the disabled tag from all f-curves to get broken F-Curves working again.

## Bake Channels

Bakes the animation by adding a keyframe at every single frame.

## Adjust last operator Bake Channels

### *Frame Range*

The frame range of the animation to bake.

### *Frame Step*

Create a keyframe every nth frame.

### *Remove Outside Range*

Removes keyframes that are outside of the frame range.

### *Interpolation Type*

Interpolation type for the animation curves.

### *Bake Modifiers*

Bake modifiers into keyframes, and delete them.

## Frame Selected Channels

Resets the viewable area to show the selected channel keyframes. This will change the zoom to fit all in the selected channel.

## Discontinuity (Euler Filter)

Fix large jumps and flips in the selected Euler Rotation F-Curves arising from the rotation values being clipped when baking physics.

This operator only affects Euler rotation animation.

## Channel Menu - Grease Pencil mode

## Delete Channels

Deletes the selected channels and all its keyframes.

## Channel Settings

Adjust the locks and check boxes in the channels list from outside of the channels list for all selected elements at once. With Toggle Mute you could for example disable all selected channels at once.

The menu items should be self explaining.

## Move

Sort the items in the channels list.

## 16.1.7 Editors - Dope Sheet - Key Menu

### Table of content

Dopesheet Editor - Key Menu.....	1

Delete Keyframes.....	4
Delete Breakdowns.....	4
Clean Keyframes.....	4
Clean Channels.....	4
Bake Keyframes.....	4

The key menu contains functionality to manage the keyframes.

The menu exist in all modes. In Grease Pencil mode it contains not so much functionality.

The grease pencil object is a special object in this regards. It can have keyframes at an object level. And keyframes at a stroke level, which the grease pencil mode is meant for.

## Transform

### Grab/Move

Moves the selected keyframe(s).

### Extend

Moves the last keyframes of the selection.

### Slide

Slides a selected keyframe between two other keyframes.

### Scale

Scales the selected keyframes. You need to have more than one keyframe selected.

## Last Operator Transform

The last operator is nearly equal for the transform operations above.

### Values

The transform values.

### Axis

Which axis is up.

### Orientation

Choose the orientation in which the transform should happen.

## Mirror Editing

Just with Grab/Move. Allow mirror edit the transform.

## Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Snaps the selected keyframes by the chosen method.

## Mirror

Flips the selected keyframes over the current frame position.

## Insert Keyframes

Choose a method how to insert a new keyframe at the current frame position.

## Jump to Keyframes

Sets the frame marker at the average position of the currently selected keyframes.

## Copy Keyframes

Copy selected keyframes.

## Paste Keyframes

Pastes copied keyframes.

## Paste Flipped

Pastes copied keyframes, but flipped.

## Duplicate

Duplicate selected keyframes.

## Delete Keyframes

Deletes selected keyframes.

## Delete Breakdowns

Remove breakdown frames generated by interpolating between two grease pencil frames.

## Clean Keyframes

Simplify FCurves by deleting keyframes that are close to each other in all channels

## Clean Channels

Simplify FCurves by deleting keyframes that are close to each other in selected channels.

## Bake Keyframes

Adds keyframes at every unit between the selected keyframes.

## 16.2 Editors - Dope Sheet - Channel list

### Table of content

Dopesheet Editor - Channel List.....	1
Hotkeys.....	1
Search field.....	1
Expand / collapse triangle.....	2
Object type Icon.....	2
Channel name.....	2
Enable F-Curve Modifiers.....	2
Mute Channel.....	2
Lock Channel.....	2
Slider values.....	2
Shape key values.....	3
Opacity values.....	3
Mask Layer.....	3
Onion Skinning.....	3

## Dopesheet Editor - Channel List

The channel list contains your objects and their animation channels. See also the different modes.

The channel list area can be resized by dragging the right border to left or right.

The list has several elements, to turn on or off different features, Or to expand or collapse the hierarchy.

### Hotkeys

Hotkey A selects all channels.

Hotkey Alt A deselects everything.

Left mouse and dragging activates box select.

Clicking at a channel selects it.

Clicking at a channel while holding down shift adds to the selection or removes from the selection.

### Search field

At the top is a search field that allows you to filter the channel list by search terms.

## Invert

Inverts the search result.

## Expand / collapse triangle

The triangle icon at the left allows you to expand or collapse the hierarchy.

## Pin

Keep the channels visible in Graph Editor for editing.

## Object type icon

This icon shows what kind of object this channel belongs to. These icons have no functionality.

## Channel name

The name of the channel name and element. Some elements can be renamed. Like the action or object type.

To rename an element double click at it. Type in the new name. Then press Enter or click elsewhere.

## Enable F-Curve Modifiers

In the Graph editor you can add F-Curve modifiers. In the other animation editor types, like the Dope Sheet editor, you can enable or disable these modifiers by the Enable F-Curve Modifiers setting in the channel list.

For further informations about the F-Curve modifiers see the graph editor chapters.

## Mute Channel

Mutes the selected channel. It will not be calculated.

## Lock Channel

Locks the selected channel. It is not longer editable.

## Slider values

F-Curves can show a slider value in the channel list. This can be adjusted in the sidebar in the View options panel. Show Sliders is off by default.

You can edit these values. Double click to make it editable. Enter or click elsewhere to confirm. When you confirm, then the original keyframe gets updated.

When no keyframe exists at the current position, then this keyframe gets created.

## Shape key values

Shape key mode only.

In Shape key mode the channels shows the blend value. You can also edit it. Double click to make it editable. Enter or click elsewhere to confirm. When you confirm, then the original keyframe gets updated.

When no keyframe exists at the current position, then this keyframe gets created.

## Opacity values

Grease Pencil only.

In Grease Pencil mode the channels shows the opacity values. You can also edit it. Double click to make it editable. Enter or click elsewhere to confirm. When you confirm, then the original keyframe gets updated.

When no keyframe exists at the current position, then this keyframe gets created.

## Mask Layer

Grease Pencil only.

Mask pixels from underlying drawing layers.

## Onion Skinning

Grease Pencil only.

Display onion skins ghost frames from before and after the current frame.

## 16.3 Editors - Dope Sheet - Sidebar

### Table of content

## Sidebar - Custom Properties

Here you can define custom properties that can be used for scripting.

### Add

Adds a new property.

### Edit

Opens a panel where you can adjust the settings for the custom property.

### Remove

Removes the property.

## Sidebar - Action panel

In Dope Sheet and Action Editor sub mode.

### Manual Frame Range

Use a manual frame range.

### Start / End

The start and end frame of the manual range.

### Cyclic Animation

If the animation in the manual frame range should cycle.

## Sidebar - Layer panel

Grease Pencil mode only. This panel contains further settings for the grease pencil layers. And also exists with nearly same content in the properties editor in the object data properties tab when you have a grease pencil object selected.

## Blend

The blend mode for the current layer.

## Opacity

The layer opacity.

## Use Lights

Enable the use of lights on stroke and fill materials.

## Autolock Inactive Layers

Lock automatically all layers except active one to avoid accidental changes.

## Disallow locked materials editing

Avoids editing of locked materials in the editor.

## Masks

Use masking.

## Enable

Activate the use of masks. Every existing grease pencil layer can be used as mask.

## Layer Specials

Choose the grease pencil layer that you want to add and use as a mask.

## Mask layer list

The list of the mask layers.

## Layer name

The name of the layer. Double clicking at it enables to edit the name.

## Invert

Invert the mask.

## Hide

Show or hide the mask.

## Search

At the end of the list you will find a search field. It can be revealed by clicking at the triangle button. Type in the term that you want to search for.

## Invert

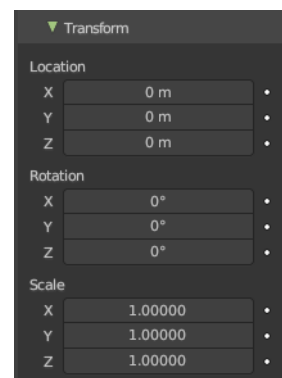

Inverts the filtering of the content.

## Resize

The list can be resized by the handler with the two lines at the bottom.

## Transform

Transform values.

## Adjustments

### Tint color

The color for tinting stroke colors. This prop can be animated by clicking the Animate Property button at the end.

### Factor

The factor for color tinting. This prop can be animated by clicking the Animate Property button at the end.

### Stroke Thickness

Thickness change to apply to the current strokes in pixels. This prop can be animated by clicking the Animate Property button at the end.

### Pass Index

Index number for the layer index pass. This prop can be animated by clicking the Animate Property button at the end.

### View Layer

Only include layer in this View Layer render output. Leave blank to include always.

### Disallow Locked Materials Editing

Avoids editing locked materials in the layer.

## Relations

### Parent

Parent object.

### Type

The object type to parent to.

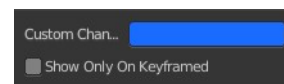

## Display

### Custom channel color

Give the selected channels another color in the channels list.

### Show only on keyframed

In Paint mode display only layers with keyframe in current frame.

## Sidebar - Create Pose Asset panel

This panel just shows when you have a armature selected and when you are in pose mode in the 3d view.

### Create Pose Asset

Creates a pose asset from the selected armature in pose mode.

### Copy Pose as Asset

Copies the current pose of the selected armature as an asset. You can then paste it into the asset library.

### Convert Legacy Pose Library

Create a pose asset for each pose marker in the current action.

## The Dopesheet Editor

The Dopesheet Editor is the editor type to edit the keyframe data of your animation data. The Dopesheet editor is part of five editor types that deals with your animation data. It is some kind of a chart, and gives you an overview over all of your animation data.

The Dope sheet editor has several areas.

Header ( Yellow )

Channel list ( Green )

Sidebar ( Blue )

Viewport ( no color )

The header is divided into two parts too. Left tools and menus. Right Options.

### Time cursor

The Time Cursor is the green line. It is used to set and display the current time frame.

### Keyframe types

The keyframes can have different color and shape.

Gray - Unselected keyframe.

Yellow - Selected keyframe.

Diamond - Free keyframe handle.

Round - Auto Clamped keyframe handle.

Circle - Automatic Keyframe handle.

Square - Vector Keyframe handle.

Rhombus - Aligned Keyframe handle.

Various colors - You can give keyframes an own color with the keyframe type drop down menu at the right.

Gray bar between keys - The two keyframes are identical.

Green line between keys - Fixed keyframe interpolation.

Upwards arrow - Maximum Extreme keyframe. You need to enable *Show Curve extremes* in the Marker options in the sidebar.

Downwards arrow - Minimum Extreme keyframe. You need to enable *Show Curve extremes* in the Marker options in the sidebar.

## Markers

Markers are visible hints to denote frames with key points or significant events within an animation. A marker could mark a character's animation starts, the position change of a camera, or a door that opens.

Markers can be added, deleted and renamed from the Marker menu. Once created they reside at the bottom of the viewport.

To select a marker click at it.

To move a marker click and drag.

The active marker is highlighted, and shows a dotted line upwards.

When a frame matches the marker position then the info string in the 3D view shows the name of this marker too.

## Recording

You usually set and record the keyframes in the 3D view. Or by activating the decorators besides a menu item in a panel.

The Dope Sheet Editor also allows you to record keyframes. Have a look in the Key menu for Insert Keyframes.

There is an exception. The grease pencil object. This is because it can have two types of keyframes. One in object mode. For the whole object. And one in edit mode. For animating points of the curve geometry. This is what the Grease Pencil mode belongs to.

In Grease Pencil mode the changes at the geometry are recorded automatically by modifying the current geometry at the current frame. There is no extra Insert Keyframes menu item. The keyframes gets generated when you modify the geometry.

## Viewport Navigation

Navigation in the viewport happens by mouse or hotkeys. Some of them does not have a menu entry. And needs to be explained here.

### Viewport navigation

Right mouse button moves the frame marker.

Clicking left at the number bar moves the frame marker.

Middle mouse button pans the view.

Holding ctrl + middle mouse button zooms the view.

Scroll Wheel zooms the view.

To drag a keyframe click at it and drag the mouse.

## Channel Context Menu

When you right click into the channel area, then you will call the Channel context menu.

### Frame selected channels

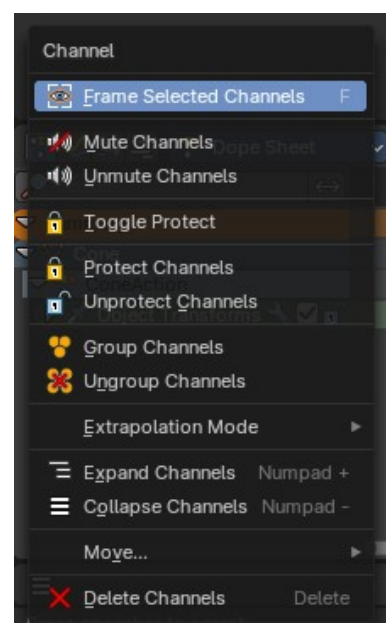

Centers the selected channels in view.

### Mute Channel

This channel is not calculated.

### Unmute Channel

This channel is calculated.

## Protect Channels

Protect channels from editing.

## Unprotect Channels

Enables editing of channels again.

## Group Channels

Groups channels together.

## Ungroup Channels

Ungroup grouped channels. Beware, the channels will not return to their initial group.

## Toggle Channel Editability

Protects or unprotects the selected channels.

## Extrapolation Mode submenu

### Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

### Constant Extrapolation

The animation curve continues straight at the end.

### Linear Extrapolation

The animation curve continues the last direction.

### Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

### Clear Cyclic

Removes the cyclic extrapolation.

### Expand Channels

Expands the channels.

### Collapse Channels

Collapses the channels.

## Move submenu

Sort the order of the channels. The menu items should be self explaining.

## Delete Channels

Removes the selected channels.

# Dope Sheet Context Menu

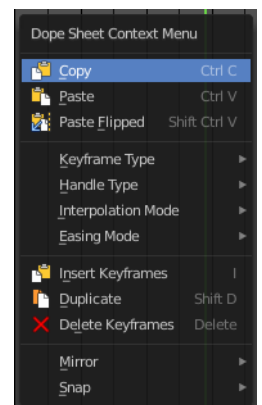

When you right click into the dope sheet viewport then you will call the Dope Sheet context menu.

## Copy

Copies the currently selected keyframe(s).

## Paste

Pastes copied keyframe(s).

## Paste Flipped

Pastes copied keyframe(s), but flipped.

## Keyframe Type

Recolor the currently selected keyframes.

## Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its own handler with which you can influence the curve behavior. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dope sheet editor too.

## Interpolation Mode

The Interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose a easing method.

## Easing Mode

Choose a easing method. The easing methods in the interpolation mode menu are for the easing shape.

## Insert Keyframes

Insert a keyframe at the current position.

## Duplicate

Duplicate the selected keyframe(s).

## Delete Keyframes

Delete the selected keyframe(s).

---

## Delete Breakdowns

In Grease Pencil mode. Deletes breakdown poses generated by interpolating between two grease pencil frames.

## Delete Duplicate Frames

In Grease Pencil mode. Deletes all duplicated frames.

---

## Mirror

Mirrors the animation by the given method.

## Snap

Snaps the selected keyframes by the given method.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider. Here the incremental snapping happens by the frame rate that you have defined. With a frame rate of 24 it will snap in steps of 24 frames when holding down ctrl.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Dope Sheet Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Introduction

The header contains various menus and tools. This chapter here is about the tools and options elements in the header.

The text menus are covered in an own chapter each.

## Playback Elements

The playback elements allows you to play your animation, and set the animation range.

### Jump to Endpoint - start

Jumps to the first frame.

### Jump to Keyframe - previous

Jumps to the keyframe before the current position.

### Play Animation - backward

Plays the animation in reverse direction.

### Play Animation - forward

Plays the animation.

### Jump to Keyframe - next

Jumps to the keyframe after the current position.

## Jump to Endpoint - end

Jumps to the last frame.

## Cancel animation

Cancels the animation and returns to the original frame.

## Current Frame

The edit box with the position of the current frame. Click at the value and type in another value to jump to another frame.

## Set Start Frame

Sets the current frame position as the start frame.

## Use Preview Range

Toggle an alternative range used to preview animations. The Preview range works for the UI playback, but will not work for rendering an animation.

The preview range is displayed in orange color. The original playback range that is used for rendering is still displayed in grey underneath. When Use Preview Range is on, then the animation will loop between the Preview range.

## Start

The start frame for the animation in current mode.

## End

The end frame for the animation in current mode.

## Set End Frame

Sets the current frame position as the end frame.

## Insert Keyframe

Inserts a keyframe. If you do not have a keying set assigned, this will default to the default keying set defined in the Preferences.

## Delete Keyframe

Removes the keyframe at the current position in the current active keying set.

## Active Keying Set

Objects needs a so called keying set so that you can record animation for it. It is a container for the animation, a set of keyframe channels. When you try to record an animation without an existing keying set, then you will get a warning since the channels for the keyframes are missing.

In this property you can choose a method from the builtin keying sets.

### Auto Keying

With auto keying on every manipulation in the 3d view will automatically create a keyframe, or update the existing keyframe at the current position.

Note that Auto Keying just works with transform properties ( Objects and Bones) in the 3d View. It will not work to animate colors in the Properties Editor for example.

### Auto Keyframing Popover

Auto keying settings. These settings shows when you have auto keying activated.

### Auto keying mode

#### *Add & Replace*

Replace existing keyframes and add new ones where no keyframes exists.

#### *Replace*

Just replace existing keyframes.

#### **Only Active Keying Set**

Automatic keyframe insertion using active keying set only.

#### **Layered Recording**

Add a new nla track and strip for every loop or pass made over the animation. This allows non destructive tweaking.

#### **Cycle aware keying**

For channels with cyclic extrapolation, the keyframe insertion is automatically remapped inside the cycle time range, and keeps the ends in sync.

### Active Keying Set

Choose your keying set.

## Playback Panel

Here you can find various options for playback.

### Sync Mode

How to synchronize playback.

### No Sync

Don't synchronize. Play every frame.

### Frame Dropping

Drop frames if playback is too slow.

### AV Sync

Drop frames to synchronize to Audio Playback.

### Audio Scrubbing

Play existing audio from sequence editor when scrubbing.

### Play Audio

Play back existing audio from sequence editor, otherwise mute the audio when deactivated. Use the Sequence Editor to add audio.

### Sub frames

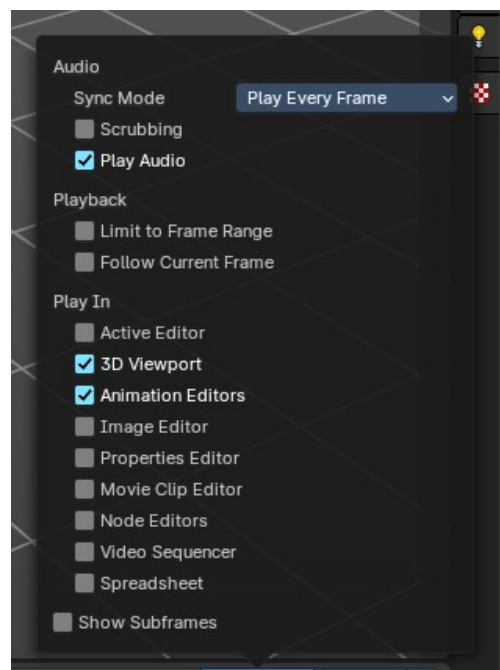

Show current scene sub frame and allow to set it by using interface tools.

### Limit Playback to Frame Range

Don't allow frame selection with the mouse outside of the play range.

### Follow Current Frame

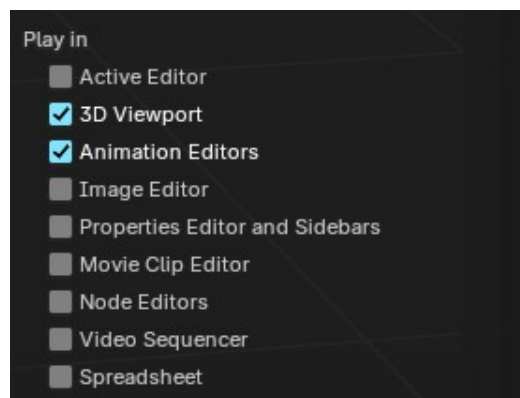

Follow current frame in editors.

## Play in

Plays the animation in the chosen editor types.

- Active Editor
- 3D Viewport
- Animation Editors
- Image Editor
- Properties Editor and Sidebars
- Movie Clip Editor
- Node Editors
- Video Sequencer
- Spreadsheet

## Keying Panel

Some more keying options.

### New Keyframe Type

Recolor the currently selected keyframes. Or create the next keyframe with this chosen keyframe color.

### Auto Keyframing

#### Auto Keying Mode

Just replace existing keyframes, or add keyframes too.

#### Auto Keyframe Insert Keying Set

Automatic Keyframe Insertion using the active keying set only.

### Layered Recording

Add a new NLA Track and Strip for every loop/ pass made over the animation to allow non destructive tweaking.

### Cycle Aware Keying

For channels with cyclic extrapolation, keyframe insertion is automatically remapped inside the cycle time

range, and keeps the ends in sync.

## Options

### Only show errors

Only include f-curves that are disabled or have errors.

### Only show selected

Just show the keyframes from the selected object.

### Show Seconds

Show the timing in the timeline area in seconds instead of frames.

### Sync visible range

Synchronize the visible timeline range with other visible time based editors. When you zoom in or out in the one editor, then it zooms in or out in the other editor too. Each editor to sync needs to have Sync Visible Range ticked.

### Show Markers

Display the markers row at the bottom of the view.

### Lock Markers

Make the markers uneditable.

## **Show Cache**

Show animation information for cached objects like Particles.

### **Softbody, Particles, etc.**

Include or exclude what kind of cache types you want to display.

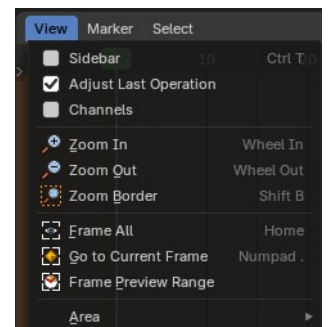

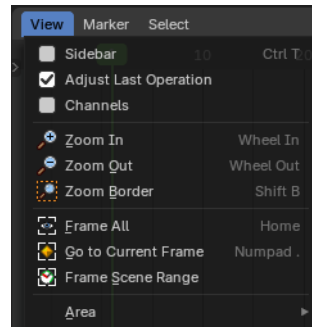

## 17.1.2 Editors - Timeline - View Menu

### Table of content

View Menu.....	1
Sidebar.....	1
Adjust Last Operation.....	2

Vertical Split.....	2
Duplicate Area into New Window.....	3
Toggle Maximize Area.....	3
Toggle Full screen Area.....	3
Close Area.....	3

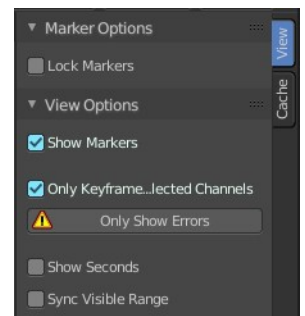

## View Menu

The View menu contains all View related tools.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Adjust Last Operation

Shows the adjust last operation panel down left.

## Channels

Shows the channels list at the left

## Zoom In

Zooms in.

## Zoom Out

Zooms out.

## Zoom Border

Draw a rectangle to zoom to the selection.

## Frame All

Zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Go to current Frame

Centers the view at the frame slider.

## Frame Scene Range

With Use Preview Range off , reset the horizontal view to the current scene frame range.

## Frame Preview Range

With Use Preview Range on , reset the horizontal view to the current preview frame range.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the area window.

## 17.1.3 Editors - Timeline - Marker Menu

### Table of content

Timeline - Marker Menu.....	1
Add Marker.....	1
Duplicate Marker.....	2
Duplicate Marker to Scene.....	2
Delete Marker.....	2
Bind Camera to Markers.....	2
Rename Marker.....	2
Move Marker.....	2

All.....	2
None.....	3
Invert.....	3
Before Current Frame.....	3
After Current Frame.....	3
Jump to Next Marker.....	3
Jump to Next Marker.....	3
Jump to Previous Marker.....	3

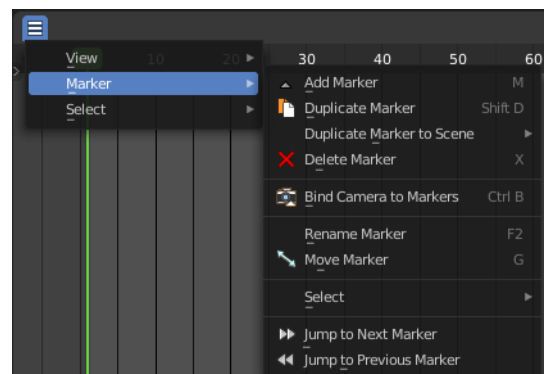

## Timeline - Marker Menu

Markers are visual landmarks. They can mark a start of a specific animation sequence, the end of a camera movement, and so on.

When you add one then a marker area appears at the bottom of the timeline.

Markers can be pulled around by clicking at them and dragging them left or right. The active marker is yellow.

By holding down shift you can select more than one marker.

### Add Marker

Adds a marker at the current frame position.

## Duplicate Marker

Duplicates the selected marker(s). The duplicate(s) sticks at the mouse until you click to give it the target destination.

## Duplicate Marker to Scene

A blend file can contain more than one scene. See Scene Properties in the Properties editor. Here you can duplicate markers to other scenes.

## Delete Marker

Deletes the selected marker(s).

## Bind Camera to Markers

Bind camera to markers turns an object into a camera object. This can be any object in the scene. Not just camera objects.

When the current frame position does not have a marker yet, then it creates a marker at the current frame position.

By binding different objects or cameras at different marker locations you can switch cameras automatically.

The marker with a bind camera attached will show a camera icon.

## Rename Marker

A menu will open up where you can rename the active marker.

## Move Marker

Hotkey only functionality! This menu item exists to show the hotkey to move the marker.

## Select sub menu

### All

Select all markers.

## **None**

Deselect all markers.

## **Invert**

Inverts the current selection.

## **Before Current Frame**

Selects the markers before the current frame.

## **After Current Frame**

Selects the markers after the current frame.

---

## **Jump to Next Marker**

## **Jump to Next Marker**

Sets the frame position to the next marker.

## **Jump to Previous Marker**

Sets the frame position to the previous marker.

## 17.1.4 Editors - Timeline - Select Menu

### Table of content

Before current Frame.....	2
After current Frame.....	3
More.....	3
Less.....	3

## Timeline - Select Menu

The Select menu contains various tools to select elements.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Box Select

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. Just what's inside of the rectangle gets selected then.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the

mouse.

## Box Select(Axis Range)

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. And what's inside the horizontal range of the rectangle gets selected then. Even when the keyframes are outside of the rectangle.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Lasso Select

A sub menu with the available lasso select modes.

## Columns on Selected Keys

Select the keyframes in the columns of the currently selected keyframe.

## Columns on Current Frame

Select the keyframes in the columns of the current frame.

## Columns on Selected Markers

Select the keyframes in the columns of the selected markers.

## Between Selected Markers

Select the keyframes between the selected markers. You need to have markers in the view for this feature.

## Linked

Select all UV vertices linked to the active UV map. The previous selection gets cleared.

## Before current Frame

Select the keyframes before the current frame.

## **After current Frame**

Select the keyframes after the current frame.

## **More**

Grow the selection.

## **Less**

Shrink the selection.

## 17.2 Editors - Timeline - Channel list

### Table of content

Timeline - Channel List.....	1
Hotkeys.....	1
Search field.....	1
Expand / collapse triangle.....	2
Object type Icon.....	2
Channel name.....	2
Enable F-Curve Modifiers.....	2
Mute Channel.....	2
Lock Channel.....	2

## Timeline - Channel List

The channel list contains your objects and their animation channels. It is basically the same list than the one in the dope sheet editor. The timeline has no modes like the Dope Sheet though. And so you will just see the content from the dope sheet mode. And not shape key animation or grease pencil edit mode animation for example.

The channel list area is hidden by default. You need to reveal it by clicking at the small button up left. It can be resized by dragging the right border to left or right.

The list has several elements, to turn on or off different features, Or to expand or collapse the hierarchy.

### Hotkeys

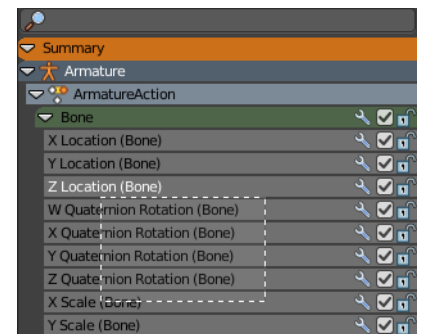

Hotkey A selects all channels.

Hotkey Alt A deselects everything.

Left mouse and dragging activates box select.

Clicking at a channel selects it.

Clicking at a channel while holding down shift adds to the selection or removes from the selection.

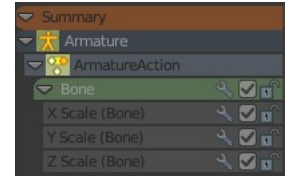

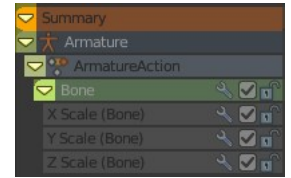

### Search field

At the top is a search field that allows you to filter the channel list by search terms.

## Expand / collapse triangle

The triangle icon at the left allows you to expand or collapse the hierarchy.

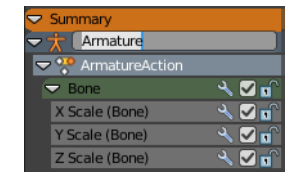

## Object type Icon

This icon shows what kind of object this channel belongs to. These icons have no functionality.

## Channel name

The name of the channel name and element. Some elements can be renamed. Like the action or object type.

To rename an element double click at it. Type in the new name. Then press Enter or click elsewhere.

## Enable F-Curve Modifiers

In the Graph editor you can add F-Curve modifiers. In the other animation editor types, like the Dope Sheet editor, you can enable or disable these modifiers by the Enable F-Curve Modifiers setting in the channel list.

For further informations about the F-Curve modifiers see the graph editor chapters.

## Mute Channel

Mutes the selected channel. It will not be calculated.

## Lock Channel

Locks the selected channel. It is not longer editable.

## Timeline Editor

The Timeline Editor is the editor type that contains playback and record elements and some further animation settings. The Timeline editor is part of five editor types that deals with your animation data.

The Dope sheet editor has several areas. Usually you will just see the header. To reveal the rest of it you have to pull the upper border of the timeline editor upwards.

### Header ( Green )

### Channel list ( Yellow )

This channel list panel is hidden by default. You have to click at the small button up left to reveal it.

### Sidebar ( Blue )

This Sidebar panel is hidden by default. You have to click at the small button up left to reveal it.

### Viewport ( no color )

The header is divided into three parts too. Left tools and menus. Right Options. And in the middle the playback elements for the animation.

### Menus ( Yellow )

### Playback tools ( Green )

### Options ( Blue )

## Time cursor

The Time Cursor is the green line. It is used to set and display the current time frame.

## Keyframes

The timeline displays the keyframes. Different from the Dope Sheet it displays all keyframe type with one icon. A rhombus shape.

## Markers

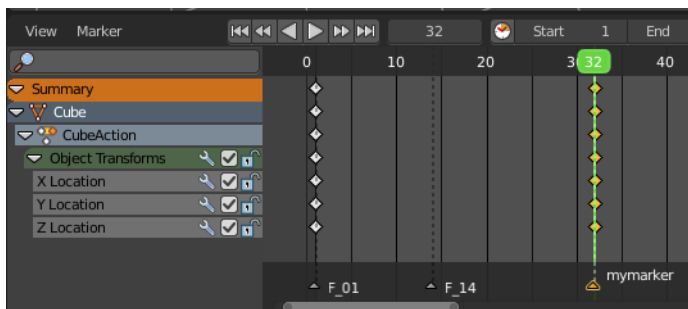

Markers are visible hints to denote frames with key points or significant events within an animation. A marker could mark a character's animation starts, the position change of a camera, or a door that opens.

Markers can be added, deleted and renamed from the Marker menu. Once created they reside at the bottom of the viewport.

To select a marker click at it.

To move a marker click and drag.

The active marker is highlighted, and shows a dotted line upwards.

When a frame matches the marker position then the info string in the 3D view shows the name of this marker too.

## Viewport Navigation

Navigation in the viewport happens by mouse or hotkeys. Some of them does not have a menu entry. And needs to be explained here.

### Viewport navigation

Right mouse button moves the frame marker.

Clicking left at the number bar moves the frame marker.

Middle mouse button pans the view.

Holding ctrl + middle mouse button zooms the view.

Scroll Wheel zooms the view.

To drag a keyframe click at it and drag the mouse.

## Channel Context Menu

When you right click into the channel area, then you will call the Channel context menu.

## Frame selected channels

Centers the selected channels in view.

## Mute Channel

This channel is not calculated.

## Unmute Channel

This channel is calculated.

## Protect Channels

Protect channels from editing.

## Unprotect Channels

Enables editing of channels again.

## Group Channels

Groups channels together.

## Ungroup Channels

Ungroup grouped channels. Beware, the channels will not return to their initial group.

## Toggle Channel Editability

Protects or unprotects the selected channels.

## Extrapolation Mode submenu

### Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

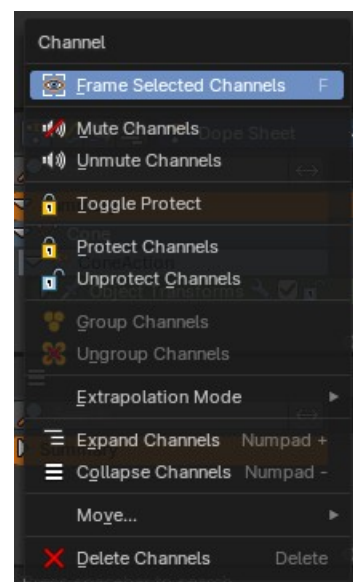

### Constant Extrapolation

The animation curve continues straight at the end.

### Linear Extrapolation

The animation curve continues the last direction.

## Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

## Clear Cyclic

Removes the cyclic extrapolation.

## Expand Channels

Expands the channels.

## Collapse Channels

Collapses the channels.

## Move submenu

Sort the order of the channels. The menu items should be self explaining.

## Delete Channels

Removes the selected channels.

# Dope Sheet Context Menu

When you right click into the timeline viewport then you will call the Dope Sheet context menu.

## Copy

Copies the currently selected keyframe(s).

## Paste

Pastes copied keyframe(s)

## Paste Flipped

Pastes copied keyframe(s), but flipped.

## Keyframe Type

Recolor the currently selected keyframes.

## Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its own handler with which you can influence the curve behavior. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dope sheet editor too.

## Interpolation Mode

The Interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose a easing method.

## Easing Mode

The easing methods in the interpolation mode menu are for the easing shape. This menu allows you to choose an easing method.

## Insert Keyframes

Insert a keyframe at the current position.

## Duplicate

Duplicate the selected keyframe(s).

## Delete Keyframes

Delete the selected keyframe(s).

## Mirror

Mirrors the animation by the given method.

## Snap

Snaps the selected keyframes by the given method.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider. here the incremental snapping happens by the frame rate that you have defined. With a frame rate of 24 it will snap in steps of 24 frames when holding down ctrl.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Dope Sheet Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## 18.1.1 Editors - Graph Editor - Header tools and options

## Introduction

The header contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

The text menus are covered in a own chapter each. They vary too much, dependent of mode and object type.

## Header Tabs

The tabs at the very left allows you to switch between the four most important editor types by one click. Dope sheet Editor, Graph Editor, Driver Editor, NLA Editor.

## Use Normalization, Create Ghost Curves

### Use Normalization

Normalizes the curves so that the maximum does not exceed 1 and the minimum does not go lower than -1

### Auto Normalization

Automatically recalculate curve normalization when you modify the curve.

### Create Ghost Curves

Creates a snapshot of the current curves, and displays it as a background image in the viewport. This background image is not permanent, and will be deleted when you close Bforartists.

When a ghost background image is created then the button turns into a delete button with which you can remove the ghost image.

## Show Hide elements

### Only Show Selected

Display only the data for the selected object in the list of elements. If off it displays all available animation data of the whole scene.

### Show Hidden

Include channels from objects / bones that are not visible. This feature just works with Only Selected off.

## Only Show Errors

Only display F-Curves and Drivers that have errors or are disabled.

# Filters

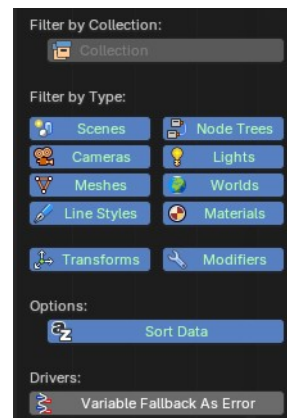

The show hide elements allows you to filter out the general elements. The Filters panel allows you to filter out further elements.

## Filter by Collection

Just display the content from the chosen collection in the list of elements.

## Filter by Type

In this section you can choose what type of animation data should be displayed. The names should be self explaining.

## Options

### Sort Data Blocks

Alphabetically sort the data in the list of elements.

## Drivers

### Variable Fallback As Error

Include drivers that relies on any fallback values for their evaluation in the "only show errors" filter, even if the driver evaluation succeeded.

# Snap

Adjust how the selected keyframe or fcurve point snaps to other elements.

## Snap

Enable snapping

## Snapping options

### Snap to

The element to snap to.

### Absolute Time Snap

Absolute Time alignment when transforming keyframes.

## Proportional Editing

### Enable proportional editing

Proportional editing allows you for example to scale two keyframes and influence the not selected neighbor keyframes in a proportional way. Or the proportional editing of fcurve points.

### Proportional Editing Falloff

The drop down menu to choose the proportional editing falloff method. It is just available when the proportional tool is active.

### Falloff Type

The falloff method

### Proportional Size

Display size of the proportional editing circle.

## Pivot Point

The pivot point defines the center of manipulations.

### Bounding Box Center

Transformation happens around the bounding box center.

### 2D Cursor

Transformation happens around the timeline cursor.

### Individual Centers

Transformation happens around the individual centers of the selected elements.

# Easing Mode

## Easing Mode

The easing methods in the interpolation mode menu are for the easing shape. This menu allows you to choose an easing method.

## Last Operator Set Keyframe Easing Type

### Type

Set the easing type.

# Keyframe Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its own handler with which you can influence the curve behavior. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dope sheet editor too.

## Last Operator Set Keyframe Handle Type

### Type

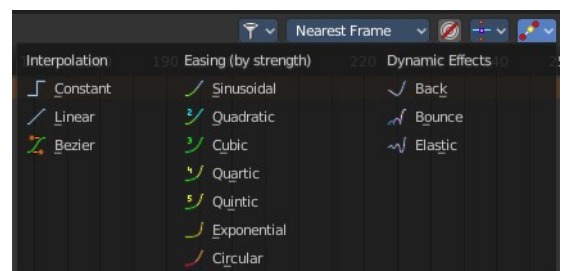

Set the handle type for the currently selected curve point.

# Keyframe Interpolation

The keyframe interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for

the easing shape. There is also an easing menu where you can choose a easing method.

## Last Operator Set Keyframe Interpolation

### Type

Set the interpolation mode.

## Options

### Real-time Updates

When transforming keyframes then this transformation is also immediately visible in other editors.

### Show Seconds

Show the timing in the timeline area in seconds instead of frames.

### Sync visible range

Synchronize the visible timeline range with other visible time based editors. When you zoom in or out in the one editor, then it zooms in or out in the other editor too. Each editor to sync needs to have Sync Visible Range ticked.

### Show Sliders

Shows the value sliders for f-curve channels in the channel list.

### AutoMerge Keyframes

Automatically merge nearby keyframes.

### Auto Lock Key Axis

Automatically locks the movement fo keyframes to the dominant axis.

### Show Extrapolation

Shows the curves after the last keyframe.

## **Show Handles**

Show the handles at the keyframes.

## **Only Selected Keyframes Handles**

Just show the handles of the keyframes from the selected curves.

## **Show Markers**

Display the markers row at the bottom of the view.

## **Lock Markers**

Make the markers uneditable.

## 18.1.2 Editors - Graph Editor - Header - Quick Menu

### Table of content

Quick Menu.....	1
Adding an operator to the Quick menu.....	1
Adding a menu to the Quick menu.....	1
Order.....	2
Removing an operator from the Quick menu.....	2
Context and mode dependent content.....	2

### Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

Note that Graph Editor and Drivers Editor shares the same quick menu.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 18.1.3 Editors - Graph Editor - View Menu

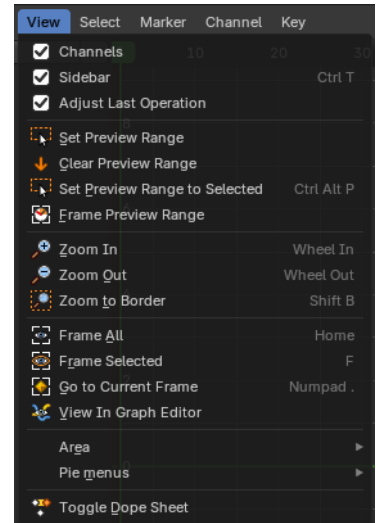

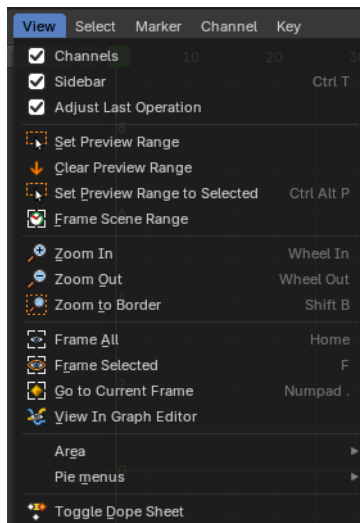

### Table of content

Graph Editor - View Menu.....	1

Toggle Full screen Area.....	4
Close Area.....	4
Pie menus.....	4
Toggle Dope Sheet.....	4

## Graph Editor - View Menu

The View menu contains all View related tools.

The content is for all modes the same.

## Channels List

Shows or hides the Channels list at the left in the viewport.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

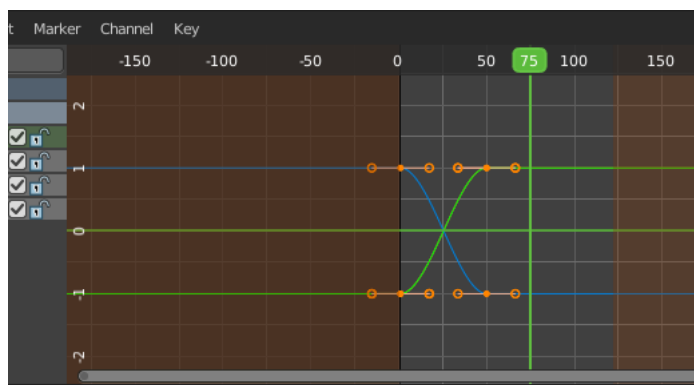

## Adjust last Operation

Show the Adjust Last Operation panel down left when you perform a tool.

## Set Preview Range

Rectangle select an area of the timeline that gets previewed. The playback now just happens in this marked area.

## Clear Preview Range

Clears an existing preview range.

## Set Preview Range to selected

Sets the preview range to fit the first and last selected keyframe.

## Frame Scene Range

With Use Preview Range off , reset the horizontal view to the current scene frame range.

## Frame Preview Range

With Use Preview Range on , reset the horizontal view to the current preview frame range.

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Frame All

Zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Frame Selected

Centers the view at the currently selected keyframe(s).

## Go to current Frame

Centers the view at the frame slider.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the area window.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

---

## Toggle Dope Sheet

Switch to the Dope Sheet Editor.

Note that this is a Blender relict. In Bforartists we already have a convenient top level UI menu entry to switch between the editors. We haven't removed this Blender entry for two reasons. It can be hotkeyed. And the entry shows that this Blender functionality exists.

## 18.1.4 Editors - Graph Editor - Select Menu

## Graph Editor - Select Menu

The Select menu contains various tools to select elements.

The content is the same in all modes. With one exception. Grease Pencil mode is missing the More / Less menu items.

### All

Select everything.

### None

Select nothing.

### Invert

Inverts the current selection.

## Box Select

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. Just what's inside of the rectangle gets selected then.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Box Select(Axis Range)

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. And what's inside the horizontal range of the rectangle gets selected then. Even when the keyframes are outside of the rectangle.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Last Operator Box Select

### Axis Range

What's inside the horizontal range of the rectangle gets selected.

## ***Include Handles***

Also select the curve handles.

## ***Tweak***

Operator has been activated using a tweak event.

## ***Mode***

The selection mode to use.

## **Circle Select**

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## **Lasso Select**

A sub menu with the available lasso select modes.

## **Columns on Selected Keys**

Select the keyframes in the columns of the currently selected keyframe.

## **Columns on Current Frame**

Select the keyframes in the columns of the current frame.

## **Columns on Selected Markers**

Select the keyframes in the columns of the selected markers.

## **Between Selected Markers**

Select the keyframes between the selected markers. You need to have markers in the view for this feature.

## **Last Operator Select All**

### ***Mode***

The selection mode to use.

## **Linked**

Select all UV vertices linked to the active UV map. The previous selection gets cleared.

## Before current Frame

Select the keyframes before the current frame.

## After current Frame

Select the keyframes after the current frame.

## Last Operator Select Left/Right

### **Mode**

The selection mode to use.

### **Extend Select**

Extend the current selection.

## Select Handles

Selects the handles of the selected keyframes.

## Last Operator Select Key / Handles

### **Left Handle**

What to do with the left handle, either select, deselect or keep selection status.

### **Right Handle**

What to do with the right handle, either select, deselect or keep selection status.

### **Key**

What to do with the center keyframe, either select, deselect or keep selection status.

## Select Key

Deselects the handles of the selected keyframes, only selecting the keyframe.

## Last Operator Select Key / Handles

### ***Left Handle***

What to do with the left handle, either select, deselect or keep selection status.

### ***Right Handle***

What to do with the right handle, either select, deselect or keep selection status.

### ***Key***

What to do with the center keyframe, either select, deselect or keep selection status.

---

## **More**

Grow the selection.

## **Less**

Shrink the selection.

## 18.1.5 Editors - Graph Editor - Marker Menu

### Table of content

Dopesheet Editor - Marker Menu.....	1

## Dopesheet Editor - Marker Menu

Markers are visual landmarks. They can mark a start of a specific animation sequence, the end of a camera movement, and so on.

When you add one then a marker area appears at the bottom of the timeline.

Markers can be pulled around by clicking at them and dragging them left or right. The active marker is yellow.

By holding down shift you can select more than one marker.

### Add Marker

Adds a marker at the current frame position.

### Duplicate Marker

Duplicates the selected marker(s). The duplicate(s) sticks at the mouse until you click to give it the target destination.

### Last Operator Duplicate Time Marker

#### Frames

The target frame to position the duplicated marker.

## Duplicate Marker to Scene

Duplicate markers to other scenes. A blend file can contain more than one scene. See Scene Properties in the Properties editor.

## Last Operator Make Links to Scene

### Scene

The target scene to duplicate the markers.

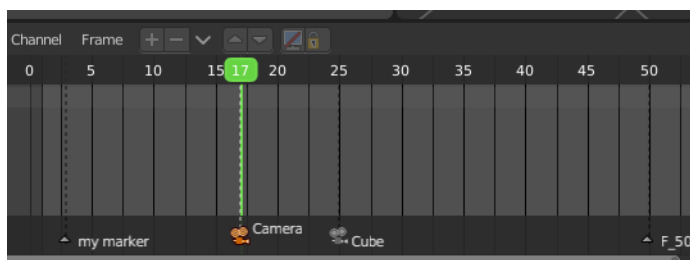

## Delete Marker

Deletes the selected marker(s).

## Bind Camera to Markers

Bind camera to markers turns an object into a camera object. This can be any object in the scene. Not just camera objects.

When the current frame position does not have a marker yet, then it creates a marker at the current frame position.

By binding different objects or cameras at different marker locations you can switch cameras automatically.

The marker with a bind camera attached will show a camera icon.

## Rename Marker

A menu will open up where you can rename the active marker.

## Last Operator Rename Marker

### Name

Rename the active marker.

## Grab/Move Marker

Hotkey only functionality! This menu item exists to show the hotkey to move the marker.

## **Jump to Next Marker**

Sets the frame position to the next marker.

## **Jump to Previous Marker**

Sets the frame position to the previous marker.

## Dopesheet Editor - Channel Menu

This menu contains functionality to manage the channels in the channels list at the left. Here you manage channels and fcurve baking. You can also manage channel groups and other settings here.

The menu doesn't exist in all modes. It exists in Dope sheet, Action Editor and Grease Pencil mode. And has different content.

## Channel Menu - Dope sheet + Action Editor mode

### Delete Channels

Deletes the selected channels and all its keyframes.

### Delete Invalid Drivers

Removes all invalid drivers.

### Group Channels

Creates a custom group from the selected channels.

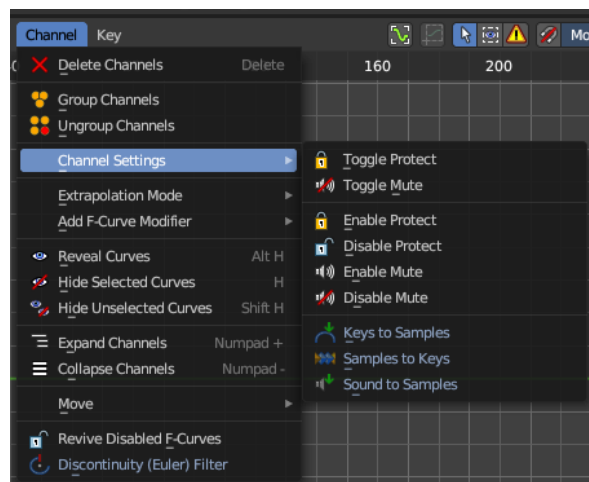

## Ungroup Channels

Removes the selected channels from the group, and adds them back to the original hierarchy.

## Channel Settings

This sub menu adjusts the locks and check boxes in the channels list from outside of the channels list for all selected elements at once. With Toggle Mute you could, for example, disable all selected channels at once.

The menu items should be self explaining.

## Toggle Protect

Toggles the locks in the channel list from their previous state to locked and back. This toggles all the selected channels' editability to inverse its protected or unprotected state. This means whatever was protected, now is not protected – and whatever is unprotected is now protected. Consider this an inverse toggle.

## Last Operator Toggle Channel Settings

### Type

The type to toggle.

## Toggle Mute

Toggles the checkbox in the channel list from the previous state to muted and back. This toggles all the selected channels' influence to inverse its muted or unmuted state. This means whatever was activated, now is muted, and whatever was de-activated is now un-muted. Consider this an inverse toggle.

## Enable Protect

This sets the editability on the selected channels to be locked. This makes sure you cannot edit these channels.

## Disable Protect

This sets the editability on the selected channels to be unlocked. This means you can now edit them.

## Enable Mute

This sets the editability on the selected channels to be locked. This makes sure you cannot edit these channels.

## Disable Mute

This sets the editability on the selected channels to be unlocked. This means you can now edit them.

## Add F-Curve Modifier

This group of operators adds modifiers to the the selected curve channel. This is useful for procedural animation. To access the modifier stack, open the Property Shelf and switch to the Modifier tab.

### Generator

Generator creates a polynomial function.

These are basic mathematical formulas that represent lines, parabolas, and other more complex curves, depending on the values used.

### Built-In Function

These are additional formulas, each with the same options to control their shape.

### Envelope

Allows you to adjust the overall shape of a curve with control points.

### Cycles

Cycles allows you add cyclic motion to a curve that has two or more control points. The options can be set for before and after the curve.

### Noise

Modifies the curve with a noise formula. This is useful for creating subtle or extreme randomness to animated movements, like camera shake.

### Limits

Limit curve values to specified X and Y ranges.

### Stepped Interpolation

Gives the curve a stepped appearance by rounding values down within a certain range of frames.

## Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

## Constant Extrapolation

The animation curve continues straight at the end.

## Linear Extrapolation

The animation curve continues the last direction.

## Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

## Clear Cyclic

Removes the cyclic extrapolation.

## Last Operator Set Keyframe Interpolation

### *Type*

Set the extrapolation mode for the selected F-Curves.

## Reveal Curves

Reveals all hidden curves.

## Last Operator Reveal Curves

### *Select*

Select all revealed curves.

## Hide selected Curves

Hides the selected curves.

## Hide unselected curves

Hides the unselected curves.

## Last Operator Hide Curves

### *Unselected*

Hide the unselected or selected curves.

## Expand Channels

Expands all channels in the channel list.

## Last Operator Expand Channels

### *All*

Expand all Channels, or just the selected channels.

## Collapse Channels

Collapses all channels in the channels list.

## Last Operator Collapse Channels

### *All*

Collapse all Channels, or just the selected channels.

## Move

Sort the items in the channels list.

## Last Operator Move Channels

### *Direction*

Sort the items in the channels list.

## Frame selected Channels

Centers the view at the selected channels.

## Revive Disabled F-Curves

Clears the disabled tag from all f-curves to get broken F-Curves working again.

## Discontinuity (Euler) Filter

Try to fix large jumps and flips in the selected F Curve. This jumps can appear when rotation values are clipping by baking physics.

# Graph Editor - Key Menu

This menu contains functionality to manage keyframes.

## Transform

### Grab/Move

Moves the selected keyframe(s).

### Last Operator Move

#### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

#### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## **Extend**

Moves the last keyframes of the selection.

### ***Last Operator Transform***

#### **Values X, Y Z, W**

The new position.

#### **Axis**

Which axis to transform.

#### **Orientation**

The widget can have different orientations. The menu items should be self explaining.

### **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

## ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Rotate**

Rotates the selection.

### ***Last Operator Rotate***

#### **Angle**

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

#### **Axis**

Which axis to rotate.

#### **Orientation**

The widget can have different orientations. The menu items should be self explaining.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Scale**

Scales the selected keyframes. You need to have more than one keyframe selected.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Snaps the selected keyframes by the chosen method.

Cursor to Selection and Cursor Value to Selection does not have a last operator.

## Last Operator Snap Keys

### Type

Snaps the selected keyframes by the chosen method.

## Equalize Handles

Equalize handles is not really a snap method. And therefore it also has another last operator. The Equalize Handles operator allows users to make selected handle lengths uniform: either respecting their original angle from the key control point or by flattening their angle (removing the overshoot sometimes produced by certain handle types).

### Last Operator Equalize Handles

### Side

Which side of the control point to affect.

### Handle length

How long the handles should become.

### Flatten

Equalize the length of the handlers to the other keyframes.

## Mirror

Flips the selected keyframes over the current frame position.

### Last Operator Mirror Keys

### Type

Flips the selected keyframes over the current frame position by the chosen method.

## Insert Keyframes

Choose a method how to insert a new keyframe at the current frame position.

## Last Operator Insert Keyframes

### Type

Choose a method how to insert a new keyframe at the current frame position.

## Jump to Selected

Sets the frame marker at the average position of the currently selected keyframes.

## Copy Keyframes

Copy selected keyframes.

## Paste Keyframes

Pastes copied keyframes.

## Paste Flipped

Pastes copied keyframes, but flipped.

## Last Operator Paste Keyframes / Flipped

### Offset

Define an offset for the paste position.

### Type

Choose a method how to paste the copied keyframes.

### Flipped

Pastes keyframes from mirrored bones if they exists.

## Duplicate

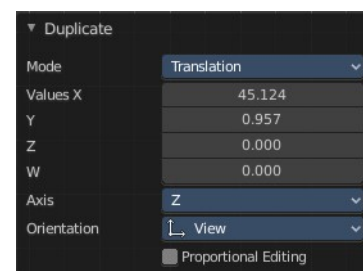

Duplicate selected keyframes.

## Last Operator Duplicate

### Mode

### Values X / Y

The x and y values for the pasted keyframes. Note that these values starts at the position of the original copied keyframe. These values are relative.

Values Z and W have no effect here.

## **Axis**

These values have no effect.

## **Orientation**

These values have no effect.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

## **Proportional Falloff**

Adjust the falloff methods.

## **Proportional Size**

See and adjust the falloff radius.

## **Connected**

The proportional falloff gets calculated for connected parts only.

## **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Delete Keyframes**

Deletes selected keyframes.

---

## **Smooth Keys**

Make selected curves less bumpy.

---

## Keys to Samples

Bake selected F-Curves to a set of sampled points. This makes the curve not longer editable.

## Sample to Keys

Un-bake a sampled point F-Curve to make it editable again.

## Sound to Samples

This operator takes a sound file and uses its sound wave to create the animation data. When running it, you will be prompted to load an audio file to apply to the selected channels.

## Bake Channels

Creates keyframes following the current shape of F-Curves of selected channels for the entire channel within the frame range.

## Density sub menu

### Decimate (Ratio)

Decimate F-Curves by removing keyframes that that has the least influence to the curve shape.

### Decimate (Allowed Change)

Decimate F-Curves by specifying how much it can derivative from the original curve.

### *Last Operator Decimate Keyframes*

This last operator appears for both decimate operators.

#### Mode

The decimate mode. Error margin is Allowed change.

#### Remove or Max Error Margin

The percentage of keyframes to remove.

## Bake Keyframes

Adds a keyframe on every frame between the selected keyframes.

---

## Clean Keyframes

Simplify FCurves by deleting keyframes that are close to each other in all channels.

## Clean Channels

Simplify FCurves by deleting keyframes that are close to each other in selected channels.

## Last Operator Clean Keyframes

### Threshold

The threshold amount for the simplify algorithm.

### Channels

Clean keyframes or channels.

---

## Blend sub menu

This sub menu contains slider operators to modify a selection of keyframes on the f-curves.

## Breakdown

Relaxes the current pose to an inbetween position between the adjacent keyframes.

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending. Move the mouse to position the blend pose where you need it.

## Last Operator Breakdown

### Factor

The percentage of relaxing.

## Blend to Neighbour

Blends the current pose with the neighbouring poses.

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending. Move the mouse to position the blend pose where you need it.

### *Last Operator Blend to Neighbour*

#### Blend

The blend factor.

## Blend to default Value

Blends the current pose to the default pose.

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending. Move the mouse to position the blend pose where you need it.

### *Last Operator Blend to Default*

#### Factor

The blend factor.

## Ease

Adds an ease in and ease out at the selected curves.

## Ease

When you perform the tool then you will see a percent slider in the header where you can read the influence of the blending. Move the mouse to position the blend pose where you need it.

### *Last Operator Ease Keyframes*

#### Factor

The blend factor.

#### Sharpness

How smooth to ease. Higher values makes the ease more sharp.

## Blend to Ease

This will blend keyframes from the current state to an ease-in or ease-out curve.

When you perform the tool then you will see a percent slider in the header where you can read the influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Blend to Ease Keyframes***

### **Curve Blend**

The curve blend factor.

### **Blend Offset**

Shift the selected keyframes to the value of the neighboring keys as a block.

When you perform the tool then you will see a percent slider in the header where you can read the influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Blend Offset Keyframes***

### **Offset Factor**

The blend factor.

## **Match Slope**

This operator is used to push the segment closer to the values of the next or previous pose. It blends selected keys to the slope of two neighboring keyframes before and after the selection.

Use this to push the segment closer to the values of the next or previous pose.

## ***Last Operator Match Slope***

The match slope factor.

## **Push Pull**

Pushes or pulls the selected keyframes.

When you perform the tool then you will see a percent slider in the header where you can read the influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Blend Push Pull Keyframes***

### **Factor**

The push / pull factor.

## **Shear**

Shears the value of the selected keyframes. The shearing is linear. And it keeps the relationship between the

keyframes, using either the left or the right key as the referene.

## ***Last Operator Shear Keyframes***

### **Shear Factor**

The amount to shear the values.

### **Direction**

Which key to pick to keep the relation. Left from the selection or right from the selection.

---

## **Scale Average**

Increase or decrease the value of the selected keys in relationship to their average. At a full value, this will flatten all keyframes.

## ***Last Operator Match Slope***

The Scale Average Keyframes Scale Factor.

## **Scale from Neighbor**

Increase or decrease the value of selected keys in relationship to the neighbouring one.

When you perform the tool then you will see a percent slider in the header where you can read the influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Scale from Neighbor***

### **Factor**

The strenght

### **Reference Key**

If the left or the right neighbour key should be used.

---

## **Time Offset**

Offsets the selected keyframes by a time amount.

When you perform the tool then you will see a percent slider in the header where you can read the influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Blend Push Pull Keyframes***

### **Frame Offset**

The time frame offset factor.

## **Smooth sub menu**

### **Smooth (Gaussian)**

Smoothens the selected curves with the Gaussian algorithm.

### **Smooth (Legacy)**

Smoothens the selected curves with the legacy algorithm.

### **Butterworth Smooth**

Smoothens the selected curves with the Butterworth algorithm.

## **Blend to default Value**

Adds an ease in and ease out at the selected curves

When you perform the tool then you will see a per cent slider in the header where you can read the percentual influence of the blending. Move the mouse to position the blend pose where you need it.

## ***Last Operator Gaussian Smooth***

### **Factor**

The blend factor.

### **Sigma**

The shape of the gaussian distribution. Lower values makes it sharper

### **Filter width**

How far to each side in frames will the filter average the key values.

## 18.2 Editors - Graph Editor - Channel list

## Dopesheet Editor - Channel List

The channel list contains your objects and their animation channels. See also the different modes.

The channel list area can be resized by dragging the right border to left or right.

The list has several elements, to turn on or off different features, Or to expand or collapse the hierarchy.

### Hotkeys

Hotkey A selects all channels.

Hotkey Alt A deselects everything.

Left mouse and dragging activates box select.

Clicking at a channel selects it.

Clicking at a channel while holding down shift adds to the selection or removes from the selection.

### Search field

At the top is a search field that allows you to filter the channel list by search terms.

## Expand / collapse triangle

The triangle icon at the left allows you to expand or collapse the hierarchy.

## Object type Icon

This icon shows what kind of object this channel belongs to. These icons have no functionality.

## Pin

Normally just the channels for selected objects are visible. With Pin the channels remains visible in Graph Editor, even when you select another object.

## Visibility

Hide the channel.

## Channel name

The name of the channel name and element. Some elements can be renamed. Like the action or object type.

To rename an element double click at it. Type in the new name. Then press Enter or click elsewhere.

## Enable F-Curve Modifiers

In the Graph editor you can add F-Curve modifiers in the sidebar. Enable or disable these modifiers by the Enable F-Curve Modifiers setting in the channel list.

## Mute Channel

Mutes the selected channel. It will not be calculated.

## Lock Channel

Locks the selected channel. It is not longer editable.

## Slider values

F-Curves can show a slider value in the channel list. This can be adjusted in the sidebar in the View options panel. Show Sliders is off by default.

You can edit these values. Double click to make it editable. Enter or click elsewhere to confirm. When you confirm, then the original keyframe gets updated.

When no keyframe exists at the current position, then this keyframe gets created.

## 18.3.1 Editors - Graph Editor - Sidebar - F-Curve Tab

### Table of content

### F-Curve Tab - Active F-Curve Panel

This panel displays the properties for the active F-Curve.

#### Channel Name

The name of the currently active F-Curve channel.

#### RNA Path

RNA Path to property. This is a read only information.

#### RNA Array Index

The RNA Array Index to the specific property affected by the F-Curve if applicable. This is a read only information.

#### Display Color

With what colors to display the curves. User defined allows you to choose a custom color for the curve. A color field appears. The other methods works random.

## Handle Smoothing

Select the method to compute automatic Bezier Handles.

### None

Only directly adjacent key values are used when computing the handles. Vector handles points directly at the adjacent keyframes.

### Continuous Acceleration

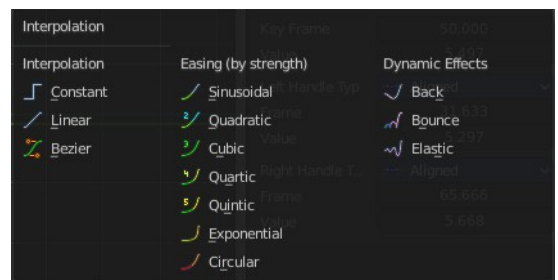

Also keyframes behind the next or previous keyframe gets used for calculation. Which results in a smoother curve.

## F-Curve Tab - Active Keyframe Panel

## Interpolation

Set the interpolation type for this keyframe.

## Key Frame

The current position of this keyframe.

## Value

The Y value of this keyframe.

## Left Handle Type / Right Handle Type

Set the handle type. The handles of a keyframe can be independent. Some constellations just works with some other constellations.

### Free

Move and adjust the handles independently.

### Aligned

With the left handler the right handler moves too.

### ***Vector***

Creates a curve with straight lines.

### ***Automatic***

Creates a smooth curve.

### ***Auto Clamped***

Creates a smooth curve that only changes the direction at other curve points. It is clamped to prevent overshoots in the curve shape.

### **Frame**

The current frame of this handle.

### **Value**

The current Y position of this handle.

## Modifiers Tab - Modifiers Panel

F-Curve modifiers are similar to Object modifiers. They allow to add adjustable non destructive effects. And they can be layered on top of each other.

Different to the Object modifiers you can't reorder this modifiers. You have to create it in the order that you need it.

### Add Modifier

The list of modifiers. Choose by clicking.

### Copy F-Curve Modifiers

Copy the F-Curve Modifiers of the active F-Curve.

### Paste F-Curve Modifiers

Paste copied F-Curve modifiers to the active F-Curve.

### Last Operator Add F-Curve Modifier

#### Type

A drop down list with the Type of modifier to add.

#### Only Active

Only add a modifier to the currently active curve.

## Modifier header

Every modifier is a panel. And every panel has a header area with some general UI elements.

### Triangle button

Every modifier panel can be expanded or collapsed by clicking at this triangle button.

### Active

This is the panel that you currently edit. When you edit a panel while it is not set to the active one, then the changes will not be applied.

### Modifier name

The name of the modifier. Read only.

### Muted

Enable or disable this modifier.

### Delete F-Curve Modifier

Delete this modifier.

## Generator modifier

### Polynomial Mode

Use Expanded Polynomial or Factorized Polynomial algorithm. With these mathematical formulas you can create lines, parabolas, and other more complex curves by changing the values in the poly order field.

### Additive

Add on top of the existing curve instead of replacing the existing curve.

## Poly Order Expanded mode

The polynomial formula for the Expanded mode. By increasing the Poly Order value you can add more polynomial fields to the formula.

Change the values to the desired results.

## Poly Order Factorized mode

The polynomial formula for the Factorized mode. By increasing the Poly Order value you can add more polynomial fields to the formula.

Change the values to the desired results.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

# Built- in Function modifier

Generate a curve by built in functions.

## Curve Type

The available wave forms for the curve.

## Amplitude

The amplitude of the curve wave. Adjusts the Y scaling.

## Phase Multiplier

A phase multiplier for the curve wave. Adjusts the X scaling.

## Phase Offset

A phase offset for the curve wave. Adjusts the Y scaling.

## Value Offset

A constant value offset for the whole curve. Adjusts the X scaling.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

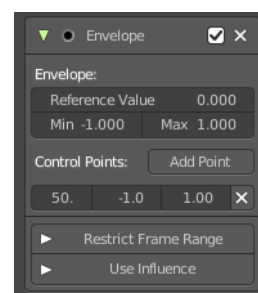

## Influence

The influence factor.

# Envelope modifier

The Envelope modifier allows you to modify the overall shape of the curve by control points.

## Envelope

### Reference Value

Set the Y value to center the envelope around.

### Min

The lower distance from reference value for 1:1 default influence.

### Max

The higher distance from reference value for 1:1 default influence.

## Control Points

### Add Point

Add a control point. A control point has two sub points, a lower control point and a higher control point.

## Point values

Adding a control point adds an entry in the Point Values list. Every added control point has its own values that can be modified here.

## Frame

The frame position of this control point.

## Min

The position of the lower control point.

## Max

The position of the higher control point.

## Delete

Delete this envelope control point.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

### Influence

The influence factor.

## Cycles modifier

Add a cyclic motion to a curve that has two or more control points. The option can be set before or after the curve.

## Trivially Cyclic Curves

When the Cycle Mode for both ends is set to either Repeat Motion or Repeat with Offset, and no other options of the modifier are changed from their defaults, it defines a simple infinite cycle.

This special case receives some additional support from other areas of Blender:

Automatic Bezier handle placement is aware of the cycle and adjusts to achieve a smooth transition.

The Cycle-Aware Keying option can be enabled to take the cycle into account when inserting new keyframes.

### Before

Set the cycle mode before the first keyframe.

## Before Cycles

Maximum number of cycles to allow before first keyframes. A value of 0 means infinite.

## After

Set the cycle mode after the first keyframe.

## After Cycles

Maximum number of cycles to allow after last keyframes. A value of 0 means infinite.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

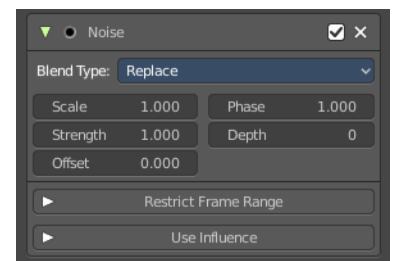

## Influence

The influence factor.

# Noise modifier

Adds noise to the curve.

## Blend Type

How to blend the noise with the curve.

## Scale

The overall size of the noise. The bigger the value the less frequent the noise.

## Strength

Adjust the Y value of the noise.

## Offset

Time offset of the noise.

## Phase

The random seed for the noise.

## Depth

How detailed the noise function is.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

## Limits modifier

Sets limits to the curve in specified x and y range values.

## Minimum / Maximum X

Cuts the curve at these minimum and maximum frame values.

## Minimum / Maximum Y

Clamps the curve at these minimum and maximum values.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

### Influence

The influence factor.

# Stepped Interpolation modifier

Adds steps to the curve by rounding the values.

## Step Size

The number of frames to hold each frame

## Offset

A number of offset frames before frames get held.

## Use Start Frame

Restrict the modifier so that it just acts before its end frame.

## Use End Frame

Restrict the modifier so that it just acts after its start frame.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

## 18.3.3 Editors - Graph Editor - Sidebar - View Tab

### Table of content

Show Cursor panel.....	1
Show Cursor checkbox.....	1
Cursor X.....	1
Cursor Y.....	1
Cursor to Selection.....	1
Cursor Value to Selection.....	1

### Show Cursor panel

The vertical green line is the time cursor. The horizontal green line is called the cursor. Or ground line cursor. Together they are the 2d cursor.

### Show Cursor checkbox

Hides the green ground line cursor.

### Cursor X

The frame position of the playhead cursor.

### Cursor Y

The Y position of the ground line cursor.

### Cursor to Selection

Sets both cursors to the center of the selection. This button also works when the ground line cursor is deactivated. In this case just the playhead cursor gets set to the center of the selection.

### Cursor Value to Selection

Place the cursor value on the average value of selected keyframes.

## 18.3 Editors - Graph Editor - Sidebar

### Table of content

Introduction.....	1
Right Click menus.....	1

### Introduction

The Movie Clip Editor is made of several areas. And it is made of several modes with different editor types.

At the right side you will find the sidebar in Tracking Mode with Clip view. And in Masking mode. In the sidebar you will find further options and settings for the Movie Clip Editor and its tools.

### Right Click menus

You will open the usual right click menus when clicking with the right mouse at elements in the sidebar. Its content is in big parts self explaining.

The right click menus are explained in the chapter 6 Editors Introduction.

# Graph Editor

The Graph Editor allows you to adjust animation curves for your animations. So called Function curves. In short F-Curves

The Graph editor has several areas.

Header ( Yellow )

Channel list ( Green ).

Sidebar ( Blue ).

Viewport ( no color )

The header is divided into two parts. Left tools and menus. Right Options. And in the middle the playback elements for the animation.

Menus ( Green )

Options ( Yellow )

## Time cursor

The Time Cursor is the green line. It is used to set and display the current time frame.

## F-Curves

The timeline displays the function curves for the animation. This curve can also be manipulated in various ways.

## Keyframes

In the Graph editor every keyframe is represented by a dot and the handlers for it.

## Handles

Every keyframe has handles assigned. The curve can be manipulated by dragging these handlers. You can also change the handle type in the Keyframe Handle Type menu in the header. To make the curve sharp at this keyframe for example.

## Markers

Markers are visible hints to denote frames with key points or significant events within an animation. A marker could mark a character's animation starts, the position change of a camera, or a door that opens.

Markers can be added, deleted and renamed from the Marker menu. Once created they reside at the bottom of the viewport.

To select a marker click at it.

To move a marker click and drag.

The active marker is highlighted, and shows a dotted line upwards.

When a frame matches the marker position then the info string in the 3D view shows the name of this marker too.

## Viewport Navigation

Navigation in the viewport happens by mouse or hotkeys. Some of them does not have a menu entry. And needs to be explained here.

### Viewport navigation

Right mouse button moves the frame marker.

Clicking left at the number bar moves the frame marker.

Middle mouse button pans the view.

Holding ctrl + middle mouse button zooms the view.

Scroll Wheel zooms the view.

To drag a keyframe click at it and drag the mouse.

To manipulate a keyframe, grab one of its handlers and drag.

## Channel Context Menu

When you right click into the channel area, then you will call the Channel context menu.

### Frame selected channels

Centers the selected channels in view.

### Mute Channel

This channel is not calculated.

### Unmute Channel

This channel is calculated.

### Protect Channels

Protect channels from editing.

### Unprotect Channels

Enables editing of channels again.

### Group Channels

Groups channels together.

### Ungroup Channels

Ungroup grouped channels. Beware, the channels will not return to their initial group.

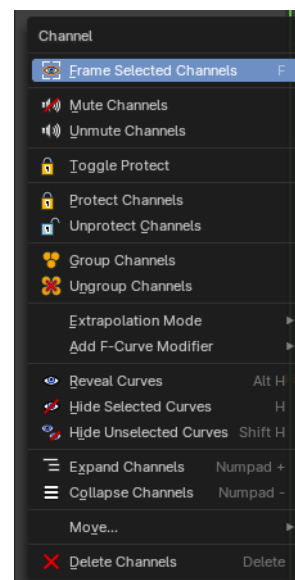

### Toggle Channel Editability

Protects or unprotects the selected channels.

### Extrapolation Mode submenu

### Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means

how the curve acts at the beginning and the end of the F-Curve.

## Constant Extrapolation

The animation curve continues straight at the end.

## Linear Extrapolation

The animation curve continues the last direction.

## Make Cyclic

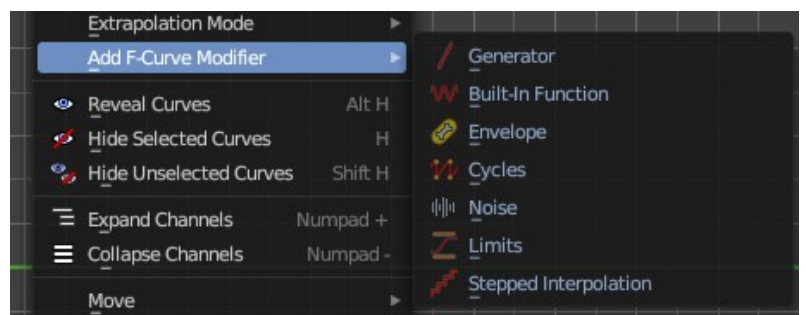

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

## Clear Cyclic

Removes the cyclic extrapolation.

## Add F-Curve Modifier

This group of operators adds modifiers to the the selected curve channel. This is useful for procedural animation. To access the modifier stack, open the Property Shelf and switch to the Modifier tab.

## Generator

Generator creates a polynomial function.

These are basic mathematical formulas that represent lines, parabolas, and other more complex curves, depending on the values used.

## Built-In Function

These are additional formulas, each with the same options to control their shape.

## Envelope

Allows you to adjust the overall shape of a curve with control points.

## Cycles

Cycles allows you add cyclic motion to a curve that has two or more control points. The options can be set for before and after the curve.

## Noise

Modifies the curve with a noise formula. This is useful for creating subtle or extreme randomness to animated movements, like camera shake.

## Limits

Limit curve values to specified X and Y ranges.

## Stepped Interpolation

Gives the curve a stepped appearance by rounding values down within a certain range of frames.

## Reveal Curves

Reveals all hidden curves.

## Last Operator Reveal Curves

### *Select*

Select all revealed curves.

## Hide selected Curves

Hides the selected curves.

## Hide unselected curves

Hides the unselected curves.

## Last Operator Hide Curves

### *Unselected*

Hide the unselected or selected curves.

## Expand Channels

Expands the channels.

## Collapse Channels

Collapses the channels.

## Move submenu

Sort the order of the channels. The menu items should be self explaining.

## Delete Channels

Removes the selected channels.

# F-Curve Context Menu

When you right click into the viewport then you will call the F-Curve context menu.

## Copy

Copies the currently selected keyframe(s).

## Paste

Pastes copied keyframe(s)

## Paste Flipped

Pastes copied keyframe(s), but flipped.

## Last operator Paste Keyframes / Flipped

## Offset

Define a time offset to paste the keys.

## Type

The paste method.

## Flipped

Paste copied curve point(s) flipped.

## Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its

own handler with which you can influence the curve behavior. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dope sheet editor too.

## Last Operator Set Keyframe Handle Type

### Type

Set the handle type for the currently selected curve point.

## Interpolation Mode

The Interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose a easing method.

## Last Operator Set Keyframe Interpolation

### Type

Set the interpolation mode.

## Easing Mode

The easing methods in the interpolation mode menu are for the easing shape. This menu allows you to choose an easing method.

## Last Operator Set Keyframe Easing Type

### Type

Set the easing type.

## Insert Keyframes

Insert a keyframe at the current position.

## Duplicate

Duplicate the selected keyframe(s).

## Last Operator Duplicate

### Mode

### Values X / Y

The x and y values for the pasted keyframes. Note that these values starts at the position of the original copied keyframe. These values are relative.

Values Z and W have no effect here.

### Axis

These values have no effect.

### Orientation

These values have no effect.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Delete Keyframes

Delete the selected keyframe(s).

## Mirror

Mirrors the animation by the given method.

## Last Operator Mirror Keys

### Type

Flips the selected keyframes over the current frame position by the chosen method.

## Snap

Snaps the selected keyframes by the given method.

## Last Operator Snap Keys

### Type

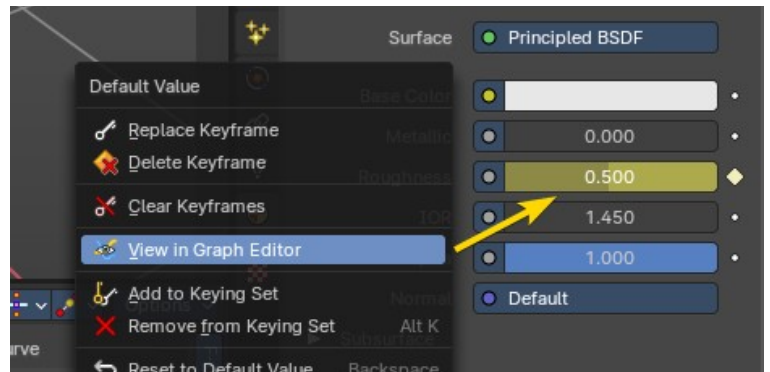

Snaps the selected keyframes by the chosen method.

## Animated Properties Context Menu

When you right click on any animated property in the interface, you can quickly view all animated fcurves in the Graph Editor.

If there is not Graph Editor open, then it will warn you that there is no Graph Editor found.

### View in Graph Editor

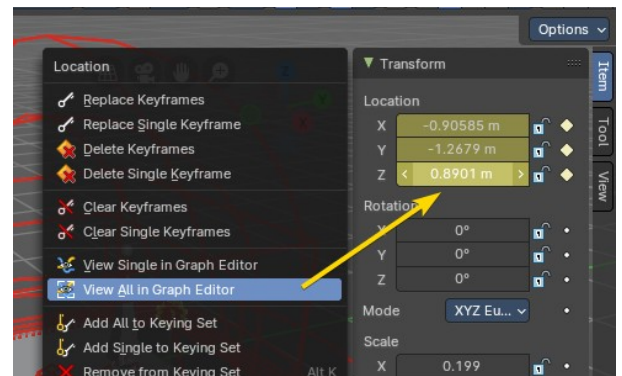

Frame the individual property under the cursor in an open Graph Editor

### View Single in Graph Editor

Frame one property of a set of properties under the cursor in an open Graph Editor

### View All in Graph Editor

Frame a set of properties under the cursor in an open Graph Editor

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider. Here the incremental snapping happens by the frame rate that you have defined. With a frame rate of 24 it will snap in steps of 24 frames when holding down ctrl.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Dope Sheet Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Introduction

The header contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

The text menus are covered in a own chapter each. They vary too much, dependent of mode and object type.

## Header Tabs

The tabs at the very left allows you to switch between the four most important editor types by one click. Dope sheet Editor, Graph Editor, Driver Editor, NLA Editor.

## Use Normalization, Create Ghost Curves

### Use Normalization

Normalizes the curves so that the maximum does not exceed 1 and the minimum does not go lower than -1

### Auto Normalization

Automatically recalculate curve normalization when you modify the curve.

### Create Ghost Curves

Creates a snapshot of the current curves, and displays it as a background image in the viewport. This background image is not permanent, and will be deleted when you close Bforartists.

When a ghost background image is created then the button turns into a delete button with which you can remove the ghost image.

## Show Hide elements

### Only Show Selected

Display only the data for the selected object in the list of elements. If off it displays all available animation data of the whole scene.

## Show Hidden

Include channels from objects / bones that are not visible. This feature just works with Only Selected off.

## Only Show Errors

Only display F-Curves and Drivers that have errors or are disabled.

# Filters

The show hide elements allows you to filter out the general elements. The Filters panel allows you to filter out further elements.

## Filter by Collection

Just display the content from the chosen collection in the list of elements.

## Filter by Type

In this section you can choose what type of animation data should be displayed. The names should be self explaining.

## Options

### Sort Data Blocks

Alphabetically sort the data in the list of elements.

# Auto Snap

Adjust how the selected keyframe or fcurve point snaps to other elements.

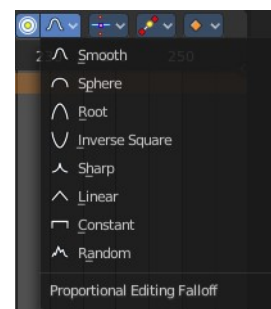

## Proportional Editing

Enable proportional editing.

Proportional editing allows you for example to scale two keyframes and influence the not selected neighbor keyframes in a proportional way. Or the proportional editing of fcurve points.

The drop down menu to choose the proportional editing falloff method is just available when the proportional tool is active.

## Pivot Point

The pivot point defines the center of manipulations.

### Bounding Box Center

Transformation happens around the bounding box center.

### 2D Cursor

Transformation happens around the timeline cursor.

### Individual Centers

Transformation happens around the individual centers of the selected elements.

## Easing Mode

### Easing Mode

The easing methods in the interpolation mode menu are for the easing shape. This menu allows you to choose an easing method.

### Last Operator Set Keyframe Easing Type

#### Type

Set the easing type.

## Keyframe Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its own handler with which you can influence the curve behavior. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dope sheet editor too.

## Last Operator Set Keyframe Handle Type

### Type

Set the handle type for the currently selected curve point.

## Keyframe Interpolation

The keyframe interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose a easing method.

## Last Operator Set Keyframe Interpolation

### Type

Set the interpolation mode.

# Options

## Real-time Updates

When transforming keyframes then this transformation is also immediately visible in other editors.

## Show Seconds

Show the timing in the timeline area in seconds instead of frames.

## Sync visible range

Synchronize the visible timeline range with other visible time based editors. When you zoom in or out in the one editor, then it zooms in or out in the other editor too. Each editor to sync needs to have Sync Visible Range ticked.

## Show Sliders

Shows the value sliders for f-curve channels in the channel list.

## AutoMerge Keyframes

Automatically merge nearby keyframes.

## Use High Quality Display

Display the curves in highest quality.

## Show Extrapolation

Shows the curves after the last keyframe.

## Show Handles

Show the handles at the keyframes.

## Only selected Curve Keyframes

Just show the keyframes from the selected curves.

## Only Selected Keyframes Handles

Just show the handles of the keyframes from the selected curves.

## 19.1.2 Editors - Drivers Editor - Header - Quick Menu

### Table of content

Quick Menu.....	1
Adding an operator to the Quick menu.....	1
Adding a menu to the Quick menu.....	1
Order.....	2
Removing an operator from the Quick menu.....	2
Context and mode dependent content.....	2

### Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

Note that Graph Editor and Drivers Editor shares the same quick menu.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 19.1.3 Editors - Drivers Editor - View Menu

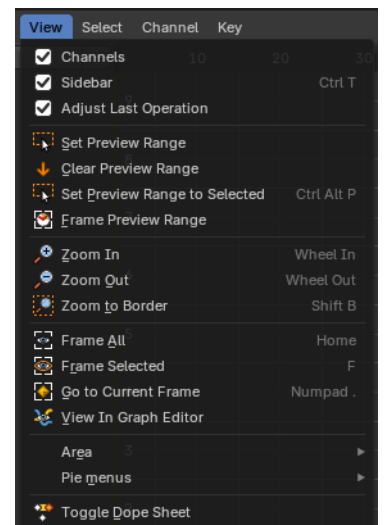

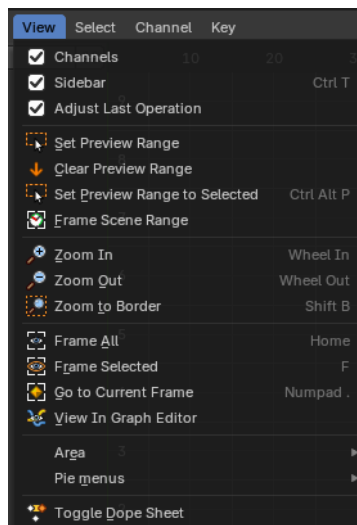

### Table of content

Drivers Editor - View Menu.....	1
Channels List.....	2
Sidebar.....	2
Adjust last Operation.....	2
Set Preview Range.....	2
Clear Preview Range.....	2
Set Preview Range to selected.....	2

Vertical Split.....	3
Duplicate Area into New Window.....	3
Toggle Maximize Area.....	3
Toggle Full screen Area.....	4
Close Area.....	4

## Drivers Editor - View Menu

The View menu contains all View related tools.

The content is for all modes the same.

## Channels List

Shows or hides the Channels list at the left in the viewport.

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Adjust last Operation

Show the Adjust Last Operation panel down left when you perform a tool.

## Set Preview Range

Rectangle select an area of the timeline that gets previewed. The playback now just happens in this marked area.

Note that you can set the range in the Drivers editor, but the preview range is currently not visible in the Drivers editor. You need to check it in the Dope Sheet editor for example.

## Clear Preview Range

Clears an existing preview range.

## Set Preview Range to selected

Sets the preview range to fit the first and last selected keyframe.

## Frame Scene Range

With Use Preview Range off , reset the horizontal view to the current scene frame range.

## Frame Preview Range

With Use Preview Range on , reset the horizontal view to the current preview frame range.

---

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Frame All

Zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Frame Selected

Centers the view at the currently selected keyframe(s).

## Go to current Frame

Centers the view at the frame slider.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI anymore.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## **Toggle Full screen Area**

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## **Close Area**

Closes the editor.

## 19.1.4 Editors - Drivers Editor - Select Menu

Less.....	3

## Drivers Editor - Select Menu

The Select menu contains various tools to select elements.

The content is the same in all modes. With one exception. Grease Pencil mode is missing the More / Less menu items.

### All

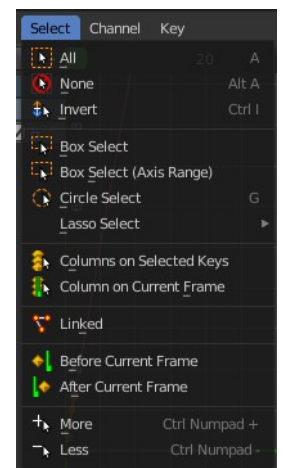

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

## Box Select

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. Just what's inside of the rectangle gets selected then.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Box Select(Axis Range)

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. And what's inside the horizontal range of the rectangle gets selected then. Even when the keyframes are outside of the rectangle.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Last Operator Box Select

### *Axis Range*

What's inside the horizontal range of the rectangle gets selected.

### *Include Handles*

Also select the curve handles.

### *Tweak*

Operator has been activated using a tweak event.

### *Mode*

The selection mode to use.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Lasso Select

A sub menu with the available lasso select modes.

## Columns on Selected Keys

Select the keyframes in the columns of the currently selected keyframe.

## Columns on Current Frame

Select the keyframes in the columns of the current frame.

## Linked

Select all UV vertices linked to the active UV map. The previous selection gets cleared.

## Before current Frame

Select the keyframes before the current frame.

## After current Frame

Select the keyframes after the current frame.

## Last Operator Select Left/Right

## Mode

The selection mode to use.

## Extend Select

Extend the current selection.

## More

Grow the selection.

## Less

Shrink the selection.

## Dopesheet Editor - Channel Menu

This menu contains functionality to manage the channels in the channels list at the left.

The menu doesn't exist in all modes. It exists in Dopesheet, Action Editor and Grease Pencil mode. And has different content.

## Channel Menu - Dopesheet + Action Editor mode

### Delete Channels

Deletes the selected channels and all its keyframes.

### Delete Invalid Drivers

Deletes invalid drivers.

### Group Channels

Creates a custom group from the selected channels.

### Ungroup Channels

Removes the selected channels from the group, and adds them back to the original hierarchy.

### Channel Settings

Adjust the locks and check boxes in the channels list from outside of the channels list for all selected elements at once. With Toggle Mute you could for example disable all selected channels at once.

The menu items should be self explaining.

## Last Operator Toggle Channel Settings

### Type

The type to toggle.

## Toggle Channel Editability

Toggles the locks in the channel list from their previous state to locked and back.

## Last Operator Toggle Channel Editability

### Type

The type to toggle.

## Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

## Constant Extrapolation

The animation curve continues straight at the end.

## Linear Extrapolation

The animation curve continues the last direction.

## Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

## Clear Cyclic

Removes the cyclic extrapolation.

## Last Operator Set Keyframe Interpolation

### Type

Set the extrapolation mode for the selected F-Curves.

## Reveal Curves

Reveals all hidden curves.

## Last Operator Reveal Curves

### Select

Select all revealed curves.

## Hide selected Curves

Hides the selected curves.

## Hide unselected curves

Hides the unselected curves.

## Last Operator Hide Curves

### *Unselected*

Hide the unselected or selected curves.

## Expand Channels

Expands all channels in the channel list.

## Last Operator Expand Channels

### *All*

Expand all Channels, or just the selected channels.

## Collapse Channels

Collapses all channels in the channels list.

## Last Operator Collapse Channels

### *All*

Collapse all Channels, or just the selected channels.

## Move

Sort the items in the channels list.

## Last Operator Move Channels

### *Direction*

Sort the items in the channels list.

## Revive Disabled F-Curves

Clears the disabled tag from all f-curves to get broken F-Curves working again.

# Drivers Editor - Key Menu

This menu contains functionality to manage the keyframes.

## Transform

### Grab/Move

Moves the selected keyframe(s).

### Last Operator Move

#### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

#### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Extend**

Moves the last keyframes of the selection.

## ***Last Operator Transform***

### **Values X, Y Z, W**

The new position.

### **Axis**

Which axis to transform.

### **Orientation**

The widget can have different orientations. The menu items should be self explaining.

## **Proportional editing**

Enables proportional editing. Activating proportional editing reveals further settings.

### ***Proportional Falloff***

Adjust the falloff methods.

### ***Proportional Size***

See and adjust the falloff radius.

### ***Connected***

The proportional falloff gets calculated for connected parts only.

### ***Projected(2D)***

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Rotate

Rotates the selection.

### *Last Operator Rotate*

#### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

#### Axis

Which axis to rotate.

#### Orientation

The widget can have different orientations. The menu items should be self explaining.

#### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

#### *Proportional Falloff*

Adjust the falloff methods.

#### *Proportional Size*

See and adjust the falloff radius.

#### *Connected*

The proportional falloff gets calculated for connected parts only.

#### *Projected(2D)*

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## Scale

Scales the selected keyframes. You need to have more than one keyframe selected.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Snap

Snaps the selected keyframes by the chosen method.

## Last Operator Snap Keys

### Type

Snaps the selected keyframes by the chosen method.

## Mirror

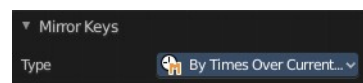

Flips the selected keyframes over the current frame position.

## Last Operator Mirror Keys

### Type

Flips the selected keyframes over the current frame position by the chosen method.

## Insert Keyframes

Choose a method how to insert a new keyframe at the current frame position.

## Last Operator Insert Keyframes

### Type

Choose a method how to insert a new keyframe at the current frame position.

## Jump to Keyframes

Sets the frame marker at the average position of the currently selected keyframes.

## Copy Keyframes

Copy selected keyframes.

## Paste Keyframes

Pastes copied keyframes.

## Paste Flipped

Pastes copied keyframes, but flipped.

## Last Operator Paste Keyframes / Flipped

### Offset

Define an offset for the paste position.

### Type

Choose a method how to paste the copied keyframes.

## ***Flipped***

Pastes keyframes from mirrored bones if they exists.

## **Duplicate**

Duplicate selected keyframes.

## **Last Operator Duplicate**

### ***Mode***

### ***Values X / Y***

The x and y values for the pasted keyframes. Note that these values starts at the position of the original copied keyframe. These values are relative.

Values Z and W have no effect here.

### ***Axis***

These values have no effect.

### ***Orientation***

These values have no effect.

### ***Proportional editing***

Enables proportional editing. Activating proportional editing reveals further settings.

### **Proportional Falloff**

Adjust the falloff methods.

### **Proportional Size**

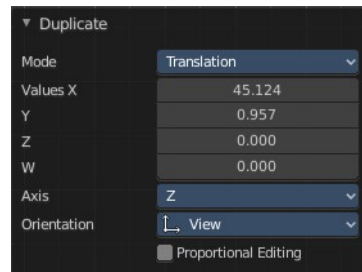

See and adjust the falloff radius.

### **Connected**

The proportional falloff gets calculated for connected parts only.

### **Projected(2D)**

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

---

## **Delete Keyframes**

Deletes selected keyframes.

## Decimate (Ratio)

Decimate F-Curves by removing keyframes that that has the least influence to the curve shape.

## Decimate (Allowed Change)

Decimate F-Curves by specifying how much it can deviate from the original curve.

## Last Operator Decimate Keyframes

### *Mode*

The decimate mode. Error margin is Allowed change.

### *Remove or Max Error Margin*

The percentage of keyframes to remove.

## Clean Keyframes

Simplify FCurces by deleting keyframes that are close to each other in all channels.

## Clean Channels

Simplify FCurces by deleting keyframes that are close to each other in selected channels.

## Last Operator Clean Keyframes

### *Threshold*

The threshold amount for the simplify algorithm.

### *Channels*

Clean keyframes or channels.

## Smooth Keys

Make selected curves less bumpy.

## Keys to Samples

Bake selected F-Curves to a set of sampled points. This makes the curve not longer editable.

## Sample to Keys

Un-bake a sampled point F-Curve to make it editable again.

## Sound to Samples

This operator takes a sound file and uses its sound wave to create the animation data. When running it, you will be prompted to load an audio file to apply to the selected channels.

## Bake Channels

Creates keyframes following the current shape of F-Curves of selected channels for the entire channel within the frame range.

## 19.2 - Drivers Editor - Channel list

### Table of content

Drivers Editor - Channel List.....	1
Hotkeys.....	1
Search field.....	1
Expand / collapse triangle.....	1
Object type Icon.....	1
Pin.....	2
Visibility.....	2
Channel name.....	2
Enable F-Curve Modifiers.....	2
Mute Channel.....	2
Lock Channel.....	2
Slider values.....	2

## Drivers Editor - Channel List

The channel list contains your objects and their animation channels. See also the different modes.

The channel list area can be resized by dragging the right border to left or right.

The list has several elements, to turn on or off different features, Or to expand or collapse the hierarchy.

### Hotkeys

Hotkey A selects all channels.

Hotkey Alt A deselects everything.

Left mouse and dragging activates box select.

Clicking at a channel selects it.

Clicking at a channel while holding down shift adds to the selection or removes from the selection.

### Search field

At the top is a search field that allows you to filter the channel list by search terms.

### Expand / collapse triangle

The triangle icon at the left allows you to expand or collapse the hierarchy.

### Object type Icon

This icon shows what kind of object this channel belongs to. These icons have no

functionality.

## Pin

Normally just the channels for selected objects are visible. With Pin the channels remains visible in Drivers Editor, even when you select another object.

## Visibility

Hide the channel.

## Channel name

The name of the channel name and element. Some elements can be renamed. Like the action or object type.

To rename an element double click at it. Type in the new name. Then press Enter or click elsewhere.

## Enable F-Curve Modifiers

In the Drivers editor you can add F-Curve modifiers in the sidebar. Enable or disable these modifiers by the Enable F-Curve Modifiers setting in the channel list.

## Mute Channel

Mutes the selected channel. It will not be calculated.

## Lock Channel

Locks the selected channel. It is not longer editable.

## Slider values

F-Curves can show a slider value in the channel list. This can be adjusted in the sidebar in the View options panel. Show Sliders is off by default.

You can edit these values. Double click to make it editable. Enter or click elsewhere to confirm. When you confirm, then the original keyframe gets updated.

When no keyframe exists at the current position, then this keyframe gets created.

## 19.3.1 Editors - Drivers Editor - Sidebar - F-Curve Tab

### Table of content

F-Curve Tab - Active F-Curve Panel.....	1
Channel Name.....	1

Free.....	2
Aligned.....	3
Vector.....	3
Automatic.....	3
Auto Clamped.....	3
Frame.....	3
Value.....	3

### F-Curve Tab - Active F-Curve Panel

This panel displays the properties for the active F-Curve.

Note that you need to have a channel selected to reveal the tabs.

#### Channel Name

The name of the currently active F-Curve channel.

#### RNA Path

RNA Path to property. This is a read only information.

#### RNA Array Index

The RNA Array Index to the specific property affected by the F-Curve if applicable. This is a read only information.

#### Display Color

With what colors to display the curves. User defined allows you to choose a custom color for the curve. A color field appears. The other methods works

random.

## Handle Smoothing

Select the method to compute automatic Bezier Handles.

### None

Only directly adjacent key values are used when computing the handles. Vector handles points directly at the adjacent keyframes.

### Continuous Acceleration

Also keyframes behind the next or previous keyframe gets used for calculation. Which results in a smoother curve.

## F-Curve Tab - Active Keyframe Panel

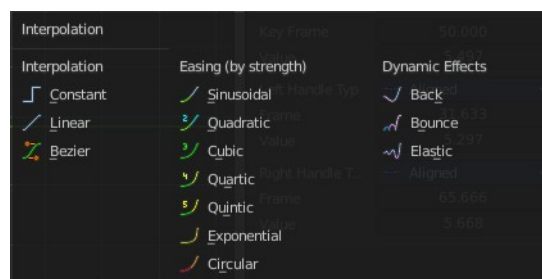

## Interpolation

Set the interpolation type for this keyframe.

## Key Frame

The current position of this keyframe.

## Value

The Y value of this keyframe.

## Left Handle Type / Right Handle Type

Set the handle type. The handles of a keyframe can be independent. Some constellations just works with some other constellations.

### Free

Move and adjust the handles independently.

### ***Aligned***

With the left handler the right handler moves too.

### ***Vector***

Creates a curve with straight lines.

### ***Automatic***

Creates a smooth curve.

### ***Auto Clamped***

Creates a smooth curve that only changes the direction at other curve points. It is clamped to prevent overshoots in the curve shape.

### **Frame**

The current frame of this handle.

### **Value**

The current Y position of this handle.

## 19.3.2 Editors - Drivers Editor - Sidebar - Drivers Tab

 Update Dependencies.....7

## Driven Property Panel

This panel displays the driven property of the object. It is read only.

Note that you need to have a channel selected to show the tabs.

## Driver Panel

The actual driver with all its settings.

### Type

#### Built in functions

Average, Sum, Min and Max are Built-In functions. The driven property will have the value of the average, sum, lowest or highest values of the referenced driver variables. Remember that you can add more than one input variable. So when you for example use the X position of two cubes as the input, and the method Average, then the driven object will be located at the average X value of cube 1 and cube 2.

When there is just one Input variable, then the driven object will be positioned at the value of the driver object.

#### Scripted Expression

Allows you to use Python expressions that can refer to the driver variables by name. An expression allows you to use standard constants and math functions.

### Expression

A text field with the current expression. Not available with all variable types.

#### Use Self

The variable Self can be used for drivers to reference their own data. Example:

self.location.x applied to the Y rotation property of the same object will make the object tumble when moving. Note that dependencies for properties accessed via self may not be fully tracked.

## Add Input Variable

Adds a new driver variable.

## Copy Driver variable

Copies the driver variable.

## Paste Driver variable

Pastes a copied driver variable.

## Driver variable panel

## Variable type

The type of variable to use.

## Single Property

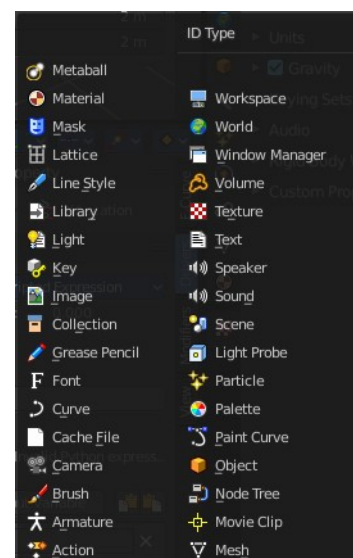

Allows you to retrieve a single value of a RNA Property, specified by a data block reference ( the source object) and a path string ( the property of this source object).

## Prop

### Type

Define the input type of the object. You can retrieve values from nearly every object type.

## ID

The source object. This is also a drop down field where you can pick objects from the scene.

## Path

The path string to use. This defines the property where you get the value from.

## Setting up by hand

Have a look at the python tool tip in the property of the source object. The bpy.data string gives you a hint of the expression that you need.

For example, if i want to use the Z location of the sphere as the driver value.

The python string in the tool tip of the Z location property says

```
bpy.data.objects["Sphere"].location[2]
```

The sphere is already chosen as the source object. Remains the part behind objects["Sphere"] in the string.

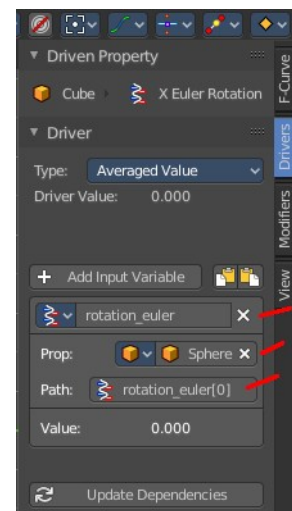

```
location[2]
```

To use location[2] in the path will already work. But you can point directly to the single axis too. The tool tip uses an array for the axis. 0 for X, 1 for Y and 2 for Z. When you want to use the axis letters, then you need a dot between location and the axis letter. And so the other working string is:

```
location.z
```

## Setting up by Copy as New Driver

The easier way is to right click at the value that you want to use as the driver value. Here choose Copy as new Driver. In the target property choose Paste Driver. And this creates a driver with the correct values then that contains all relevant settings.

## Value

The result of the driver variable. Read only.

## Transform Channel

Uses the transform values of the source object.

## Type

The transform type.

## Rotation Mode

Just for Rotation transformations. The rotation mode.

## Transform space

In which transform space the transformation should happen.

### World Space

Transforms includes effect of parenting / restpose and constraints.

### Transform Space

Transforms don't include effect of parenting / restpose and constraints.

### Local Space

Transforms include constraints, but not effect of parenting / restpose.

## Value

The result of the driver variable. Read only.

## Rotational Difference

Use the angle between two bones. The parent bone acts as the second bone here.

### Object 1

The source armature.

### Bone Name

The source bone of this armature.

### Object 2

The target object.

### Value

The result of the driver variable. Read only.

## Distance

The distance between two bones or objects is used for the driver.

### Object 1

The source armature.

### Bone Name

The source bone of this armature.

### Transform space

In which transform space the transformation should happen.

### World Space

Transforms includes effect of parenting / restpose and constraints.

### Transform Space

Transforms don't include effect of parenting / restpose and constraints.

### Local Space

Transforms include constraints, but not effect of parenting / restpose.

### Object 2

The target object.

### Transform space

In which transform space the transformation should happen.

### ***World Space***

Transforms includes effect of parenting / restpose and constraints.

### ***Transform Space***

Transforms don't include effect of parenting / restpose and constraints.

### ***Local Space***

Transforms include constraints, but not effect of parenting / restpose.

### **Value**

The result of the diver variable. Read only.

---

### **Variable name**

The name of the variable. This name of the variable is used for calculation in the expression. This variable can be renamed. Make sure to update the name of the variable in the expression then too.

### **Delete Target Variable**

Removes the variable.

### **Update Dependencies**

Some changes may not update automatically. Update dependencies updates all the changes done to the drivers.

## Modifiers Tab - Modifiers Panel

F-Curve modifiers are similar to Object modifiers. They allow to add adjustable non destructive effects. And they can be layered on top of each other.

Different to the Object modifiers you can't reorder this modifiers. You have to create it in the order that you need it.

### Add Modifier

The list of modifiers. Choose by clicking.

### Copy F-Curve Modifiers

Copy the F-Curve Modifiers of the active F-Curve.

### Paste F-Curve Modifiers

Paste copied F-Curve modifiers to the active F-Curve.

### Last Operator Add F-Curve Modifier

#### Type

A drop down list with the Type of modifier to add.

#### Only Active

Only add a modifier to the currently active curve.

## Modifier header

Every modifier is a panel. And every panel has a header area with some general UI elements.

## Triangle button

Every modifier panel can be expanded or collapsed by clicking at this triangle button.

## Active

This is the panel that you currently edit. When you edit a panel while it is not set to the active one, then the changes will not be applied.

## Modifier name

The name of the modifier. Read only.

## Muted

Enable or disable this modifier.

## Delete F-Curve Modifier

Delete this modifier.

# Generator modifier

## Polynomial Mode

Use Expanded Polynomial or Factorized Polynomial algorithm. With these mathematical formulas you can create lines, parabolas, and other more complex curves by changing the values in the poly order field.

## Additive

Add on top of the existing curve instead of replacing the existing curve.

## Poly Order Expanded mode

The polynomial formula for the Expanded mode. By increasing the Poly Order value you can add more polynomial fields to the formula.

Change the values to the desired results.

## Poly Order Factorized mode

The polynomial formula for the Factorized mode. By increasing the Poly Order value you can add more polynomial fields to the formula.

Change the values to the desired results.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

### Influence

The influence factor.

## Built- in Function modifier

Generate a curve by built in functions.

## Curve Type

The available wave forms for the curve.

## Amplitude

The amplitude of the curve wave. Adjusts the Y scaling.

## Phase Multiplier

A phase multiplier for the curve wave. Adjusts the X scaling.

## Phase Offset

A phase offset for the curve wave. Adjusts the Y scaling.

## Value Offset

A constant value offset for the whole curve. Adjusts the X scaling.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

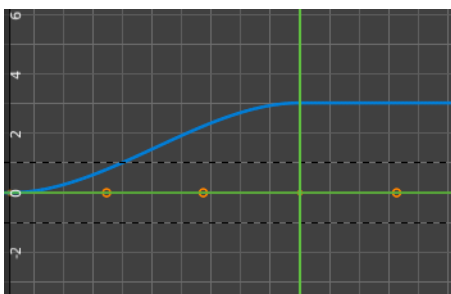

## Influence

The influence factor.

# Envelope modifier

The Envelope modifier allows you to modify the overall shape of the curve by control points.

## Envelope

### Reference Value

Set the Y value to center the envelope around.

### Min

The lower distance from reference value for 1:1 default influence.

### Max

The higher distance from reference value for 1:1 default influence.

## Control Points

### Add Point

Add a control point. A control point has two sub points, a lower control point and a higher control point.

### Point values

Adding a control point adds an entry in the Point Values list. Every added control point has its own values that can be modified here.

### Frame

The frame position of this control point.

### Min

The position of the lower control point.

### Max

The position of the higher control point.

### Delete

Delete this envelope control point.

### Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

Restrict Frame Range			
Start	0.000	End	50.000
In	0.000	Out	0.000

### Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

## Cycles modifier

Add a cyclic motion to a curve that has two or more control points. The option can be set before or after the curve.

## Trivially Cyclic Curves

When the Cycle Mode for both ends is set to either Repeat Motion or Repeat with Offset, and no other options of the modifier are changed from their defaults, it defines a simple infinite cycle.

This special case receives some additional support from other areas of Blender:

Automatic Bezier handle placement is aware of the cycle and adjusts to achieve a smooth transition.

The Cycle-Aware Keying option can be enabled to take the cycle into account when inserting new keyframes.

## Before

Set the cycle mode before the first keyframe.

## Before Cycles

Maximum number of cycles to allow before first keyframes. A value of 0 means infinite.

## After

Set the cycle mode after the first keyframe.

## After Cycles

Maximum number of cycles to allow after last keyframes. A value of 0 means infinite.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

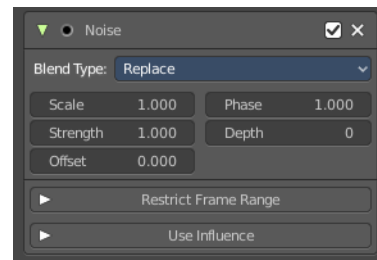

## Influence

The influence factor.

# Noise modifier

Adds noise to the curve.

## Blend Type

How to blend the noise with the curve.

## Scale

The overall size of the noise. The bigger the value the less frequent the noise.

## Strength

Adjust the Y value of the noise.

## Offset

Time offset of the noise.

## Phase

The random seed for the noise.

## Depth

How detailed the noise function is.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

## Limits modifier

Sets limits to the curve in specified x and y range values.

## Minimum / Maximum X

Cuts the curve at these minimum and maximum frame values.

## Minimum / Maximum Y

Clamps the curve at these minimum and maximum values.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

# Stepped Interpolation modifier

Adds steps to the curve by rounding the values.

## Step Size

The number of frames to hold each frame

## Offset

A number of offset frames before frames get held.

## Use Start Frame

Restrict the modifier so that it just acts before its end frame.

## Use End Frame

Restrict the modifier so that it just acts after its start frame.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

### Table of content

Show Cursor panel.....	1
Show Cursor checkbox.....	1
Cursor X.....	1
Cursor Y.....	1
Cursor to Selection.....	1
Cursor Value to Selection.....	1

### Show Cursor panel

The green playhead at the top is the time cursor. The horizontal green line is called the cursor. Or ground line cursor. Together they are the 2d cursor.

### Show Cursor checkbox

Hides the green ground line cursor.

### Cursor X

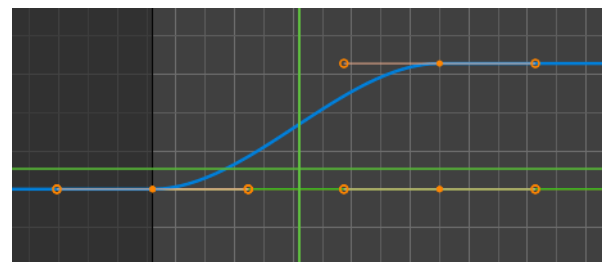

The frame position of the playhead cursor.

### Cursor Y

The Y position of the ground line cursor.

### Cursor to Selection

Sets both cursors to the center of the selection. This button also works when the ground line cursor is deactivated. In this case just the playhead cursor gets set to the center of the selection.

### Cursor Value to Selection

Place the cursor value on the average value of selected keyframes.

# Drivers Editor

Drivers are a way to control values or properties by other values or properties. This is done by expressions. As an example, you can use the Y rotation of a sphere to control the X movement of a cube. The rotation of the sphere drives the cube then.

The Drivers Editor is the place to adjust the settings for drivers.

The Drivers editor has several areas.

Header ( Yellow )

Channel list ( Green ).

Sidebar ( Blue ). The sidebar needs to be revealed, which can be done by clicking at the small triangle button up right.

Viewport ( no color )

The header is divided into two parts. Left tools and menus. Right Options.

Menus ( Green )

Options ( Yellow )

## Time cursor

The Time Cursor is the green slider at the top. It is used to set and display the current time frame.

## F-Curves

The timeline displays the function curves for the driver. This curve is controlled by the expression. But this curve can also be manipulated in various ways like any other F-Curve. Note that manipulating the curve does not manipulate the expression. It adds on top of it. And there is no way to reset it but create the driver from scratch. So be careful with manipulations.

## Handles

Every curve point has handles assigned. The curve can be manipulated by dragging these handlers. You can also change the handle type in the Keyframe Handle Type menu in the header. To make the curve sharp at this keyframe for example.

# Viewport Navigation

Navigation in the viewport happens by mouse or hotkeys. Some of them does not have a menu entry. And needs to be explained here.

## Viewport navigation

Clicking left at the number bar moves the frame marker.

Middle mouse button pans the view.

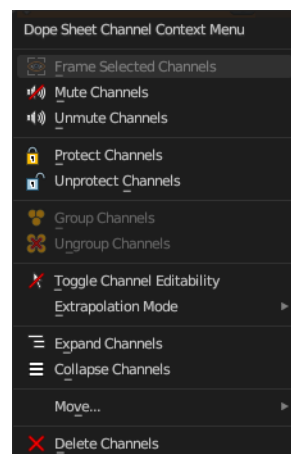

Holding ctrl + middle mouse button zooms the view.

Scroll Wheel zooms the view.

To manipulate a curve point, grab one of its handlers and drag.

# Dope Sheet Channel Context Menu

When you right click into the channel area, then you will call the Dope Sheet Channel context menu.

## Frame selected channels

Centers the selected channels in view.

## Mute Channel

This channel is not calculated.

## Unmute Channel

This channel is calculated.

## Protect Channels

Protect channels from editing.

## Unprotect Channels

Enables editing of channels again.

## Group Channels

Groups channels together.

## Ungroup Channels

Ungroup grouped channels. Beware, the channels will not return to their initial group.

## Toggle Channel Editability

Protects or unprotects the selected channels.

## Extrapolation Mode submenu

### Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

### Constant Extrapolation

The animation curve continues straight at the end.

### Linear Extrapolation

The animation curve continues the last direction.

### Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

### Clear Cyclic

Removes the cyclic extrapolation.

### Expand Channels

Expands the channels.

## Collapse Channels

Collapses the channels.

## Move submenu

Sort the order of the channels. The menu items should be self explaining.

## Delete Channels

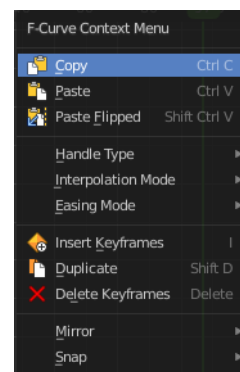

Removes the selected channels.

# F-Curve Context Menu

When you double right click into the viewport then you will call the F-Curve context menu.

## Copy

Copies the currently selected curve point(s).

## Paste

Pastes copied curve point(s)

## Paste Flipped

Pastes copied curve point(s), but flipped.

## Last operator Paste Keyframes / Flipped

## Offset

Define a time offset to paste the keys.

## Type

The paste method.

## Flipped

Paste copied curve point(s) flipped.

## Handle Type

Set the handle type for the currently selected curve point.

## Last Operator Set Keyframe Handle Type

### Type

Set the handle type for the currently selected curve point.

## Interpolation Mode

The Interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose a easing method.

## Last Operator Set Keyframe Interpolation

### Type

Set the interpolation mode.

## Easing Mode

The easing methods in the interpolation mode menu are for the easing shape. This menu allows you to choose an easing method.

## Last Operator Set Keyframe Easing Type

### Type

Set the easing type.

## Insert Keyframes

Insert a keyframe at the current position. This functionality does not work from the Drivers editor.

## Duplicate

Duplicate the selected curve point(s).

## Last Operator Duplicate

### Mode

### Values X / Y

The x and y values for the pasted keyframes. Note that these values starts at the position of the original copied keyframe. These values are relative.

Values Z and W have no effect here.

### Axis

These values have no effect.

### Orientation

These values have no effect.

### Proportional editing

Enables proportional editing. Activating proportional editing reveals further settings.

### Proportional Falloff

Adjust the falloff methods.

### Proportional Size

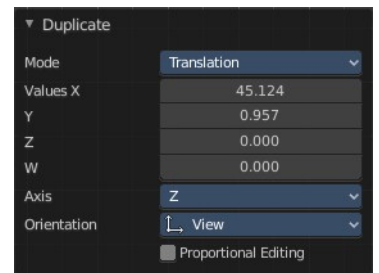

See and adjust the falloff radius.

### Connected

The proportional falloff gets calculated for connected parts only.

### Projected(2D)

The proportional falloff gets calculated in the screen space. Depth doesn't play a role. When it's in the radius, then it gets calculated.

## Delete Keyframes

Delete the selected curve point(s).

## Mirror

Mirrors the animation by the given method.

## Last Operator Mirror Keys

### Type

Flips the selected keyframes over the current frame position by the chosen method.

## Snap

Snaps the selected keyframes by the given method.

## Last Operator Snap Keys

### Type

Snaps the selected keyframes by the chosen method.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **Ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider. Here the incremental snapping happens by the frame rate that you have defined. With a frame rate of 24 it will snap in steps of 24 frames when holding down ctrl.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Menu is empty by default. With Add to Quick favorites you can add this menu

to the Quick menu.

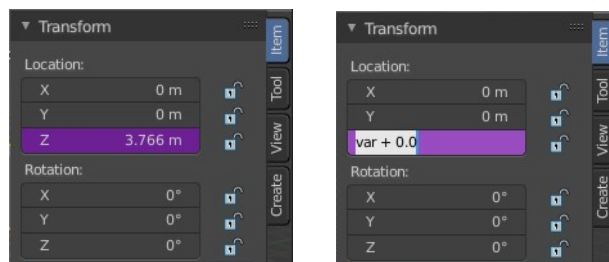

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Dope Sheet Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## Editing the expression from the property

A property with a driver attached will turn pink.

When you click into the edit box, then the expression for the driver will appear. And you can edit this expression now without to edit the driver again.

## Simple Expressions

There are some advanced expression methods, called Simple Expressions.

### Variable Names

Use only ASCII characters.

### Literals

Floating point and decimal integer.

### Globals

frame

### Constants

pi, True, False

### Operators

+, -, \*, /, ==, !=, <, <=, >, >=, and, or, not, conditional operator/ ternary if

### Functions

min, max, radians, degrees, abs, fabs, floor, ceil, trunc, int, sin, cos, tan, asin, acos, atan, atan2, exp, log, sqrt, pow, fmod

Simple expressions are evaluated even when Python script execution is disabled.

When an expression outside of this subset is used, Blender displays a “Slow Python expression” warning. However, as long as the majority of drivers use simple expressions, using a complex expression in select few is

OK.

## Drivers setup example

### Control movement of a cube by rotation of a sphere

Create a cube and a sphere, and place the sphere a bit off. We want to be able to select and modify it.

Select the cube.

In the Transform panel in the sidebar right click at the Z value and choose Add Driver. We will add the driver to the Z axis property of the cube.

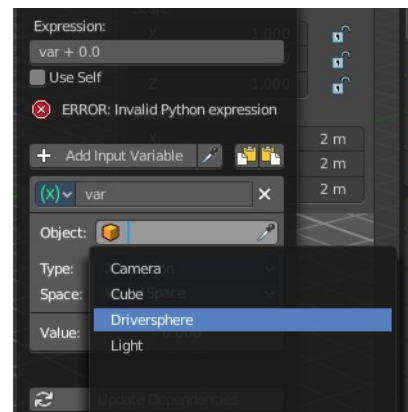

When you add a driver a panel will pop up where you can do the drivers setup.

In case you miss this panel by too fast clicking, it can be called again by right clicking at the property again and choose Edit Drivers from the menu.

Don't worry about the ERROR: invalid Python expression at this point. we are going to change this now.

In the red field with the Object label choose the sphere.

By default the X value influences now the Z position of the cube. So when you move the sphere in X direction, the cube will move in Z direction.

Let's change this to rotation around Z axis. Now the cube moves in Z axis when we rotate our sphere in Z axis.

Let's have a look into our Drivers editor.

We have now content available- The channels list has an entry. And when you click at the Z Location channel in the channel list then the content and the driver settings panel in the sidebar will appear. It is the same than the one from the right click menu.

Let's have a closer look at how this all works. The Expression field is the place where the magic happens. When you change this expression then you can change the behavior of the driver. For example instead of `var + 0.0` you could add a multiplicator here to our variable called `var`. Let's say `var *2`. Then the cube moves in double speed of the rotation of our sphere.

## Add input variable

You could also add a second input value, and connect it with another object. Let's say a cone.

Add a cone object.

In the Driver add a new input variable.

Change this input variable to type Transform Channel.

Now in the object field choose our cone object. And rename the input variable to something meaningful. Again set the type to your needs.

Now let's change the Expression to this: var + mysecondvar.

As a last step update the dependencies by clicking at the Update Dependencies button at the end, which will remove the Invalid Python Expression error.

And now the driver is controlled by the Z rotation of our sphere, which is defined in the variable var. PLUS the x location of the cone object, which is defined in the variable mysecondvar.

## 20.1.1 Editors - NLA Editor - Header tools and options

### Table of content

Introduction.....	1
Header Tabs.....	1
Tweak Mode.....	2
Tweak.....	2

Sync visible range.....	4
Show Control F-Curves.....	4
Show Markers.....	4
Show Local Markers.....	4
Lock Markers.....	4

### Introduction

The header contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

The text menus are covered in an own chapter each.

### Header Tabs

The tabs at the very left allows you to switch between the four most important editor types by one click. Dope sheet Editor, Graph Editor, Driver Editor, NLA Editor.

## Tweak Mode

### Tweak

The tweak mode allows you to edit the keyframe data within an Action clip while evaluating the full stack. The strip will turn green and in the Dope Sheet editor you will find the Action clip's keyframes, which you can now tweak.

Playback will show a blend of all NLA tracks while you edit the Action clip.

### Isolate

Tweak with the Isolate checkbox on allows editing of the animation data on only the selected and isolated Action Clip.

Playback will show only the keyframes of of the isolated Action clip.

**Note:** You can also isolate a clip by clicking on the star icon at the left.

There are similar Tweak mode tool in the Edit menu too where you can edit with the full stack, lower stack or isolated Action clips. Leaving the Tweak mode is for the first two methods evaluated in the header.

## Show Hide elements

### Only Show Selected

Display only the data for the selected object in the list of elements. If off it displays all available animation data of the whole scene.

### Show Hidden

Include channels from objects / bones that are not visible. This feature just works with Only Selected off.

## Include Missing NLA

Include Animation data blocks without NLA data.

## Filters

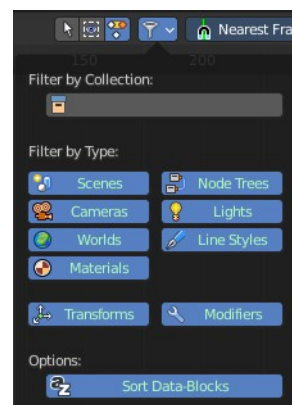

The show hide elements allows you to filter out the general elements. The Filters panel allows you to filter out further elements.

### Filter by Collection

Just display the content from the chosen collection in the list of elements.

### Filter by Type

In this section you can choose what type of animation data should be displayed. The names should be self explaining.

## Options

### Sort Data Blocks

Alphabetically sort the data in the list of elements.

## Auto Snap

Adjust how the selected keyframe or fcurve point snaps to other elements.

## Options

## Real-time Updates

When transforming keyframes then this transformation is also immediately visible in other editors.

## Show Seconds

Show the timing in the timeline area in seconds instead of frames.

## Sync visible range

Synchronize the visible timeline range with other visible time based editors. When you zoom in or out in the one editor, then it zooms in or out in the other editor too. Each editor to sync needs to have Sync Visible Range ticked.

## Show Control F-Curves

Shows existing f-curves in the action strip. Like for keyframed Animated influence.

## Show Markers

Display the markers.

## Show Local Markers

Show action-local markers on the strips.

## Lock Markers

Make the markers uneditable.

## 20.1.2 Editors - NLA Editor - Header - Quick Menu

### Table of content

- Quick Menu..... 1
  - Adding an operator to the Quick menu..... 1
  - Adding a menu to the Quick menu..... 1
  - Order..... 2

  - Context and mode dependent content..... 2

## Quick Menu

The quick menu, or in long Quick Favorites menu, is a menu that can be customized to your needs. Here you can add operators for quick access.

It is located in the header. But it can be called by hotkey Q directly under the mouse. This hotkey works in other editors too.

When the menu is empty, then you will see the message "No Menu Items found". This means that you first have to add some tools to the menu. It is a user configurable menu.

Note that added operators in this menu does not have icons. Just text.

### Adding an operator to the Quick menu

Open the panel or the menu where your operator is that you want to add.

Let's add the open command from the File menu. Open the File menu, right click at open, and choose Add to Quick Favorites.

Do the same with Save As. We should now have two new menu items in the Quick menu, which you can use now.

As a rule of thumb, when the right click menu has an Add to Quick Favorites, then you can add it to the quick menu.

Note that you can also add operators from the tool shelf at the left. And also operators from other editor types. Some other editors have their own quick menu though. The Image Editor for example. These operators gets added in the quick menu of the image editor then. And does not show in the quick menu in the header of the 3D view.

### Adding a menu to the Quick menu

It is also possible to add a menu to the Quick menu. For example the whole Add menu. The way is the same. Right click at it, and choose Add to Quick Favorites.

## Order

You might notice that the add menu adds at the top of the menu, and not at the bottom as you would expect. First comes menus, then comes operators. And they get added in the order in which you add them.

Besides that, operators and menus gets added in the order that you add them. They cannot be sorted afterwards. So be careful how you add them. You can of course always remove operators and menus, and re-add them at the end of the list.

## Removing an operator from the Quick menu

Removing is as simple as adding. Right click at the operators in the Quick menu, and choose Remove from Quick favorites.

## Context and mode dependent content

The quick favorites. menu exists in nearly all editors. But it is just in the 3D view available in the header. So that you know this functionality exists. In the other editors you call it with hotkey Q.

The content of the quick favorites. menu changes, dependent over which editor you are, and in what mode you are. When you add for example an operator from the image editor, then this operator just shows in the quick menu when you call the menu from the image editor. Same goes for the modes. Edit mode tools will just show in edit mode. And so on.

## 20.1.3 Editors - NLA Editor - View Menu

## NLA Editor - View Menu

The View menu contains all View related tools.

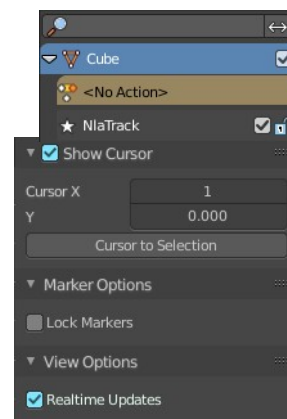

## Channels List

Shows or hides the Channels list at the left in the viewport.

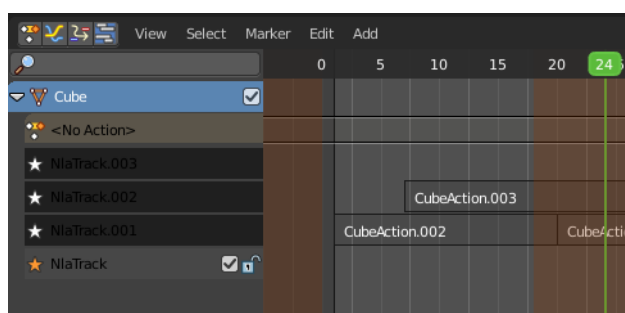

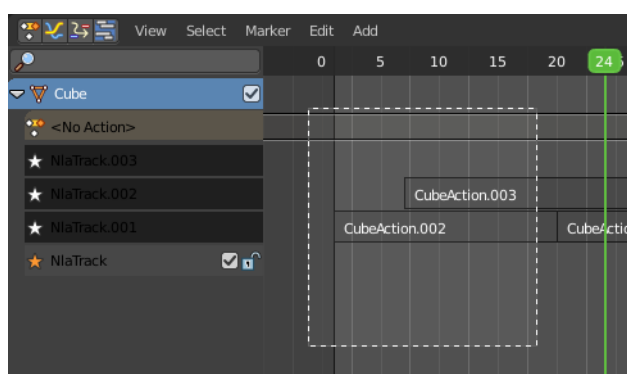

## Sidebar

Shows or hides the sidebar at the right in the viewport.

## Set Preview Range

Rectangle select an area of the timeline that gets previewed. The playback now just happens in this marked area.

## Clear Preview Range

Clears an existing preview range.

## Set Preview Range to selected

Sets the preview range to fit the first and last selected keyframe.

## Frame Scene Range

With Use Preview Range off , reset the horizontal view to the current scene frame range.

## Frame Preview Range

With Use Preview Range on , reset the horizontal view to the current preview frame range.

## Set Preview Range to selected

Sets the preview range to fit the first and last selected keyframe.

## Frame Scene Range

With Use Preview Range off , reset the horizontal view to the current scene frame range.

## Frame Preview Range

With Use Preview Range on , reset the horizontal view to the current preview frame range.

## Zoom In

Zooms into the viewport.

## Zoom Out

Zooms out of the viewport.

## Zoom Border

Draws a rectangle and zooms then to fit the size of this rectangle.

Zooming in is done with drawing the rectangle with left mouse button. Zooming out is done with drawing the rectangle with middle mouse button.

## Frame All

Zooms in or out in the viewport until all objects in the scene are displayed fitting in the viewport.

## Frame Selected

Centers the view at the currently selected keyframe(s).

## Go to current Frame

Centers the view at the frame slider.

---

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

---

## Area

This menu contains general view functionality. And exists in most other editor types too.

## Horizontal Split

Splits the current view horizontally into two independent editor windows.

## Vertical Split

Splits the current view vertically into two independent editor windows.

## Duplicate Area into New Window

Duplicate Area into New Window makes the selected editor window floating. You can then drag it around at the monitor. It is not connected with the rest of the UI any more.

A separated window cannot be merged into the main window again. You have to close it when not longer needed.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return from the maximized view press hotkey ctrl + spacebar. Or reuse the menu item in the area menu.

## Toggle Full screen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey ctrl + alt + spacebar.

## Close Area

Closes the area window.

## 20.1.4 Editors - NLA Editor - Select Menu

## NLA Editor - Select Menu

The Select menu contains various tools to select elements.

The content is the same in all modes. With one exception. Grease Pencil mode is missing the More / Less menu items.

### All

Select everything.

### None

Select nothing.

### Inverse

Invert the current selection.

### Box Select

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. Just what's inside of the rectangle gets selected then.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Box Select(Axis Range)

Box select enters the Border Select mode. Select elements by dragging a rectangle around it. And what's inside the horizontal range of the rectangle gets selected then. Even when the keyframes are outside of the rectangle.

It adds to selection by default. To subtract from selection hold down Shift key.

The selection gets applied when you release the mouse. You leave the mode automatically when you release the mouse.

## Last Operator Box Select

### *Axis Range*

What's inside the horizontal range of the rectangle gets selected.

### *Include Handles*

Also select the curve handles.

### *Tweak*

Operator has been activated using a tweak event.

### *Mode*

The selection mode to use.

## Circle Select

Circle select enters the Circle Select mode. This is a special select mode where you can select elements by moving with the mouse over it. It adds to selection by default.

To subtract from selection hold down Shift key. To exit the Circle select click with the right mouse button.

The pencil radius of the circle select tool can be adjusted with the scroll wheel.

## Before current Frame

Select the keyframes before the current frame.

## After current Frame

Select the keyframes after the current frame.

## Last Operator Select Left/Right

## ***Mode***

The selection mode to use.

## ***Extend Select***

Extend the current selection.

## 21.1.5 Editors - NLA Editor - Marker Menu

### Table of content

NLA Editor - Marker Menu.....	1

After Current Frame.....	3
Jump to Next Marker.....	3
Jump to Previous Marker.....	3

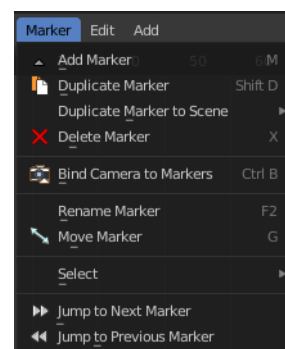

## NLA Editor - Marker Menu

Markers are visual landmarks. They can mark a start of a specific animation sequence, the end of a camera movement, and so on.

When you add one then a marker area appears at the bottom of the timeline.

Markers can be pulled around by clicking at them and dragging them left or right. The active marker is yellow.

By holding down shift you can select more than one marker.

### Add Marker

Adds a marker at the current frame position

### Duplicate Marker

Duplicates the selected marker(s). The duplicate(s) sticks at the mouse until you click to give it the target destination.

## Last Operator Duplicate Time Marker

### Frames

The target frame to position the duplicated marker.

## Duplicate Marker to Scene

Duplicate markers to other scenes. A blend file can contain more than one scene. See Scene Properties in the Properties editor.

## Last Operator Make Links to Scene

### Scene

The target scene to duplicate the markers.

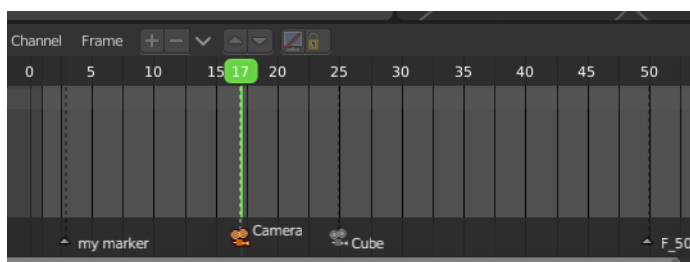

## Delete Marker

Deletes the selected marker(s).

## Bind Camera to Markers

Bind camera to markers turns an object into a camera object. This can be any object in the scene. Not just camera objects.

When the current frame position does not have a marker yet, then it creates a marker at the current frame position.

By binding different objects or cameras at different marker locations you can switch cameras automatically.

The marker with a bind camera attached will show a camera icon.

## Rename Marker

A menu will open up where you can rename the active marker.

Note that for the hotkey to work you need to hover over the Marker region.

In the NLA viewport F2 will call the rename menu to rename the clip instead.

## Last Operator Rename Marker

### Name

Rename the active marker.

## Move Marker

Hotkey only functionality! This menu item exists to show the hotkey to move the marker.

---

## Select sub menu

### All

Select all markers.

### None

Deselect all markers.

### Invert

Inverts the current selection

### Before Current Frame

Selects the markers before the current frame.

### After Current Frame

Selects the markers after the current frame.

---

## Jump to Next Marker

Sets the frame position to the next marker.

## Jump to Previous Marker

Sets the frame position to the previous marker.

Add Transition.....	1
Add Sound Clip.....	1
Add Meta Strips.....	1
Remove Meta Strips.....	2
Add Tracks.....	2
Add Tracks Above Selected.....	2
Include Selected Objects.....	2

## NLA Editor - Add Menu

A menu where you can add various elements to the NLA.

### Add Action Strip

Adds an action strip. Opens a popup menu where you can choose what animation data this new action strip should contain.

### Add Transition

Adds a transition strip between two selected action strips.

### Add Sound Clip

Adds a sound clip at the marker position.

A Sound Clip Controls when a speaker plays a sound. This strip type requires a Speaker object with a sound clip assigned. You can create a speaker object in the 3D view. The sample can be loaded in the Object Data Properties tab in the Properties editor then.

### Add Meta Strips

Turns selected strips into a meta strip. A group of strips.

## **Remove Meta Strips**

Ungroups the meta strips into its original action strips.

## **Add Tracks**

Adds a new track in the Channel list.

## **Add Tracks Above Selected**

Adds a new track in the Channel list.

## **Include Selected Objects**

Objects without animation or a NLA strip will not appear in the channel list. With this command you can load selected objects into the NLA, regardless if they have animation yet or not.

## 20.1.6 Editors - NLA Editor - Track Menu

# NLA Editor - Strip Menu

This menu contains functionality to manage the keyframes.

## Transform

## Grab/Move

Moves the selected keyframe(s).

## Last Operator Move

### Move X, Y Z

The position. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and moves relative to this zero then. For the actual location values have a look in the sidebar in the transform panel.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Mirror Editing

Enable Mirror editing

### Proportional editing

Proportional editing is not available for this mode.

## Extend

Moves the last keyframes of the selection.

## Last Operator Transform

### Values X, Y Z, W

The new position.

### Axis

Which axis to transform.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

### Mirror Editing

Enable Mirror editing

### Proportional editing

Proportional editing is not available for this mode.

## Scale

Scales the selected keyframes. You need to have more than one keyframe selected.

## Last Operator Resize

### Angle

The rotation. Attention, the actual world orientation and rotation does not matter here. It always starts with a value of zero, and rotates relative to this zero then. For the actual rotation values have a look in the sidebar in the transform panel.

### Axis

Which axis to rotate.

### Orientation

The widget can have different orientations. The menu items should be self explaining.

## Mirror Editing

Enable Mirror editing

## Proportional editing

Proportional editing is not available for this mode.

## Snap

Snaps the selected keyframes by the chosen method.

## Bake Action

Bakes all selected objects locations/scale/rotation animations to an action.

To use this operator, a dialogue will prompt to define the parameters before applying the bake action.

The final animation of the selected objects or bones is computed with all modifiers, drivers, and constraints applied with keyed results per frame step in a range.

## Duplicate

Duplicate selected keyframes.

## Linked Duplicate

Duplicates the selected strip(s), and creates a new track for the duplicates. This copy is linked to the original action strip. Modifications at the original will also affect the linked action strip.

Linked strips are visually different from normal strips. And when you start to modify the linked duplicate, then the original strip will turn red.

## Split Strips

Splits the selected strip(s) at the marker position.

## Rename

Allows you to rename the current NLA strip. The operator calls a rename popup.

## Delete Strips

Deletes the selected strips.

## Delete Tracks

Deletes the selected track(s).

## Toggle Muting

Disables the selected action clip. Be careful, there is no visual hint if the clip is muted or not.

## Apply Scale

Applies the current scale of the clips to be 1.

## Clear Scale

Resets the scale of the clip back to 1.

## Sync Action Length

Synchronize the length of the action with the keyframe length used in the strip.

## Make Single User

You can create linked duplicates. Make single user makes them into individual clips.

## Swap Strips

Swaps the selected strips.

## Move strips up

Moves the selected action strips upwards into the next track.

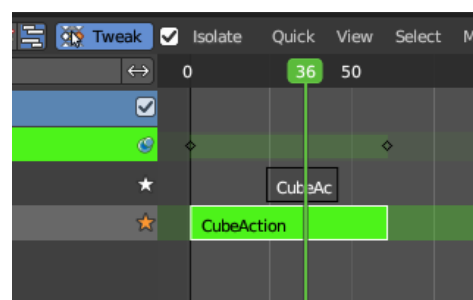

## Move Strips down

Moves the selected action strips downwards into the next track.

## Tweak Action (Lower Stack)

Allows you to edit the keyframe data within the Action strip while evaluating only Action clips located below the active track in the NLA stack. This mutes all tracks above the active Action clip track and only evaluates tracks below.

This tweak mode is similar to the one in the header but it allows you to insert keyframes and preserve the pose that you visually keyed while lower strips are evaluating only.

Note that **Tweak Isolated Action** and **Tweak Action (Full Stack)** is done from the header. And leaving the Tweak mode is for all methods evaluated in the header by clicking at the active Tweak button.

## 20.2 Editors - NLA Editor - Channel list

### Table of content

NLA Editor - Channel List.....	1
Action channel and NLA Track channel.....	1

Search field.....	1
Expand / collapse triangle.....	2
Object type Icon.....	2
Pin.....	2
Mute.....	2
Lock.....	2
Push Down Action.....	2
Solo.....	2
Channel / Track name.....	2

## NLA Editor - Channel List

The channel list contains your objects and their animation channels.

The channel list area can be resized by dragging the right border to left or right.

The list has several elements, to turn on or off different features, Or to expand or collapse the hierarchy.

### Action channel and NLA Track channel

An action channel is a channel with keyframe animation. Before converting the animation to an action.

A track channel is a channel with an action strip. After converting the animation to an action.

### Hotkeys

Hotkey A selects all channels.

Hotkey Alt A deselects everything.

Left mouse and dragging activates box select.

Clicking at a channel selects it.

Clicking at a channel while holding down shift adds to the selection or removes from the selection.

### Search field

At the top is a search field that allows you to filter the channel list by search terms.

## Expand / collapse triangle

The triangle icon at the left allows you to expand or collapse the hierarchy.

## Object type Icon

This icon shows what kind of object this channel belongs to. These icons have no functionality.

## Pin

In Tweaking mode. When unpinned display action without any time remapping. The keyframes remains at their initial position when you move the action strip.

## Mute

Mutes the channel.

## Lock

Locks the channel from editing.

## Push Down Action

Tracks that are no Action strips yet shows this button. Converts a keyframe animation to an Action strip.

## Solo

Just edit this track.

## Channel / Track name

The name of the channel name and element. Some elements can be renamed. Like the

action or object type.

To rename an element double click at it. Type in the new name. Then press Enter or click elsewhere.

## 20.3.1 Editors - NLA Editor - Sidebar - Edited Action tab

### Table of content

Edited Action Tab.....	1
Animation data property.....	1
Data Browser.....	1
Action Edit Box.....	1
Number of users.....	1
Fake User.....	2
Add.....	2
Remove Action.....	2
Extrapolation.....	2
Hold.....	2
Hold Forward.....	2
Nothing.....	2
Blending.....	2
Replace.....	2
Combine.....	2
Add, Subtract, Multiply.....	3
Influence.....	3

## Edited Action Tab

This tab allows you to edit existing actions or add more actions. This way you can add several actions to an object. Add action, record keyframes, and then push down the action to create an action strip of it.

With selecting an action channel, with a not pushed down action, it shows the current action. When you select a track channel then it shows a New button where you can add more action channels.

### Animation data property

#### Data Browser

The list of available actions in the scene.

#### Action Edit Box

The name of the current active action. You can rename the action here too.

#### Number of users

The number of users for this data.

## Fake User

Has this data a fake user assigned. Fake user is a concept to keep data in the scene even when it has no users.

## Add

Adds a new blank Action.

## Remove Action

Removes the action from the current channel.

---

## Extrapolation

Action to take for gaps past the strip extents.

## Hold

Affects both sides of the strip. This should only be set on the very first strip.

## Hold Forward

Affects the region after the clip, only. This can be set on any strip.

## Nothing

Affects only the region of the strip itself. This can be set on any strip.

---

## Blending

Affects how the property values directly produced by the strip are combined with the result of evaluating the stack below. The bottom-most strip is blended on top of the default values of the properties.

## Replace

The top strip is linearly blended in with the accumulated result according to influence, completely overwriting it if influence is set to 100%.

## Combine

Depending on the type of each property, one of the following methods is automatically chosen:

Axis/Angle Rotation

$result = previous + value * influence$

This results in averaging the axis and adding the amount of rotation.

Quaternion Rotation

Quaternion math is applied to all four channels of the property at once:

$\text{result} = \text{previous} \times \text{value} \times \text{influence}$

Proportional (Scale)

$\text{result} = \text{previous} * (\text{value} / \text{default}) \times \text{influence}$

Others

$\text{result} = \text{previous} + (\text{value} - \text{default}) * \text{influence}$

This allows layering actions that can also be used as a standalone. Properties keyframed at their default values remain at default.

## **Add, Subtract, Multiply**

The result of the strip is multiplied, subtracted, or added to the accumulated results, and then blended in according to influence.

$\text{result} = \text{mix}(\text{previous}, \text{previous} (+ - *) \text{value}, \text{influence})$

## **Influence**

Amount the active Action contributes to the result of the NLA stack.

## 20.3.2 Editors - NLA Editor - Sidebar - Strip tab

## Strip Tab

The settings for the currently selected action strip. You need to have a action strip selected to show this tab.

### Name

The name of the currently selected action strip.

To rename the strip click into the edit field, change the name and press enter.

## Mute

Disable the action strip.

# Active Strip panel

## Frame Start + End

The start and end position of the strip.

## Extrapolation

Action to take for gaps past the strip extents.

### Hold

Affects both sides of the strip. This should only be set on the very first strip.

### Hold Forward

Affects the region after the clip, only. This can be set on any strip.

### Nothing

Affects only the region of the strip itself. This can be set on any strip.

## Blending

Affects how the property values directly produced by the strip are combined with the result of evaluating the stack below. The bottom-most strip is blended on top of the default values of the properties.

### Replace

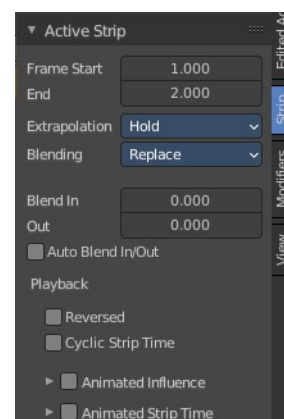

The top strip is linearly blended in with the accumulated result according to influence, completely overwriting it if influence is set to 100%.

### Combine

Depending on the type of each property, one of the following methods is automatically chosen:

Axis/Angle Rotation

result=previous+value\*influence

This results in averaging the axis and adding the amount of rotation.

### Quaternion Rotation

Quaternion math is applied to all four channels of the property at once:

$result = previous \times value \times influence$

### Proportional (Scale)

$result = previous * (value / default) \times influence$

### Others

$result = previous + (value - default) * influence$

This allows layering actions that can also be used as a standalone. Properties keyframed at their default values remain at default.

## Add, Subtract, Multiply

The result of the strip is multiplied, subtracted, or added to the accumulated results, and then blended in according to influence.

$result = mix(previous, previous (+-*)value, influence)$

## Blend In + Out

Number of frames to fade in or out the action strip.

## Auto Blend In/Out

Number of frames for blending in and out is automatically calculated from overlapping strips.

## Playback

### Reversed

The action strip is played in reversed order. This just works when timing is determined automatic.

### Cyclic Strip Time

Cycle the action strip.

## Animated Influence

Control the influence settings by an F-Curve instead of automatically determined. The F-Curve can be edited in the Graph Editor.

### Influence

The influence value.

## Animate Property

Set or remove a keyframe at current position.

## Animated Strip Time

Control the Strip time settings by an F-Curve instead of automatically determined. The F-Curve can be edited in the Graph Editor.

## Influence

The influence value.

## Animate Property

Set or remove a keyframe at current position.

## Action Clip panel

This represents the 'object data' of the strip. Much like the transform values of an object.

## Action

The action that is referenced in the strip. This can be changed to replace the current strip's value with another Action in the scene.

## Frame Start / End

The start and end frame values of the strip.

Note. To loop the animation you might need to reduce the End Frame by one frame to have a loopable animation.

Note. If you select values that are above or below the actual keyframe count of the Action, then the F-curve Extrapolation will be applied.

## Sync Length

Set the Start and End Frames to the first and last keyframed frames of the Action.

## Now

Causes the Start and End Frames, above, to be reset to the first and last keyframed frames of the Action.

## Playback Scale

Stretches the strip.

## **Repeat**

Repeats the strip by the chosen value. With a value of 1 the strip plays once.

## Modifiers Tab - Modifiers Panel

F-Curve modifiers are similar to Object modifiers. They allow to add adjustable non destructive effects. And they can be layered on top of each other.

Different to the Object modifiers you can't reorder this modifiers. You have to create it in the order that you need it.

Note that the F-Curve for the modifiers is just visible in the Graph editor when you are in Tweaking mode.

### Add Modifier

The list of modifiers. Choose by clicking.

### Copy F-Curve Modifiers

Copy the F-Curve Modifiers of the active F-Curve.

### Paste F-Curve Modifiers

Paste copied F-Curve modifiers to the active F-Curve.

## Last Operator Add F-Curve Modifier

### Type

A drop down list with the Type of modifier to add.

### Only Active

Only add a modifier to the currently active curve.

## Modifier header

Every modifier is a panel. And every panel has a header area with some general UI elements.

### Triangle button

Every modifier panel can be expanded or collapsed by clicking at this triangle button.

### Active

This is the panel that you currently edit. When you edit a panel while it is not set to the active one, then the changes will not be applied.

### Modifier name

The name of the modifier. Read only.

### Muted

Enable or disable this modifier.

## Delete F-Curve Modifier

Delete this modifier.

## Generator modifier

## Polynomial Mode

Use Expanded Polynomial or Factorized Polynomial algorithm. With these mathematical formulas you can create lines, parabolas, and other more complex curves by changing the values in the poly order field.

## Additive

Add on top of the existing curve instead of replacing the existing curve.

## Poly Order Expanded mode

The polynomial formula for the Expanded mode. By increasing the Poly Order value you can add more polynomial fields to the formula.

Change the values to the desired results.

## Poly Order Factorized mode

The polynomial formula for the Factorized mode. By increasing the Poly Order value you can add more polynomial fields to the formula.

Change the values to the desired results.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

## Built- in Function modifier

Generate a curve by built in functions.

## Curve Type

The available wave forms for the curve.

## Amplitude

The amplitude of the curve wave. Adjusts the Y scaling.

## Phase Multiplier

A phase multiplier for the curve wave. Adjusts the X scaling.

## Phase Offset

A phase offset for the curve wave. Adjusts the Y scaling.

## Value Offset

A constant value offset for the whole curve. Adjusts the X scaling.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

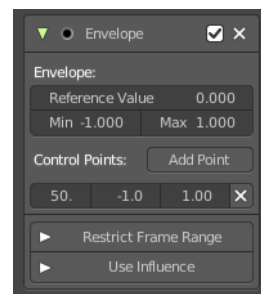

## Influence

The influence factor.

# Envelope modifier

The Envelope modifier allows you to modify the overall shape of the curve by control points.

## Envelope

### Reference Value

Set the Y value to center the envelope around.

### Min

The lower distance from reference value for 1:1 default influence.

### Max

The higher distance from reference value for 1:1 default influence.

## Control Points

### Add Point

Add a control point. A control point has two sub points, a lower control point and a higher control point.

### Point values

Adding a control point adds an entry in the Point Values list. Every added control point has its own values that can be modified here.

### Frame

The frame position of this control point.

### Min

The position of the lower control point.

### Max

The position of the higher control point.

### Delete

Delete this envelope control point.

### Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

### Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

### Influence

The influence factor.

## Cycles modifier

Add a cyclic motion to a curve that has two or more control points. The option can be set before or after the curve.

### Trivially Cyclic Curves

When the Cycle Mode for both ends is set to either Repeat Motion or Repeat with Offset, and no other options of the modifier are changed from their defaults, it defines a simple infinite cycle.

This special case receives some additional support from other areas of Blender:

Automatic Bezier handle placement is aware of the cycle and adjusts to achieve a smooth transition.

The Cycle-Aware Keying option can be enabled to take the cycle into account when inserting new keyframes.

### Before

Set the cycle mode before the first keyframe.

### Before Cycles

Maximum number of cycles to allow before first keyframes. A value of 0 means infinite.

### After

Set the cycle mode after the first keyframe.

### After Cycles

Maximum number of cycles to allow after last keyframes. A value of 0 means infinite.

### Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

# Noise modifier

Adds noise to the curve.

## Blend Type

How to blend the noise with the curve.

## Scale

The overall size of the noise. The bigger the value the less frequent the noise.

## Strength

Adjust the Y value of the noise.

## Offset

Time offset of the noise.

## Phase

The random seed for the noise.

## Depth

How detailed the noise function is.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

## Start / End

The start and end frame of the generated curve.

## In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

## Influence

The influence factor.

## Limits modifier

Sets limits to the curve in specified x and y range values.

### Minimum / Maximum X

Cuts the curve at these minimum and maximum frame values.

### Minimum / Maximum Y

Clamps the curve at these minimum and maximum values.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

### Influence

The influence factor.

# Stepped Interpolation modifier

Adds steps to the curve by rounding the values.

### Step Size

The number of frames to hold each frame

### Offset

A number of offset frames before frames get held.

### Use Start Frame

Restrict the modifier so that it just acts before its end frame.

### Use End Frame

Restrict the modifier so that it just acts after its start frame.

## Restrict Frame Range

Expanding the Restrict Frame range sets it to active. It reveals some value slider then.

### Start / End

The start and end frame of the generated curve.

### In / Out

Fade the curve in or out for chosen frame numbers.

## Use Influence

Temper the F-Curve Modifier effect by a default influence factor.

Expanding the Use Influence sets it to active. It reveals a value slider then.

### Influence

The influence factor.

# Non-Linear Animation Editor

In the NLA Editor you can use and work with so called Actions, which contains the animation data. Instead of working with the single keyframes you work with strips made from these keyframes.

## Editor Areas

The Non-Linear Animation Editor has several areas.

Header ( Yellow )

Channel list ( Green )

Sidebar ( Blue ). The sidebar needs to be revealed, which can be done by clicking at the small triangle button up right.

Viewport ( no color )

The header is divided into two parts. Left tools and menus. Right Options.

Menus ( Green )

Options ( Yellow )

## Time cursor

The Time Cursor is the green slider at the top. It is used to set and display the current time frame.

## Strip types

There are three types of strips.

## Action Strips

Action Strips contains the actual converted keyframe data.

## Transition Strips

Transition strips can be created by adding a transition between two Action strips. Select both action strips. In the Add menu choose Add Transition.

## Meta Strips

Meta Strips can be created by joining action strips together. Meta Strips still contains the Action strips that they are made of, and can be ungrouped in the add menu with remove meta.

## Sound Clip Strips

Controls when a speaker plays a sound clip. This strip type requires a Speaker object with a sound clip assigned. You can create a speaker object in the 3D view. The sample can be loaded in the Object Data Properties tab in the Properties editor then.

## Viewport Navigation

Navigation in the viewport happens by mouse or hotkeys. Some of them does not have a menu entry. And needs to be explained here.

### Viewport navigation

Clicking left at the number bar moves the frame marker.

Middle mouse button pans the view.

Holding ctrl + middle mouse button zooms the view.

Scroll Wheel zooms the view.

## Dope Sheet Channel Context Menu

When you right click into the channel area, then you will call the Dope Sheet Channel context menu.

### Frame selected channels

Centers the selected channels in view.

### Mute Channel

This channel is not calculated.

### Unmute Channel

This channel is calculated.

### Protect Channels

Protect channels from editing.

### Unprotect Channels

Enables editing of channels again.

### Group Channels

Groups channels together.

### Ungroup Channels

Ungroup grouped channels. Beware, the channels will not return to their initial group.

### Toggle Channel Editability

Protects or unprotects the selected channels.

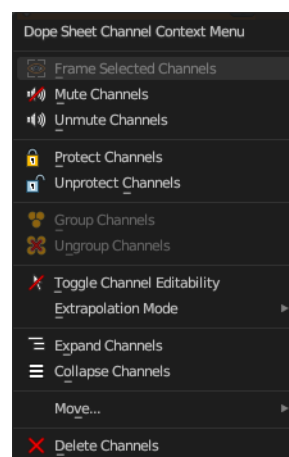

### Extrapolation Mode submenu

#### Extrapolation Mode

Sets the extrapolation mode for the selected F-Curves. Means how the curve acts at the beginning and the end of the F-Curve.

#### Constant Extrapolation

The animation curve continues straight at the end.

## Linear Extrapolation

The animation curve continues the last direction.

## Make Cyclic

Makes the animation loopable. The interpolation curves are adjusted so that the first frame fits to the last frame.

## Clear Cyclic

Removes the cyclic extrapolation.

## Expand Channels

Expands the channels.

## Collapse Channels

Collapses the channels.

## Move submenu

Sort the order of the channels. The menu items should be self explaining.

## Delete Channels

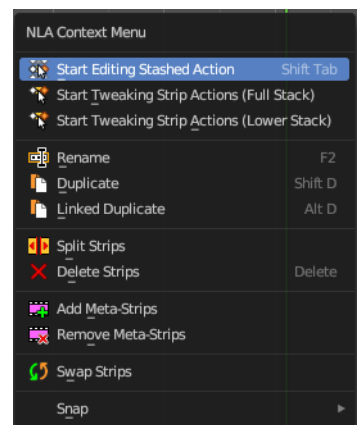

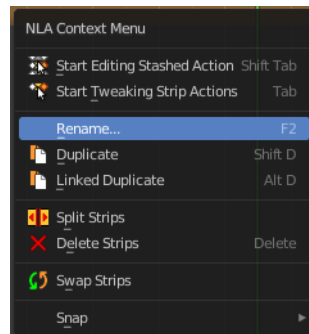

Removes the selected channels.

# NLA Context Menu

When you double right click into the viewport then you will call the NLA context menu.

## Start Editing Stashed Actions

Same as Start Tweaking Strip Actions. But with Solo already ticked. Which allows editing of the animation data for this strip only.

## Start Tweaking Strip Actions(Full Stack)

Allows you to edit the keyframe data within the Action strip. The strip will turn grey, and in the Dope Sheet editor you will find the keyframes again, which you can tweak now. Preserves the pose that you visually keyed while upper strips are evaluating.

## Start Tweaking Strip Actions(Lower Stack)

Allows you to edit the keyframe data within the Action strip. The strip will turn grey, and in the Dope Sheet editor you will find the keyframes again, which you can tweak now.

## Duplicate

Duplicates the selected strip(s), and creates a new track for the duplicates. This copy is independent.

## Rename

Allows you to rename the current NLA strip. The operator calls a rename popup.

## Linked Duplicate

Duplicates the selected strip(s), and creates a new track for the duplicates. This copy is linked to the original action strip. Modifications at the original will also affect the linked action strip.

Linked strips are visually different from normal strips. And when you start to modify the linked duplicate, then the original strip will turn red.

## Split Strips

Splits the selected strip(s) at the marker position.

## Delete Strips

Deletes the selected strips.

## Add Meta Strips

Turns selected strips into a meta strip. A group of strips.

## Remove Meta Strips

Ungroups the meta strips into its original action strips.

## Swap Strips

Swaps the selected strips.

## Snap

Snaps the selected strips by the chosen method.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider. here the incremental snapping happens by the frame rate that you have defined. With a frame rate of 24 it will snap in steps of 24 frames when holding down ctrl.

## Quick Favorites menu

When you right click at a menu or a button, then a right click menu will open. Tools have usually a Add to Quick Favorites menu entry.

The Quick Menu is empty by default. With Add to Quick favorites you can add this menu to the Quick menu.

In the 3D view we have a menu called Quick in the header, which shows this content then. In the Dope Sheet Editor you can just call it with its hotkey. Q. It has no regular menu entry here.

## How to

First create a keyframe animation.

Switch to NLA editor.

Click at the Push Down Action button to create the Action strip for this keyframe animation.

This turns your keyframe sequence into a single Action strip, which can now be used in the NLA editor.

You will notice that the keyframes in the Dope Sheet editor are gone. They are now part of the Action strip.

When you want to edit the keyframes of an Action strip then you need to enter the tweak mode by activating Start Tweaking Strip Actions.

This turns the strip to green to tell you that you are now in tweak mode. And it reveals the keyframes, which you can now edit in Dope Sheet editor.

To leave the edit mode click the menu item again, or press Tab key.

## Text Editor

The Text Editor is mainly used to write scripts. And so the functionality orients towards this usage. But you can also use it to write any text. To store some notes for the scene for example. See Tip below.

When you don't have a file loaded then the header content is rather small.

Once you create a new file, or load a file, you will see the toolbar change, and reveal further functionality.

Some text related functionality can also be found in the tool shelf at the right.

### Tip

A Text window can be used to write in a README text explaining the contents of your blend file. Be sure to keep it visible when saving! And be sure to tell the receiver to activate Load UI to display the text file then. Bforartists has Load UI deactivated by default.

## Slider snapping

Snapping also works at sliders. Hover with the mouse over the slider, start to slide, and holding down **ctrl** will snap the sliders in incremental steps.

When it's a default value between 0 and 1 then it usually snaps in 0.1 steps. When it's a default value over 1 then it usually snaps in steps of 10.

The increment snapping also works at the frame slider.

## Header - File Menu

The File menu contains the load and save functionality. But also some Python and OSL templates. And some general debug functionality.

When no text is loaded then the menu is reduced.

## New Text

Creates a new text file.

## Open Text

Open a text file.

## Reload

It can happen that you work with an external script editor, like Visual Studio, and change your script there. The reload button reloads the current active text file from hard disk.

You will get a warning symbol in the header when the script in the text editor doesn't match with the external text anymore.

## Edit Externally

Allows you to edit your file externally with a defined code editor like VS Code.

Note that you need to define the external editor in the preferences first.

## Save

Saves the text file. Overwrites the existing version immediately.

## Save As

Save as opens a save as file dialog.

## Templates

The Templates category contains some example scripts. There are two kind of templates. Python scripts and Open Shading Language scripts. The name of the files should tell you what the script is good for.

## Redraw Timer

This is a relict from early Blender days. A debugging timer for the UI where you can test the redraw time of different UI elements.

## Debug Menu

Another development tool. Set the debug level.

```
bpy.data.window_managers["WinMan"].(null) = 5
```

## Reload Scripts

Reload Scripts reloads all active python scripts and addons. Including the Bforartists python UI files. This can be useful when you work at the UI or at an add-on. Then you don't have to close and reload Bforartists to see the changes. You can simply reload the scripts and keep Bforartists open.

## Clean up Space Data

Remove unused settings for invisible editors.

## Memory Statistics

Print memory statistics to the console. You need to have the console open.

```
total memory len: 19.353 MB
peak memory len: 24.806 MB
```

## Clean Up Operator Presets

Remove outdated operator properties from presets that may cause problems. This is useful when an operator supports presets to customize settings need to be reset.

# Header - View Menu

The View menu contains some view related functionality.

## Sidebar

Opens or closes the sidebar.

## Zoom In

Zooms in to adjust the font size to use for displaying the text. The font size can also be adjusted in the sidebar.

## Zoom Out

Zooms out to adjust the font size to use for displaying the text. The font size can also be adjusted in the sidebar.

## Top of File

Jumps to the top of the text file.

## Bottom of File

Jumps to the bottom of the text file.

## Area

Area is a menu with window related settings.

## Horizontal Split

Splits the editor horizontally into two editors.

## Vertical Split

Splits the editor vertically into two editors.

## Duplicate Area into new Window

Creates a floating window out of the current editor

## Toggle Maximize Area

Displays the editor maximized with menus.

To return to split view press hotkey Ctrl Up Arrow, or reuse the menu item in the View menu.

## Toggle Fullscreen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey Alt F10, or use the little button that appears up right when you move the mouse in this corner.

## Close Area

Closes the area window.

# Header - Edit Menu

The Edit menu contains tools to modify the text.

## Cut

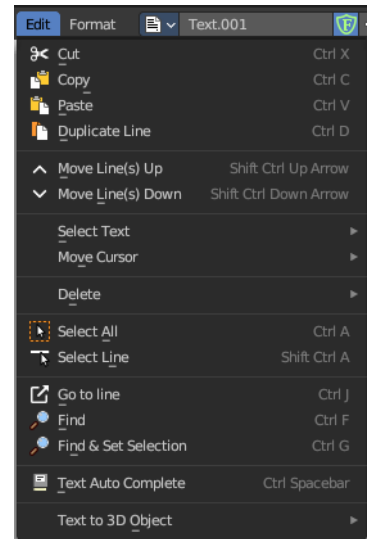

Cuts the selected text.

## Copy

Copies the selected text.

## Paste

Pastes copied text at Text cursor position.

## Duplicate Line

Duplicates the line where the Text cursor currently is.

## Move Line up

Moves the line where the Text cursor is one line up.

## Move Line down

Moves the line where the Text cursor is one line down.

## Select Text sub menu

Select text is a sub menu that contains selection functionality, starting from the current position of the Text cursor. The buttons should be self explaining. And usually you use the hotkeys for this functionality.

## Move Cursor sub menu

This sub menu contains all available methods and its hotkeys to set the mouse cursor in the text.

## Delete

Delete is a sub menu with some special Delete methods, starting from the current position of the Text cursor. And usually you use the hotkeys for this functionality.

## Select all

Selects all text.

## Select Line

Selects the line where the Text cursor. currently is

## Go to Line

This tool opens a sub menu where you can type in the line number and jump to this line then.

## Find

Find opens the Tool Shelf, where you can find a Find & Replace panel. The Find & Replace panel is explained in the tool shelf chapter.

## Find & Set Selection

Finds and selects the next text element that matches with the current selection. It's the same functionality than the Find Next button in the Find & Replace panel.

## Text Auto Complete

Auto Complete tries to complete your text input.

## Text to 3D Object

Text to 3D Object converts the text of the file to an

editable 3D object in the 3D Viewport.

## One Object

Converts the whole text into one object.

## One Object Per Line

Converts every line of the text into a separate object.

## Header - Format Menu

The format menu contains some formatting functionality.

### Indent

Indents the text. Python requires proper indentation.

### Unindent

Unindents the text.

### Comment

Comments the text out. For Python usually with a # sign.

### Uncomment

Uncomments commented text.

### Toggle comments

Toggles the comments.

### Whitespaces to Spaces

Converts Whitespaces in the text to Spaces.

### Whitespaces to Tabs

Converts Whitespaces in the text to Tabs.

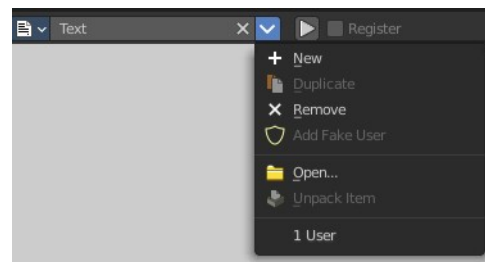

## Header - Tools

The Header tools provides you with quick access functionality.

## Text Prop

## List of text files

This is a list of the images in the scene. This list allows you to switch to other images.

### **Search form**

Search for specific images.

### **Text Edit Box**

Read the name of the currently selected text. And you can rename the textfile here too.

## Unlink Datablock

This closes the selected text. Attention, different from the rest of the UI this text really vanishes immediately from the list then.

## File selector menu

### **New**

Create a new text file.

### **Duplicate**

Not supported here.

### **Unlink Datablock**

This deletes the selected image. Unfortunately not immediately. You need to save the scene and to reload it.

And you need to make sure that it is not linked to anything else. A mesh or a fake user for example. Have a look if there is a number besides the F button. When this is the case then the image has still a user, and so still loads with loading the scene.

### **Fake User**

With this button you assign a fake user to this selected image.

Data, like images, that is not longer linked to anything else gets removed when you save and reload a scene. Bforartists has the concept of fake users to go around this behavior. An image with a fake user is in fact linked

to something. And so it is not lost when you save and reload the scene.

### **Open Image**

Opens the file browser to load an image.

### **Unpack Item**

Unpack packed files to a directory.

### **User**

The number of users that uses this data. Data with a user number of 0 will be removed with closing Bforartists.

---

## **Run Script**

This button is for python or OSL scripts. It executes the script.

## **Register**

This checkbox is for Python or OSL Scripts. When checked the classes of the script gets registered in Bforartists.

## **Info String**

Shows infos about the current text file. When it's an internal created file then it displays the String File: Internal. When it's an external loaded file, then the string displays the path to the location of the file.

## **Show Line Numbers, Wrap and Syntax Highlight**

Show Line numbers displays a row of numbers at the left side of the text file.

Wrap words wraps the text to fit into the current editor size.

Syntax highlighting colors text parts fitting to the language.

## **Tool Shelf**

The Tool Shelf is the place for some options and the text search panel.

### **Properties Panel**

#### **Highlight**

Highlights the line where the text cursor is.

#### **Live Edit**

Updates the script while editing.

## Font Size

The font size for the text editor

## Tab width

Number of spaces to display tabs with. Default is four.

## Show Margin

Shows a dotted line at the right. Note that we have currently a theming problem here with the default Bforartists theme. We have white text, means a white dotted line. And we have a white background. This means that the dotted line just shows with other themes where the header text color is black.

## Margin Column

This edit box becomes visible when Show Margin is ticked.

Here you can adjust the width from the left at which the dotted margin line should show.

---

## Find & Replace Panel

In the find panel you will find tools with text search and replace functionality.

---

## Find Edit Box

Here you can type in the string that you want to search.

## Find set selected

Copies the currently selected text into the Find edit box, searches for a matching string in the text, and selects this match then.

## Find Next

Searches for the next matching string in the text.

## Replace Edit Box

Here you can type in the string that you want to replace in the text.

## Replace set selected

Copies the currently selected text into the Find edit box, searches for a matching string in the text, and replaces this match with the string in the Replace edit box.

## Replace

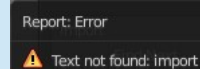

Searches for the next matching string in the text. And replaces it the string in the Replace edit box.

## Replace all

Searches for matching strings in the text. And replaces them all by the string in the Replace edit box.

### Note

By default when the search does not find a matching string anymore in the text below the current selection, then you will get a warning that the search string is not present in the text file. It will not automatically start the search from the top again. You have to place the text cursor manually at the top of the text.

Or turn on the Wrap checkbox below.

## Match case

When ticked then the search is Upper case sensitive.

## Wrap

Starts the search from the top of the document when the search has reached the end of the document.

## All

Search in all opened Text files, not just the currently active one.

## Footer

## Info String

File: H:\bforartists\bforartists\_build64\bin\Release\2.80\scripts\startup\bl\_ui\space\_view3d.py

This string shows infos about the current text file.

When it's an internal created file then it displays the String File: Internal.

When it's an external loaded file, then the string displays the full path to the location of the file.

## Context menu

When you right click into the text editor then a popup menu opens up. It is to 100% made of double menu entries.

### Cut

Cuts the selected text.

### Copy

Copies the selected text.

### Paste

Pastes copied text at Text cursor. position.

### Move Line up

Moves the line where the Text cursor. is one line up.

### Move Line down

Moves the line where the Text cursor. is one line down.

### Indent

Indents the text. Python requires proper indentation.

### Unindent

Unindents the text.

### Toggle comments

Toggles the comments.

### Text Auto Complete

Auto Complete tries to complete your text input.

## Python Console

The Python console is a quick way to execute commands, with access to the entire Python API, command history and auto-complete. It's a research tool for addon- and script developers. But also a place to quickly execute single operators or to try out some simple code.

## Console Menu

The Console menu provides some console editor window specific functionality.

### Console Execute

The expressions in the python console are not read only. You can execute them like you would do from a script. This button executes a selected command.

### Clear

Clears all lines. The blue help text remains.

### Clear Line

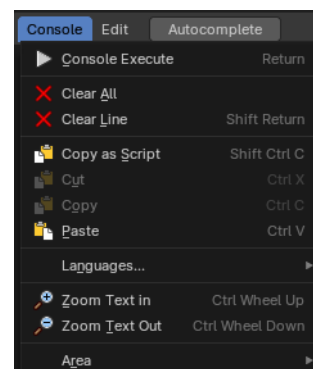

Clears the selected line(s).

### Copy as Script

Copies the whole content of the console as a script that can be pasted into the Text editor.

### Cut

Cuts out selected content.

## Copy

Copies selected content.

## Paste

Pastes copied content.

## Zoom Text Out

Zooms out the text in the console window.

## Zoom Text In

Zooms in the text in the console window.

## Languages

Languages is a sub menu where you can choose the language.

This menu looks pretty useless, since there is just one language available. Python. But it has its usage. With a click at the Python button you can restart the console when you have lost yourself in the deeps of the API.

## Area Menu

Area is a menu with window related settings.

### Horizontal Split

Splits the editor horizontally into two editors.

### Vertical Split

Splits the editor vertically into two editors.

### Duplicate Area into new Window

Creates a floating window out of the current editor.

## Toggle Maximize Area

Displays the editor maximized with menus.

To return to split view press hotkey Ctrl Spacebar, or reuse the menu item in the View menu.

## Toggle Fullscreen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey Ctrl Alt Spacebar, or use the little button that appears up right when you move the mouse in this corner.

## Close Area

Closes the area window.

# Edit Menu

The Edit menu provides you with text specific functionality. Its content should be used by hotkeys. The menu is more to show that this functionality exists.

## Indent

Indents the selected text.

## Unindent

Removes indentation of the selected text.

## Select Text sub menu

### Select all

Selects all text.

### Line Begin

Selects the text to line begin.

### Line End

Selects the text to line end.

## Previous word

Selects the text in front of the current word.

## Next word

Selects the text behind the current word.

## Previous Character

Selects the previous character.

## Next character

Selects the next character.

## Move Cursor sub menu

### Cursor to Next character

Sets the caret in front of the next character.

### Cursor to Previous word

Sets the caret in front of the previous word.

### Cursor to Next word

Sets the caret in front of the next word.

### Cursor to Line Begin

Sets the caret to line begin.

### Cursor to Line End

Sets the caret to line end.

### Cursor to Previous Character

Sets the caret in front of the previous character.

### Cursor to Next character

Sets the caret in front of the next character.

---

## Delete

Delete is a sub menu with several delete methods.

### Next character

Deletes the character beyond the caret.

## Previous Character

Deletes the character before the caret.

## Next Word

Deletes the word beyond the caret.

## Previous Word

Deletes the word before the caret.

---

## History Cycle

Cycles through the history.

Up arrow cycles forwards through the history. Down arrow cycles backwards through the history.

What does this mean? When you write some text, then add something more, delete something, then all this steps are entries in the history. And with History cycle you can access this steps.

## Auto complete

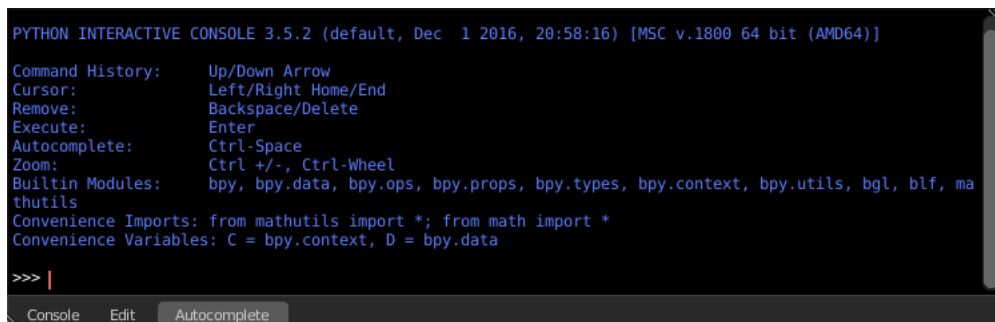

Auto complete is a functionality to auto complete what you have written in the console. It lists for example all available bpy operators when you type in `bpy.context.area`, and then hit the Auto complete button. That way you can go through the whole bpy hierarchy down to what you need for your code, starting with `bpy.`, and having a look at what is available.

## Usage

### Accessing Built-in Python Console

```
PYTHON INTERACTIVE CONSOLE 3.5.2 (default, Dec 1 2016, 20:58:16) [MSC v.1800 64 bit (AMD64)]
Command History: Up/Down Arrow
Cursor: Left/Right Home/End
Remove: Backspace/Delete
Execute: Enter
Autocomplete: Ctrl-Space
Zoom: Ctrl +/-, Ctrl-Wheel
Builtin Modules: bpy, bpy.data, bpy.ops, bpy.props, bpy.types, bpy.context, bpy.utils, bgl, blf, ma
thutils
Convenience Imports: from mathutils import *; from math import *
Convenience Variables: C = bpy.context, D = bpy.data
>>> |
```

From the screen shot above, you will notice that by clicking at the Auto complete button you can enable Auto-complete feature.

The command prompt is typical for Python 3.x, the interpreter is loaded and is ready to accept commands at the prompt `>>>`

### First look at the Console Environment

To check what is loaded into the interpreter environment, type `dir()` at the prompt and execute it.

```
Builtin Modules: bpy, bpy.data, bpy.ops, bpy.props, bpy.types, bpy.context, bpy.utils, bgl, blf, mat
hutils
Convenience Imports: from mathutils import *; from math import *
Convenience Variables: C = bpy.context, D = bpy.data
>>> dir()
['C', 'Color', 'D', 'Euler', 'Matrix', 'Quaternion', 'Vector', '_builtins_', '_doc_', '_loader_',
'_name_', '_package_', '_spec_', 'acos', 'acosh', 'asin', 'asinh', 'atan', 'atan2', 'atanh', 'bpy',
'bvhtree', 'ceil', 'copysign', 'cos', 'cosh', 'degrees', 'e', 'erf', 'erfc', 'exp', 'expm1', 'fabs', 'factorial', 'floor', 'fmod', 'frexp', 'fsum', 'gamma', 'gcd', 'geometry', 'help', 'hypot', 'inf', 'interpolat
e', 'isclose', 'isfinite', 'isinf', 'isnan', 'kdtree', 'ldexp', 'lgamma', 'log', 'log10', 'loglp', 'log2', 'modf', 'nan', 'noise', 'pi', 'pow', 'radians', 'sin', 'sinh', 'sqrt', 'tan', 'tanh', 'trunc']
>>> |
```

Following is a quick overview of the output

**C**

Quick access to `bpy.context`

**D**

Quick access to `bpy.data`

**bpy**

Top level Bforartists Python API module.

The rest of the commands are of various content. Most of them are mathematical expressions.

### Auto Completion at work

Type `bpy.` and then press the Auto complete button.

```
Builtin Modules: bpy, bpy.data, bpy.ops, bpy.props, bpy.types, bpy.context, bpy.utils, bgl, blf, mat
hutils
Convenience Imports: from mathutils import *; from math import *
Convenience Variables: C = bpy.context, D = bpy.data

>>> dir()
['C', 'Color', 'D', 'Euler', 'Matrix', 'Quaternion', 'Vector', '_builtins_', '_doc_', '_loader_',
'_name_', '_package_', '_spec_', 'acos', 'acosh', 'asin', 'asinh', 'atan', 'atan2', 'atanh', 'bpy',
'_bvhtree', 'ceil', 'copysign', 'cos', 'cosh', 'degrees', 'e', 'erf', 'erfc', 'exp', 'expm1', 'fabs',
'factorial', 'floor', 'fmod', 'frexp', 'fsum', 'gamma', 'gcd', 'geometry', 'help', 'hypot', 'inf', 'inter
polate', 'isclose', 'isfinite', 'isinf', 'isnan', 'kdtree', 'ldexp', 'lgamma', 'log', 'log10', 'log1p',
'log2', 'modf', 'nan', 'noise', 'pi', 'pow', 'radians', 'sin', 'sinh', 'sqrt', 'tan', 'tanh', 'trunc']

>>> bpy.
```

A list of sub-modules inside of bpy will appear. These modules encapsulate all that we can do with Bforartists Python API.

Lets list all the contents of bpy.app module.

```
>>> bpy.app.version
(2, 78, 4)

>>> bpy.app.version_string
'2.78 (sub 4)'

>>> |
```

Notice the green output above the prompt where you enabled auto-completion. What you see is the result of auto completion listing. In the above listing all are module attribute names, but if you see any name end with ‘(‘, then that is a function.

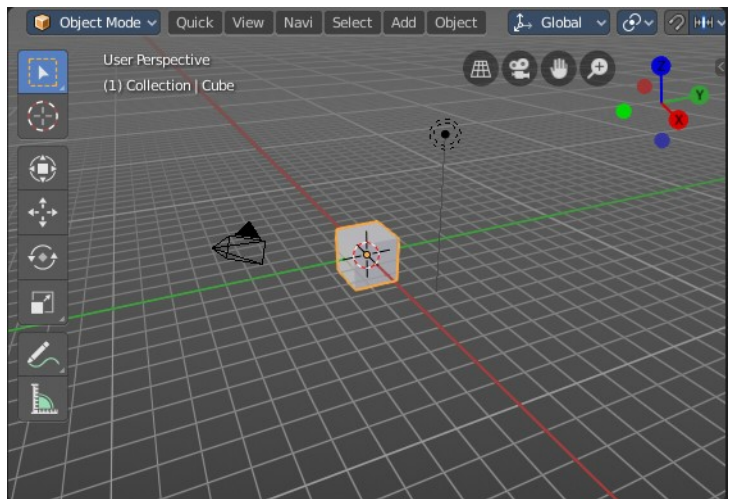

We will make use of this a lot to help our learning the API faster. Now that you got a hang of this, lets proceed to investigate some of modules in bpy.

## Before working with the modules.

If you look at the 3D Viewport in the default Bforartists scene, you will notice some objects. We have added a cube here too.

- All objects exist in a context and there can be various modes under which they are operated upon.
- At any instance, only one object is active and there can be more than one selected objects.
- All objects are data in the Bforartists file.
- There are operators/functions that create and modify these objects.

For all the scenarios listed above the bpy module provides functionality to access and modify data.

## Examples

### Note

For the commands below to show the proper output, make sure you have selected object(s) in the 3D view.

## bpy.context

```
>>> bpy.context.mode
'OBJECT'

>>> bpy.context.object
bpy.data.objects['Cube']

>>> bpy.context.active_object
bpy.data.objects['Cube']

>>> bpy.context.selected_objects
[bpy.data.objects['Cube']]

>>> bpy.context.selected_objects
[bpy.data.objects['Cube'], bpy.data.objects['Lamp Hemi'], bpy.data.objects['Camera']]

>>> |
```

### Try it out!

#### bpy.context.mode

Will print the current 3D View mode (Object, Edit, Sculpt etc.)

#### bpy.context.object or bpy.context.active\_object

Will give access to the active object in the 3D View

```
>>> bpy.context.object.location.x = 1
```

Change x location to a value of 1

```
>>> bpy.context.object.location.x += 0.5
```

Move object from previous x location by 0.5 unit

```
>>> bpy.context.object.location = (1, 2, 3)
```

Changes x, y, z location

```
>>> bpy.context.object.location.xyz = (1, 2, 3)
```

Same as above

```
>>> type(bpy.context.object.location)
```

Data type of objects location

```
>>> dir(bpy.context.object.location)
```

Now that is a lot of data that you have access to

### **bpy.context.selected\_objects**

Will give access to a list of all selected objects.

```
>>> bpy.context.selected_objects
```

... then press `Ctrl-Spacebar`

```
>>> bpy.context.selected_objects[0]
```

Prints out name of first object in the list

```
>>> [object for object in bpy.context.selected_objects if object != bpy.context.object]
```

Complex one... But this prints a list of objects not including the active object

---

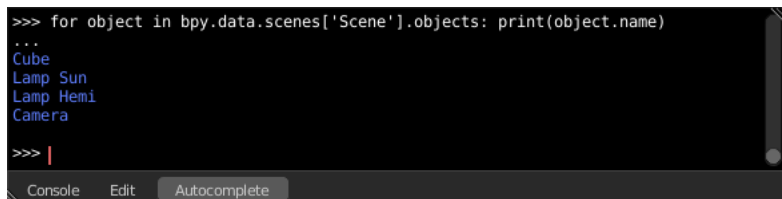

## **bpy.data**

`bpy.data` has functions and attributes that give you access to all the data in the Bforartists file.

You can access following data in the current Bforartists file: objects, meshes, materials, textures, scenes, screens, sounds, scripts, ... etc.

That's a lot of data.

### **Try it out!**

```
>>> for object in bpy.data.scenes['Scene'].objects: print(object.name)
...
Cube
Lamp Sun
Lamp Hemi
Camera
>>> |
```

### **Exercise**

```
>>> for object in bpy.data.scenes['Scene'].objects: print(object.name)
```

Return twice Prints the names of all objects belonging to the Bforartists scene with name “Scene”

```
>>> bpy.data.scenes['Scene'].objects.unlink(bpy.context.active_object)
```

Unlink the active object from the Bforartists scene named ‘Scene’

```
>>> bpy.data.materials['Material'].shadows
```

```
>>> bpy.data.materials['Material'].shadows = False
```

---

## **bpy.ops**

The tool/action system in Bforartists is built around the concept of operators. These operators can be called

directly from console or can be executed by click of a button or packaged in a python script. Very powerful they are..

Lets create a set of five Cubes in the 3D Viewport. First, delete the existing Cube object by selecting it and pressing X

## Try it out!

The following commands are used to specify that the objects are created in layer 1. So first we define an array variable for later reference:

```
>>> mylayers = [False] * 20
>>> mylayers[0] = True
```

We create a reference to the operator that is used for creating a cube mesh primitive

```
>>> add_cube = bpy.ops.mesh.primitive_cube_add
```

Now in a for loop, we create the five objects like this (In the screenshot above, I used another method) Press ENTER-KEY twice after entering the command at the shell prompt.

```
>>> for index in range(0, 5): add_cube(location=(index * 3, 0, 0), layers=mylayers)
```

## Info Editor

The Info Editor has just one purpose. It lists the performed operations in the current session. And displays them as Python commands. Here you can also find error messages.

You can find the Info Editor in the scripting layout down left.

You can copy text from the Info Editor by marking some text, and then use the hotkey ctrl + c to copy it.

### Header

In the Scripting Layout the header of the Info Editor is collapsed. Pull it down to reveal it. The Editor Type menu is explained in chapter 6 Editors introduction.

```
✓ bpy.ops.mesh.primitive_cube_add(size=2, enter_editmode=False, location=(0, 0, 0))
✓ bpy.ops.mesh.primitive_uv_sphere_add(radius=1, enter_editmode=False, location=(0, 0, 0))
✓ bpy.ops.object.editmode_toggle()
bpy.context.space_data.show_region_header = False
```

```
View Info
✓ bpy.ops.mesh.primitive_cube_add(size=2, enter_editmode=False, location=(0, 0, 0))
✓ bpy.ops.mesh.primitive_uv_sphere_add(radius=1, enter_editmode=False, location=(0, 0, 0))
✓ bpy.ops.object.editmode_toggle()
bpy.context.space_data.show_region_header = False
```

## View Menu

### Area Menu

Area is a menu with window related settings.

#### *Horizontal Split*

Splits the editor horizontally into two editors.

#### *Vertical Split*

Splits the editor vertically into two editors.

#### *Duplicate Area into new Window*

Creates a floating window out of the current editor.

#### *Toggle Maximize Area*

Displays the editor maximized with menus.

To return to split view press hotkey Ctrl Spacebar, click at the Back to Previous button, or reuse the menu item in the View menu.

## Toggle Fullscreen Area

Displays the editor maximized without menus.

To return from the full screen view press hotkey Ctrl Alt Spacebar, or use the little button that appears up right when you move the mouse in this corner.

## Close Area

Closes the area window.

## Info Menu

The Info menu provides some console editor window specific functionality.

### All

Select all.

### None

Select nothing.

### Inverse

Inverts the selection.

### Toggle Selection

Toggles the selection.

### Box Select

Box select text.

### Delete

Deletes selected content.

### Copy

Copies selected content.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map. And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

## **Replay Operator - R**

Replay Operator.

## Introduction

The Toolbar editor is what you normally have to avoid in UI design. It's a bunch of double menu entries. It is made by lots of tools that already exists elsewhere.

But the value of this double menu here is that it is configurable. This customizable toolbar makes it possible to have the most needed tools at top UI level. This can save a ton of clicks, tabbing, scrolling, and digging in sub menus. And you can display what you need for your personal workflow. And hide away the rest.

The toolbar editor uses pure Icon buttons.

Parts of the toolbars are just visible when you are in the right mode. The full Primitives toolbar for example in just visible in Object mode. Parts of it are visible in Edit mode, dependent of what type of object you modify. And in the other modes the toolbars are hidden.

Parts of the toolbars are just visible when the right object type in the scene exists / is selected.

As told, the toolbars are double menu entries. This means the description of the tools in this chapter will be as short as possible. Closer descriptions, like how to use the tools, can be found in the other chapters where the tools comes from. The Tool Shelf in the 3D View for example.

## Limits

- The toolbar does not contain all possible tools. More the opposite, the selection is very limited. Lots of tools depends to be performed in the editor type where you want to do the change. They just work there. And not in other editors. This affects for example most tools in edit mode. And the toolbar is another editor. This limits the available tools in the toolbar dramatically.
- The toolbars have a fixed order. The content is not sortable. The sorting is defined by the order of the toolbar type. And inside the toolbar type by the order in the toolbars menu. You would need to have to edit the python file to change this order.
- Just the toolbar types are independent. The check boxes to display the toolbars themselves are global. Means when you set one toolbar type to Primitives, and activate all the primitives types there, then other toolbars with this toolbar type will have the same primitives types displayed.

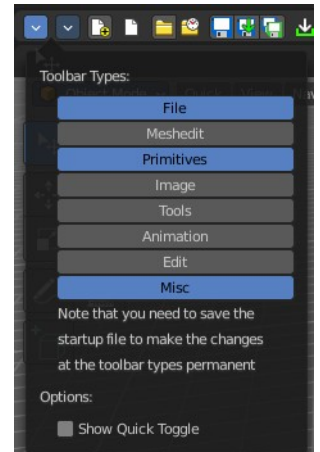

## Menus

### Toolbar Type menu

The first entry of a toolbar is the Toolbar Type menu.

Choose what kind of Toolbar Type you want to show. You can show multiple types of toolbars at once.

The toolbar types are independent from each other. You can set up every toolbar to display different content.

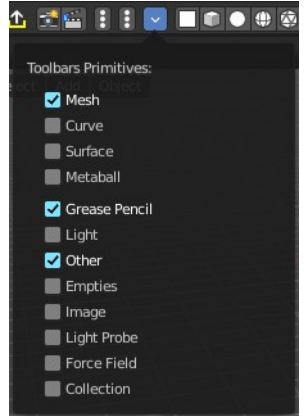

## Toolbars Menus

Every toolbar type has several toolbars to display.

In the toolbar menu at the front of a toolbar type you can choose what toolbars you want to display.

The toolbars are not independent. This setup is global. When you for example tick the Toolbar File in this toolbar, then it will be displayed in all other toolbars too. Including in other layouts.

These check boxes are also available in the Toolbar Settings Bforartists add-on

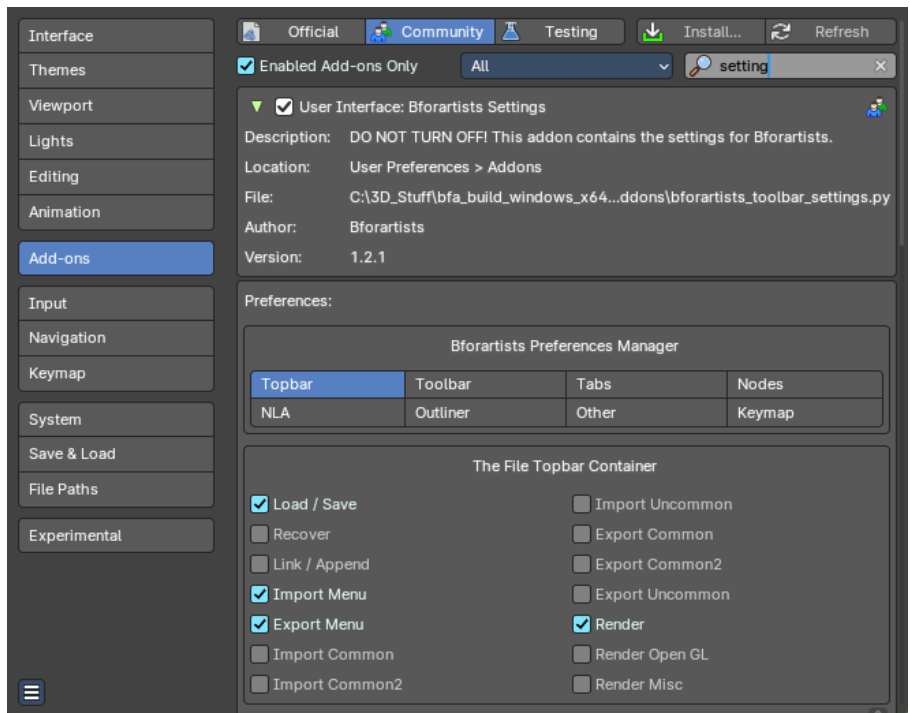

## Bforartists Settings add-on

The settings for the toolbar needs to be stored somewhere. This is done in an add-on called Bforartists Settings.

This add-on contains the same check boxes than the single toolbars menus in the toolbar. But all of them at once.

Changing a setting here will automatically save the user preferences.

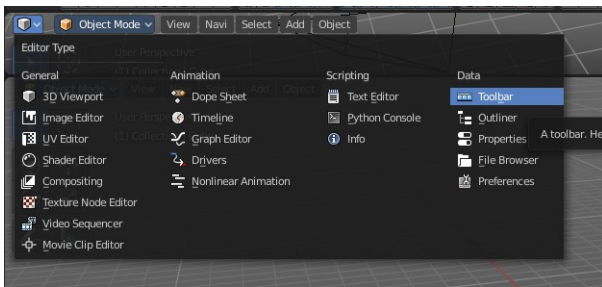

**Warning!**  
Do not deactivate this add-on. The toolbar will not work then. It depends of the settings in the add-on!

## Create new toolbar

You might want to create your own toolbar for a new layout. Let's explain the needed steps.

First create a new editor type. This can be done by dragging the triangle area of an existing editor. And will create a new editor.

Look at the right of this new created editor type. You will now see a small button. This is the Editor type menu. Open it by clicking at it. And choose Toolbar.

Now set up your new created Toolbar editor. Choose the toolbar types you want to display here. Then choose the toolbars to display.

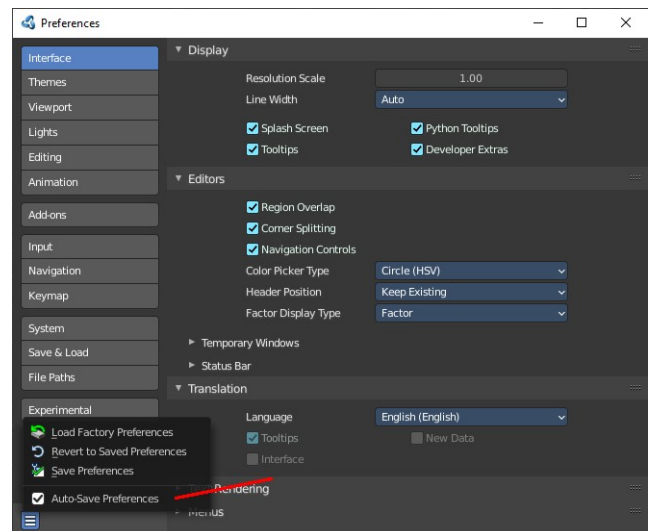

The last step is to hide the Editor Type menu and to collapse the menus. Right click at the toolbar, and tick Collapse Menus and Hide Editortype menu.

## Save Toolbar state

Because of the autosave Preferences feature changes in the menus of the single toolbars are stored automatically.

When you activate for example the Curve toolbar in the Primitives, then the curve toolbar will stay activated when you close and open Bforartists.

But the general setup of the toolbar type is layout. And so you have to save the startup file to make this changes permanent.

Be careful here. Saving the startup file saves every change at the layout. Including things like having a mesh in the scene.

## Toolbar Types

Currently the Toolbar editor contains eight toolbar types.

### Toolbar Types

The single toolbar types.

Note that you need to save the startup file to make changes at the toolbar types permanent. They are part of the layout. Which was the only way to allow them to act independent from each other.

**File** - Contains some file menu related tools. Like load save. But also the render menu.

**Mesh Edit** - Contains tools for Meshes in Edit Mode.

**Primitives** - Contains the primitives from the Create tab in the Tool Shelf.

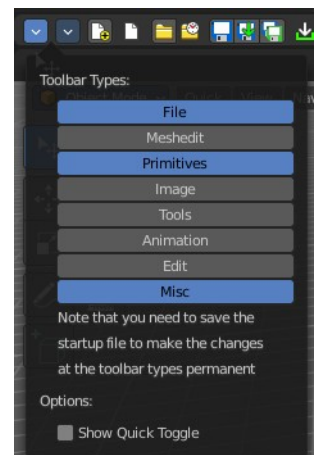

**Image** - Contains some tools for editing UV

**Tools** - Contains the content of the Relations panel in Object mode.

**Animation** - Contains Animation tools

**Edit** - Contains some tools from Object and Edit Mode

**Misc** - Contains Undo, and an empty menu as a place holder.

## Options

### Show Quick Toggle

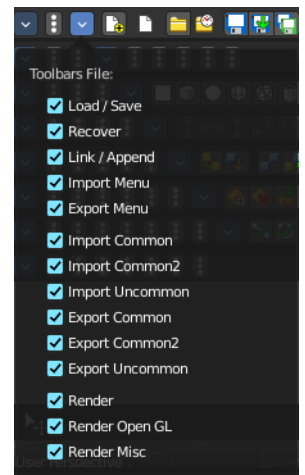

By default you need to turn on or off the toolbar types in the toolbar type menu. With quick toggles turned on you will reveal small buttons besides the single toolbar types that allows you to expand or collapse the toolbar types from within the toolbar. Each quick toggle represents a toolbar type.

## Toolbars File

The Toolbars File contains some file menu related tools. Like load save. But also the render menu.

These toolbars are available in all modes.

## Available Toolbars

The description of the single buttons goes from left to right.

## Load / Save

The original menu items are in the File menu of the Info editor.

### ***File New***

Creates a new scene, using the current template.

### ***New from Template***

Creates a new scene in one of the templates.

### ***Open***

Load a Blend file.

### ***Open Recent***

The recent files menu.

### ***Save Blend File***

Save a Blend file.

### ***Save As Blend File***

Save a Blend file as.

### ***Save Copy***

Saves a copy of the Blend file.

---

## Recover

### ***Revert***

Reload the saved file.

### ***Recover***

Reload a startup file from one of the templates.

### ***Recover Last Session***

Open the last closed file, which is stored in the quit.blend.

### ***Recover Autosave***

Open an automatically saved file to recover it. Like after a crash. See Preferences , Save & Load , Autosave

---

## Link Append

The original menu items are in the File menu of the Info editor.

## ***Link from Library***

Link content from a Blend file

## ***Append from Library***

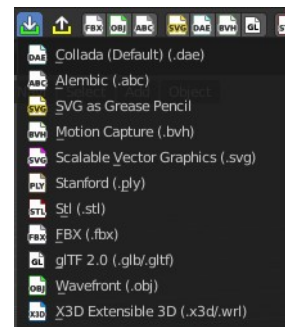

Append content

---

## **Import Menu**

The Import menu is the same menu that you can find in the File menu of the Info editor. It contains all available file import types.

Note that im- and exporters are partially addons that can be disabled. So some content might miss.

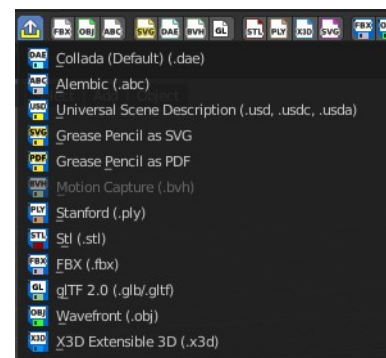

---

## **Export Menu**

The Export menu is the same menu that you can find in the File menu of the Info editor.

It contains all available file export types.

Note that im- and exporters are partially addons that can be disabled. So some content might miss.

---

## **Import Common**

The original menu items are in the File menu of the Info editor.

### ***Import FBX***

Import FBX files.

### ***Import Obj***

Import Object files.

### ***Import ABC***

Import Alembic files.

## Import Common 2

The original menu items are in the File menu of the Info editor.

### ***Import SVG into Grease Pencil***

Import a svg file into a grease pencil object.

### ***Import DAE***

Import Collada files.

### ***Import BVH***

Import Biovision Motion Capture files.

### ***Import glTF2***

Import glTF2 files.

---

## Import Uncommon

The original menu items are in the File menu of the Info editor.

### ***Import STL***

Import STL files

### ***Import PLY***

Import PLY files.

### ***Import SVG***

Import SVG Files.

---

## Export Common

The original menu items are in the File menu of the Info editor.

### ***Export FBX***

Export as FBX file.

### ***Export Obj***

Export as Obj file.

### ***Export ABC***

Export as Alembic file.

## Export Common 2

The original menu items are in the File menu of the Info editor.

### ***Export Grease Pencil to SVG***

Exports a grease pencil object as an svg file.

### ***Export Grease Pencil to PDF***

Exports a grease pencil object as a PDF file.

### ***Export DAE***

Export as Collada file.

### ***Export BVH***

Export as BVH Motion Capture file.

### ***Export USD***

Export as USD file.

### ***Export glTF2***

Export as glTF2 file.

---

## Export Uncommon

The original menu items are in the File menu of the Info editor.

### ***Export 3DS***

Export as 3DS.

### ***Export PLY***

Export as PLY file.

---

## Render

The original menu items are in the Render menu of the Info editor.

### ***Render Image***

Renders the current scene as an image by using the current offline renderer. Either Blender Internal or Cycles.

### ***Render Animation***

Renders the current scene as an animation. Either Blender Internal or Cycles.

## Render Open GL

### *Open GL Render Image*

Renders the current scene as an image by using the Viewport and Open GL.

### *Open GL Render Animation*

Renders the current scene as an animation by using the Viewport and Open GL.

## Render Misc

The original menu items are in the Render menu of the Info editor.

### *Mixdown Audio*

Mixdown and export the scene's audio to an audio file.

### *Show/ Hide Render view*

Toggles display of Render view.

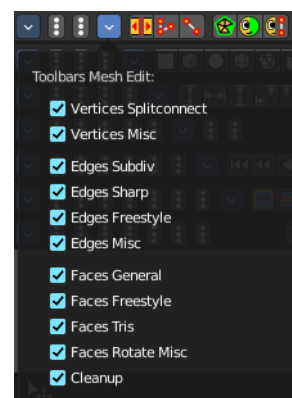

### *Play rendered animation*

Play rendered Animation sequence.

## Toolbars Mesh Edit

The Toolbars Mesh Edit contains tools for Mesh Objects in Edit Mode. The original menu items are mainly in the Mesh menu in Edit Mode. In the Vertices, Edges and Faces sub menus.

This toolbars shows its content Edit mode.

## Available Toolbars

The description of the single buttons goes from left to right.

---

### Vertices Split connect

#### ***Split***

Splits two connected Vertices.

#### ***Vertex Connect Path***

Connect Vertices by their selection order, creating edges, splitting faces

#### ***Vertex Connect***

Connect selected vertices of faces, splitting the face.

---

### Vertices Misc

#### ***Convex Hull***

Enclose selected vertices in a convex polyhedron.

#### ***Blend from Shape***

Blend in shape from a shape key.

#### ***Shape Propagate***

Apply selected vertex locations to all other shape keys.

---

### Edges Subdiv

#### ***Subdivide***

Subdivides selected edges.

#### ***Subdivide Edge Ring***

Subdivides an Edge Ring.

#### ***Un-Subdivide***

Unsubdivides selected edges and faces.

---

## Edges Sharp

### **Mark Sharp**

Mark selected edges as sharp.

### **Unmark Sharp**

Unmark selected edges as sharp.

---

## Edges Freestyle

### **Mark Freestyle Edge**

Mark selected edges as Freestyle feature edges.

### **Unmark Freestyle Edge**

Unmark selected edges as Freestyle feature edges.

---

## Edges Rotate

### **Rotate**

Rotate selected edges or adjoining faces.

---

## Edges Misc

### **Edge Split**

Split selected edges so that each neighbor face gets its own copy.

### **Bridge Edge loops**

Create faces between selected edge loops.

---

## Faces general

### **Fill**

Fill a selected edge loop with faces.

### **Grid Fill**

Fill grid from two loops.

### **Beautify Faces**

Rearrange some faces to minimize degeneration.

## ***Solidify***

Create a solid skin by extruding. Compensating for sharp angles.

## ***Intersect***

Cut an intersection into faces.

## ***Boolean Intersect***

Cut solid geometry from selected to unselected.

## ***Wire Frame***

Create a solid wire frame from faces.

---

## **Faces Freestyle**

### ***Mark Freestyle Face***

Mark selected faces for exclusion from freestyle feature edge detection.

### ***Unmark Freestyle Face***

Unmark selected faces for exclusion from freestyle feature edge detection.

---

## **Faces Tris**

### ***Poke Faces***

Split a face into a fan.

### ***Triangulate Faces***

Triangulates selected faces.

### ***Tris to Quads***

Join triangle faces into quads.

### ***Split by Edges***

Split faces by loose edges.

---

## **Faces Rotate Misc**

### ***Rotate UV's***

Rotate UV coordinates inside faces.

### **Reverse UV's**

Flip direction of UV coordinates inside faces.

### **Rotate Colors**

Rotate Vertex Colors inside faces.

### **Reverse Colors**

Flip direction of Vertex Colors inside faces.

## **Cleanup**

### **Delete Loose**

Delete loose vertices, edges or faces.

### **Decimate Geometry**

Simplify geometry by collapsing edges.

### **Degenerate Dissolve**

Dissolve zero area faces and zero length edges.

### **Make Planar Faces**

Flatten selected faces.

### **Split Non Planar Faces**

Split non planar faces that exceeds the angle threshold.

### **Split Concave Faces**

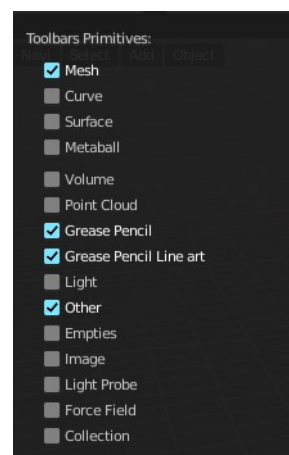

Make all faces convex.

### **Fill Holes**

Fill in holes (boundary edge loops).

## **Toolbars Primitives**

The toolbars Primitives contains the Add items from the Create tab.

The full toolbar with all its content is just available in Object mode. In other modes it hides away. Single types are also visible in Edit mode. When you work at a mesh type, then the Mesh primitives toolbar is visible for example.

## Available Toolbars

The description of the single buttons goes from left to right.

---

### Mesh

The Mesh toolbar contains the Mesh primitives.

#### ***Add Plane***

Add a Plane primitive.

#### ***Add Cube***

Add a Cube primitive.

#### ***Add Circle***

Add a Circle primitive.

#### ***Add UV Sphere***

Add a UV Sphere primitive.

#### ***Add Cylinder***

Add a Cylinder primitive.

#### ***Add Cone***

Add a Cone primitive.

#### ***Add Torus***

Add a Torus primitive.

#### ***Add Grid***

Add a Grid primitive.

---

### Curve

The Curve toolbar contains the Curve primitives.

### **Add Bezier**

Add a Bezier curve primitive.

### **Add Circle**

Add a Circle curve primitive.

### **Add Nurbs Curve**

Add a Nurbs Curve primitive.

### **Add Nurbs Circle**

Add a Nurbs Circle curve primitive.

### **Add Nurbs Path**

Add a Nurbs Path curve primitive.

---

## **Surface**

The Surface toolbar contains the Surface primitives.

### **Add Surface Curve**

Add a Nurbs Surface curve primitive.

### **Add Surface Circle**

Add a Nurbs Surface Circle primitive.

### **Add Surface Patch**

Add a Nurbs Surface Patch primitive.

### **Add Surface Cylinder**

Add a Nurbs Surface Cylinder primitive.

### **Add Surface Sphere**

Add a Nurbs Surface Sphere primitive.

### **Add Surface Torus**

Add a Nurbs Surface Torus primitive.

---

## **Metaball**

The metaball toolbar contains the Metaball primitives.

### ***Add Metaball of type Ball***

Add Metaball of type Ball primitive.

### ***Add Metaball of type Capsule***

Add Metaball of type Capsule primitive.

### ***Add Metaball of type Plane***

Add Metaball of type Plane primitive.

### ***Add Metaball of type Ellipsoid***

Add Metaball of type Ellipsoid primitive.

### ***Add Metaball of type Cube***

Add Metaball of type Cube primitive.

---

## **Point Cloud**

The Point Cloud toolbar contains the Point Cloud primitive.

### ***Add Point Cloud***

Add a point cloud primitive.

---

## **Volume**

The Volume toolbar contains the Volume primitives.

### ***Import OpenVDB Volume***

Imports a OpenVDP volume object.

### ***Add Volume***

Adds a volume object.

---

## **Grease Pencil**

### ***Blank***

Inserts a blank Grease Pencil Object. A blank Grease Pencil Object has just one color

### ***Stroke***

Inserts a Stroke Grease Pencil Object. A Stroke Grease Pencil Object has a few standard colors already.

## **Monkey**

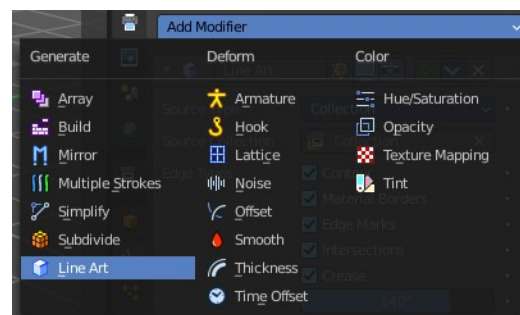

Inserts a Monkey Grease Pencil Object. This is a grease pencil object which contains the shape of a monkey already. This monkey is an example object.

## **Scene Line Art**

Line Art is a modifier for the grease pencil object. Scene Line Art adds a grease pencil object with the Line Art Modifier set up for the whole scene.

## **Collection Line Art**

Line Art is a modifier for the grease pencil object. Scene Line Art adds a grease pencil object with the Line Art Modifier set up for a collection.

---

## **Lamp**

The Lamp toolbar contains the different lamp types.

### **Add Lamp of type Point**

Add Lamp of type Point.

### **Add Lamp of type Sun**

Add Lamp of type Sun.

### **Add Lamp of type Spot**

Add Lamp of type Spot.

### **Add Lamp of type Area**

Add Lamp of type Area.

---

## **Other**

The Other toolbar contains some other ground types like bones and text.

### **Add Text**

Add a Text object.

### **Add Armature**

Add an Armature object.

### **Add Lattice**

Add a Lattice object.

## **Add Camera**

Add a Camera object.

## **Add Speaker**

Add a Speaker object.

---

## **Empties**

The Empties toolbar contains the available empty types.

### **Add Empty of type Plain Axes**

Add Empty of type Plain Axes.

### **Add Empty of type Sphere**

Add Empty of type Sphere.

### **Add Empty of type Circle**

Add Empty of type Circle.

### **Add Empty of type Cone**

Add Empty of type Cone.

### **Add Empty of type Cube**

Add Empty of type Cube.

### **Add Empty of type Single Arrow**

Add Empty of type Single Arrow.

### **Add Empty of type Arrows**

Add Empty of type Arrows.

### **Add Empty of type Image**

Add Empty of type Image.

---

## **Image**

### **Reference Image**

Creates a plane with an image that can be used as a reference image.

### **Background Image**

Creates a plane with an image that can be used as a Background image.

## ***Images as Planes***

Creates a mesh plane with an image.

---

## **Light Probe**

### ***Sphere***

Adds a reflective light probe in sphere shape.

### ***Plane***

Adds a reflective light probe in plane shape.

### ***Volume***

Adds a volumetric array light probe.

---

## **Force Field**

The Force Field toolbar contains the available Force field types.

### ***Add Physics Effector of Type Boid***

Add Physics Effector of Type Boid.

### ***Add Physics Effector of Type Charge***

Add Physics Effector of Type Charge.

### ***Add Physics Effector of Type Curve Guide***

Add Physics Effector of Type Curve Guide.

### ***Add Physics Effector of Type Drag***

Add Physics Effector of Type Drag.

### ***Add Physics Effector of Type Force***

Add Physics Effector of Type Force.

### ***Add Physics Effector of Type Harmonic***

Add Physics Effector of Type Harmonic.

### ***Add Physics Effector of Type Lenard-Jones***

Add Physics Effector of Type Lenard-Jones.

### ***Add Physics Effector of Type Magnetic***

Add Physics Effector of Type Magnetic.

### **Add Physics Effector of Type Smoke Flow**

Add Physics Effector of Type Smoke Flow.

### **Add Physics Effector of Type Texture**

Add Physics Effector of Type Texture.

### **Add Physics Effector of Type Turbulence**

Add Physics Effector of Type Turbulence.

### **Add Physics Effector of Type Vortex**

Add Physics Effector of Type Vortex.

### **Add Physics Effector of Type Wind**

Add Physics Effector of Type Wind.

---

## **Collection**

### **Add Collection Instance**

Add a collection instance.

## **Toolbars Image**

The toolbars Image contains some image related tools.

At the moment this toolbar contains just tools to edit

UV meshes. This means that you have to be in Edit mode with an UV mapped mesh to make the tools active.

The original menu items are in the Image menu of the UV Image Editor.

---

## **Available Toolbars**

The description of the single buttons goes from left to right.

### **UV Mirror**

Mirror along X or Y axis.

## UV Rotate

Rotate by 90 degrees clockwise or counter clockwise.

## UV Align

The UV Align toolbar contains tools to clean up and align the selected UV geometry.

### ***Align Straighten***

Align UV's along the line defined by the end points of the selection.

### ***Align Straighten X***

Align UV's along the line defined by the end points along the X axis.

### ***Align Straighten Y***

Align UV's along the line defined by the end points along the Y axis.

### ***Align Auto***

Automatically choose the axis on which there is most alignment already.

### ***Align X***

Align UV's at X axis.

### ***Align Y***

Align UV's at Y axis.

### ***Align Rotation***

Aligns the rotation of the selected geometry.

## UV Unwrap

The UV Common toolbar contains tools for unwrapping.

### ***Mark Seam***

Mark selected UV Edges as Seam.

### ***Clear Seam***

Remove Seam from selected UV Edges.

### ***Seams from Islands***

Marks the border edges of the UV patches as Seam.

### ***Unwrap Angle Based***

Unwraps the selected geometry with the Angle based ( ABF ) method.

### ***Unwrap Conformal***

Unwraps the selected geometry with the Conformal ( LSCM ) method.

## **UV Modify UV**

The UV Modify toolbar contains tools to clean up the UV mapping.

### ***Pin***

Pins the selected vertices.

### ***Unpin***

Unpins the selected vertices.

### ***Weld***

Weld the selected UV vertices together.

### ***Remove Doubles UV***

Removes double vertices

### ***Average Island Scale***

Average the size of separated UV patches, based at their size in 3D space.

### ***Pack Island***

Packs the UV patches so that they fit best into the UV space, and as few texture space as possible is wasted.

### ***Copy mirrored UV Coordinates***

Copy mirrored UV Coordinates at X axis based on a mirrored mesh.

## **Toolbars Tools**

The Toolbars Tools contains some tools in object mode. The content from the relations panel and the edit panel in the tool shelf. And one tool in Edit mode. Make Vertex Parent. Since this is also part of the relations panel.

## Available Toolbars

The description of the single buttons goes from left to right.

---

### Parent

#### ***Make Parent***

Parents the selected object to the active object.

#### ***Clear Parent***

Removes the parenting.

---

### Object to Data

#### ***Make Single User***

Make linked data local to each object. This operator opens a popup to adjust further settings.

#### ***Link Data***

Apply active object links to other selected objects.

This button is a menu to choose the link method.

### Link to SCN

#### ***Link to SCN***

Link selection to another scene. This other scene has of course to exist.

---

## Linked Objects

### ***Make Local***

Make library linked data blocks local to this file.

### ***Make Library Override***

Add empty object to become local replacement data of a library linked object.

---

## Join

### ***Join***

Join selected objects into active objects.

---

## Origin

### ***Set Geometry to Origin***

Sets the geometry to origin.

### ***Set Origin to Geometry***

Sets the origin to geometry.

### ***Set Origin to 3D cursor***

Sets the origin to the 3D cursor.

### ***Set Origin to Center of Mass***

Sets the origin to the center of mass.

### ***Set Origin to Center of Volume***

Sets the origin to the center of volume.

---

## Shading

### ***Shade Smooth***

Shades the geometry smooth.

### ***Shade Smooth by Angle***

Activate auto smooth, and define the angle. Note that you need to call the adjust last operator here to set the angle. Either with the Last button. Or with the hotkey F6.

## Shade Flat

Shades the geometry flat.

---

## Data Transfer

### Transfer Mesh Data

Transfers mesh data.

### Transfer Mesh Data Layout

Transfers the mesh data layout.

### Join UV's

Transfer UV Maps.

---

## Relations

The Relations toolbar contains one tool in Edit mode. Make Vertex Parent.

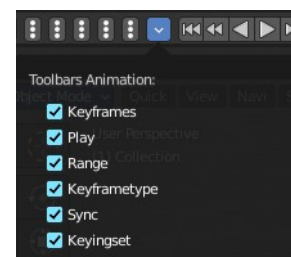

### Make Vertex Parent

Parents an object to the selected vertice(s).

# Toolbars Animation

The Toolbars Animation contains tools around animation. The Toolbars Range, Play, Sync and Keying set are the toolbars from the Timeline. But separated into four independent parts.

## Available Toolbars

The description of the single buttons goes from left to right.

---

### Keyframes

The Keyframes toolbar contains some keyframe tools. The original menu items can be found in the Tool Shelf in the Animation tab in the Animation panel.

The original menu items are in the Tool Shelf in the 3D View, in the Animation tab in the Animation panel.

#### ***Insert Keyframe Menu***

When there is no keying set assigned to the currently selected object, then this button is a menu to choose a keying set. When there is already a keying set assigned, then you can record a keyframe with this button

#### ***Delete Keyframe***

Deletes the current Keyframe

#### ***Bake Action***

Bakes the animation to a new action

#### ***Remove Animation***

Remove all keyframe animation for selected objects

#### ***Calculate Object Paths***

Calculate motion paths for the selected objects.

#### ***Clear Object Paths***

Clears motion paths for the selected objects.

---

### Play

#### ***Jump to Endpoint***

Jumps to beginning of animation.

#### ***Jump to Keyframe***

Jumps to the previous keyframe Play Animation.

#### ***Play Animation***

Plays animation reversed.

## ***Play Animation***

Plays animation forward.

## ***Jump to Keyframe***

Jumps to next keyframe.

## ***Jump to Endpoint***

Jumps to end of animation.

## ***Current Frame***

The current frame number.

---

## **Range**

## ***Use Preview Range***

Use an alternative start/end frame grange for animation playback and OpenGL renders instead of the Render Properties start/end frame range.

## ***Lock Frame Selection to Range***

Don't allow frame to be selected with mouse outside of frame range.

## ***Frame Start***

The frame start point.

## ***Frame End***

The frame end point.

---

## **Keying set**

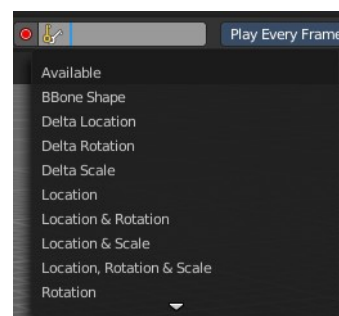

## ***Insert Keyframe***

Insert a keyframe.

## ***Delete Keying set Keyframe***

Delete Keyframe.

## Use Keyframe Insert Auto

Auto insert keyframes at manipulation.

## Keying set Drop down box

This is a drop down box to choose the keying set method.

## Sync

Sync is a drop down box where you can adjust the syncing method.

## Keyframe Type

Keyframe Type is a drop down box to choose in what color the keyframe gets displayed in the Dope Sheet Editor.

# Toolbars Edit

The Toolbars Edit contains various toolbars around editing. Some content just shows when an object exists in the scene. Some content is visible in Object mode. Some content is visible in Edit mode.

## Available Toolbars

The description of the single buttons goes from left to right.

## Edit

The Edit toolbar is just visible in Edit Mode. The original menu items are in the Tool Shelf in the 3D View in the Tools tab in the Mesh Tools panel.

## Dissolve Vertices

Dissolve Vertices.

## ***Invert***

Inverts the weighting.

## ***Clean***

Remove Vertex Assignments that are not required.

## ***Quantize***

Set Weights to a fixed number of steps.

## ***Levels***

Add some offset and multiply with some gain the weights of the active vertex group.

## ***Smooth***

Smooth weights for selected vertices.

## ***Limit Total***

Limit deform weights.

---

## ***Object Apply***

The Object Apply toolbar is just visible in Object Mode. The original menu items are in the Object menu in the 3D View. The Apply menu.

## ***Apply Location***

Apply location.

## ***Apply Rotation***

Apply Rotation.

## ***Apply Scale***

Apply Scale.

## ***Apply All***

Apply Location, Rotation, Scale.

## ***Apply Rotation & Scale***

Apply Rotation, Scale.

## ***Apply Visual Transform***

Apply Visual Transform.

## ***Apply Make Duplicates real***

Make Duplicates attached to this object real.

---

## **Object Apply Deltas**

Object Apply deltas converts normal object transforms to delta transforms. Any existing delta transform will also be included.

### ***Location***

Apply location.

### ***Rotation***

Apply Rotation.

### ***Scale***

Apply Scale.

### ***All***

Apply Location, Rotation, Scale.

## ***Transforms to Delta Anims***

Convert object animation for normal transforms to delta transforms.

---

## **Object Clear**

The Object Clear toolbar is just visible in Object Mode. The original menu items are in the Object menu in the 3D View. The Clear menu.

### ***Location***

Resets the position of the object to zero.

### ***Rotation***

Resets the object's rotation to zero.

### ***Scale***

Resets the object's scale to 1.

### ***Origin***

Resets the Origin Position.

## Toolbars Misc

The Toolbars Misc contains some miscellaneous tools. Undo, the Scene drop down box, Last Operator, Operator Search and scene informations.

## Available Toolbars

The description of the single buttons goes from left to right.

### Viewport

Displays the viewport panel from the object properties tab in the properties editor.

This panel allows you to adjust the display of the selected object.

Note that you need to have an object selected to show this dropdown panel.

### Undo / Redo

#### *Undo*

Undo the last step

#### *Redo*

Redo the last undone step

### Undo History

#### *Undo History*

A click at at the button reveals a list of the last operations where you can undo more than one step.

## Repeat

### *Repeat*

Repeats the last action

### *Repeat History*

A click at the button reveals a list of the last operations to choose from which undo step to repeat.

## Scene

The Scene drop down box to choose and create a new scene data block. The original drop down box is in the Properties editor in the Scene Properties tab in the Scene panel.

## View Layer

Show the active view layer and switch between available view layers.

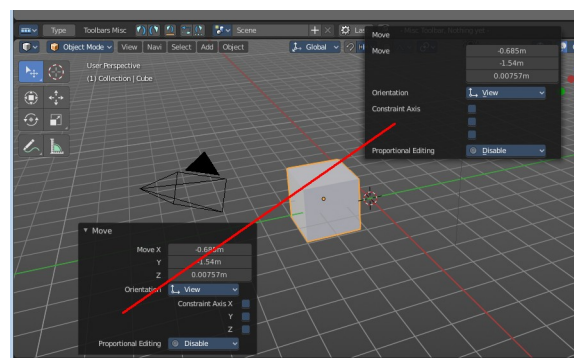

The original drop down box is in the Properties editor in the View Layer Properties in the View Layer panel.

## Adjust last Operation

Adjust the latest operation. This is the same panel than the one in the 3D view down left. At least when it comes to content.

## Operatorsearch

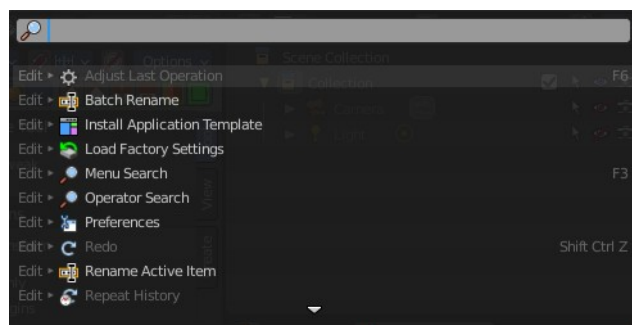

This toolbar contains two search options. The search menu allows you to search for menus. The operator search menu allows you to search for single operators.

## Search Menu

The original menu item is in the header in the Edit menu. It lists the available menus, and allows searching.

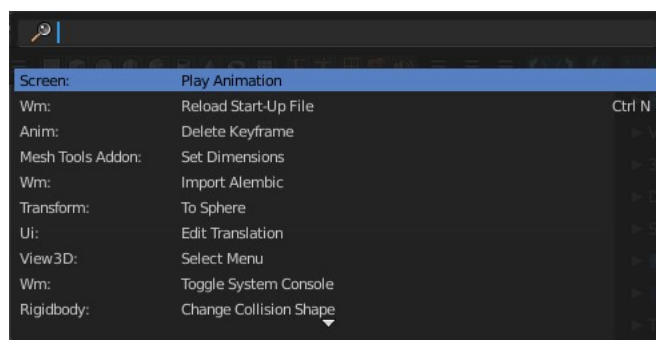

This button calls the menu search menu.

## Search Operator

The original menu item is in the header in the Edit menu.

This button calls the Operator search menu. It lists the available operators, and allows searching.

## Info

The Info toolbar displays the scene statistics.

## 25 Editors - Outliner

# Outliner

The Outliner is an editor where you can organize the data in your scene. It is in the View Layer mode basically a list of the available objects and data in the scene, which is organized in so called collections. Think of it as a container that carries the scene data. This also includes things like brushes, textures and materials.

The outliner not only lists the data. But you can modify the data in various ways. And it has more than one mode. We will go through them, one by one.

The outliner has some context menus that are available by a right click at an element. We will also cover them, one by one.

## General hotkey functionality

There is some general hotkey functionality that works across the whole interface. And so it works in the outliner too.

Left click at an object selects it. When you select an object in the outliner, then it is also selected in the scene.

Dragging the mouse with left click box selects.

Like in the 3D view, Shift + LMB adds to the selection, or can remove the clicked object from the selection.

Ctrl+LMB enters the rename mode for the object. You can also double click at it. In both cases the text becomes editable.

You can drag objects into the hierarchy of other objects, and make them a

child object by that.

You can navigate with the arrow buttons. Holding shift while navigating with the arrow buttons will extend the selection.

Delete hotkey deletes the selected items. Also selected collections.

## Extended Functionality

The outliner has some extended functionality in some modes.

Objects with an arrow sign at the left are hierarchical objects. Hierarchy can be expanded and collapsed by clicking at the + and - signs.

When you click at a data block of some object types object, like the mesh component for a mesh or a curve object, then you will jump from object mode into edit mode. And vice versa.

## Collections

Collections are containers that can contain objects or anything else in the scene. They can also include collections, and are fully recursive.

## Header - All Modes

The header content changes, dependent of the display mode. Here we list the elements that are available in all display modes.

## Switch to Properties Editor / Outliner

Sometimes you want to switch from Outliner to the Properties Editor, or vice versa. Since you sometimes don't have enough space for both, and end in dragging the borders of the editors around all the time. This two editors are connected by a menu that allows exactly that. A button in each header that switches to the other editor.

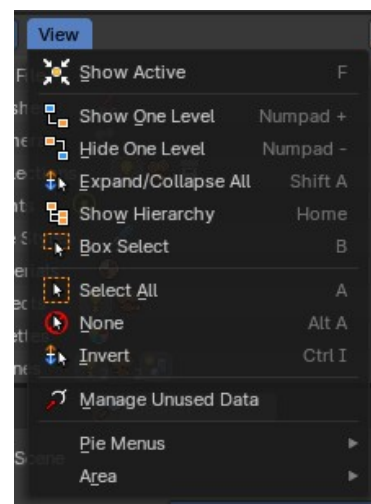

## Display Mode

The Outliner has more than one purpose and workspace. In this drop down menu you can switch to different display modes. The available Modes are Scenes, View Layer, Sequence, Blender File, Data API and Unused Data. We will cover their functionality in their own chapters.

## View Menu

The View menu contains general view related functionality.

### Show Active

Centers the view of the list to the active object.

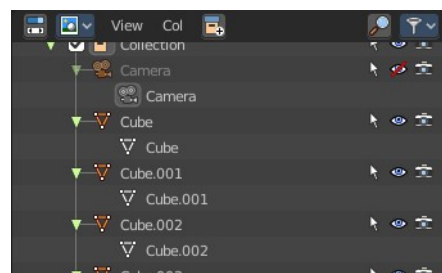

### Show One Level

Expands the list hierarchy level by one.

### Hide One Level

Collapses the list hierarchy level by one.

### Expand / Collapse All

Expands or collapses all collapsed hierarchy. It's a toggle

### Show Hierarchy

Open all object entries and close all others. For example, when you are in Scene view, and have the objects expanded, then the Show Hierarchy closes the objects hierarchy.

### Box Select

Box select items in the list.

### Select All

Select all items in the list.

### Deselect All

Deselect all items in the list.

### Invert Selection

Inverts the selection. Unselected list items becomes selected, selected list items becomes unselected.

## Manage Unused Data

This opens a pop-out floating Outliner Editor in the Unused Data mode, so you can view and manage the unused data while remaining in the same Outliner mode.

## Pie menus

Lists the available pie menus, and gives you the ability to read the hotkeys and assign own hotkeys.

## Area

Area is a menu with window related settings.

### **Horizontal Split**

Splits the editor horizontally into two editors.

### **Vertical Split**

Splits the editor vertically into two editors.

### **Duplicate Area into new Window**

Creates a floating window out of the current editor

### **Toggle Maximize Area**

Displays the editor maximized with menus.

To return to split view press hotkey Ctrl Up Arrow, or reuse the menu item in the View menu.

### **Toggle Fullscreen Area**

Displays the editor maximized without menus.

To return from the full screen view press hotkey Alt F10, or use the little button that appears up right when you move the mouse in this corner.

### **Close Area**

Closes the area window.

## Search Field

Search for specific terms in the list. When the search term matches a name in the list, then the list will center at the first entry with the match.

This search field is collapsible, and closed by default to free some UI space.

## Right Click Menus

The Outliner comes with various right click functionality, dependent at what data you right click.

### Outliner Scene Operation

This menu appears when you right click at a scene in Scene mode.

#### Delete

Deletes the currently selected scene.

#### Copy Settings

Creates an empty scene but also copies the settings from the active scene into the new one.

#### Linked Copy

This option creates a new scene with the same settings and contents as the active scene. However, instead of copying the objects, the new scene contains links to the objects in the old scene. Therefore, changes to objects in the new scene will result in the same changes to the original scene, because the objects used are literally the same. The reverse is also true.

#### Full Copy

Using this option, nothing is shared. This option creates a fully independent scene with copies of the active scenes contents. Every object in the original scene is duplicated, and a duplicate, private copy of its object-data is made as well.

#### Mark as Asset, Clear Asset, Clear Asset (Set Fake User)

Scenes cannot be stored in the asset library. This menu entries are redundant.

### Outliner Data Operation

This menu appears at various object types and when you for example right click at the View Layer item. It also appears at objects in Data API mode, with varying content.

#### Select

Select the current element.

#### Deselect

Deselect the current element.

## Hide

Hides the current element.

## Unhide

Unhides the current element.

## Select Linked

Does not show on all objects and tree elements. Selects the linked elements.

## Mark as Asset, Clear Asset, Clear Asset (Set Fake User)

View Layers cannot be stored in the asset library. This menu entries are redundant.

---

## Collection

This menu appears when you right click at a collection. Clicking at a Scene collection will have not this much entries than clicking at the Collection item lower in the hierarchy.

### New Nested

Create a new nested collection. There is no difference. Both gets added in the selected collection as a child, and the functionality is the same. Ask the Blender developers what they did here.

### New

Create a new scene collection.

### Duplicate Collection

Duplicates the currently selected collection, all its children, objects and the object data.

### Duplicate Linked

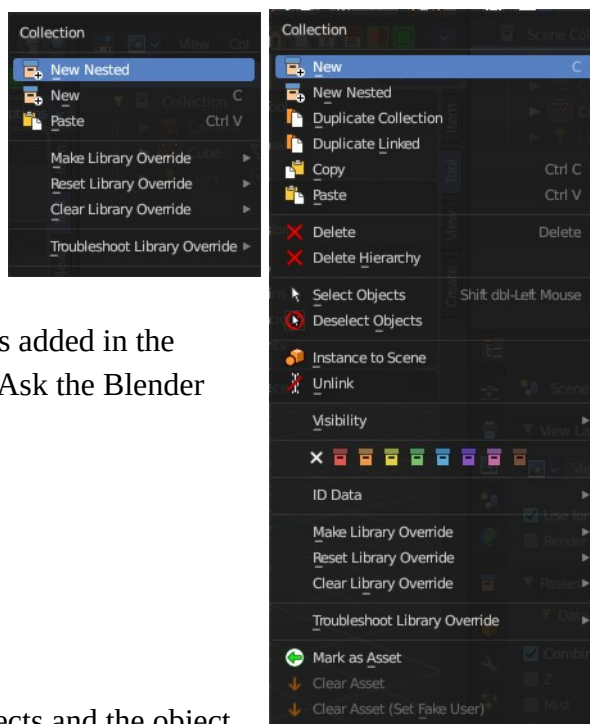

Recursively duplicate the selected collection, all its children and objects, including linked object data.

### Copy

Copies the collection.

### Paste

Pastes a copied collection.

## Delete

Delete the collection. Objects in the hierarchy will remain.

## Delete Hierarchy

Delete the collection. Objects in the hierarchy will be deleted too.

## Select Objects

Select the objects in the collection.

## Deselect Objects

Deselect the objects in the collection.

## Instance to Scene

Instance selected collections to the active scene.

## Unlink

Unlink selected collections from the active scene.

## Visibility

Visibility is a sub menu with some visibility functionality. The greyed out menu items will become available when the functionality becomes available. For example, Show becomes available when something is hidden.

## Isolate

Hide all but this collection and its parents.

## Show All Inside

Reveals the collection and all its content.

## Hide

Hides the collection.

## Set Color Tag

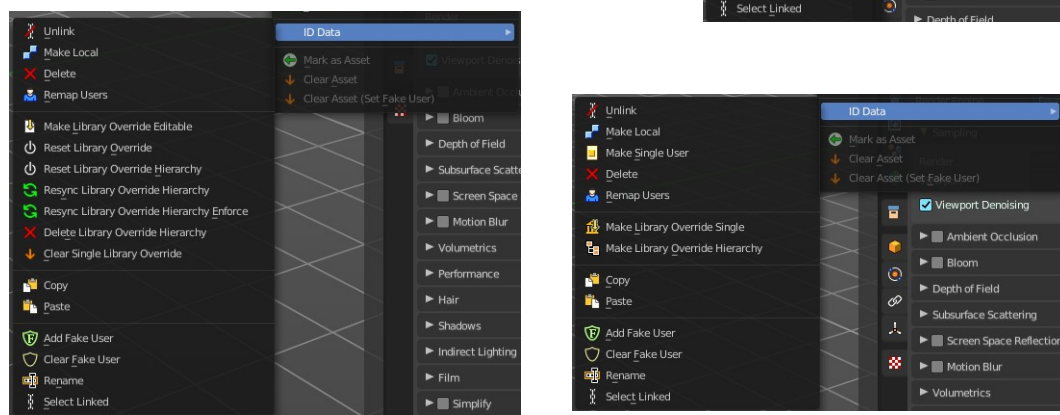

Give the collections a colored icon.

## ID Data

Data related operations.

The content differs, dependant of the collection element that you right click at. And in which display mode you are. Linked collections have different content.

### Unlink

Does basically the same than delete. It unlinks all data, and removes the object from the scene.

### Make Local

For appended or linked data. Makes the selected object a local copy in the current blend file.

### Add Library Override

Add a local library override to this collection.

This tool works different from Make Override in the outliner. It does not iterate through the hierarchy of objects and collections based on the selection. But works just for the currently selected object.

Library Overrides is the new system designed to replace and supersede Proxies. Most types of linked data-blocks can be overridden, and the properties of those overrides can then be edited. When the library data change, unmodified properties of the override one will be updated accordingly.

### Make Single User

For duplicated content. Makes the data block of the selected object a single user.

### Delete

Not functional in all situations. In the Unused Data mode you can remove objects with this.

### Remap Users

Remaps the user of a data block to another one of the same type. This allows you to replace all usages of a material or texture by another one.

## **Copy**

Copies the user data block.

## **Paste**

Pastes a copied user data block.

---

## **Make Library Override Editable**

Just with a linked collection. Make a single, out of hierarchy, local override of this linked data.

This only applies to the active outliner item.

## **Make Library Override Hierarchy**

Just with a linked collection. Make a local override of this linked data and its hierarchy of dependencies. Means the collection becomes local to the current blend file. And the hierarchy gets revealed.

This only applies to the active outliner item.

---

## **Reset Library Override**

Just with a local made linked collection, by Make Library Override Hierarchy.

Reset this local override to its linked values.

## **Reset Library Override Hierarchy**

Reset this local override to its linked values, including its hierarchical dependencies.

## **Resync Library Override Hierarchy**

Rebuild this local override from its linked reference, including its hierarchical dependencies.

## **Resync Library Override Hierarchy Enforce**

Rebuild this local override from its linked reference, including its hierarchical dependencies. But enforce the hierarchy to match the linked data. This ignores existing overrides on data pointer properties.

## **Delete Library Override Hierarchy**

Deletes the selected element.

## **Clear Single Library Override**

Deletes this local override if possible. If not reset it and mark it as not editable.

## **Copy**

Copies the selected element.

## **Paste**

Pastes the selected element.

---

## **Add Fake User**

Adds a fake user to the selected object. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

## **Clear Fake User**

Removes the fake user from the selected object.

## **Rename**

Rename the object in the outliner.

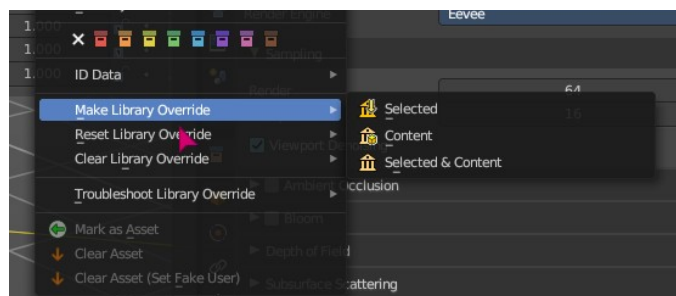

## **Select Linked**

Selects all objects that are linked to the currently selected one.

---

## **Make Library Override**

Library Overrides is a system designed to allow editing linked data, while keeping it in sync with the original library data. Most types of linked data-blocks can be overridden, and the properties of these overrides can then be edited.

## **Selected**

Add a library override to the selected collection.

## **Content**

Add a library override to the content of the selected collection.

## **Selected & Content**

Add a library override to both, the content of the selected collection, and the selected collection.

## **Reset Library Override**

Library Overrides is a system designed to allow editing linked data, while keeping it in sync with the original library data. Most types of linked data-blocks can be overridden, and the properties of these overrides can then be edited.

## ***Selected***

Reset a library override to the selected collection.

## ***Content***

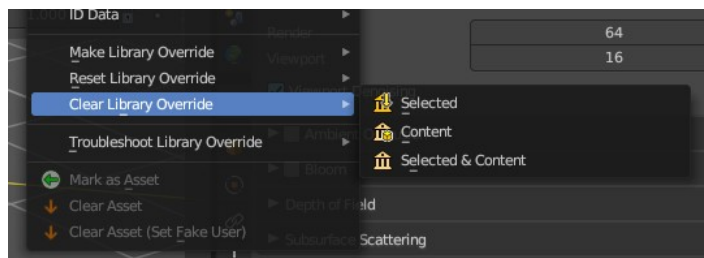

Reset a library override to the content of the selected collection.

## ***Selected & Content***

Reset a library override to both, the content of the selected collection, and the selected collection.

## **Clear Library Override**

Library Overrides is a system designed to allow editing linked data, while keeping it in sync with the original library data. Most types of linked data-blocks can be overridden, and the properties of these overrides can then be edited.

## ***Selected***

Clear the library override to the selected collection.

## ***Content***

Clear the library override to the content of the selected collection.

## ***Selected & Content***

Clear the library override to both, the content of the selected collection, and the selected collection.

## **Troubleshoot Library Override**

Troubleshoot library Override operators are useful to help synchronize or remove overrides without needing to reload scene or the linked file.

## ***Resync***

Rebuild the selected library overrides.

## ***Resync Enforce***

Rebuild the selected library overrides, enforcing libraries to match the linked data.

## ***Delete***

Delete the selected local library overrides. And relink the usage to the selected data.

---

## **Mark as Asset**

Adds the collection to the asset library.

## Clear Asset

Removes the collection from the asset library.

## Clear Asset (Set Fake User)

Removes the collection from the asset library. But marks it with a fake user so that it remains in the scene.

---

## Object Menu

This menu appears when you click at an object type. A mesh, a lamp, a camera ...

### Select

Selects the object.

### Select Hierarchy

Selects the object and its hierarchy.

### Deselect

Deselects the object.

### Duplicate

Duplicates the currently selected object and the object data.

### Duplicate Linked

Duplicates the selected object, including linked object data.

### Copy

Copies object.

### Paste

Pastes copied object.

### Delete

Deletes the selected object. Child objects gets unparented.

### Delete Hierarchy

Deletes the selected object and all its child objects.

### Unlink

Deletes the selected object.

## ID Data

Data related operations. Note that the tool tips are currently missing here.

### ***Unlink***

Does basically the same than delete. It unlinks all data, and removes the object from the scene.

### ***Make Local***

For appended or linked data. Makes the selected object a local copy in the current blend file.

### ***Make Single User***

For duplicated content. Makes the data block of the selected object a single user.

### ***Delete***

Not functional in all situations. In the Unused Data mode you can remove objects with this.

### ***Remap Users***

Remaps the user of a data block to another one of the same type. This allows you to replace all usages of a material or texture by another one.

### ***Copy***

Copies ID data.

### ***Paste***

Pastes copied ID data.

### ***Add Fake User***

Adds a fake user to the selected object. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### ***Clear Fake User***

Removes the fake user from the selected object.

### ***Rename***

Rename the object in the outliner.

### ***Select Linked***

Selects all objects that are linked to the currently selected one.

## Outliner ID Data Operation

This menu appears when you for example click at the mesh component of a mesh object. It is the same content than the ID Data menu from the Object menu.

### Unlink

Does basically the same than delete. It unlinks all data, and removes the object from the scene.

### Make Local

For appended or linked data. Makes the selected object a local copy in the current blend file.

### Delete

Not functional in all situations. In the Unused Data mode you can remove objects with this.

### Remap Users

Remaps the user of a data block to another one of the same type. This allows you to replace all usages of a material or texture by another one.

### Copy

Copies ID data.

### Paste

Pastes copied ID data.

### *Add Fake User*

Adds a fake user to the selected object. Fake users is an odd concept to keep data in the scene even if it has no user somewhere. The fake user is then a dummy user so that the object is not deleted when saving the scene.

### *Clear Fake User*

Removes the fake user from the selected object.

### *Rename*

Rename the object in the outliner.

### *Select Linked*

Selects all objects that are linked to the currently selected one.

## Mark as Asset

Adds the collection to the asset library.

## Clear Asset

Removes the collection from the asset library.

## Clear Asset (Set Fake User)

Removes the collection from the asset library. But marks it as fake user so that it remains in the scene.

---

## Outliner Animation Data Property

This menu appears with a right click at an Animation data.

## Clear Animation Data

Removes the whole animation.

## Set Action

Opens a popup menu where you can choose the action for this object.

## Unlink Action

Removes the action.

## Refresh Drivers

Refreshes existing drivers.

## Clear Drivers

Removes existing drivers.

---

## Outliner Modifier Operation

This menu appears with a right click on modifiers.

### Apply

Applies the modifier.

### Delete

Removes the modifier.

## Toggle Viewport Use

Toggles the visibility of the modifier in viewport.

## Toggle Render Use

Toggles the visibility of the modifier on render time.

## Mark as Asset

Adds the collection to the asset library.

## Clear Asset

Removes the collection from the asset library.

## Clear Asset (Set Fake User)

Removes the collection from the asset library. But marks it as fake user so that it remains in the scene.

# Level Restrictions

Some list items have so called level restrictions. You can click at them, and so exclude the object from specific things. You can make more level restrictions available in the filter settings, which will be covered below. The by default activated are:

## Selectability

Makes the object unselectable in the viewport. Or disables it, in case of a collection for example.

## Hide from Viewport

Hides the object from the Viewport.

## Hide from Render

Excludes the object from rendering.

# Scenes Mode

The Scenes mode starts one hierarchy higher than the default View Layer Mode. It shows all available scenes and their content.

Normally you work with one scene. And so the default starts with the View Layer mode of the scene. But you can create more scenes in the Properties Editor in the Scene tab.

## Collection Menu

### Move to Collection

Moves the selected object to a collection. The object is removed from the collection it was in.

By clicking at this menu item a popup will appear to choose the new collection. Allows also to create a new collection. Once done, the object will be moved to this new created collection.

### Last Operator Move to Collection

#### Name

Set a name for your new collection. When you haven't created a new collection, then this name stays blank.

### Link to Collection

Links the object to a collection. The object remains in the collection it was in.

By clicking at this menu item a popup will appear to choose the collection. Here you can also create a new collection. Once done, the object will be linked to this new created collection.

## Last Operator Link to Collection

### Name

Set a name for your new collection. When you haven't created a new collection, then this name stays blank.

---

## Remove From Collection

Objects can be in more than one collection. Remove from collection removes the selected object from the current collection.

When the object is in no collection anymore, then it gets removed.

## Remove From all Unlinked Collections

Objects can be in more than one collection. Remove from all unlinked collection removes the selected object from all unlinked collections.

When the object is in no collection anymore, then it gets removed.

## Add selected To Active Collection

Objects can be in more than one collection. Adds the selected object to the active collection.

## Remove Selected From Active Collection

Objects can be in more than one collection. Removes the selected object from the active collection.

When the object is in no collection anymore, then it gets removed.

---

## Add Collection

Add a collection inside of the current selected collection.

---

## New Scene

### New

Creates an empty scene with default values.

### Copy Settings

Creates an empty scene but also copies the settings from the active scene into the new one.

### Linked Copy

This option creates a new scene with the same settings and contents as the active scene. However, instead of

copying the objects, the new scene contains links to the objects in the old scene. Therefore, changes to objects in the new scene will result in the same changes to the original scene, because the objects used are literally the same. The reverse is also true.

## Full Copy

Using this option, nothing is shared. This option creates a fully independent scene with copies of the active scenes contents. Every object in the original scene is duplicated, and a duplicate, private copy of its object-data is made as well.

## Filter

Options and filter settings.

## Restriction Toggles

Enable or disable further level restrictions. Note that these toggles shows when you expand a scene hierarchy. Scenes itself have no such toggles.

## Sort Alphabetically

Sorts the content of the outliner in alphabetically order.

## Sync Selection

Synchronize the selection between outliner and 3d view.

## Show Mode Column

Display the Mode column at the left. When you are not in object mode, but in edit mode, or in vertex paint mode etc. , then a mode icon is displayed at the left of the object that you currently edit.

## Search

### *Exact Match Search*

The search result must fit exactly. For example, when you search for cam, then a camera should not display as a search result.

### *Case Sensitive Search*

Search case sensitive.

## View Layer Mode

The view layer mode shows the content of the current View Layer. This is the default mode.

## Collection Menu

### Move to Collection

Moves the selected object to a collection. The object is removed from the collection it was in.

By clicking at this menu item a popup will appear to choose the new collection. Allows also to create a new collection. Once done, the object will be moved to this new created collection.

### Link to Collection

Links the object to a collection. The object remains in the collection it was in.

By clicking at this menu item a popup will appear to choose the collection. Here you can also create a new collection. Once done, the object will be linked to this new created collection.

Note that there is a tool called Add to collection in the Object Properties in the Collections panel that does a similar job. It links an object to other collections. But this Link to Collection tool here just lists the collections in the current view layer.

### Remove From Collection

Objects can be in more than one collection. Remove from collection removes the selected object from the current collection.

When the object is in no collection anymore, then it gets removed.

## Remove From all Unlinked Collections

Objects can be in more than one collection. Remove from all unlinked collection removes the selected object from all unlinked collections.

When the object is in no collection anymore, then it gets removed.

## Add selected To Active Collection

Objects can be in more than one collection. Adds the selected object to the active collection.

## Remove Selected From Active Collection

Objects can be in more than one collection. Removes the selected object from the active collection.

When the object is in no collection anymore, then it gets removed.

## Add Collection

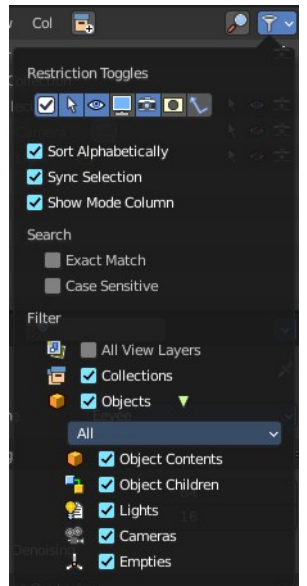

Add a collection inside of the current selected collection.

## Filter

Options and filter settings.

## Restriction Toggles

Enable or disable further level restrictions. To make the changes permanent you would have to save the startup file. This settings is part of the layout.

## Exclude from View Layer

include / Exclude the collection from the view layer.

## Selectable

Make the object selectable / unselectable.

## Hide in Viewport

Show or hide the object in the viewport.

## ***Disable in Viewport***

Enable or disable the object in the viewport.

## ***Disable in Renders***

Enable or disable the object in the rendered result.

## ***Holdout***

Mask out objects in the collection from view layer.

## ***Indirect only***

Make the objects in the collection just distribute indirect lighting to the layer.

## **Sort Alphabetically**

Sorts the content of the outliner in alphabetically order.

## **Sync Selection**

Synchronize the selection between outliner and 3d view.

## **Show Mode Column**

Display the Mode column at the left. When you are not in object mode, but in edit mode, or in vertex paint mode etc. , then a mode icon is displayed at the left of the object that you currently edit.

## **Search**

### ***Exact Match Search***

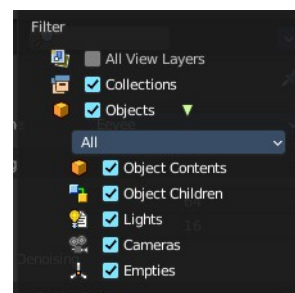

The search result must fit exactly. For example, when you search for cam, then a camera should not display as a search result.

### ***Case Sensitive Search***

Search case sensitive.

## **Filter**

Shows or hides the object and data types. The names should be self explaining. Note that the Library Override option just shows for appended objects.

### ***Object State Filter***

Shows or hides objects by its state.

## Invert

Inverts the object state filter.

# Sequence Mode

This mode lists the loaded files when you work with the sequencer layout and have video material loaded.

## Sync Outliner Selection

Keep the selection in synchronization with the other editors. 3D View and VSE.

# Blender File Mode

This mode lists the whole content of the current Blender file. It includes also things like the default brushes, which comes from the startup defaults.

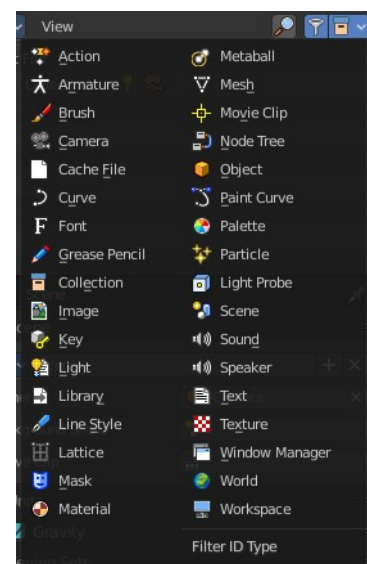

## Filter

Enable a filter to display a specific data type. You can just filter by one data type at a time. The rest will be hidden.

### Filter ID Type

The menu to choose the data type that should be displayed.

## Outliner Library Operation

In this mode, you can see linked data from external \*.blend files.

Grey arrows means the data is directly referenced from a linked \*.blend file.

Green arrows means the data is indirectly referenced into another linked \*.blend file.

## Delete

Deletes linked libraries.

## Relocate

Relocated the path of a linked library.

## Reload

Reloads and refreshes the linked library in the current file.

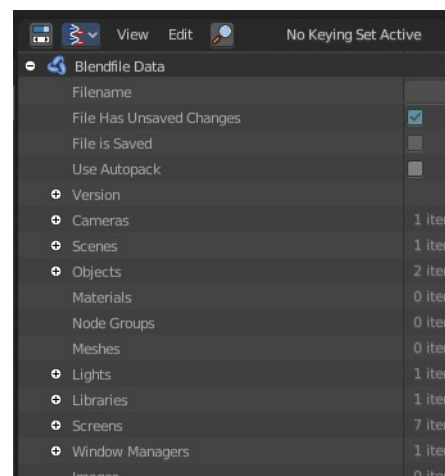

# Data API Mode

Displays Low Level Blender data and its properties.

This view also reveals some properties. Like File is Saved or Use Autopack.

When no keying set is defined then you will get a No Keying set Active message instead of the Keying set element.

## Header tools

### Edit Menu

#### ***Keying Set Add Selected***

Add a keying set to the selected object.

#### ***Keying Set Remove Selected***

Remove the keying set from the selected object.

#### ***Add Drivers to Selected***

Add a driver to the selected object.

#### ***Delete Drivers for Selected***

Delete a driver from the selected object.

#### **Set Keying set**

Choose a keying set.

## Add keyframe

Adds a keyframe for the selected element.

## Remove keyframe

Removes the current keyframe from the selected element.

# Library Override Mode

Lists the library overrides in the scene.

This feature is experimental and this lousy documented in the Blender manual that it is not to find out what library overrides are and how to use them. None of the mentioned ways to create a library override works.

What you can read there though is how great they are, and that they replace the proxies. So here comes the outliner section for the great library overrides. Whatever it is ...

## Library Override View Mode

## Properties

Show the properties of the library overrides.

## Hierarchies

Show the objects with library overrides in a hierarchical way.

## Filter options

### Sort alphabetically

Sorts the library overrides in alphabetical order in the outliner list.

### Search

Search options.

### Exact match

Search with exact match.

### Case sensitive

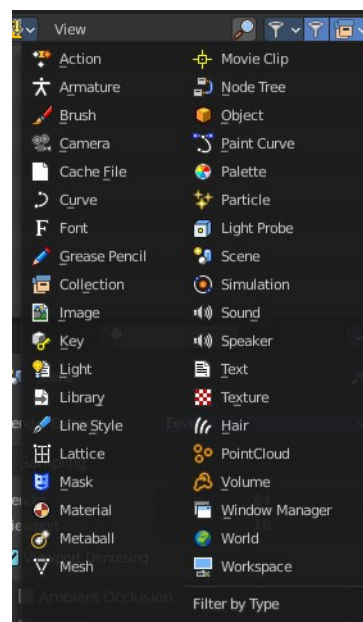

Take upper and lower case status into account.

## Filter

Enable a filter to display a specific data type. You can just filter by one data type at a time. The rest will be hidden.

### Filter ID Type

The menu to choose the data type that should be displayed.

## Unused Data Mode

Bforartists has a special system to treat not longer used data. Unused data will normally remain in the scene as long as you haven't saved it and reloaded it. Means delete does not immediately remove a mesh completely from the scene for example. It will be unused data now. Until you save and reopen the scene. The cleanup process happens at saving the blend file.

The Unused Data allows you to clean up the unused data without to save and reload the blend file. It lists all data that has no user in the scene. This includes the standard brushes from the startup configuration. Don't delete them!

## Clean Up

Normally you would need to save the blend file and reload it to get rid of the unused data. Clean Up removes all unued data from the blend file immediately. Note that this does not remove objects with a fake user associated.

### Clean Up menu

The clean up button cleans up what is in the list. This is good enough for most cases. But sometimes you might want to have a bit more fine control.

### Unused Data

Removes unused data blocks.

## ***Recursive Unused Data***

Recursively removes unused data blocks. Means the child objects gets removed too.

## ***Unused Linked Data***

Removes unused data that is linked to this file.

## ***Recursive Unused Linked Data***

Recursively removes unused data that is linked to this file. Means the child objects gets removed too.

## ***Unused Local Data***

Removes unused local data.

## ***Recursive Unused Local Data***

Recursively removes unused local data. Means the child objects gets removed too.

---

## **Filter**

Enable a filter to display a specific data type. You can just filter by one data type at a time. The rest will be hidden.

### ***Filter ID Type***

The menu to choose the data type that should be displayed.

## **Status column**

The number at the right tells you how many users the object has.

Objects with a power icon and an F besides the number have a fake

user assigned. Objects with an X in the row is unused data, and will be removed with the next save and reload of the blend file. Objects with the power icon will remain in the scene. They have a fake user.

To remove the Fake User at an object click at the Power icon. It will turn into the X button then. And the object will be removed at saving.

## Hotkey only functionality

Important! These hotkeys works with the default Bforartists key map And they do not list the N dof hotkeys. N dof is a 3d connexion mouse device that is also used for tablets.

Most of the tools can be found in the graphical UI. But there are still some tools that are hotkey only. Some have a UI brother with equal functionality. For example, Pick shortest path is the hotkey sister of Select shortest path. Some are hotkey only since they cannot be integrated in the graphical UI. Like calling the File menu under the mouse. Or mouse position dependent functionality like selecting an edge loop.

The navigation hotkeys and the context menus are excluded here since they are already covered.

### **Insert Keyframe - I**

Insert a keyframe at current position. You need to have a keying set added to the object.

### **Delete Keying Set Keyframe - Alt I**

Remove existing keyframes.

### **Hide - H**

Hides the object in the 3d view.

### **Unhide - Alt H**

Unhides all hidden objects in the 3d view.

## 26.10.10 Editors - Properties Editor - Particle Properties Tab - Hair - Hair Dynamics panel

### Table of content

Hair Dynamics panel.....	1
Quality Steps.....	1
Pin Goal Strength.....	1
Collisions.....	1
Quality.....	1
Distance.....	2

Stiffness.....	2
Random.....	2
Damping.....	2
Volume.....	2
Air Drag.....	2
Internal Friction.....	2
Voxel Grid Cell Size.....	3
Density Target.....	3
Density Strength.....	3

## Hair Dynamics panel

Hair particles can have dynamic properties using physics. To enable hair physics, click the checkbox beside Hair Dynamics.

### Quality Steps

Quality of the simulation in steps per frame (higher is better quality but slower).

### Pin Goal Strength

Spring stiffness of the vertex target position.

Warning! If you use motion blur in your animation, you will need to bake one extra frame past the last frame which you will be rendering.

### Collisions

#### Quality

A general setting for how fine and good a simulation you wish. Higher numbers take more time but ensure less tears and penetrations through the cloth.

## Distance

The distance another object must get to the cloth for the simulation to repel the cloth out of the way. Smaller values might cause errors but provide some speed-up while larger will give unrealistic results if too large and can be slow. It is best to find a good in between value.

## Impulse Clamping

Prevents explosions in tight and complicated collision situations by restricting the amount of movement after a collision.

## Collision Collection

Only objects that are a part of this Collection can collide with the cloth. Note that these objects must also have Collision physics enabled.

## Structure

### Vertex Mass

Value for the mass of the hair.

### Stiffness

Controls the bending stiffness of the hair strands.

### Random

Random stiffness of hair.

### Damping

Damping of bending motion.

## Volume

Some phenomena of real-world hair can be simulated more efficiently using a volumetric model instead of the basic geometric strand model. This means constructing a regular grid such as those used in fluid simulations and interpolating hair properties between the grid cells.

### Air Drag

Controls how thick the air is around the hair causing the hair to flow slower.

### Internal Friction

Amount of friction between individual hairs.

## **Voxel Grid Cell Size**

Size of the voxel grid cells for interaction effects.

## **Density Target**

Maximum density of the hair.

## **Density Strength**

The influence that the Density Target has on the simulation.

## 26.10.11 Editors - Properties Editor - Particle Properties Tab - Hair - Cache Panel

### Table of content

Cache Panel.....	1

Bake All Dynamics.....	4
Free All Bakes.....	5
Update All To Frame.....	5

### Cache Panel

Particle data can be cached in memory or stored on a drive. This improves real-time response and avoids unnecessary recalculation of particles. But creates also big files.

The Emitter particle system uses a unified system for caching and baking (together with Soft Body and Cloth).

Important! The file needs to be saved after baking. When the file is not saved then some options are not available.

Important! The particle settings becomes unavailable once the particle cache is baked. You need to remove the bake when you want to change the settings.

## Hints

The simulation is only calculated for positive frames in between the Start and End frames of the Cache panel, whether you bake or not. So if you want a simulation that is longer than the default frame range, you have to change the End frame.

When an animation is played, each physics system writes each frame to the cache. Note that for the cache to fill up, one has to start the playback before or on the frame that the simulation starts.

The cache is cleared automatically on changes. But not on all changes, so it may be necessary to free it manually. For example if you change a force field.

The system is protected against changes after baking. If for example the mesh changes the simulation is not calculated anew.

The bake result can be cleared by clicking on the Free Bake button in the simulation cache settings.

A simulation can only be edited in Particle Edit Mode when it has been baked in memory. And cannot be edited if the Disk Cache is used.

If you are not allowed to write to the required sub directory caching will not happen. For example if your blend-file path is very long and your operating system has a limit on the path length that is supported.

Be careful with the sequence of modifiers in the modifier stack. You may have a different number of faces in the 3D Viewport and for rendering (For example when using subdivision surface). Then the rendered result may be very different from what you see in the 3D Viewport.

## Caches List

The list of available caches. The caches have no name by default. Double click to add a name.

You can store and manage multiple caches at once for the same physics object. The active cache is the one that gets used.

## Drag Handler

The two vertical lines at the end is a handler with which you can expand the list.

## Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## *Invert*

Exclude the search term instead of searching for it.

## *Sort by Name*

Sort the List by name.

## Add New Cache

Add a new cache.

## Delete current Cache

Deletes the selected cache.

## External

Allows you to read the cache from a drive using a user-specified file path.

Note! The cache name in Caches List and the Index Number has to exactly match the external cache files name in order to work. The cache files name format is name\_frame\_index.bphys.

You can create such cache files when you tick Disk cache with External off, and save the blend file. Then the bphys files gets created in a folder besides the blend file.

## Index Number

The index number of cache files. (The last two digits of the files name.)

## File Path

Select the directory path to the cache files.

## Info string

An info string. Gives different messages, dependent of the status.

## Cache Step

The interval for storing simulation data.

Note! Some physics systems (such as particles) allow for positions to be stored only on every nth frame, letting the positions for in-between frames be interpolated. Using a cache step greater than one will result in a smaller cache, but the result may differ from the original simulation.

## Info string

An info string. Gives different messages, dependent of the status.

## Disk Cache

Save the cache externally in a folder instead inside of the blend file. The cache of a baked simulation will be stored inside the blend-file when you save it. A folder named blendcache\_[filename] will then be created along-

side the blend-file. The blend-file must be saved first and then again.

## Use Library Path

Share the disk cache when the physics object is linked into another blend-file.

When this option is enabled, linked versions of the object will reference the same disk cache. Otherwise linked versions of the object will use independent caches.

## Compression

The compression level for cached files.

### **None**

Do not compress the cache.

### **Light**

Compression will optimize the speed of compressing/decompressing operations over file size.

### **Heavy**

Compression will result in smaller cache files, but requires more CPU power to compress / decompress.

## Bake / Delete Bake

Start baking. Once you have baked the cache the button turns into a Delete bake button. And allows you to remove the bake.

The baking progress can be seen in the footer. You need to be in Object Mode to bake.

## Calculate To Frame

Bake only up to the current frame. Limited by End frame set in the cache settings.

## Current Cache to Bake

Store any temporarily cached simulation data as a bake. Note that playing the animation will try to simulate any visible physics simulations. Depending on the physics type, this data may be temporarily cached. Normally such temporary caches are cleared when an object or setting is modified, but converting it to a bake will “save” it.

## Bake All Dynamics

Bake all physics systems in the scene, even those of different types. Useful for baking complex setups involving interactions between different physics types.

## **Free All Bakes**

Free bakes of all physics systems in the scene, even those of different types.

## **Update All To Frame**

Bake all physics systems in the scene to the current frame.

## 26.10.12 Editors - Properties Editor - Particle Properties Tab - Hair - Rotation panel

### Table of content

Rotation Panel.....	1
Orientation Axis.....	1
None.....	1
Normal.....	1
Normal-Tangent.....	1
Velocity.....	2
Global X, Y, Z.....	2
Object X, Y, Z.....	2
Randomize.....	2
Phase.....	2
Randomize Phase.....	2
Dynamic.....	2
Angular Velocity.....	2
Axis.....	2
Amount.....	2

## Rotation Panel

Specify how the individual particles are rotated during their travel. To visualize the rotation of a particle you should choose visualization type Axis in the Visualization panel and increase the Display Size.

### Orientation Axis

Sets the initial rotation of the particle by aligning the X axis in the direction of:

#### None

The global X axis.

#### Normal

Orient to the emitter's surface normal, the objects Y axis points outwards.

#### Normal-Tangent

As with normal, orient the Y axis to the surface normal. Also orient the X axis to the tangent for control over the objects rotation about the normal. requires UV coordinates, the UV rotation effects the objects orientation, currently uses the active UV map. This allow deformation without the objects rotating in relation to their surface.

## Velocity

The particle's initial velocity.

## Global X, Y, Z

One of the global axes.

## Object X, Y, Z

One of the emitter object axes.

## Randomize

Randomizes rotation.

## Phase

Initial rotation phase.

## Randomize Phase

Adds a random variation to the Phase.

## Dynamic

If Dynamic is enabled, only initializes particles to the chosen rotation and angular velocity and let the physics simulation handle the rest. Particles then change their angular velocity if they collide with other objects (like in the real world due to friction between the colliding surfaces). Otherwise the angular velocity is predetermined at all times (i.e. set rotation to dynamic/constant).

## Angular Velocity

## Axis

Which axis to use for the angular velocity.

Hint! If you use a Curve Guide do not turn on Dynamic. Curve Follow does also not work for particles.

## Amount

The magnitude of angular velocity.

# Render Panel

Hair particles can be rendered as a Path. And it can render Objects or collections as the hair particles.

## Render As

Render the particles with different methods.

### All render methods

#### Show Emitter

Render the particle emitting mesh. This does not affect viewport rendering!

## None

Don't render the particles.

## Path

Render the hair particles as paths.

#### Material

Set which of the object's materials is used to shade the particles.

## **Coordinates System**

Use a different object's coordinates to determine the birth of particles.

### **Path subpanel**

#### **B-Spline**

Interpolate hair using B-splines. This may be an option for you if you want to use low Render values. You lose a bit of control but gain smoother paths.

#### **Steps**

Set the number of subdivisions of the rendered paths (the value is a power of 2). You should set this value carefully, because if you increase the render value by two you need four times more memory to render. Also the rendering is faster if you use low render values (sometimes drastically). But how low you can go with this value depends on the waviness of the hair (the value is a power of 2). This means 0 steps give 1 subdivision, 1 give 2 subdivisions, 2 → 4, 3 → 8, 4 → 16, ... n → n<sup>2</sup>.

### **Timing subpanel**

#### **Absolute Path Time**

Path timing is in absolute frames.

#### **Start**

Start time of the path.

#### **End**

End time of the path.

#### **Random**

Give the path length a random variation.

### **Extra subpanel**

#### **Parents Particles**

Render also parent particles if child particles are used. Children have a lot of different deformation options, so the straight parents would stand between their curly children. So by default Parents are not rendered if you activate Children. See Children.

#### **Unborn**

Render particles before they are born.

#### **Dead**

Render particles after they have died. This is very useful if particles die in a collision Die on hit, so you can cover objects with particles.

## Object

Render collections instead of the paths of the hair particles.

## Scale

The scale factor of the object.

## Scale randomness

Give the particle size a randomness.

## Object Sub tab

Choose the object to render instead of the path.

## Instance Object

Pick the object that you want to use as the particle.

## Global Coordinates

Use the global coordinates of the object for duplication. This sets the particles to the position of the chosen object.

## Object Rotation

Use the rotation of the object for duplication.

## Object Scale

Use the scale of the object for duplication.

## Extra sub tab

### Parents Particles

Render also parent particles if child particles are used. Children have a lot of different deformation options, so the straight parents would stand between their curly children. So by default Parents are not rendered if you activate Children. See Children.

### Unborn

Render particles before they are born.

### Dead

Render particles after they have died. This is very useful if particles die in a collision Die on hit, so you can cover objects with particles.

---

## Collection

Render the content of a collection instead of the paths of the hair particles.

## Scale

The scale factor of the object.

## Scale randomness

Give the particle size a randomness.

## Collection Sub tab

Choose the object to render instead of the path.

## Instance Collection

Pick the collection that you want to use as the particle.

## Whole collection

Use the whole collection at once.

## Pick Random

Pick objects from the collection randomly.

## Global Coordinates

Use the global coordinates of the object for duplication. This sets the particles to the position of the chosen object.

## Object Rotation

Use the rotation of the object for duplication.

## Object Scale

Use the scale of the object for duplication.

## Use Count

Use objects multiple times in the collection.

## Active Dupli Object Index list

The list with the objects from the collection. The number behind the object tells you how often this object is used in the particles, relative to the other objects.

## Drag Handler

The two vertical lines at the end is a handler with which you can expand the list.

## Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## Invert

Exclude the search term instead of searching for it.

### **Sort by Name**

Sort the List by name.

### **Revert**

Revert the list. The last list item becomes the first, and vice versa.

### **Copy Particle Dupliobject**

Duplicate the current dupli object.

### **Remove Particle Dupliobject**

Remove the selected dupli object.

### **Move Up / Down Dupli Object**

Move the dupli object up or down in the list.

### **Refresh Dupli Objects**

Refresh the list of dupli objects and their weights.

### **Count**

The number of times this object is repeated with respect to other objects.

---

## **Extra sub tab**

### **Parents Particles**

Render also parent particles if child particles are used. Children have a lot of different deformation options, so the straight parents would stand between their curly children. So by default Parents are not rendered if you activate Children. See Children.

### **Unborn**

Render particles before they are born.

### **Dead**

Render particles after they have died. This is very useful if particles die in a collision Die on hit, so you can cover objects with particles.

# 26.10.14 Editors - Properties Editor - Particle Properties Tab - Hair - Viewport Display panel

## Table of content

Viewport Display.....	1
Display as.....	1
None.....	1
Rendered.....	1
Point.....	2
Circle.....	2
Cross.....	2
Axis.....	2
Color.....	2
Fade Distance.....	2
Amount.....	2
Show Emitter.....	2
Size.....	2
Strand Steps.....	3

## Viewport Display

How to display the particles in the 3d viewport.

### Display as

How to display the particles in the viewport.

### None

Don't display particles in the viewport.

### Rendered

Display the particles as rendered.

Important! These settings are dependent of the render as mode in the Render panel, and some settings just displays in the right mode.

## Point

Display the particles as Points.

## Circle

Display the particles as circles.

## Cross

Displays each particle as a cross.

## Axis

Displays each particle as an axis widget.

## Color

What draw color to use for the particles.

## Fade Distance

With color mode Velocity and Acceleration. Maximum length of the particle color vector.

## Amount

Percentage of particles to display in the 3d viewport. Choosing a display percentage lower 100 makes dynamics inaccurate without baking.

## Show Emitter

Render the particle emitting mesh.

## Size

Shows with render method Halo. Size of particles in viewport in Blender Units.

## Strand Steps

Shows with render method With Path. How many steps paths are drawn with. The value needs to be a power of two.

## 26.10.15 Editors - Properties Editor - Particle Properties Tab - Hair - Hair Shape panel

### Table of content

Hair Shape panel.....	1
Strand Shape.....	1
Diameter Root.....	1
Tip.....	1
Diameter Scale.....	1
Close Tip.....	1

### Hair Shape panel

These settings control the shape of hair curves for rendering.

#### Strand Shape

A shape parameter that controls the transition in thickness between the root and tip. Negative values make the primitive rounded more towards the top, the value of zero makes the primitive linear, and positive values make the primitive rounded more towards the bottom.

#### Diameter Root

Multiplier of the hair width at the root.

#### Tip

Multiplier of the hair width at the tip.

#### Diameter Scale

Multiplier for the Root and Tip values. This can be used to change the thickness of the hair.

#### Close Tip

Sets the thickness at the tip to zero, even when using a non-zero tip multiplier.

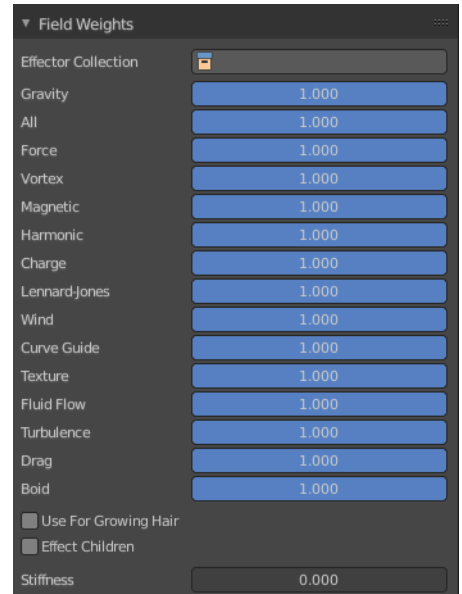

## 26.10.16 Editors - Properties Editor - Particle Properties Tab - Hair - Field Weights panel

### Table of content

Field weights panel.....	1
Effector Collection.....	1
Gravity.....	1
All.....	1
Force, Vortex, etc.....	1
Use For Growing Hair.....	1
Effect Children.....	1
Stiffness.....	2

### Field weights panel

The Field Weight panel allows you to control how much influence each type of external force field, or effector, has on the particle system. Force fields are external forces that give dynamic system's motion.

#### Effector Collection

Limit effectors to a specified group. Only effectors in this group will have an effect on the current system.

#### Gravity

Control how much the Global Gravity has an effect on the system.

#### All

Scale all of the effector weights.

#### Force, Vortex, etc.

The influence for the single corresponding effector weights.

#### Use For Growing Hair

Use force fields when growing hair.

#### Effect Children

Apply effectors to children

## **Stiffness**

Hair stiffness for effectors.

## 26.10.17 Editors - Properties Editor - Particle Properties Tab - Velocity panel

### Table of content

Velocity Panel.....	1
Normal.....	1
Tangent.....	1
Tangent Phase.....	1
Object Aligned X Y Z.....	1
Object Velocity.....	1
Randomize.....	1

## Velocity Panel

The initial velocity of particles can be set through different parameters, based on the type of the particle system.

### Normal

The emitter's surface normals (i.e. let the surface normal give the particle a starting speed).

### Tangent

Let the tangent speed give the particle a starting speed.

### Tangent Phase

Rotates the surface tangent.

### Object Aligned X Y Z

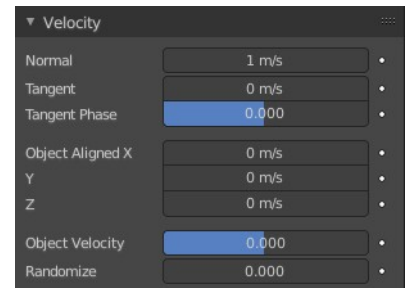

Give an initial velocity in the X, Y, and Z axes.

### Object Velocity

Let the object give the particle a starting speed.

### Randomize

Gives the starting speed a random variation.

# Physics Panel

The movement of particles can be controlled and influenced in various ways. Physics is one of it.

## Physics Type

The kind of physics to influence the particles.

# Physics Panel - Physics type None

The particles are created, and remains at their creation point.

This physics type does not have further settings.

# Physics Panel - Physics type Newtonian

Particles are influenced by gravity.

## Mass

Specify the mass of the particles.

## Multiply Mass with Size

Causes larger particles to have larger masses.

## Forces subpanel

### Brownian

Specify the amount of Brownian motion. Brownian motion adds random motion to the particles based on a Brownian noise field.

## Drag

A force that reduces particle velocity in relation to its speed and size (useful in order to simulate air drag or water drag).

## Damp

Reduces particle velocity (deceleration, friction, dampening).

## Deflection subpanel

### Size Deflect

Use the particle size in deflections.

### Die on Hit

Kill particle when it hits a deflector object.

### Collision Collection

If set, particles collide with objects from the collection.

## Integration subpanel

Integrators are a set of mathematical methods available to calculate the movement of particles. The following guidelines will help to choose a proper integrator, according to the behavior aimed at by the animator.

## Integration

### *Euler*

Also known as “Forward Euler”. Simplest integrator. Very fast but also with less exact results. If no dampening is used, particles get more and more energy over time. For example, bouncing particles will bounce higher and higher each time. Should not be confused with “Backward Euler” (not implemented) which has the opposite feature, the energy decrease over time, even with no dampening. Use this integrator for short simulations or simulations with a lot of dampening where speedy calculations are more important than accuracy.

### *Verlet*

Very fast and stable integrator, energy is conserved over time with very little numerical dissipation.

### *Midpoint*

Also known as “2nd order Runge-Kutta”. Slower than Euler but much more stable. If the acceleration is constant (no drag for example), it is energy conservative. It should be noted that in example of the bouncing particles, the particles might bounce higher than they started once in a while, but this is not a trend. This integrator is a generally good integrator for use in most cases.

## **RK4**

Short for “4th order Runge-Kutta”. Similar to Midpoint but slower and in most cases more accurate. It is energy conservative even if the acceleration is not constant. Only needed in complex simulations where Midpoint is found not to be accurate enough.

## **Time step**

The amount of simulation time (in seconds) that passes during each frame.

## **Sub frames**

The number of simulation steps per frame. Sub frames to simulate for improved stability and finer granularity in simulations. Use higher values for faster-moving particles.

# Physics Panel - Physics type Keyed

The path of Keyed particles is determined between particles of any two (or more) particle systems. This allows the creation of a chains of systems to create long strands or groovy moving particles. Basically the particles have no dynamics but are interpolated from one system to the next each frame.

To setup Keyed particles you need at least two particle systems in the Keys list.

## **Mass**

Specify the mass of the particles.

## **Multiply Mass with Size**

Causes larger particles to have larger masses.

## **Loops**

Sets the number of times the entire Keys list is repeated. Disabled if Use Timing is enabled.

## **Use Timing**

Specify the timing for each key independently, using the Time and Duration options. By default, the Use Timing option is deactivated, and the particles will pass through all keys for a time equal to its lifetime. A shorter lifetime means faster movement. The lifetime will be split equally between the keys, this may lead to varying particle speeds between the targets.

## Relations sub tab

### Particle Targets list

A list of the available particle systems. You need at least two.

#### **Drag Handler**

The two vertical lines at the end is a handler with which you can expand the list.

#### **Search Field**

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

#### **Invert**

Exclude the search term instead of searching for it.

#### **Sort by Name**

Sort the List by name.

#### **New Particle Target**

Add a particle target. You need to specify the object that contains the particle system, which can be done below. Empty particle targets are marked as Invalid target!

#### **Move Up Target / Move Down Target**

Move the selected particle target up or down in the list.

#### **Target Object**

Choose the target object that contains the particle system.

#### **System**

The index of the particle system on the target object.

#### **Time**

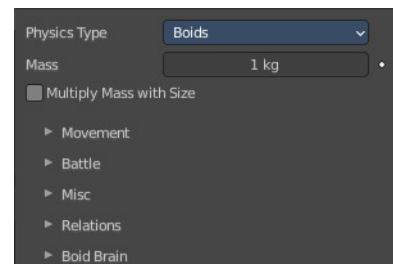

Becomes active when Use Timing is activated. The start time.

#### **Duration**

Becomes active when Use Timing is activated. The duration.

## Physics Panel - Physics type Boid

Boids particle systems are controlled by a limited artificial intelligence, which can be programmed to follow basic rules and behaviors. They are ideal for simulating flocks, swarms, herds and schools of various kind of animals, insects and fishes or predators vs. preys simulations. They can react on the presence of other objects and on the members of their own system. Boids can handle only a certain amount of information, therefore the sequence of the Boid Brain rules is very important. In certain situations only the first three parameter are evaluated.

### Mass

Specify the mass of the particles.

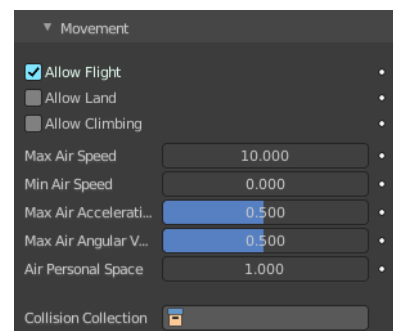

### Multiply Mass with Size

Causes larger particles to have larger masses.

### Movement subpanel

Boids try to avoid objects with activated Collision. They try to reach goal objects, and fly from “predators” according to the Boid Brain settings.

Boids can have different physics depending on whether they are in the air, or on land (on collision object).

### Allow Flight

Allow boids to move in the air.

### Allow Land

Allow boids to move on land. Activating this setting will reveal further sliders.

### Allow Climbing

Allow boids to climb goal objects.

### Max Air Speed

Set the Maximum velocity in the air.

## **Min Air Speed**

Set the Minimum velocity in the air.

## **Max Air Acceleration**

Lateral acceleration in air, percentage of the max velocity (turn). Defines how fast a boid is able to change direction.

## **Max Air Angular Velocity**

Tangential acceleration in air, percent 180 degrees. Defines how much the boid can suddenly accelerate in order to fulfill a rule.

## **Air Personal Space**

Radius of boids personal space in air. Percentage of particle size.

## **Landing Smoothness**

How smoothly the boids land.

## **Max Land Speed**

Set the Maximum velocity on land.

## **Jump Speed**

Maximum speed for jumping.

## **Max Land Acceleration**

Lateral acceleration on land, percent of max velocity (turn). Defines how fast a boid is able to change direction.

## **Max Land Angular Velocity**

Tangential acceleration on land, percent 180 degrees. Defines how much the boid can suddenly accelerate in order to fulfill a rule.

## **Land Personal Space**

Radius of boids personal space on land. Percentage of particle size.

## **Land Stick Force**

How strong a force must be to start effecting a boid on land.

## **Collision Collection**

Only collide with objects in this collection.

---

## Battle subpanel

### **Health**

Initial boid health when born.

### **Strength**

Maximum caused damage per second on attack.

### **Aggression**

Boid will fight this time stronger than enemy.

### **Accuracy**

Accuracy of attack.

### **Range**

Maximum distance of which a boid can attack.

## Misc subpanel

### **Banking**

Amount of rotation around velocity vector on turns. Banking of 1.0 gives a natural banking effect.

### **Pitch**

Amount of rotation around side vector.

### **Height**

Boid height relative to particle size.

## Relations subpanel

Boid particles can react with other particle systems. This list allows you to select other objects with their particle systems.

### **Deflection**

Boids will try to avoid deflector objects according to the Collision rule's weight. It works best for convex surfaces (some work needed for concave surfaces).

### **Force Fields**

As other physics types, Boids is also influenced by external force fields.

In addition, special Boid force fields can be used with the Boids physics. These effectors could be predators (positive Strength) that boids try to avoid, or targets (negative Strength) that boids try to reach according to the (respectively) Avoid and Goal rules of the Boid Brain.

---

## Particle Targets list

A list of the available particle systems.

### **Drag Handler**

The two vertical lines at the end is a handler with which you can expand the list.

### **Search Field**

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

### **Invert**

Exclude the search term instead of searching for it.

### **Sort by Name**

Sort the List by name.

### **New Particle Target**

Add a particle target. You need to specify the object that contains the particle system, which can be done below. Empty particle targets are marked as Invalid target!

### **Move Up Target / Move Down Target**

Move the selected particle target up or down in the list.

## Target Object

Choose the target object that contains the particle system.

## System

Index of the Object's particle system as set in the list view in the particle panel.

## Mode

### **Enemy**

Setting the type to Enemy will cause the systems to fight with each other.

### **Friend**

Will make the systems work together.

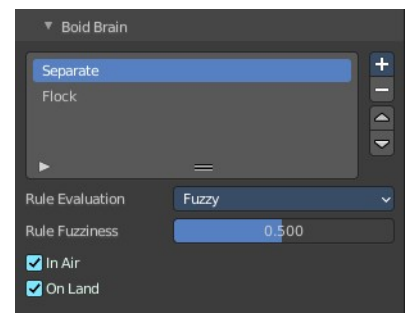

## Neutral

Will not cause them to align or fight with each other.

## Boid Brain subpanel

The Boid Brain panel controls how the boids particles will react with each other. The boids' behavior is controlled by a list of rules. Only a certain amount of information in the list can be evaluated. If the memory capacity is exceeded, the remaining rules are ignored.

The rules are by default parsed from top-list to bottom-list (thus giving explicit priorities), and the order can be modified using the little arrows buttons on the right side.

## List of Rules

The list of the current rules.

## Search Field

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

## Invert

Exclude the search term instead of searching for it.

## Sort by Name

Sort the List by name.

## Add Boid Rule

A list of the available boid rules. Each rule has different settings.

## All rules

### Rule Evaluation

There are three ways to control how rules are evaluated:

#### Average

All rules are averaged.

## **Random**

A random rule is selected for each boid.

## **Fuzzy**

Uses fuzzy logic to evaluate rules. Rules are gone through top to bottom. Only the first rule that affect above the Rule Fuzziness threshold is evaluated. The value should be considered how hard the boid will try to respect a given rule (a value of 1 means the Boid will always stick to it, a value of 0 means it will never). If the boid meets more than one conflicting condition at the same time, it will try to fulfill all the rules according to the respective weight of each.

Note! A given boid will try as much as it can to comply to each of the rules it is given, but it is more than likely that some rule will take precedence on other in some cases. For example, in order to avoid a predator, a boid could probably “forget” about Collision, Separate and Flock rules, meaning that “while panicked” it could well run into obstacles, e.g. even if instructed not to, most of the time.

## **Rule Fuzziness**

The fuzziness for the rule evaluation method Fuzzy.

## **In Air**

The current rule affects boids while they are flying.

## **On Land**

The current rule affects boids while they are not flying.

## **Goal Boid Rule**

Seek the goal.

## **Object**

Specifies the goal object. If not specified, Boid force fields with negative Strength are used as goals.

## **Predict**

Predict target’s movements.

## **Avoid Boid Rule**

Avoid “predators”.

## **Object**

Specifies the object to avoid. If not specified, Boid force fields with positive Strength are used as predators.

## **Predict**

Predict target’s movements.

## **Fear Factor**

Avoid object if danger from it is above this threshold.

## ***Avoid Collision Boid Rule***

Avoid objects with activated Deflection.

### **Boids**

Avoid collision with other boids.

### **Deflectors**

Avoid collision with deflector objects.

### **Look Ahead**

Time to look ahead in seconds.

## ***Separate Boid Rule***

Boids move away from each other.

## ***Flock Boid Rule***

Copy movements of neighboring boids, but avoid each other.

## ***Follow Leader Boid Rule***

Follows a leader object instead of a boid.

### **Object**

Pick the leader object.

### **Distance**

Distance behind leader to follow.

### **Line**

Follow the leader in a line.

### **Queue Size**

How many boids that are allowed to follow in a line.

## ***Average Speed Boid Rule***

Maintain average velocity.

### **Speed**

Percentage of maximum speed.

### **Wander**

How fast velocity's direction is randomized.

### **Level**

How much velocity's Z component is kept constant.

## ***Fight Boid Rule***

Move toward nearby boids.

## **Fight Distance**

Attack boids at a maximum of this distance.

## **Flee Distance**

Flee to this distance.

Fight Distance	100.000
Flee Distance	100.000

---

## ***Remove Boid Rule***

Remove the boid rule from the list.

## ***Move Up / Move Down Boid Rule***

Move the boid rule up or down the list.

# Physics Panel - Physics type Fluid

Fluid particles are similar to Newtonian particles. But the particles are influenced by internal forces like pressure, surface tension, viscosity, springs, etc. The range goes from liquids to slime, goo to sand and wispy.

## **Mass**

Specify the mass of the particles.

## **Multiply Mass with Size**

Causes larger particles to have larger masses.

## **SPH Solver**

Smoothed-particle hydrodynamics (SPH) is a computational method used for simulating fluid flows. It is a mesh-free Lagrangian method where the coordinates move with the fluid.

## **Double density**

An artistic solver with strong surface tension effects. Reveals the Spring sub panel.

## **Classic**

A more physically accurate solver.

## **Stiffness**

How incompressible the fluid is.

## Viscosity

Linear viscosity. Use lower viscosity for thicker fluids.

## Buoyancy

Artificial buoyancy force in negative gravity direction based on pressure differences inside the fluid.

## Forces subpanel

### Brownian

Specify the amount of Brownian motion. Brownian motion adds random motion to the particles based on a Brownian noise field.

### Drag

A force that reduces particle velocity in relation to its speed and size (useful in order to simulate air drag or water drag).

### Damp

Reduces particle velocity (deceleration, friction, dampening).

## Deflection subpanel

### Size Deflect

Use the particle size in deflections.

### Die on Hit

Kill particle when it hits a deflector object.

## Collision Collection

If set, particles collide with objects from the collection.

## Integration subpanel

Integrators are a set of mathematical methods available to calculate the movement of particles. The following guidelines will help to choose a proper integrator, according to the behavior aimed at by the animator.

## Integration

### Euler

Also known as “Forward Euler”. Simplest integrator. Very fast but also with less exact results. If no dampening is used, particles get more and more energy over time. For example, bouncing particles will bounce higher and higher each time. Should not be confused with “Backward Euler”

(not implemented) which has the opposite feature, the energy decrease over time, even with no dampening. Use this integrator for short simulations or simulations with a lot of dampening where speedy calculations are more important than accuracy.

### **Verlet**

Very fast and stable integrator, energy is conserved over time with very little numerical dissipation.

### **Midpoint**

Also known as “2nd order Runge-Kutta”. Slower than Euler but much more stable. If the acceleration is constant (no drag for example), it is energy conservative. It should be noted that in example of the bouncing particles, the particles might bounce higher than they started once in a while, but this is not a trend. This integrator is a generally good integrator for use in most cases.

### **RK4**

Short for “4th order Runge-Kutta”. Similar to Midpoint but slower and in most cases more accurate. It is energy conservative even if the acceleration is not constant. Only needed in complex simulations where Midpoint is found not to be accurate enough.

### **Time step**

The amount of simulation time (in seconds) that passes during each frame.

### **Sub frames**

The number of simulation steps per frame. Sub frames to simulate for improved stability and finer granularity in simulations. Use higher values for faster-moving particles.

## **Springs Subpanel**

### **Force**

Spring force.

### **Viscoelastic Springs**

Use viscoelastic springs instead of Hooke’s springs.

#### **Elastic Limit**

How much the spring has to be stretched/compressed in order to change its rest length.

#### **Plasticity**

How much the spring rest length can change after the elastic limit is crossed.

#### **Initial Rest Length**

Use initial length as spring rest length instead of  $2 \times$  particle size.

## **Frames**

Create springs for this number of frames since particle's birth (0 is always).

## **Advanced**

### **Rest Length**

Rest length of springs. Factor of particle radius. Checkbox sets this to be a factor of  $2 \times$  particle size.

### **Factor Rest Length**

Spring rest length is a factor of  $2 \times$  particle size.

## **Fluid Interaction**

Add a particle system to interact with the fluid.

### **Particle Targets list**

A list of the available particle systems.

### **Search Field**

You can expand a search field at the bottom of the list. Type in your term and hit enter to filter for your term.

### **Invert**

Exclude the search term instead of searching for it.

### **Sort by Name**

Sort the List by name.

### **Target Object**

Choose the target object that contains the particle system.

### **System**

The index of the particle system on the target object.
